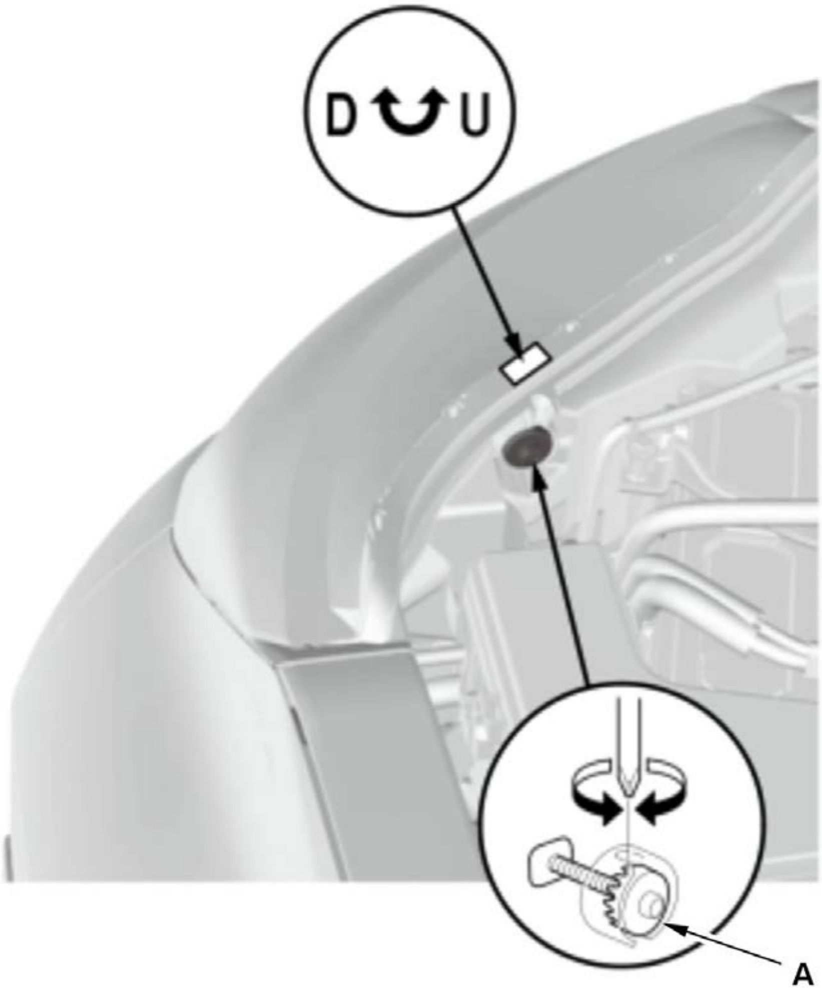
 	4. Turn on the low beam headlights. 5. To see if the headlights are adjusted properly, observe the beams of light proj screen. The highest edge or "cut line" (A) of the headlights should be equal with (B). **NOTE:** To help determine if a headlight is out of adjustment, block one of the b piece of cardboard or equivalent, and observe the other beam on the wall or scre the other headlight.



6. If adjustment is necessary, adjust the headlights to local turning the adjuster (A).

NOTE: The headlights can o and down.

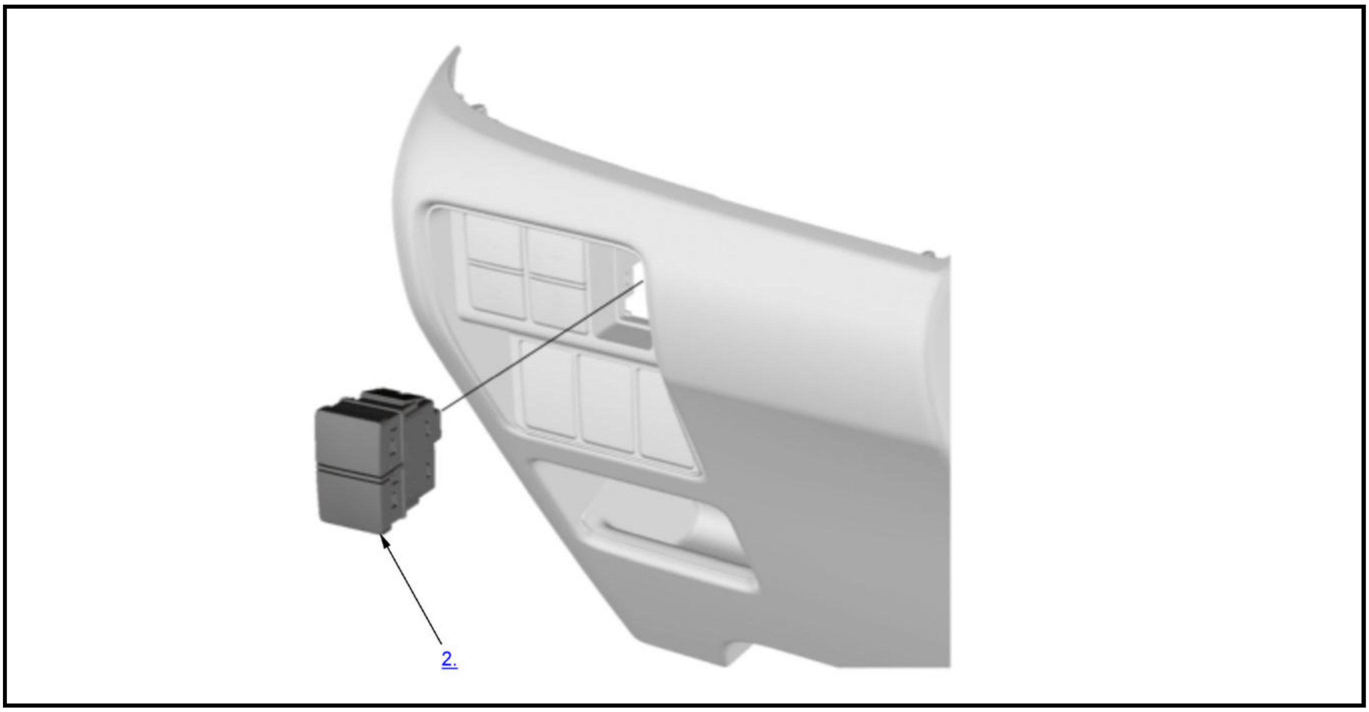
REMOVAL INSTALLATION TEST

DRIVER'S POWER TAILGATE SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: The switch location of the driver's power tailgate switch is different depending on the model.

1



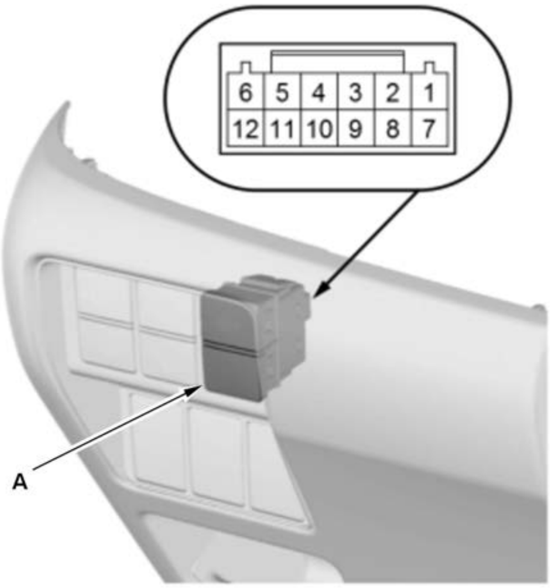
1. Driver's Dashboard Lower Cover - Remove
2. Driver's Power Tailgate Switch - Remove
3. All Removed Parts - Install

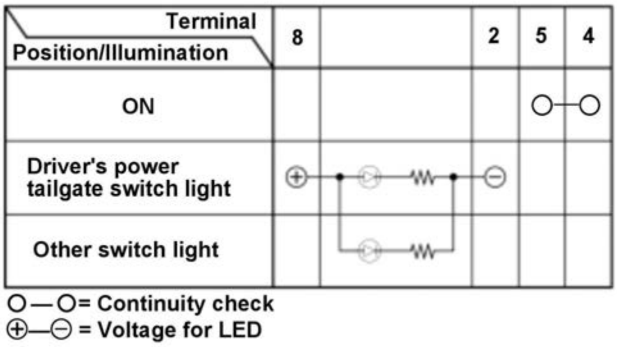
   1. Install the parts in the reverse order of removal.

Test

1. Driver's Power Tailgate Switch - Test

12P connector type

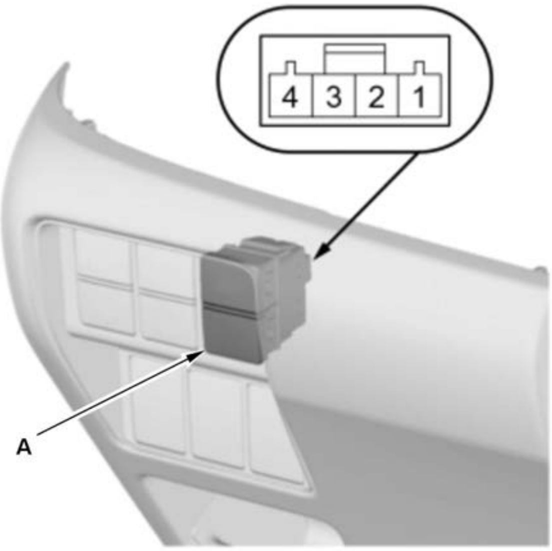


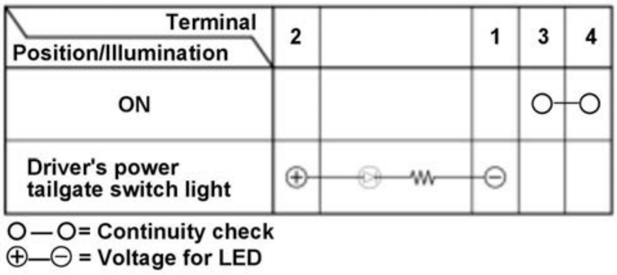


Terminal Position/Illumination	8		2	5	4
ON				○	○
Driver's power tailgate switch light	⊕		⊖		
Other switch light					

○—○= Continuity check
⊕—⊖ = Voltage for LED

4P connector type





Terminal Position/Illumination	2		1	3	4
ON				○	○
Driver's power tailgate switch light	⊕		⊖		

○—○= Continuity check
⊕—⊖ = Voltage for LED

The switch location of the driver's power tailgate switch (A) is different depending on the model.

1. Check the driver's power tailgate switch for continuity and voltage according to the table.

NOTE:

- Before testing, make sure not to short the driver's power tailgate switch circuit.
- When an LED is located between terminals, check if the LED lights up by connecting power and ground to the LED.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

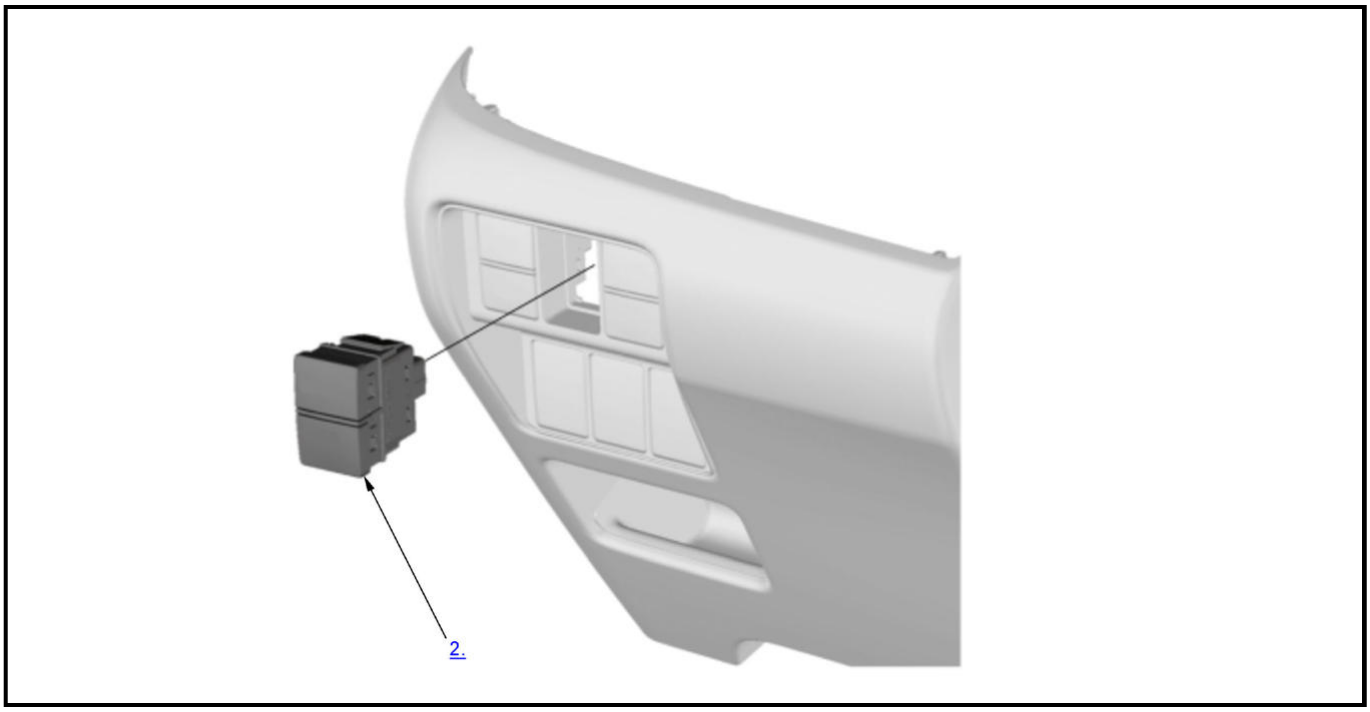
2. If the continuity is not as specified, replace the driver's power tailgate switch.

HEATED WINDSHIELD WIPER AREA SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: The mounting position of the heated windshield wiper area switch is different depending on the model.

1



1. **Driver's Dashboard Lower Cover - Remove**
2. Heated Windshield Wiper Area Switch - Remove
3. All Parts Removed - Install

    1. Install the parts in the reverse order of removal.

Test

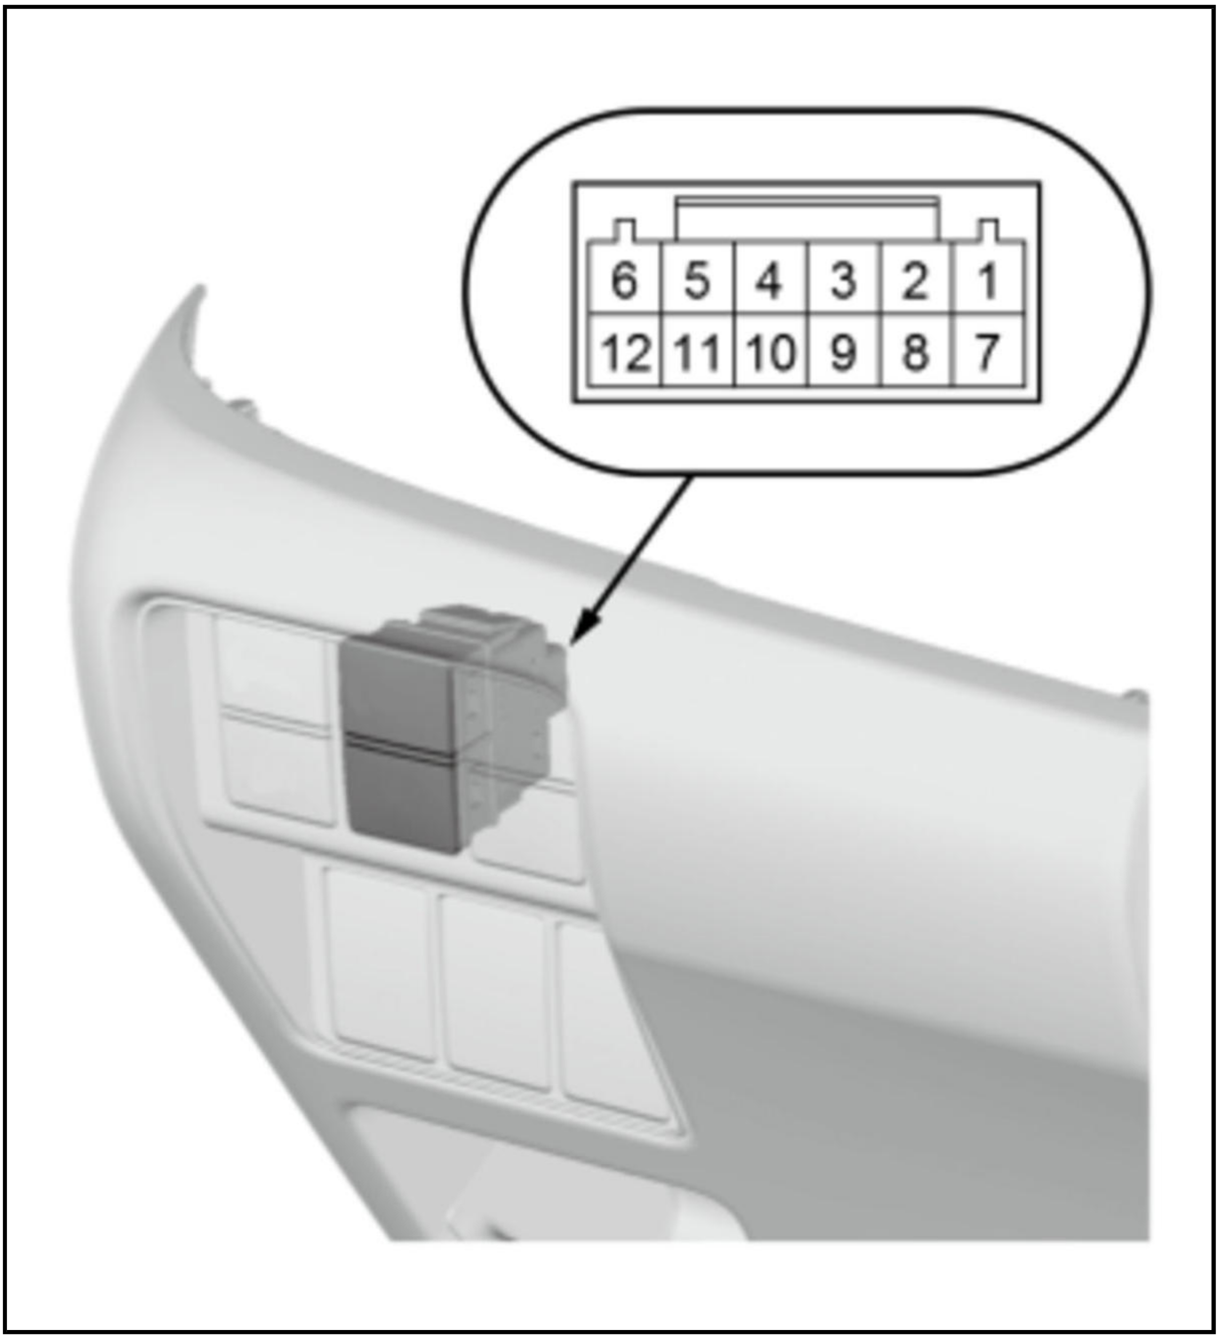
1. Heated Windshield Wiper Area Switch - Test

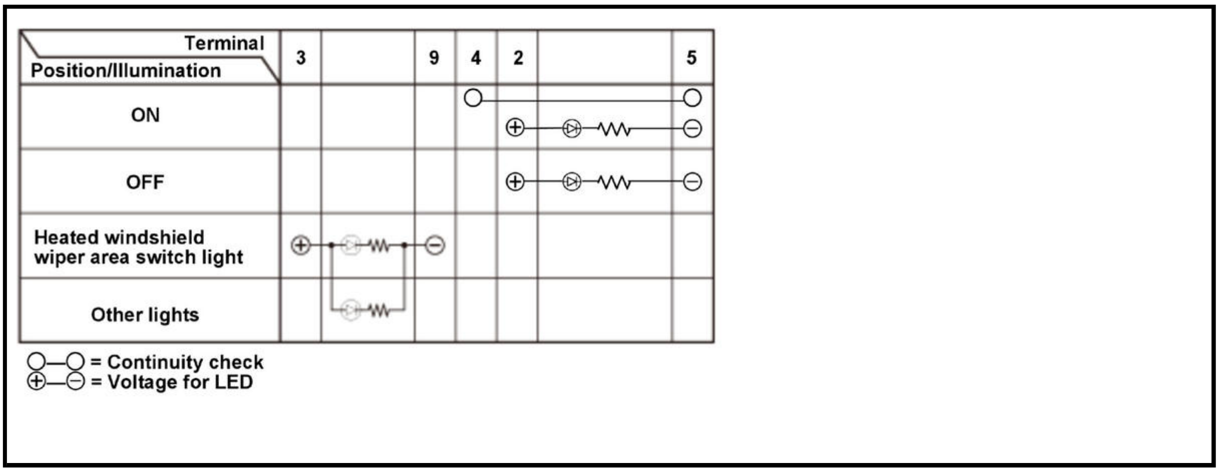
    NOTE: The mounting position of the heated windshield wiper area switch is different depending on the model.

    1. Check the heated windshield wiper area switch according to the table.

    NOTE:

    - When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.
    - Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).





Terminal / Position/Illumination	3		9	4	2		5
ON				○			○
					⊕		⊖
OFF					⊕		⊖
Heated windshield wiper area switch light	⊕		⊖				
Other lights							

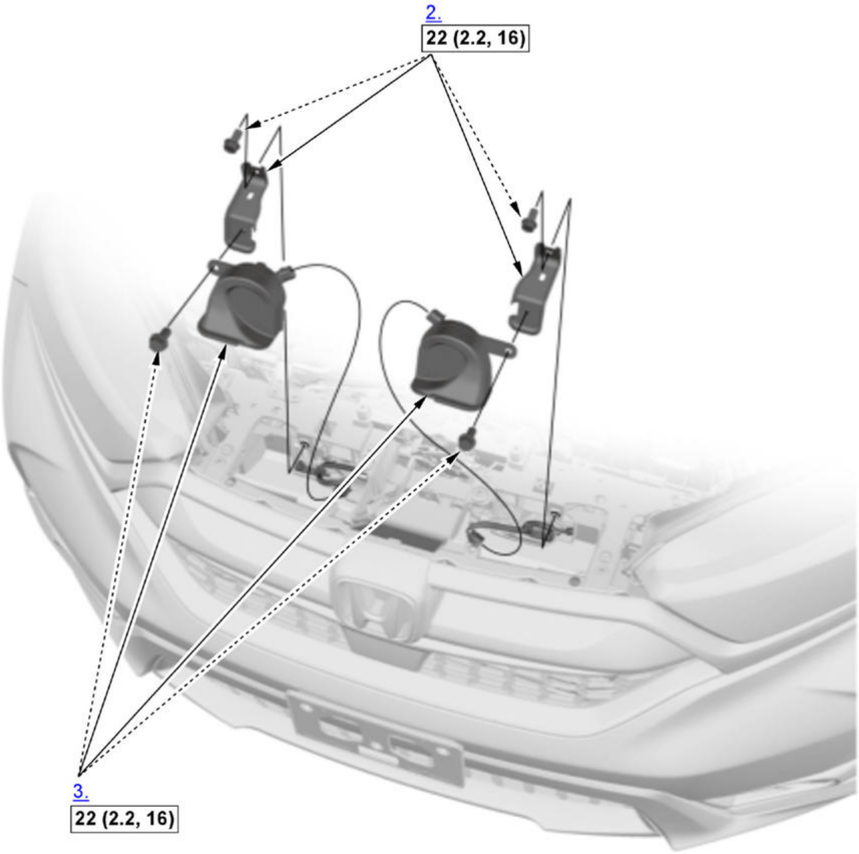
○—○ = Continuity check
⊕—⊖ = Voltage for LED

2. If the result is not as specified, replace the heated windshield wiper area switch.

HORN REMOVAL, INSTALLATION, AND TEST

Removal and Installation

Type A

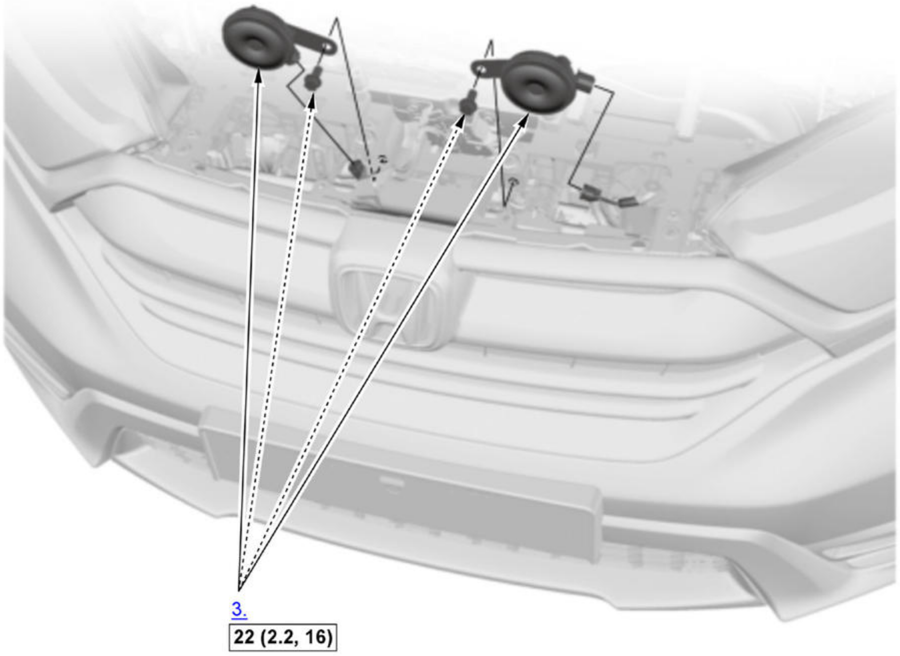


2.
22 (2.2, 16)
3.
22 (2.2, 16)

☐	Torque: N.m (kgf.m, lbf.ft)

2

Type B



▭	Torque: N.m (kgf.m, lbf.ft)

1. **Front Bulkhead Cover - Remove**
2. Bracket - Remove (For some model)
3. Horns - Remove
4. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

Test

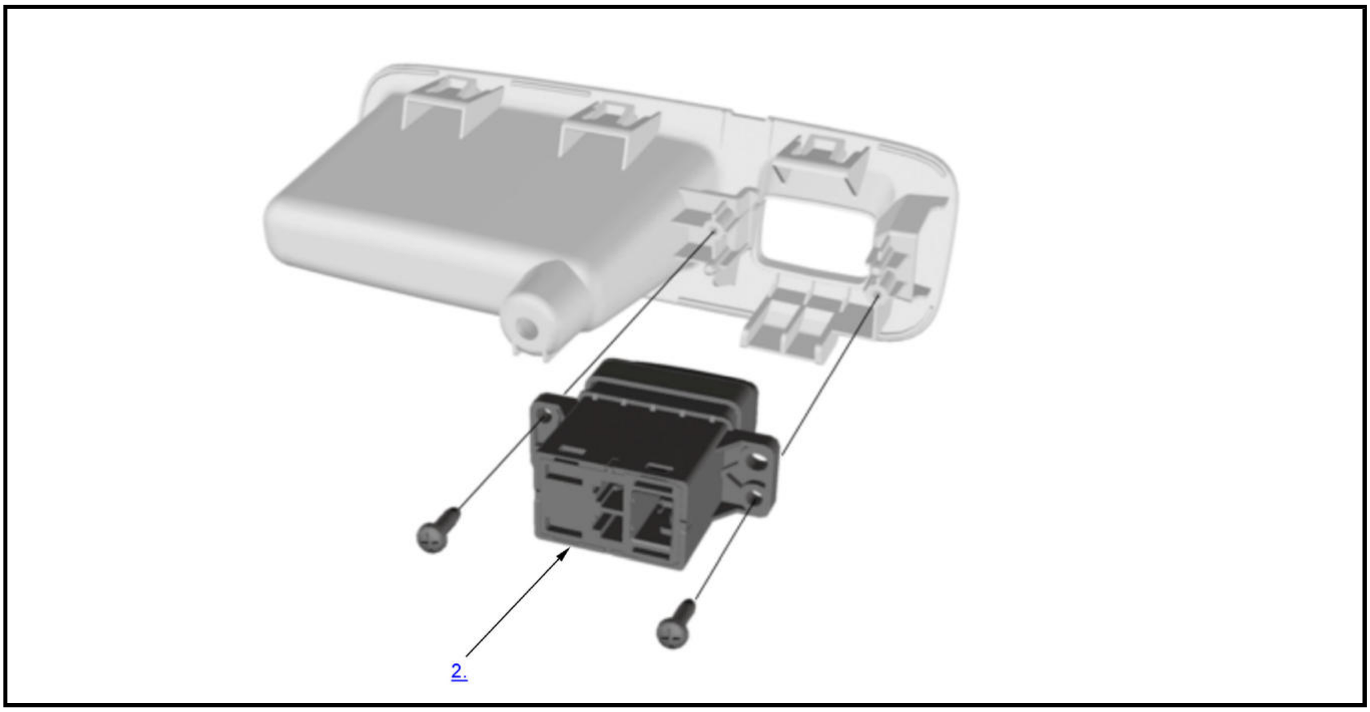
1. Horn - Test

 **Type A** **Type B** 	**NOTE:** Before testing, make sure not to short the horn circuit. 1. Test the horn by connecting battery power to terminal No. 1 and ground to terminal No. 2 of the horn. The horn should sound. 2. If it fails to sound, replace the horn.

POWER TAILGATE INSIDE SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1

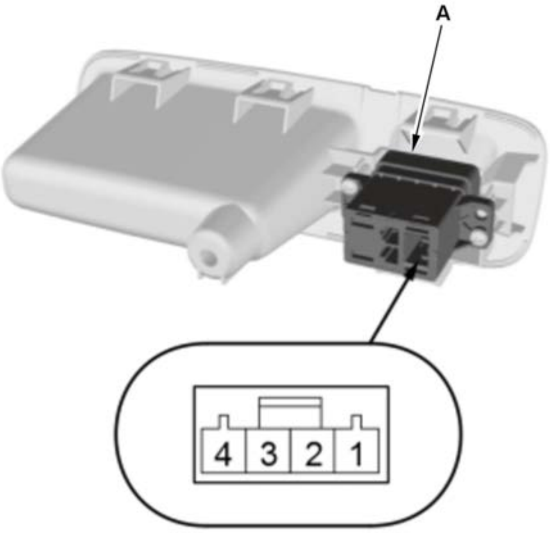


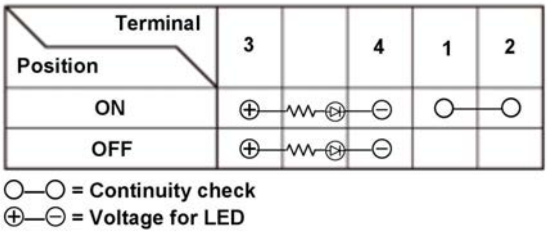
1. **Tailgate Pull Pocket - Remove**
2. Power Tailgate Inside Switch - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

Test

1. Power Tailgate Inside Switch - Test





Terminal / Position	3		4	1	2
ON	⊕	—	⊖	○	○
OFF	⊕	—	⊖		

○—○ = Continuity check
⊕—⊖ = Voltage for LED

1. Check the power tailgate inside switch (A) for continuity and voltage according to the table.

NOTE:

- Before testing, make sure not to short the power tailgate inside switch circuit.
- When an LED is located between terminals, check if the LED lights up by connecting power and ground to the LED.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

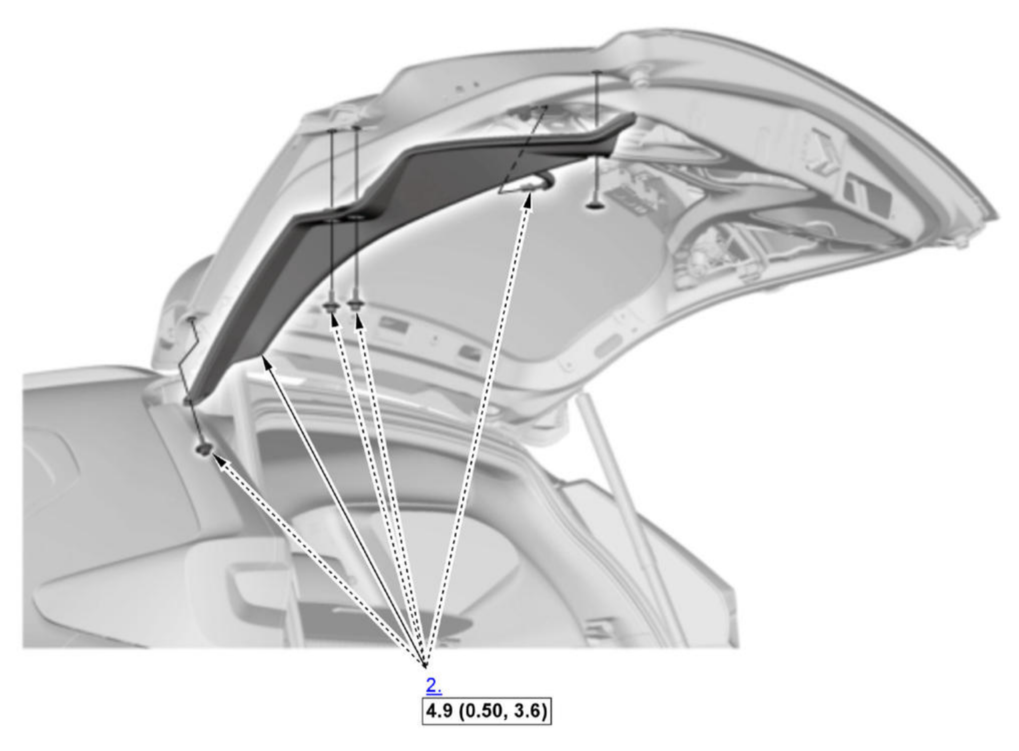
2. If the continuity is not as specified, replace the power tailgate inside switch.

POWER TAILGATE PINCH SENSOR REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: The left side is as shown; the right side is similar.

1



▭	Torque: N.m (kgf.m, lbf.ft)

1. **Tailgate Lower Trim Panel - Remove**
2. Power Tailgate Pinch Sensor - Remove
3. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

Test

1. Power Tailgate Pinch Sensor - Test

Left Side  	1. Measure the resistance between the pinch sensor connector terminals No. 1 and No. 2. The resistance value should be about 5 kΩ when the sensor is not pressed, and less than 2 kΩ when pressed. 2. If the resistance is not as specified, replace the pinch sensor.

Right Side  	

TAILGATE LOCK SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

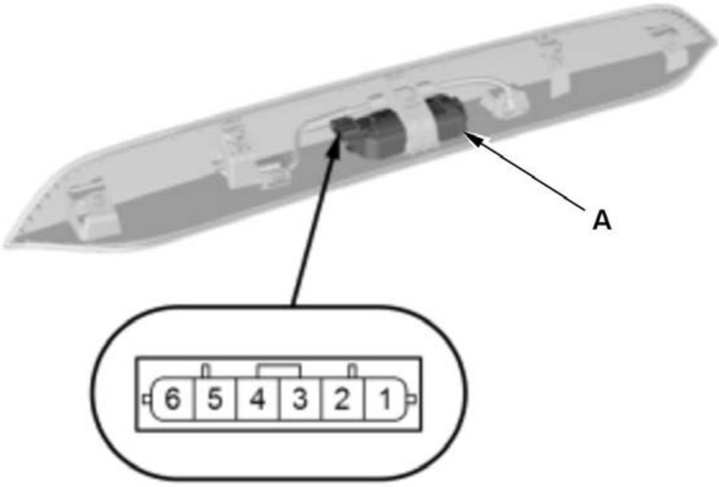
NOTE: The tailgate lock switch is a part of the license plate light, and it cannot be replaced by itself.

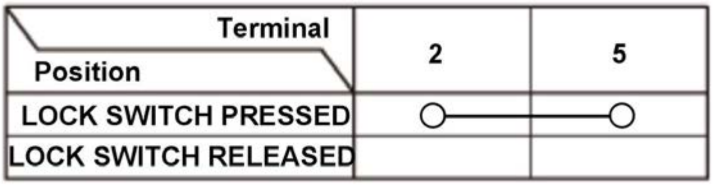
1. Tailgate Lock Switch - Remove
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Tailgate Lock Switch - Test





Terminal Position	2	5
LOCK SWITCH PRESSED	○—	—○
LOCK SWITCH RELEASED		

1. Check for continuity between the terminals in each switch position according to the table.

2. If the continuity is not as specified, replace the tailgate lock switch (A).

TAILGATE OUTER HANDLE SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

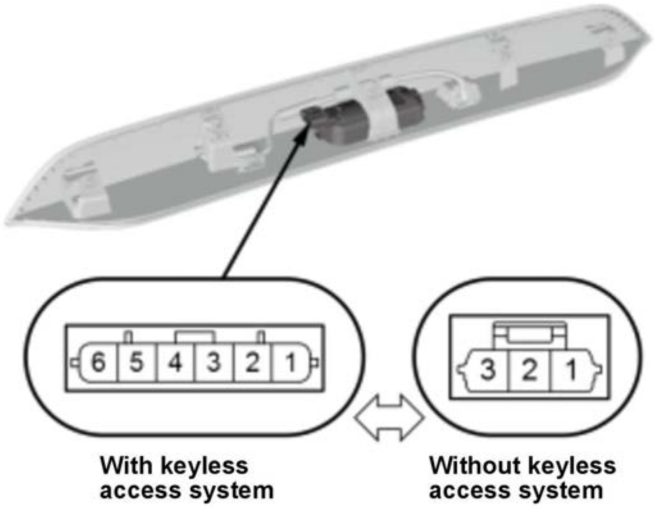
NOTE: The tailgate outer handle switch is a part of the license plate light, and it cannot be replaced by itself.

1. License Plate Light - Remove
2. All Removed Parts - Install

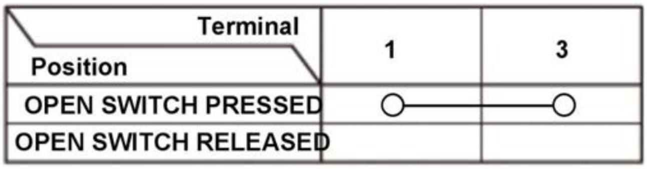
1. Install the parts in the reverse order of removal.

Test

1. Rear License Trim - Remove
2. Tailgate Outer Handle Switch - Test

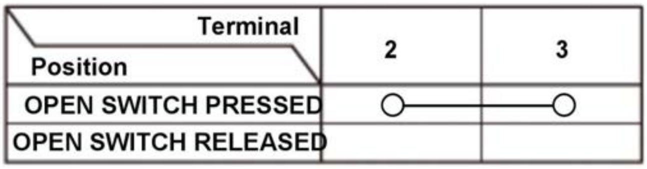


With keyless access system



Position \ Terminal	1	3
OPEN SWITCH PRESSED	○	○
OPEN SWITCH RELEASED		

Without keyless access system



Position \ Terminal	2	3
OPEN SWITCH PRESSED	○	○
OPEN SWITCH RELEASED		

1. Check for continuity between the terminals in each switch position according to the table.

2. If the continuity is not as specified, replace the tailgate outer handle switch.

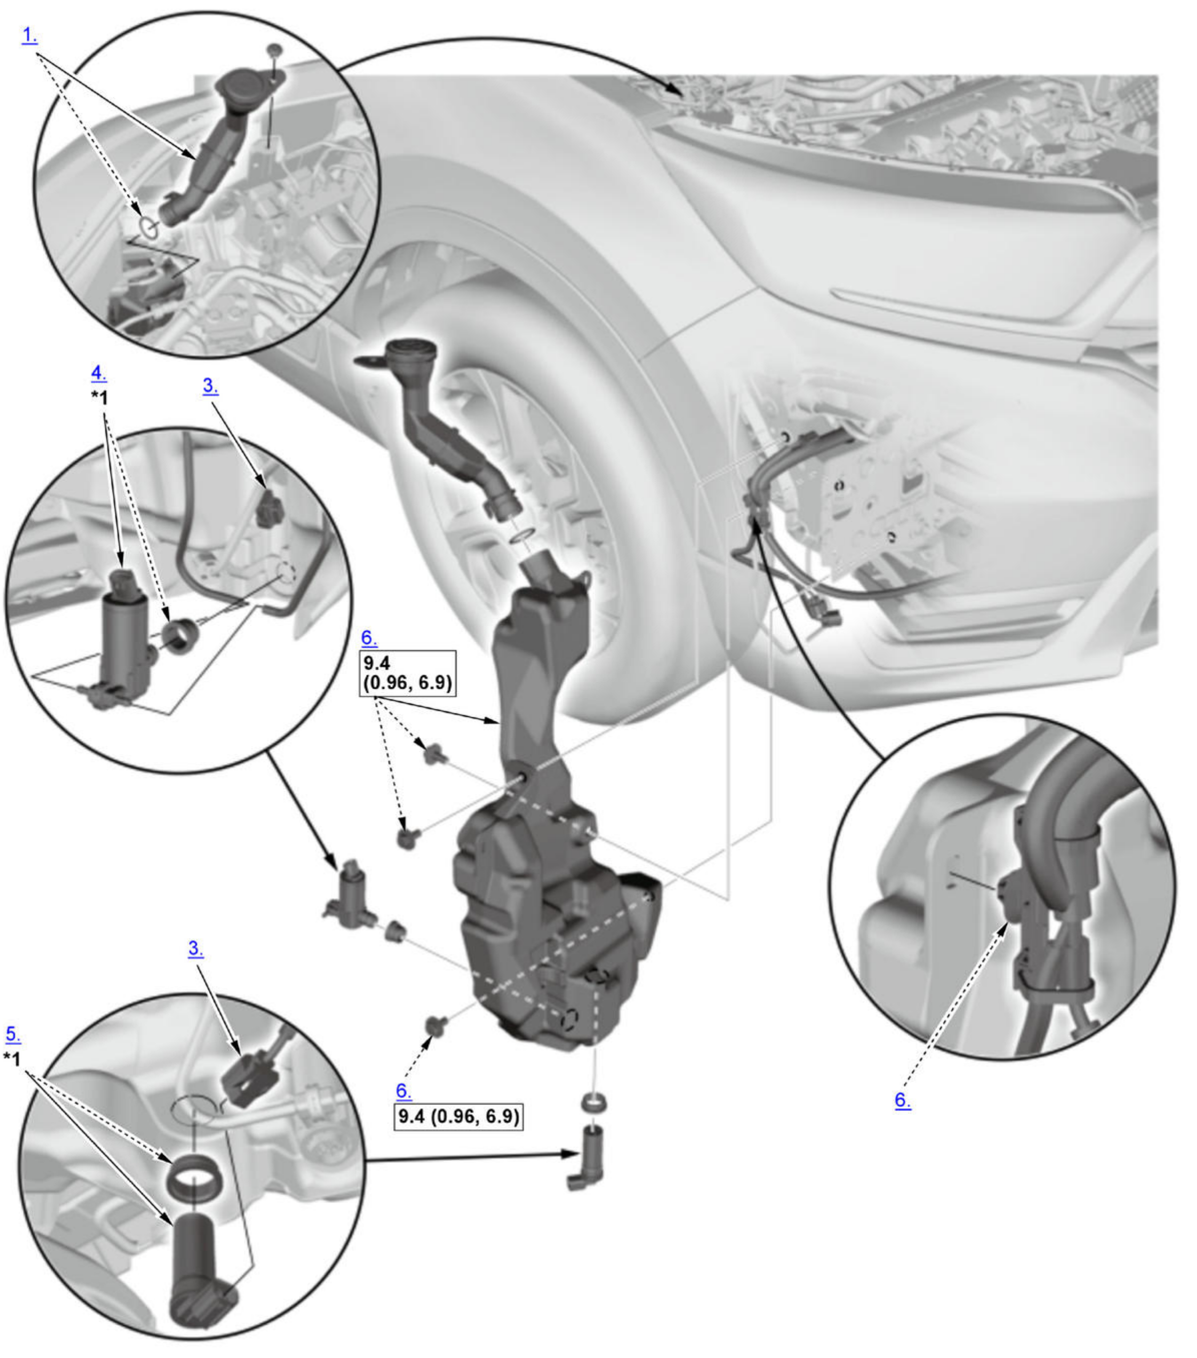
WASHER ASSEMBLY REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE:

- Fluid may flow out of the opening.
- Although a numbered sequence is shown, " *1 " indicated parts are separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.
- Washer Reservoir Capacity:
-
    - 2.5 L (2.6 Us qt) (Without washer fluid level switch)
    - 4.5 L (4.8 Us qt) (With washer fluid level switch)

1



▭	Torque: N.m (kgf.m, lbf.ft)

1. Washer Filler Neck - Remove
2. Front Inner Fender - Remove

   1. **Remove the front inner fender as needed**.

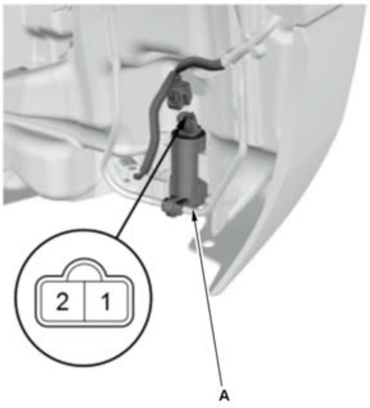
3. Connector - Disconnect
4. Windshield/Rear Window Washer Motor - Remove
5. Washer fluid level switch - Remove
6. Washer Reservoir - Remove
7. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

Test

Windshield/Rear Window Washer Motor

1. Windshield/Rear Window Washer Motor - Test

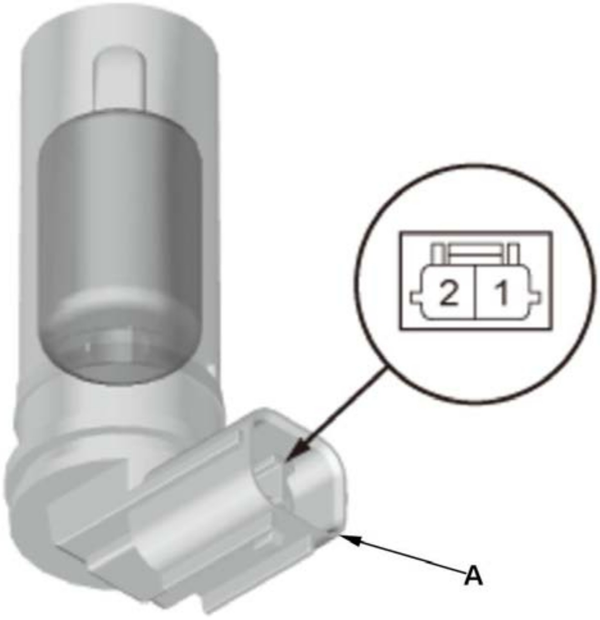


1. Test the washer motor by connecting battery power to terminal No. 1 (No. 2)* and ground to terminal No. 2 (No. 1)* of the washer motor. The motor should run.*: Rear window washer motor operation.

- If the washer motor does not run or fails to run smoothly, replace the windshield/rear window washer motor (A).
- If the washer motor runs smoothly, but little or no washer fluid is pumped, check for a disconnected or blocked washer hose, or a clogged washer motor outlet.

Washer Fluid Level Switch

2. Washer Fluid Level Switch - Test



Position \ Terminal	1	2
FLOAT UP		
FLOAT DOWN	○	○

1. Check for continuity between the terminals in each switch position according to the table.

2. If the continuity is not as specified, replace the washer fluid level switch (A).

Windshield

1. Dust Seal - Install
2. Windshield Wiper Control Unit/Motor - Install

	**NOTE:** Bolt threads are not provided on the new wiper motor. Install the wiper motor to the linkage as follows: 1. Before installing the wiper motor, connect the wiper motor connector, and turn the wiper/washer switch ON to (LO) or (HI) position, then OFF to return the wiper motor shaft to the park position. **NOTE:** • Do not use the windshield wiper/washer switch (AUTO) or (INT) position in this step. • Apply multipurpose grease to the moving parts. • Check the wiper motor operation. 2. Set the motor onto the wiper linkage assembly, and using the provided new self-tapping bolts, tighten them until the bolt head comes in contact with the linkage. **NOTE:** • Keep the bolts perfectly straight while bolting them in. • Do not use air tools and impact wrenches. 3. Loosen the bolts, then retighten the bolts to the specified torque. 4. Align the marks (A) on the link (B) and the wiper linkage assembly (C), and install the link.

3. Linkage Assembly - Install

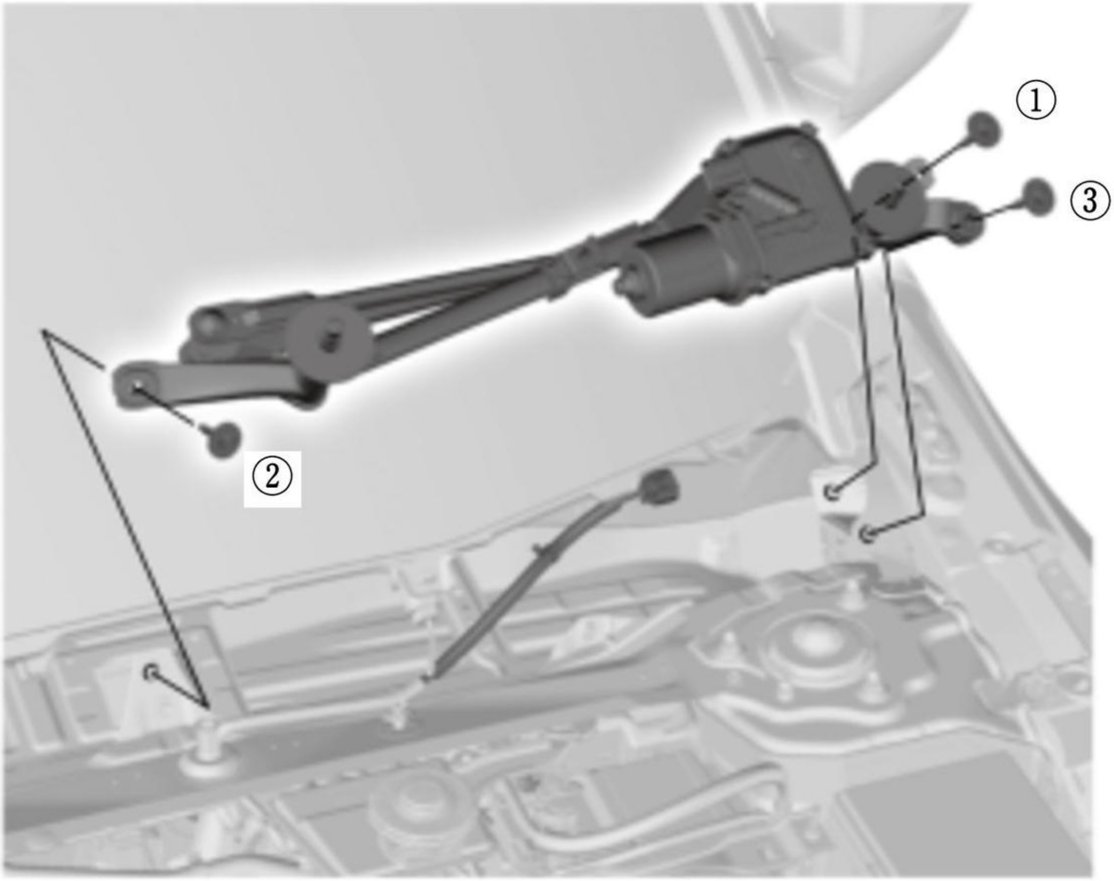

Fig. 1: Motor Wiper Linkage Assembly Bolts Tightening Sequence
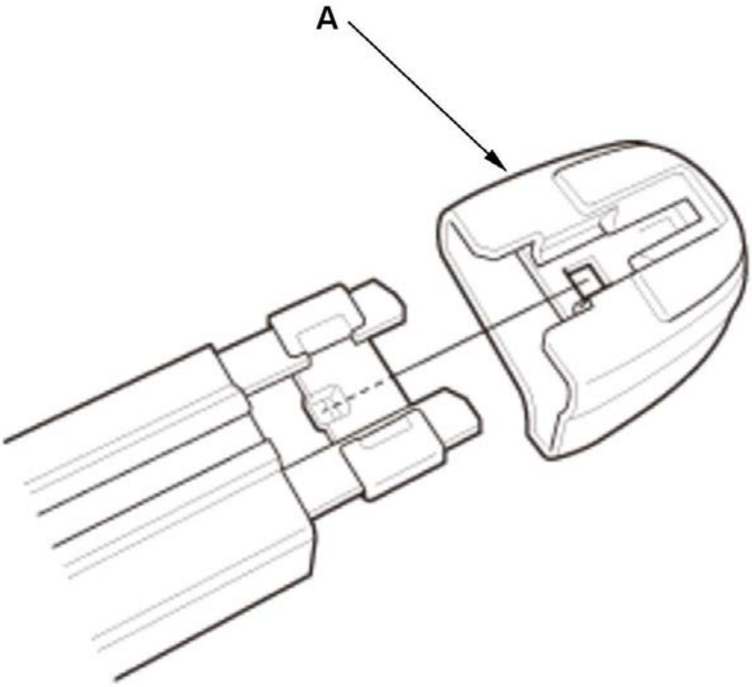
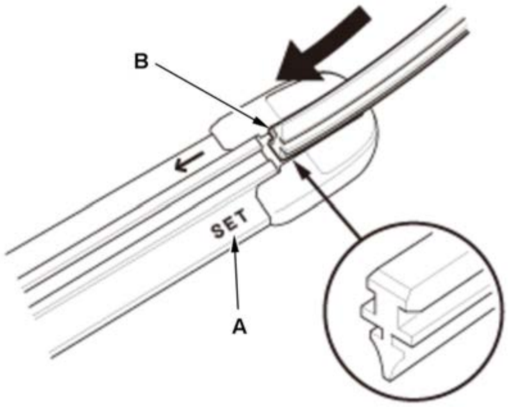
Courtesy of HONDA, U.S.A., INC.

NOTE: Tighten the bolts in the sequence shown.

4. Center Cowl Cover - Install
5. Windshield Wiper Arm - Install
6. Windshield Wiper Blade - Install



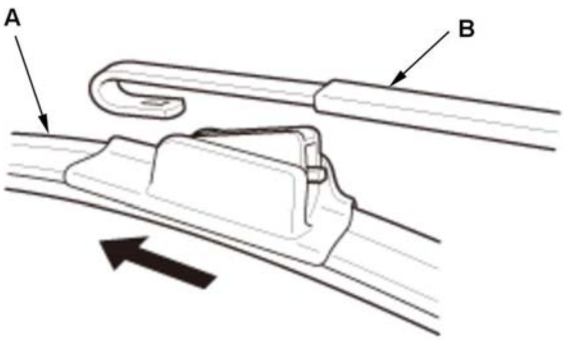
1. Install the end cap (A).



2. Find the end of the blade holder labeled "SET" (A), and install the wiper starting with the tip that has no projection.

NOTE: The wiper end with the projection should not be installed first.

3. Install the new windshield wiper blade (B).



4. Install the windshield wiper blade assembly (A) on the windshield wiper arm (B).

7. Windshield Wiper Arm/Nozzle - Adjustment

Rear Window

8. Seal - Install

9. Rear Window Wiper Motor - Install

1. Before reinstalling the rear window wiper arm, connect the rear window wiper motor connector, and turn the rear window wiper switch ON, then OFF to return the rear window wiper motor shaft to the park position. **NOTE:** • Apply multipurpose grease to the moving parts. • Check the rear window wiper motor operation.

10. Rear Window Wiper Arm - Install
11. Rear Window Wiper Blade - Install
12. **Tailgate Lower Trim Panel - Install**
13. **Rear Wiper Arm/Nozzle - Adjustment**

Test

Rear Window

1. Rear Window Wiper Motor - Test

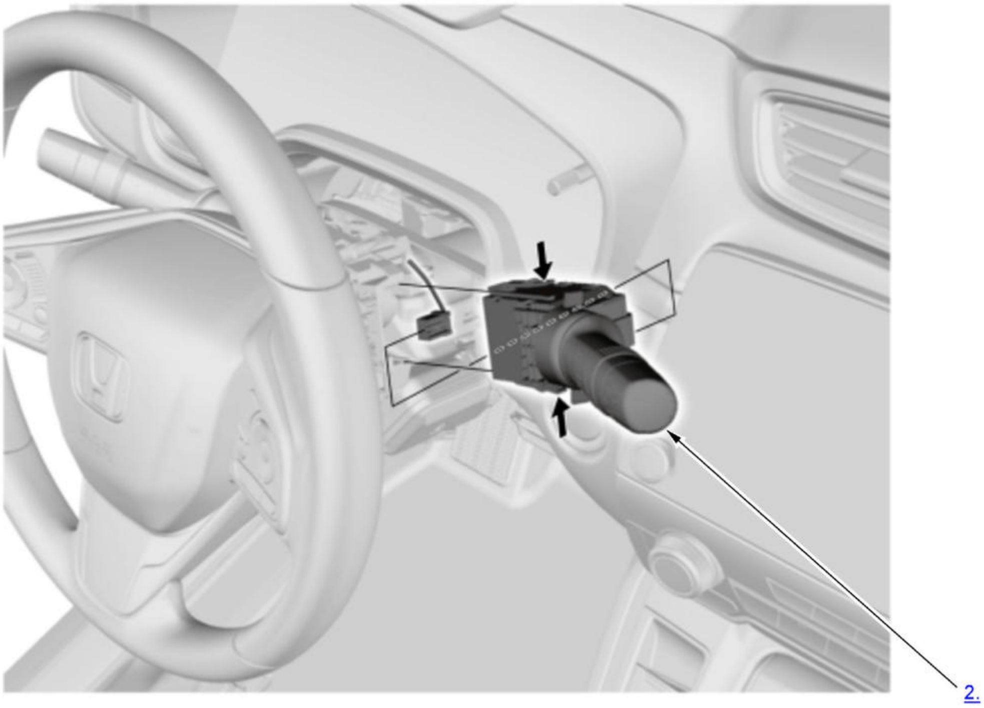
	1. Test the rear window wiper motor by connecting 12 volt battery power to terminal No. 1 and ground to terminal No. 3 of the rear window wiper motor. The rear window wiper motor should run. 2. Connect an analog ohmmeter to terminals No. 2 and No. 3. The ohmmeter should indicate continuity and no continuity alternately. If the rear window wiper motor does not run or fails to run smoothly, or there is no pulse, replace the rear window wiper motor.

WIPER/WASHER SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1

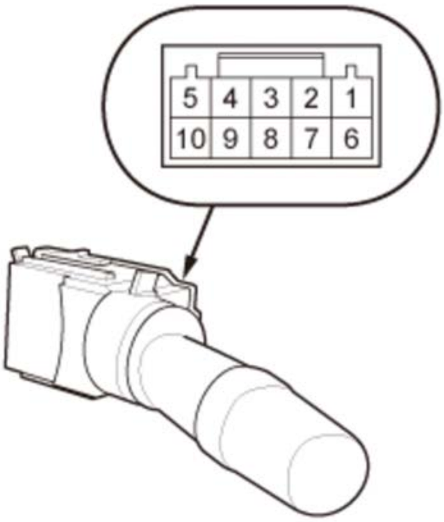


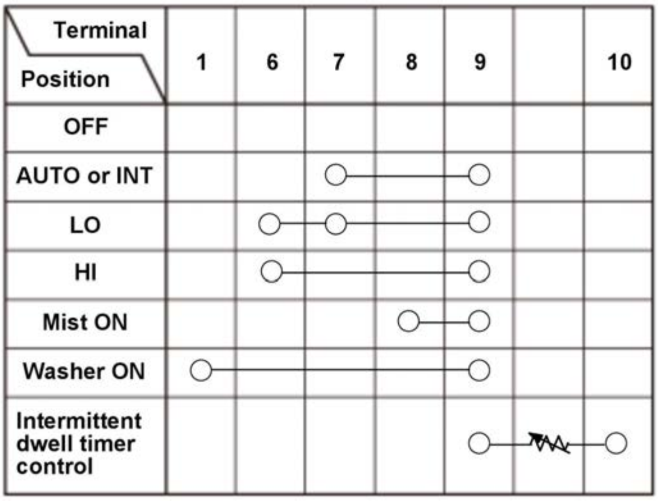
1. Column Cover - Remove
2. Wiper/Washer Switch - Remove
3. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

Test

1. Wiper/Washer Switch - Test





Terminal / Position	1	6	7	8	9		10
OFF

2. All Removed Parts - Install

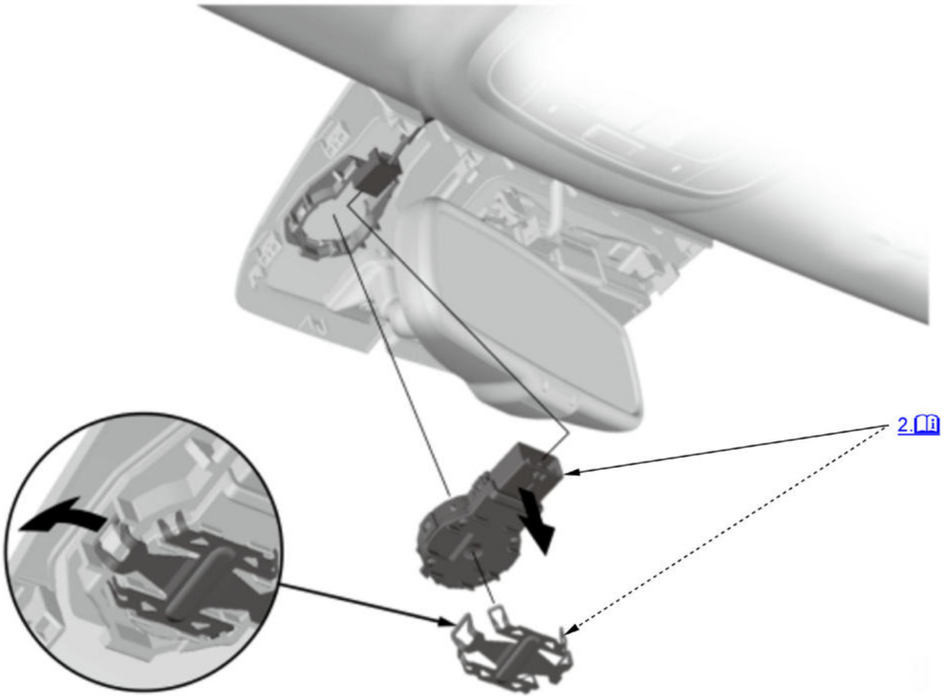
1. Install the parts in the reverse order of removal.

AUTOMATIC LIGHTING/RAIN SENSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE: 🛈 Where icon is shown further information.

1



ℹ	Detailed information, notes, and precautions

1. **Sensor Cover - Remove**
2. Automatic Lighting/Rain Sensor - Remove

	1. Prying on the automatic lighting/rain sensor bracket (A) may cause damage to the bracket. Insert a pick tool (B) from inside the clip (C) as shown, and carefully remove the clip. Be careful not to damage the windshield with the tip of the pick tool while working. **NOTE:** Hold the connector portion, and carefully remove the automatic lighting/rain sensor and silicon sheet together from the glass surface. **Note for installation** • Make sure that there are no air bubbles between the windshield glass and silicon sheet during installation. • If the automatic lighting/rain sensor connector is connected after the 12 volt battery terminal is connected, the automatic lighting/rain sensor is not confirmed by the body control module. • If the body control module does not confirm the automatic lighting/rain sensor, the automatic wiper system does not

	work.

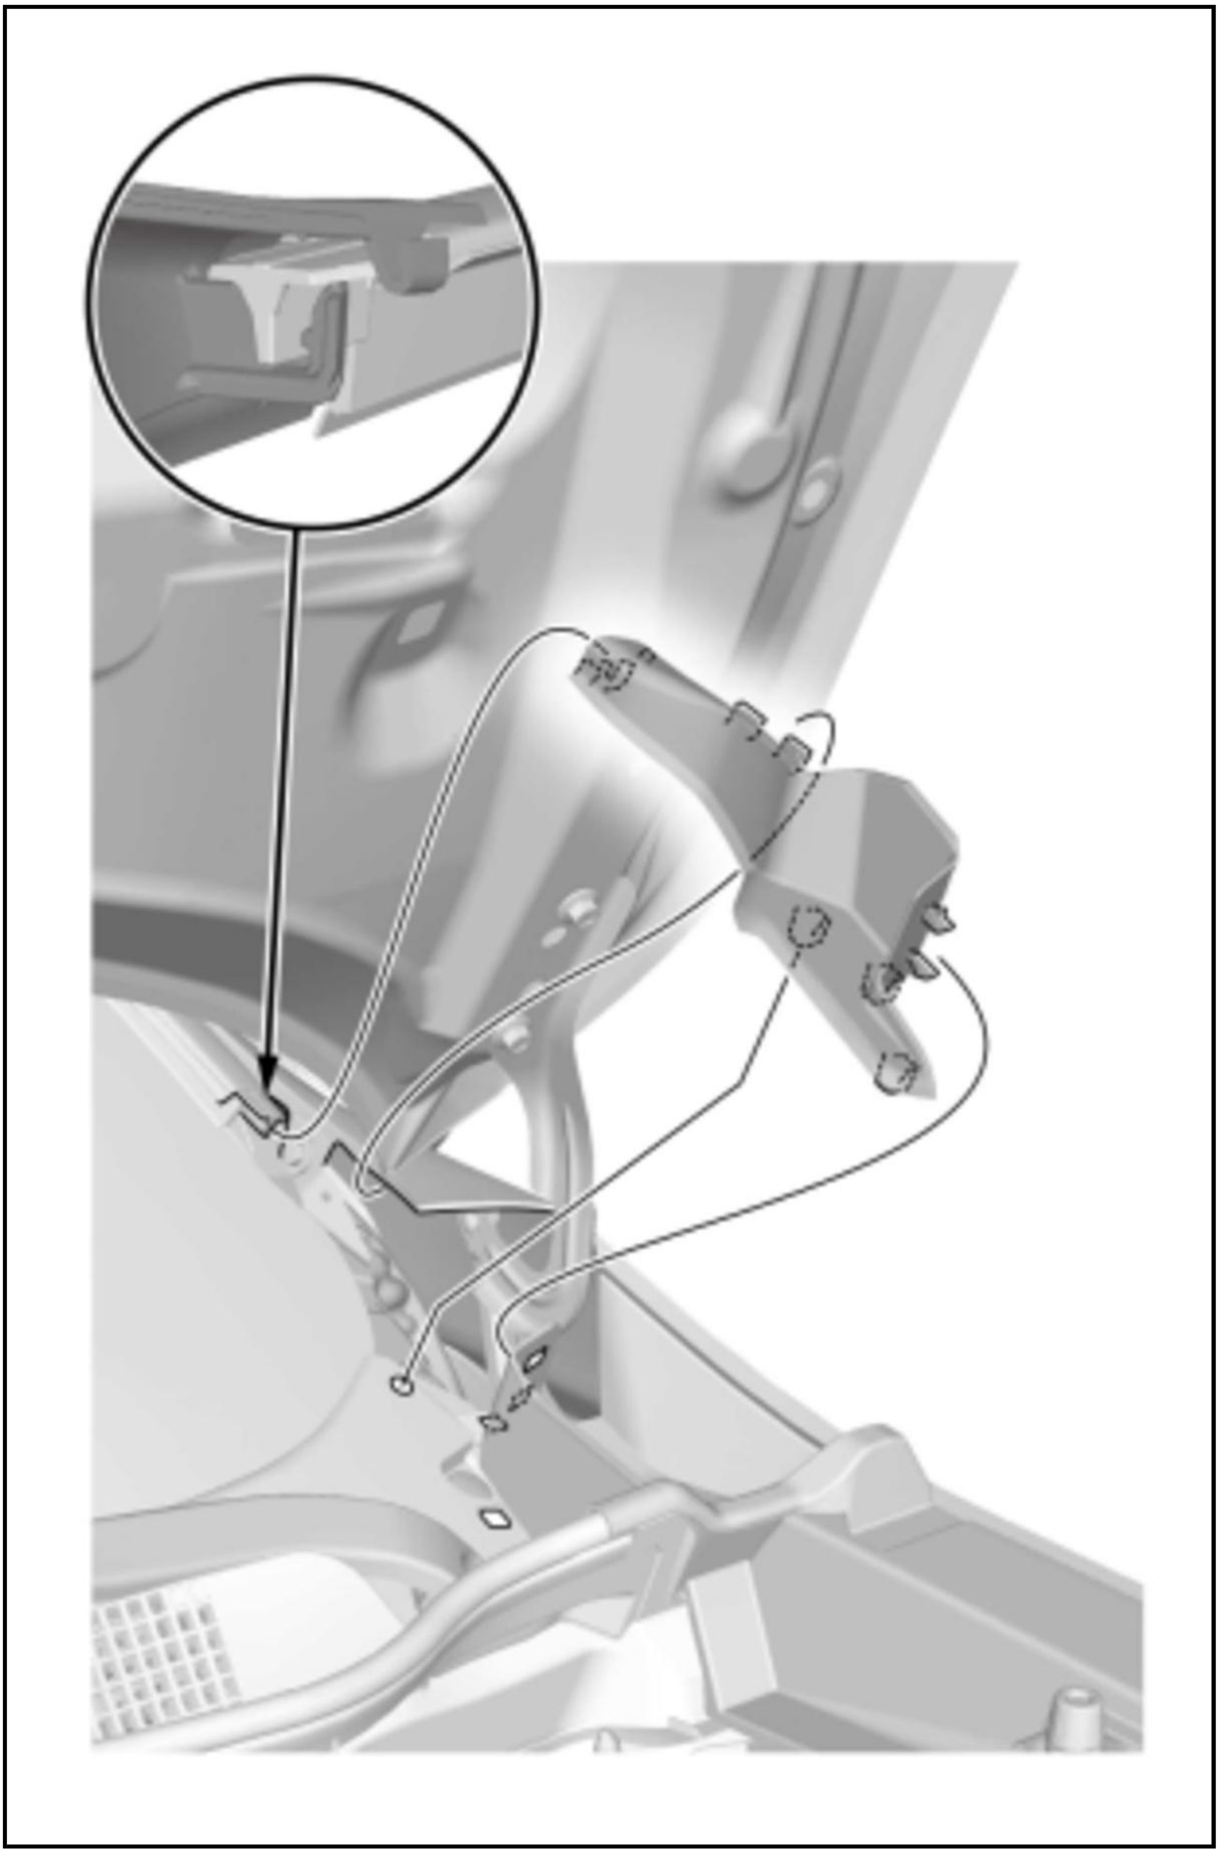
3. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

CENTER COWL COVER REMOVAL AND INSTALLATION

Removal and Installation

1. Both Side Cowl Covers - Remove



NOTE: Repeat this procedure on the opposite side.

2. **Both Front Fender Trims - Remove**
3. Center Cowl Cover - Remove

 	1. Remove the center cowl cover (A). 2. Disconnect the windshield washer tube (B).

4. Rear Hood Seal - Remove

 	1. If necessary, remove the rear hood seal (A).

5. All Removed Parts - Install

4. All Removed Parts - Install

	1. Install the parts in the reverse order of removal. **NOTE:** Install the clip onto the tailgate spoiler using the following procedures. • Install the clip (A) onto the tailgate spoiler (B) at the half-lock position. • Then, install the grommet (C) onto the tailgate (D) also at the half-lock position. • Push the tailgate spoiler onto the tailgate until a click is heard.

TAILGATE SUPPORT STRUT REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Have an assistant help you when removing and installing the tailgate support strut.
- Use eye protection when prying the support strut clips.
- Do not handle the tailgate support strut by its harness.
- Do not twist or apply transverse force to the tailgate support strut.
- Support the tailgate with a prop to the vehicle, not to the ground.
- Do not remove the support strut from the pivot bracket. If you do, you will have to replace it with new one.
- Take care when handling the tailgate support strut. If it is dropped, you must replace it.

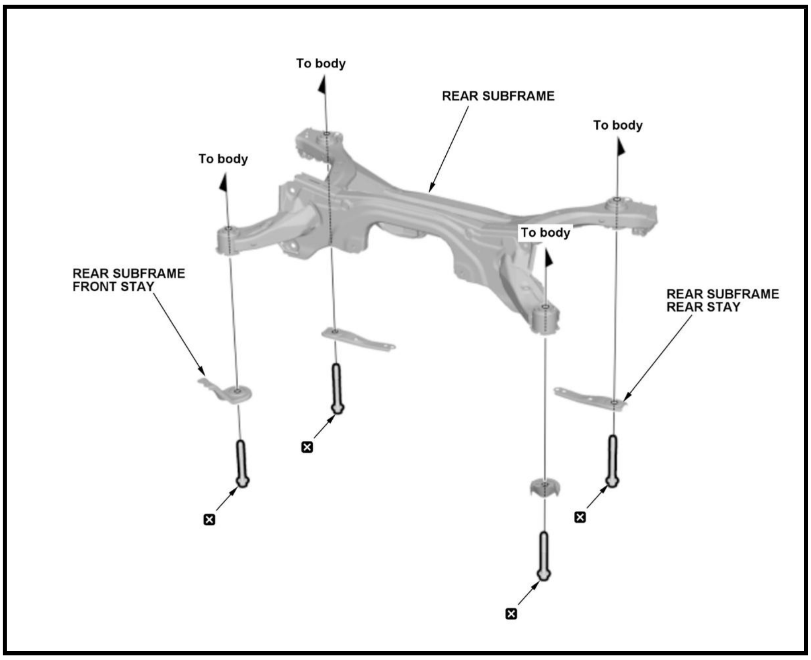
FRONT SUBFRAME BRACE

2. Rear Subframe - Remove

   NOTE: After removing the rear subframe mounting bolts, be sure to replace them with new ones.



Installation

NOTE: **How to read the torque specifications**

1. Front Subframe - Tightening Torque

NOTE:

- Align the front subframe with the subframe alignment pin.
- Align the front subframe in the following sequence.

1. Align the front subframe (A) in the following sequence.

-1. Lift the front subframe up to the body, and loosely install the new subframe mounting bolts (B, C).

-2. Insert the subframe alignment pin (D) through the positioning hole (E) on the right rear subframe, and into the positioning hole (F) on the body, then loosely tighten the subframe right rear mounting bolt.

-3. Insert the subframe alignment pin through the positioning hole on the left rear subframe, and into the positioning hole on the body, then loosely tighten the subframe left rear mounting bolt.

-4. Tighten the subframe mounting bolts to the specified torque in the sequence shown. Use the subframe alignment pin when tightening the rear side subframe mounting bolts.

-5. Check all of the subframe mounting bolts, and retighten if necessary.

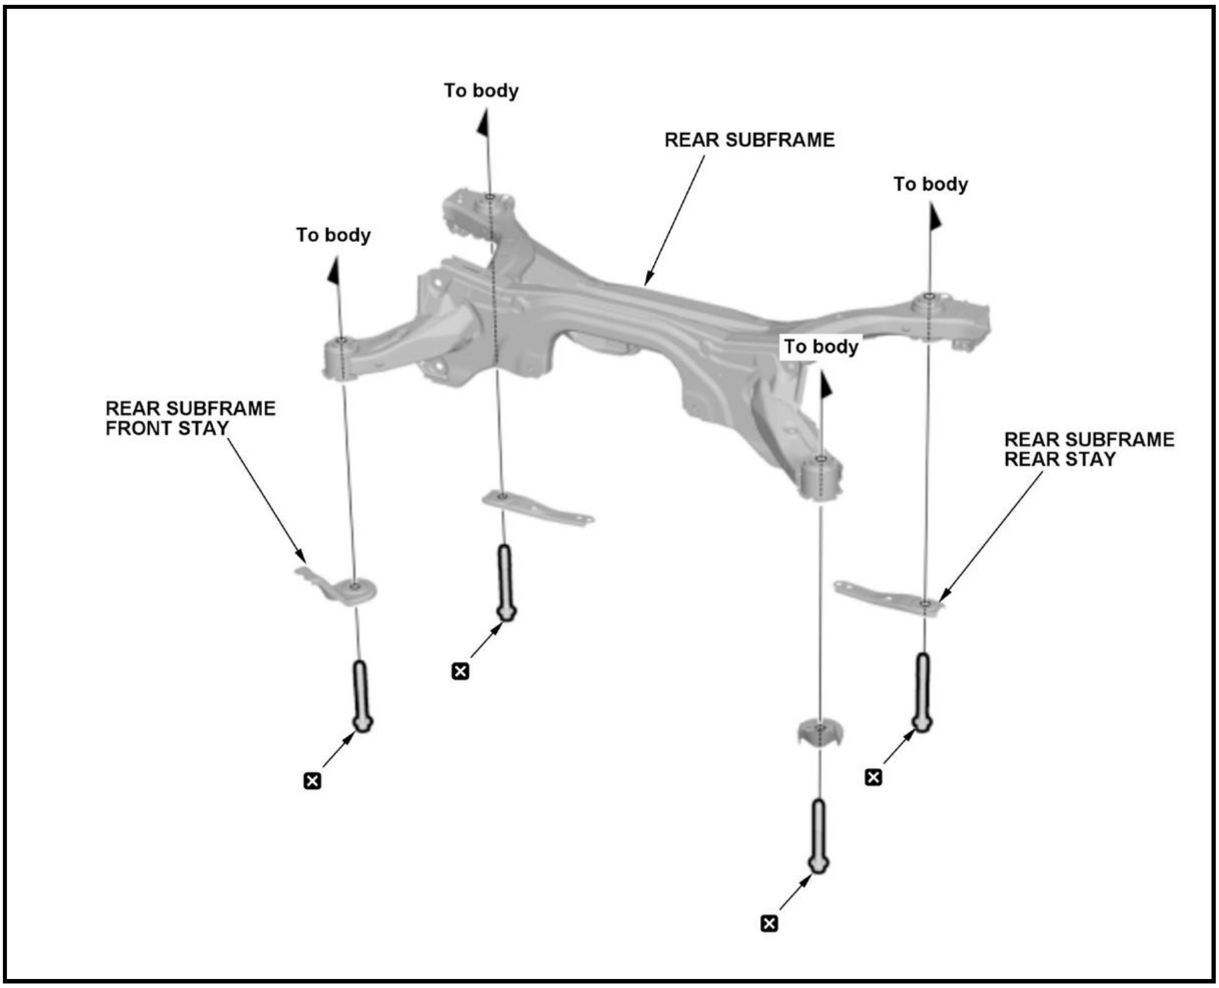
NOTE: After removing the rear subframe mounting bolts, be sure to replace them with new ones.



Installation

NOTE: How to read the torque specifications

1. Front Subframe - Tightening Torque

NOTE:

- Align the front subframe with the subframe alignment pin.
- Align the front subframe in the following sequence.

1. Align the front subframe (A) in the following sequence.

Lift the front subframe up to the body, and loosely install the new subframe mounting bolts (B, C).

-2. Insert the subframe alignment pin (D) through the positioning hole (E) on the right rear subframe, and into the positioning hole (F) on the body, then loosely tighten the subframe right rear mounting bolt.

-3. Insert the subframe alignment pin through the positioning hole on the left rear subframe, and into the positioning hole on the body, then loosely tighten the subframe left rear mounting bolt.

-4. Tighten the subframe mounting bolts to the specified torque in the sequence shown in illustration. Use the subframe alignment pin when tightening the rear side subframe mounting bolts.

-5. Check all of the subframe mounting bolts, and retighten if necessary.

   2. After reinstalling all removed parts, **check and adjust the front wheel alignment** .

2. Rear Subframe - Tightening Torque

   NOTE: When installing, align both positioning holes on the rear subframe with the positioning holes on the body using the subframe alignment pin as a guide. First align the right positioning hole, and next align the left positioning hole.

   1. Install the rear subframe (A).

TROUBLESHOOTING

DTC B1175

DTC B1175 : Fuel level sensor (Fuel gauge sending unit) circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1175 Fuel level sensor (Fuel gauge sending unit) circuit malfunction	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 30 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1175 Fuel level sensor (Fuel gauge sending unit) circuit malfunction	B

   Is DTC B1175 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (FUEL GAUGE lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

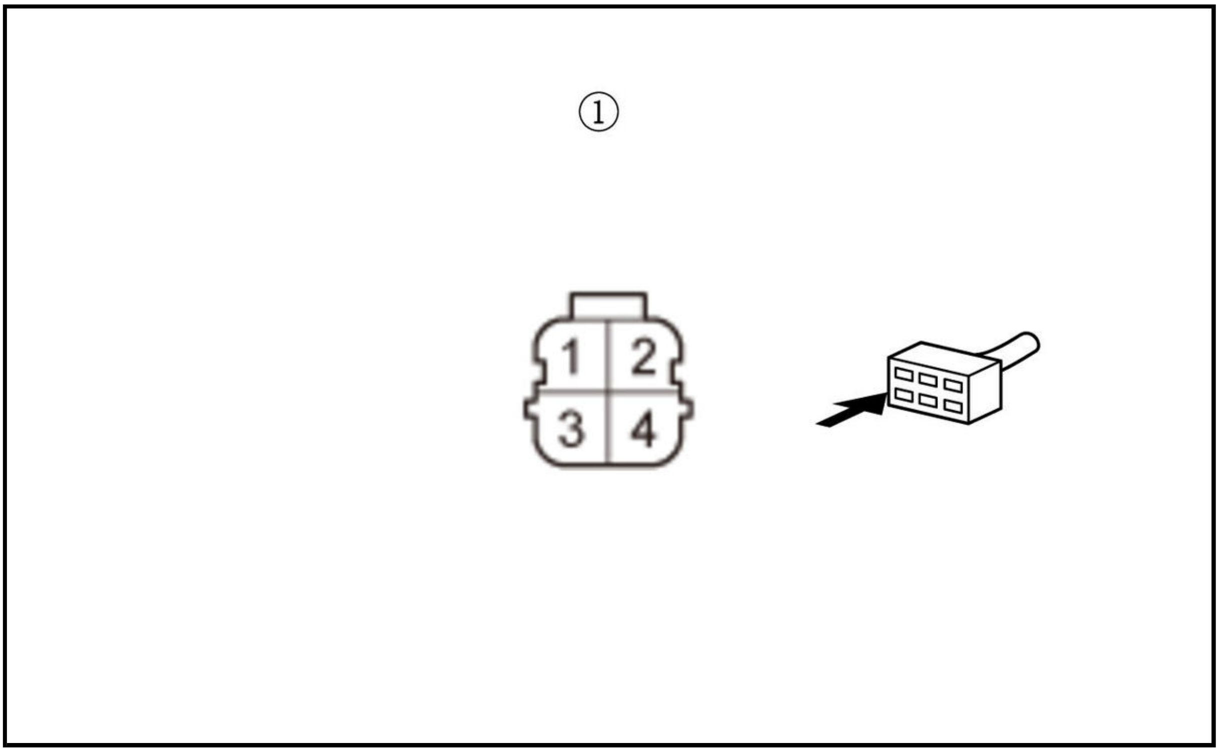
   -2. Disconnect the following connector.

Gauge control module connector A (32P) Fuel tank unit 4P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Fuel tank unit 4P connector: disconnected
Test point 1	Gauge control module connector A (32P) No. 22
Test point 2	Fuel tank unit 4P connector (female terminals) No. 2: ①

Test point 1	Gauge control module connector A (32P) No. 21
Test point 2	Fuel tank unit 4P connector (female terminals) No. 4: ①



Is there continuity?

YES

The FUEL GAUGE wires are OK. Go to step 3.

NO

Repair an open or high resistance in the wire(s).

3. Fuel gauge sending unit check

-1. **Do the fuel gauge sending unit test** .

Is the unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC B1176

DTC B1176 : Fuel level sensor (Fuel gauge sending unit) circuit short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1176 Fuel level sensor (Fuel gauge sending unit) circuit short	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 30 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1176 Fuel level sensor (Fuel gauge sending unit) circuit short	B

   Is DTC B1176 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Short wire check (FUEL GAUGE+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Gauge control module connector A (32P) Fuel tank unit 4P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Fuel tank unit 4P connector: disconnected
Test point 1	Gauge control module connector A (32P) No. 22
Test point 2	Body ground

   Is there continuity?

   YES

   Repair a short to ground in the wire.

   NO

   The FUEL GAUGE+ wire is OK. Go to step 3.

3. Fuel gauge sending unit check

   -1. Do the fuel gauge sending unit test .

   Is the unit OK?

   YES

   Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC B1195

DTC B1195 : Gauge control module lost communication with Audio Remote Switch (LIN bus connected)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1195 Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 4 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1195 Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	B

   Is DTC B1195 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Fuse check

   -1. Check the following fuse.

Fuse	No. D24 (5 A)
Location	Under-dash fuse/relay box

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Replace the fuse. If the fuse blows again, repair a short to ground in the +B wire.

3. Determine possible failure area (audio remote-HFL switch power and ground, LIN (START SW)/STRG SW LIN line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Audio remote-HFL switch 12P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Audio remote-HFL switch 12P connector: disconnected
Test point 1	**Audio remote-HFL switch 12P connector No. 7**
Test point 2	**Audio remote-HFL switch 12P connector No. 10**

   Is there battery voltage?

   YES

   Go to step 5.

   NO

   Go to step 4.

4. Open wire check (+B line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Audio remote-HFL switch 12P connector: disconnected

Test point 1	**Audio remote-HFL switch 12P connector No. 7**
Test point 2	Body ground

   Is there battery voltage?

   YES

   Repair an open or high resistance in the ground wire or poor ground (G401).

   NO

   Repair an open or high resistance in the wire.

5. Shorted wire check (LIN (START SW)/STRG SW LIN line)

   -1. Disconnect the following connector.

Gauge control module connector A (32P)

   -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Audio remote-HFL switch 12P connector: disconnected
Test point 1	**Audio remote-HFL switch 12P connector No. 12**
Test point 2	Body ground

   Is there continuity?

YES

Repair a short to ground in the wire.

NO

The LIN (START SW)/STRG SW LIN wire is not shorted. Go to step 6.

6. Open wire check (LIN (START SW)/STRG SW LIN line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Audio remote-HFL switch 12P connector: disconnected
Test point 1	**Gauge control module connector A (32P) No. 23**
Test point 2	**Audio remote-HFL switch 12P connector No. 12**

Is there continuity?

YES

The LIN (START SW)/STRG SW LIN wire is OK. **Replace the audio remote-HFL switch** . If the DTC is still present, **replace the gauge control module** .

NO

An open or poor connection in the wire.

DTC U0029 (GAUGE CONTROL MODULE)

DTC U0029 : F-CAN communication line error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U0029 F-CAN communication line error	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0029 F-CAN communication line error	B

Is DTC U0029 indicated?

YES: with CAN gateway

Go to the troubleshooting for CAN gateway system DTC(s) .

YES: without CAN gateway

Go to F-CAN Circuit Troubleshooting .

NO

Intermittent failure, the system is OK at this time.

DTC U0100, U0101, U0104, U0114, U0122, U0128, U0131, U0151, U129C (GAUGE CONTROL MODULE)

DTC U0100 : Gauge control module lost communication with ENG/AT **DTC U0101** : Gauge control module lost communication with AT **DTC U0104** : Gauge Control Module Lost Communication With Driving Support System Control Unit **DTC U0114** : Gauge control module lost communication with All Wheel Drive Control Module **DTC U0122** : Gauge control module lost communication with VSA modulator-control unit **DTC U0128** : Gauge control module lost communication with EPB **DTC U0131** : Gauge control module lost communication with EPS Unit **DTC U0151** : Gauge control module lost communication with SRS unit **DTC U129C** : Gauge control module lost communication with multi purpose camera unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0100 Gauge control module lost communication with ENG/AT	B
U0101 Gauge control module lost communication with AT	B
U0104 Gauge Control Module Lost Communication With Driving Support System Control Unit	B
U0114 Gauge control module lost communication with All Wheel Drive Control Module	B
U0122 Gauge control module lost communication with VSA modulator-control unit	B
U0128 Gauge control module lost communication with EPB	B
U0131 Gauge control module lost communication with EPS Unit	B
U0151 Gauge control module lost communication with SRS unit	B
U129C Gauge control module lost communication with multi purpose camera unit	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0100 Gauge control module lost communication with ENG/AT	B
U0101 Gauge control module lost communication with AT	B
U0104 Gauge Control Module Lost Communication With Driving Support System Control Unit	B
U0114 Gauge control module lost communication with All Wheel Drive Control Module	B
U0122 Gauge control module lost communication with VSA modulator-control unit	B
U0128 Gauge control module lost communication with EPB	B
U0131 Gauge control module lost communication with EPS Unit	B
U0151 Gauge control module lost communication with SRS unit	B
U129C Gauge control module lost communication with multi purpose camera unit	B

Are any DTCs indicated?

YES: with CAN gateway

Go to step 2.

YES: without CAN gateway

Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the gauge control module detect the CAN gateway Bus channels A?

Bus A is Not Available

Go to step 4.

Bus A is Available

Go to step 5.

4. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

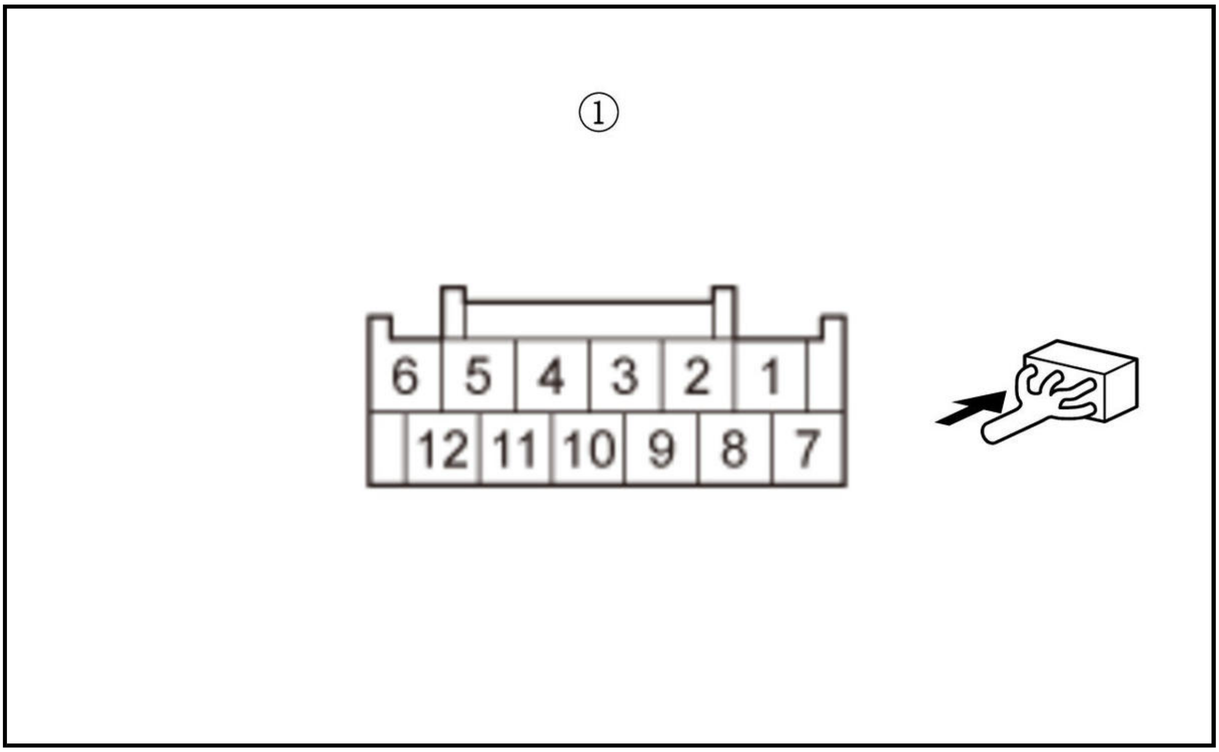
-2. Disconnect the following connectors.

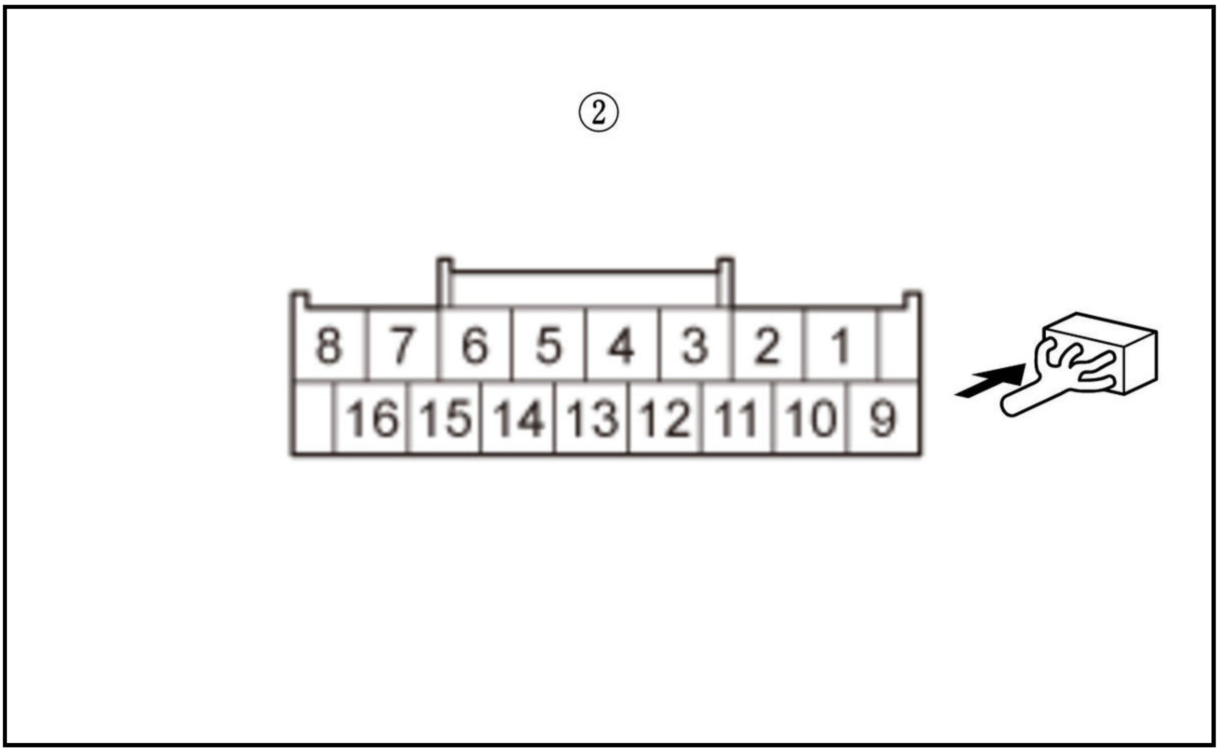
CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type) Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected Gauge control module connector A (32P): disconnected
Test point 1	CAN gateway 12P connector (female terminals) (12P connector type) No. 3: ① CAN gateway 16P connector (female terminals) (16P connector type) No. 3: ②
Test point 2	**Gauge control module connector A (32P) No. 19**

Test point 1	CAN gateway 12P connector (female terminals) (12P connector type) No. 9: ① CAN gateway 16P connector (female terminals) (16P connector type) No. 11: ②
Test point 2	**Gauge control module connector A (32P) No. 20**





Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. **Replace the gauge control module** .

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100	PCM	A, B
U0101	TCM	A
U0104	Millimeter wave radar	B
U0114	Real time AWD control unit	B
U0122	VSA modulator-control unit	A, B
U0128	VSA modulator-control unit	A, B
U0131	EPS control unit	B
U0151	SRS unit	B
U129C	Multipurpose camera unit	B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 6.

U0100: PCM is Not Available for Bus B

Go to step 7.

U0101: TCM is Not Available for Bus A

Go to step 6.

U0104: Millimeter wave radar is Not Available for Bus B

Go to step 7.

U0114: Real time AWD control unit is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus A

Go to step 6.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0128: VSA modulator-control unit is Not Available for Bus A

Go to step 6.

U0128: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0131: EPS control unit is Not Available for Bus B

Go to step 7.

U0151: SRS unit is Not Available for Bus B

Go to step 7.

U129C: Multipurpose camera unit is Not Available for Bus B

Go to step 7.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100, U0101: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0101	TCM 50P connector
U0122	VSA modulator-control unit 46P connector
U0128	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

CAN gateway 12P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. According to the detected DTC on the following chart replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM
U0101	TCM
U0122	VSA modulator-control unit
U0128	VSA modulator-control unit

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

U0151: Do the 12 volt battery terminal disconnection procedure , and wait for at least 3 minutes.

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0104	Millimeter wave radar 8P connector

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK.According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0104	**Millimeter wave radar**
U0114	**Real time AWD control unit**
U0122	**VSA modulator-control unit**
U0128	**VSA modulator-control unit**
U0131	**EPS control unit**
U0151	**SRS unit**
U129C	**Multipurpose camera unit**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

U0151: **Do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector
U0100	PCM connector A (51P)
U0114	Real time AWD control unit 24P connector
U0122	VSA modulator-control unit 46P connector

DTC	Connector
U0128	VSA modulator-control unit 46P connector
U0131	EPS control unit connector B (6P)
U0151	SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN_H	**Gauge control module connector A**	No. 19	**PCM connector A (51P)**	No. 2

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
	F-CAN_L	(32P)	No. 20		No. 1
U0114	F-CAN_H	Gauge control module connector A (32P)	No. 19	Real time AWD control unit 24P connector	No. 14
	F-CAN_L		No. 20		No. 24
U0122	F-CAN_H	Gauge control module connector A (32P)	No. 19	VSA modulator-control unit 46P connector	No. 40
	F-CAN_L		No. 20		No. 28
U0128	F-CAN_H	Gauge control module connector A (32P)	No. 19	VSA modulator-control unit 46P connector	No. 40
	F-CAN_L		No. 20		No. 28
U0131	F-CAN_H	Gauge control module connector A (32P)	No. 19	EPS control unit connector B (6P)	No. 3
	F-CAN_L		No. 20		No. 1
U0151	F-CAN_H	Gauge control module connector A (32P)	No. 19	SRS unit connector A (39P)	No. 34
	F-CAN_L		No. 20		No. 35

Is there 1.0 Ω or less?

YES

The F-CAN_H wire and the F-CAN_L wire are OK.According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM
U0114	Real time AWD control unit
U0122	VSA modulator-control unit
U0128	VSA modulator-control unit
U0131	EPS control unit
U0151	SRS unit

NO

Repair an open in F-CAN_H or F-CAN_L wire.

DTC U1280 (GAUGE CONTROL MODULE)

DTC U1280 : Communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280-00 Communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time.

DTC U1281, U1288, U128F (GAUGE CONTROL MODULE)

DTC U1281 : Gauge control module lost communication with MICU (MICU frame)**DTC U1288** : Gauge control module lost communication with PARKSR **DTC U128F** : Gauge control module lost communication with BSI unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Gauge control module lost communication with MICU (MICU frame)	B
U1288 Gauge control module lost communication with PARKSR	B
U128F Gauge control module lost communication with BSI unit	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Gauge control module lost communication with MICU (MICU frame)	B

DTC Description	DTC
U1288 Gauge control module lost communication with PARKSR	B
U128F Gauge control module lost communication with BSI unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Gauge control module connector A (32P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U1288	Parking and back-up sensor control unit 16P connector
U128F	Left side BSI radar unit 6P connector

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Gauge control module connector A (32P)	No. 30	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 31		No. 21
U1288	B-CAN_H	Gauge control module connector A (32P)	No. 30	Parking and back-up sensor control unit 16P connector	No. 9
	B-CAN_L		No. 31		No. 2
U128F	B-CAN_H	Gauge control module connector A (32P)	No. 30	Left side BSI radar unit 6P connector	No. 3
	B-CAN_L		No. 31		No. 5

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	Body control module
U128D	Parking and back-up sensor control unit
U128F	BSI radar unit

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U3000-49 (GAUGE CONTROL MODULE)

DTC U3000-49 : ECU internal circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U3000-49 ECU internal circuit malfunction	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 ECU internal circuit malfunction	B

Is DTC U3000-49 indicated?

YES

Replace the gauge control module .

NO

Intermittent failure, the system is OK at this time.

DTC U3000-51 (GAUGE CONTROL MODULE)

DTC U3000-51 : Reprogramming error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before reprogramming the gauge control module, make sure the 12 volt battery in the vehicle is fully charged, and connect a 12 volt jumper battery (not a 12 volt battery charger) to maintain system voltage.
- Never turn the vehicle to the ACCESSORY mode or OFF (LOCK) mode, during the reprogramming. If there is a problem with the reprogramming, turn the vehicle to the ON mode.

DTC Description	DTC
U3000-51 Reprogramming error	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 Reprogramming error	B

Is DTC U3000-51 indicated?

YES

Reprogramming the gauge control module.

NO

Intermittent failure, the system is OK at this time.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE BODY ELECTRICAL

Tips and Precautions

Special Tools Required

Back Probe Adapter, 17 mm 07TAZ-001020A

Before Troubleshooting

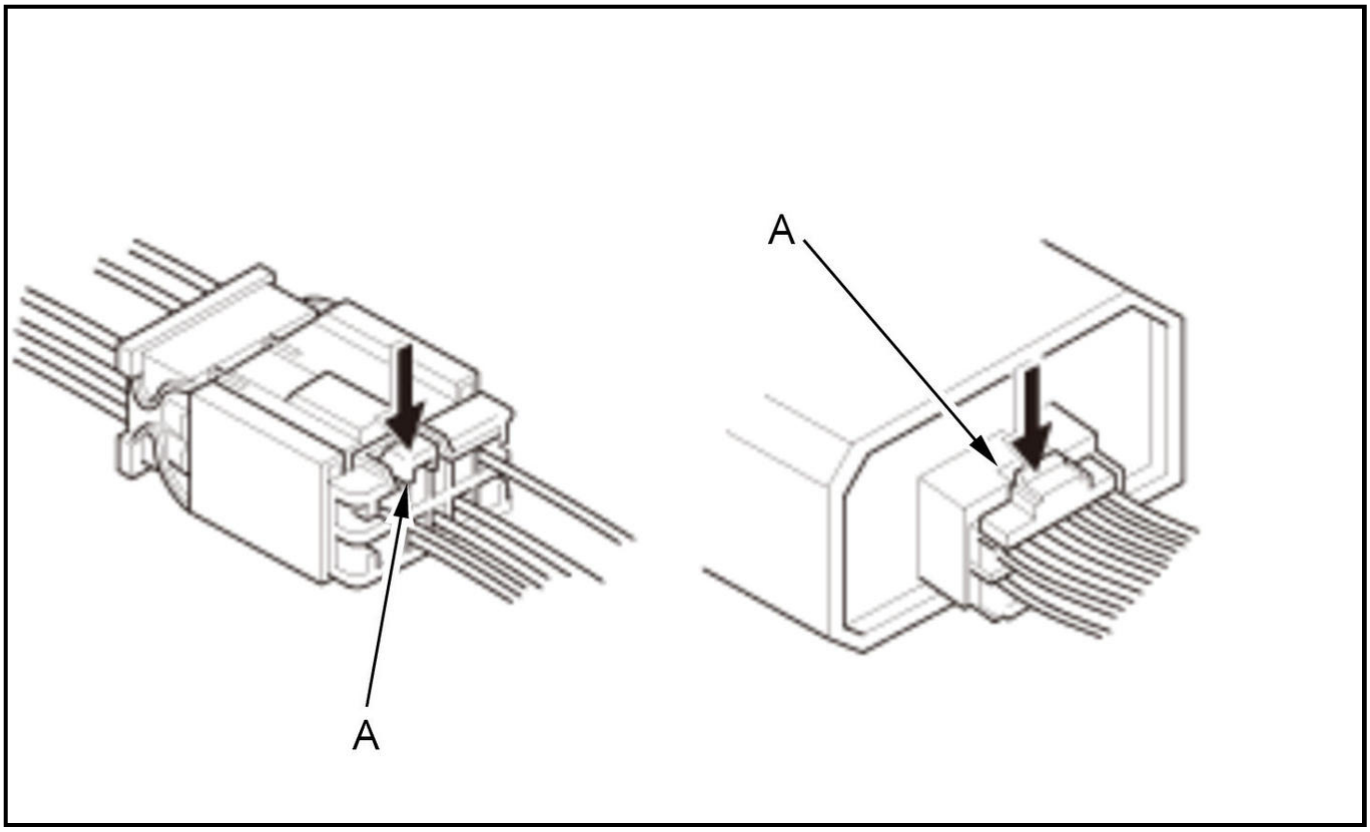
1. Check applicable fuses in the appropriate fuse/relay box. Check the 12 volt battery for damage, state of charge, and clean and tight connections.

NOTE:

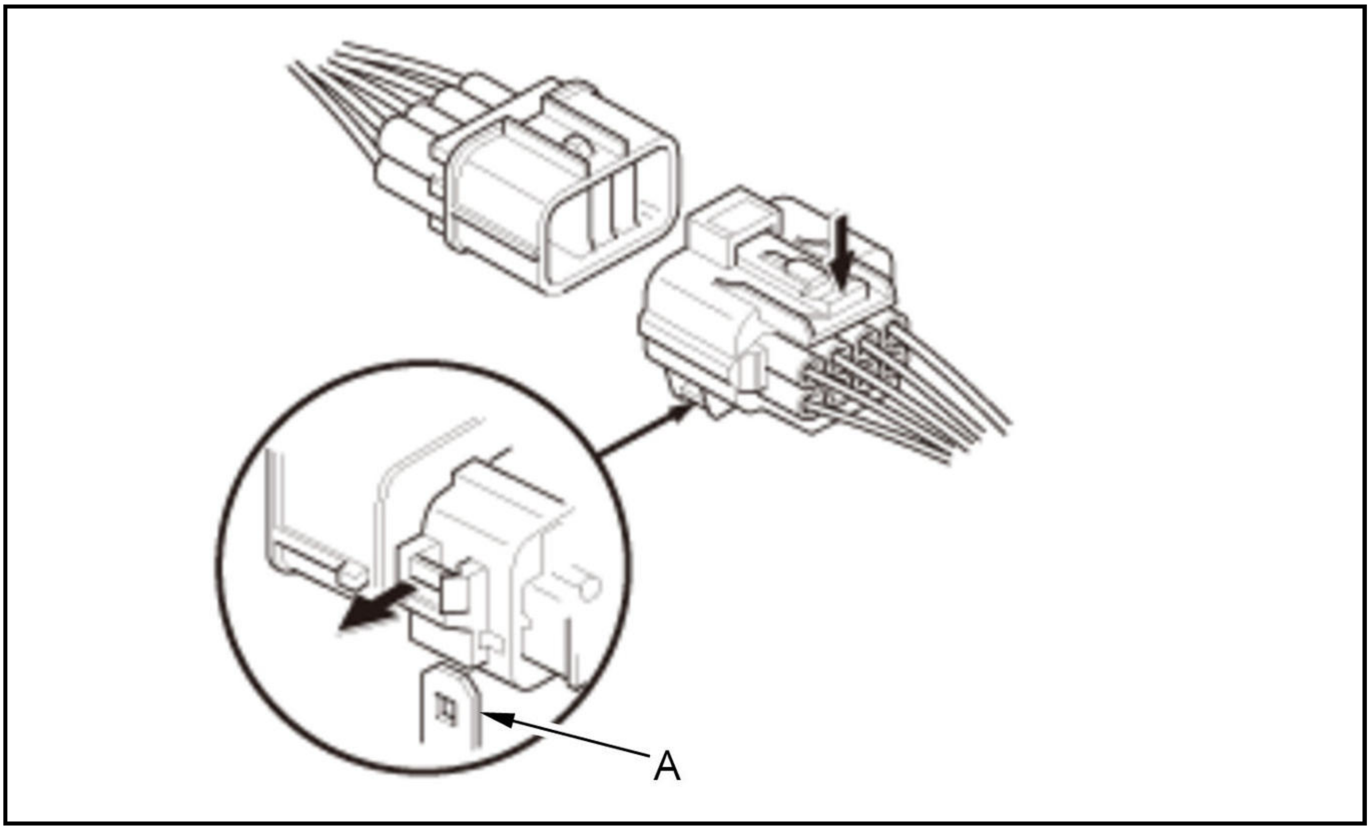
- **Do not quick-charge a 12 volt battery unless the 12 volt battery ground cable has been disconnected; otherwise you will damage the alternator diodes.**
- **Do not attempt to crank the engine with the 12 volt battery ground cable loosely connected, or you will severely damage the wiring.**

Handling Connectors

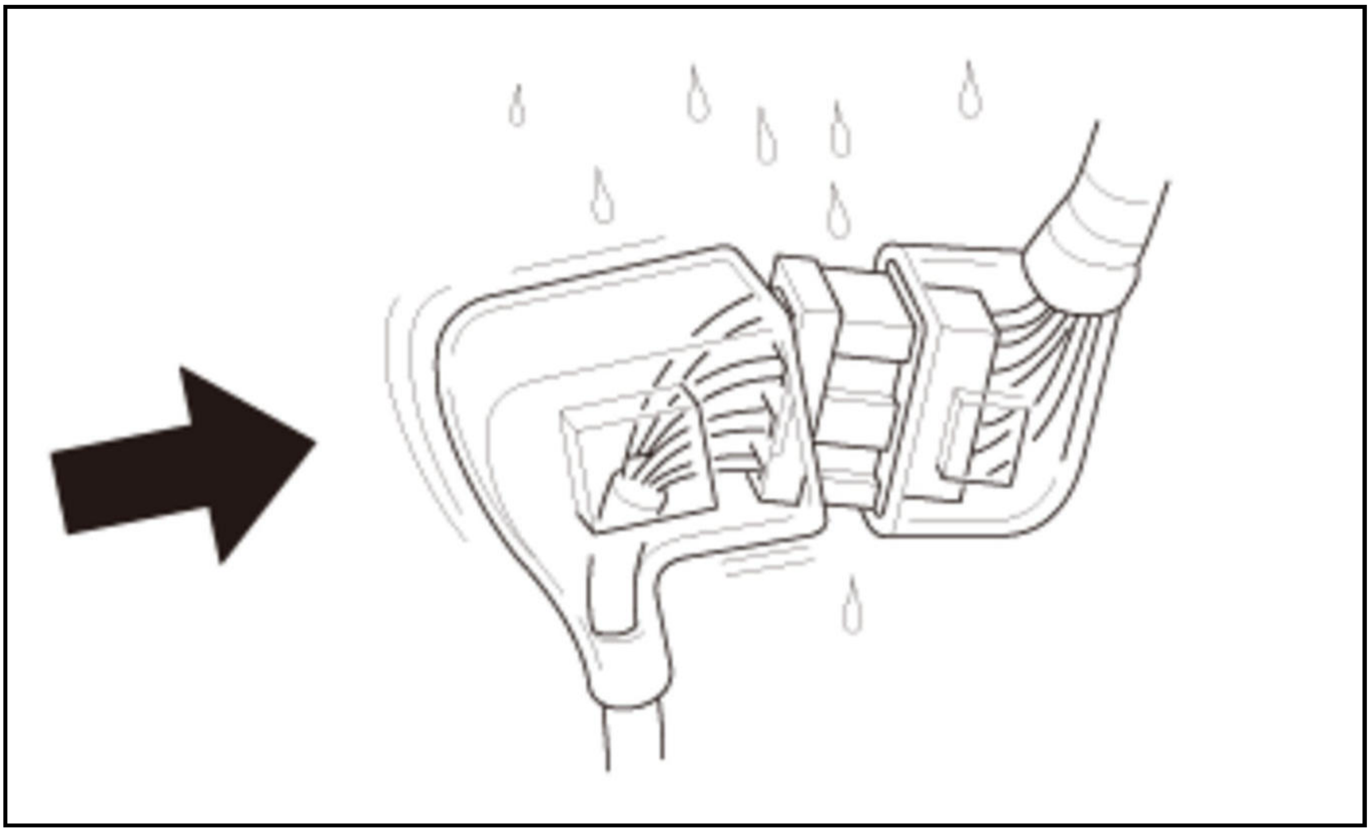
- Make sure the connectors are clean and have no loose wire terminals.
- Make sure multiple cavity connectors are packed with dielectric grease (except waterproof connectors).
- All connectors have press-down release type locks (A).



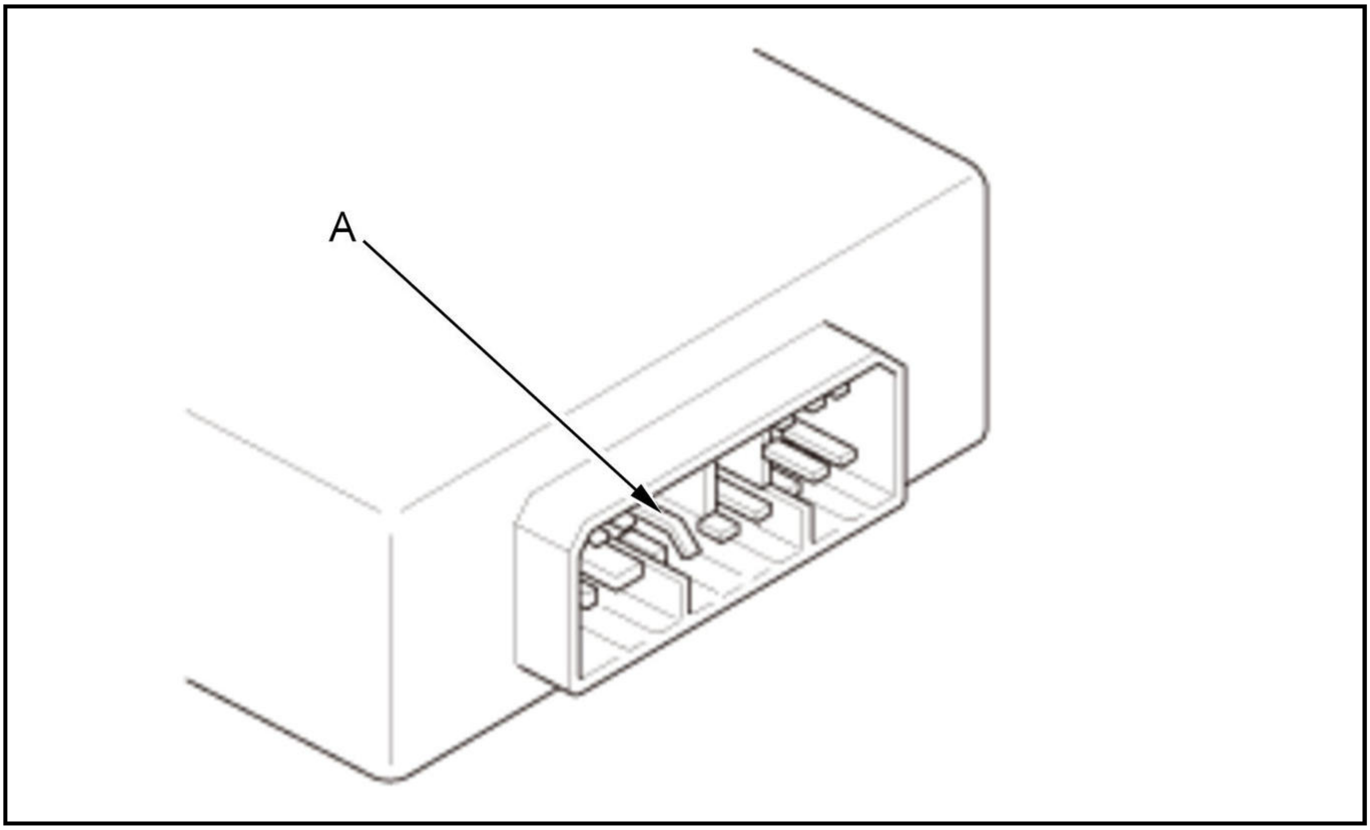
- Some connectors have a clip on their side used to attach them to a mount bracket on the body or on another component. This clip has a pull type lock.
- Some mounted connectors cannot be disconnected unless you first release the lock and remove the connector from its mount bracket (A).



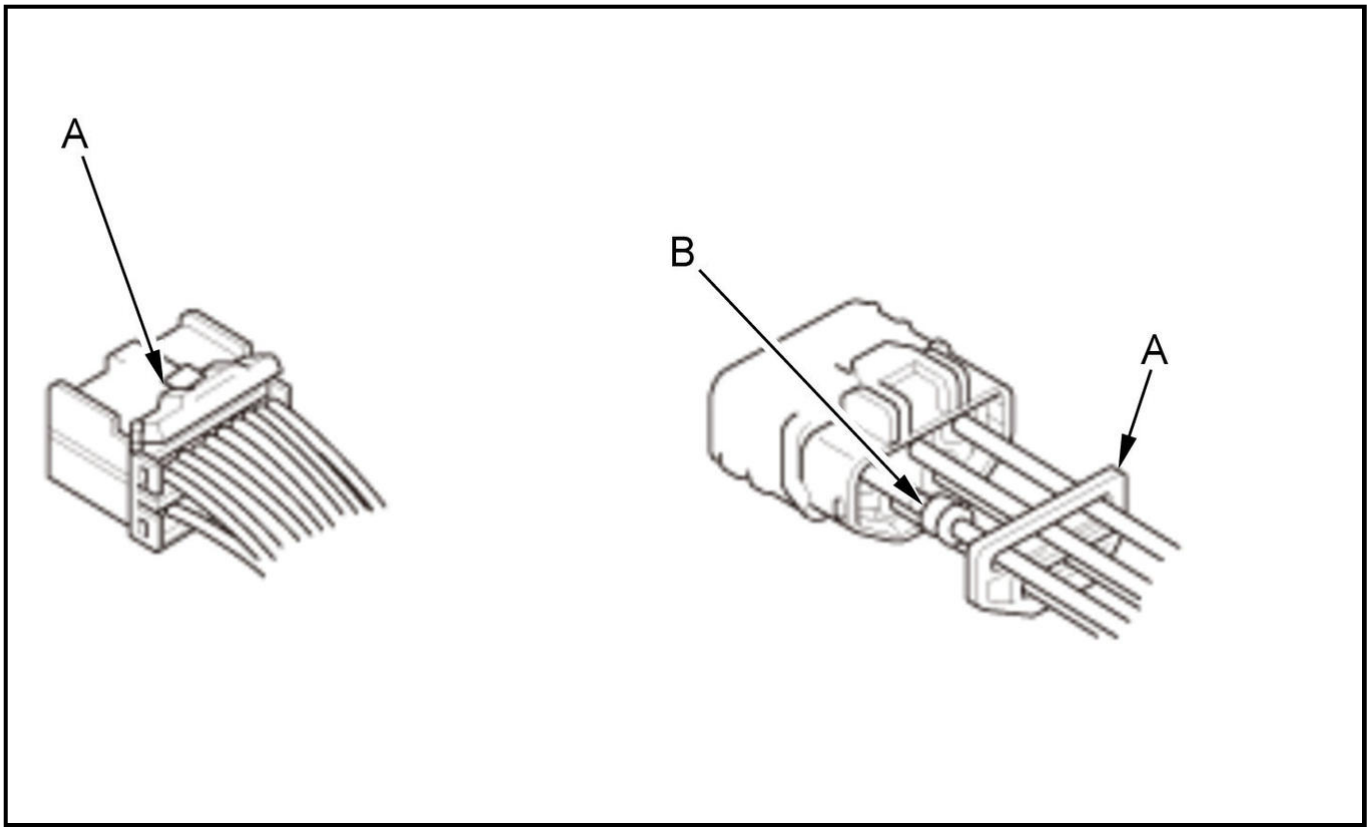
- Never try to disconnect connectors by pulling on their wires; pull on the connector halves instead.
- Always reinstall plastic covers.



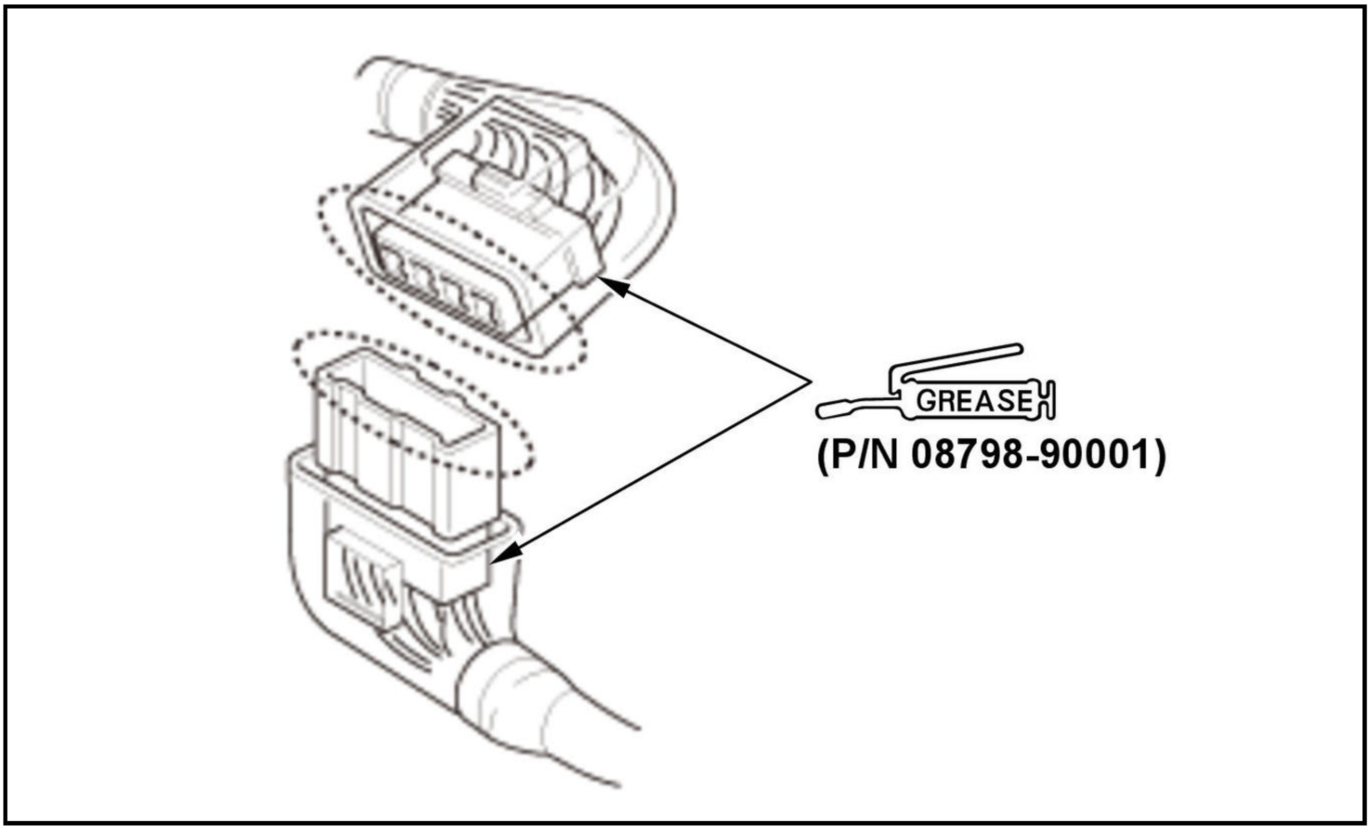
- Before connecting connectors, make sure the terminals are in place and not bent (A).



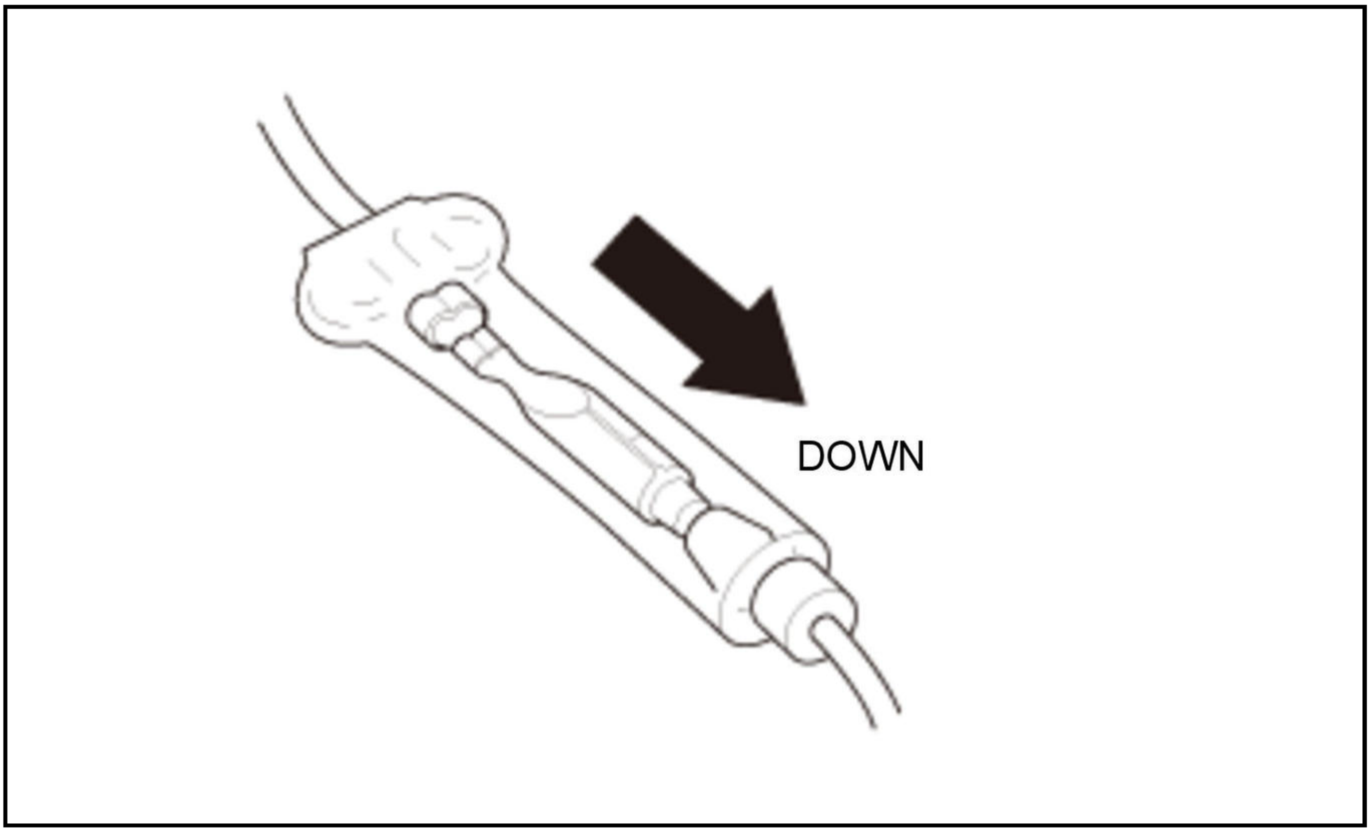
- Check for loose retainers (A) and rubber seals (B).



- The backs of some connectors are packed with dielectric grease. Add grease if necessary. If the grease is contaminated, replace it.

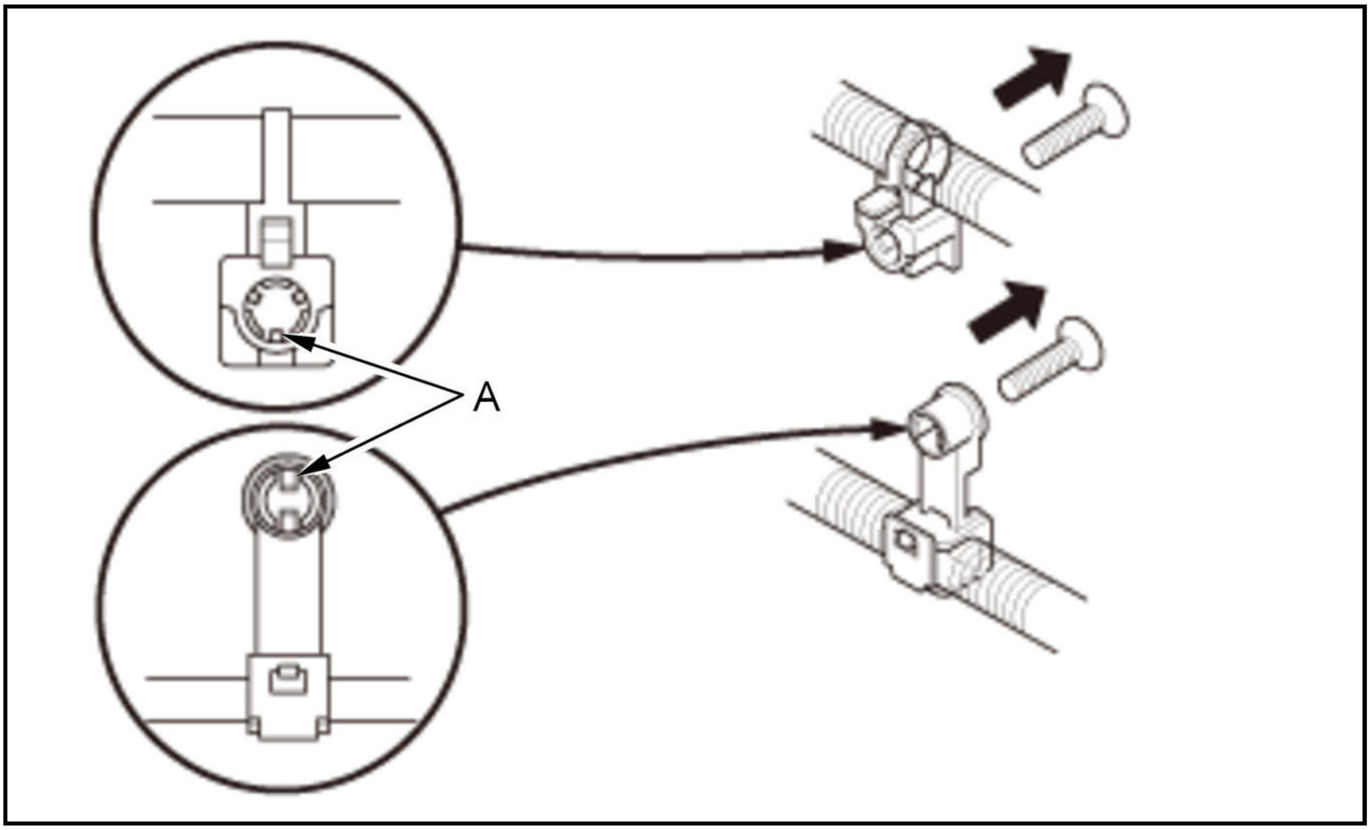


- Insert the connector all the way and make sure it is securely locked.
- Position wires so that the open end of the cover faces down.

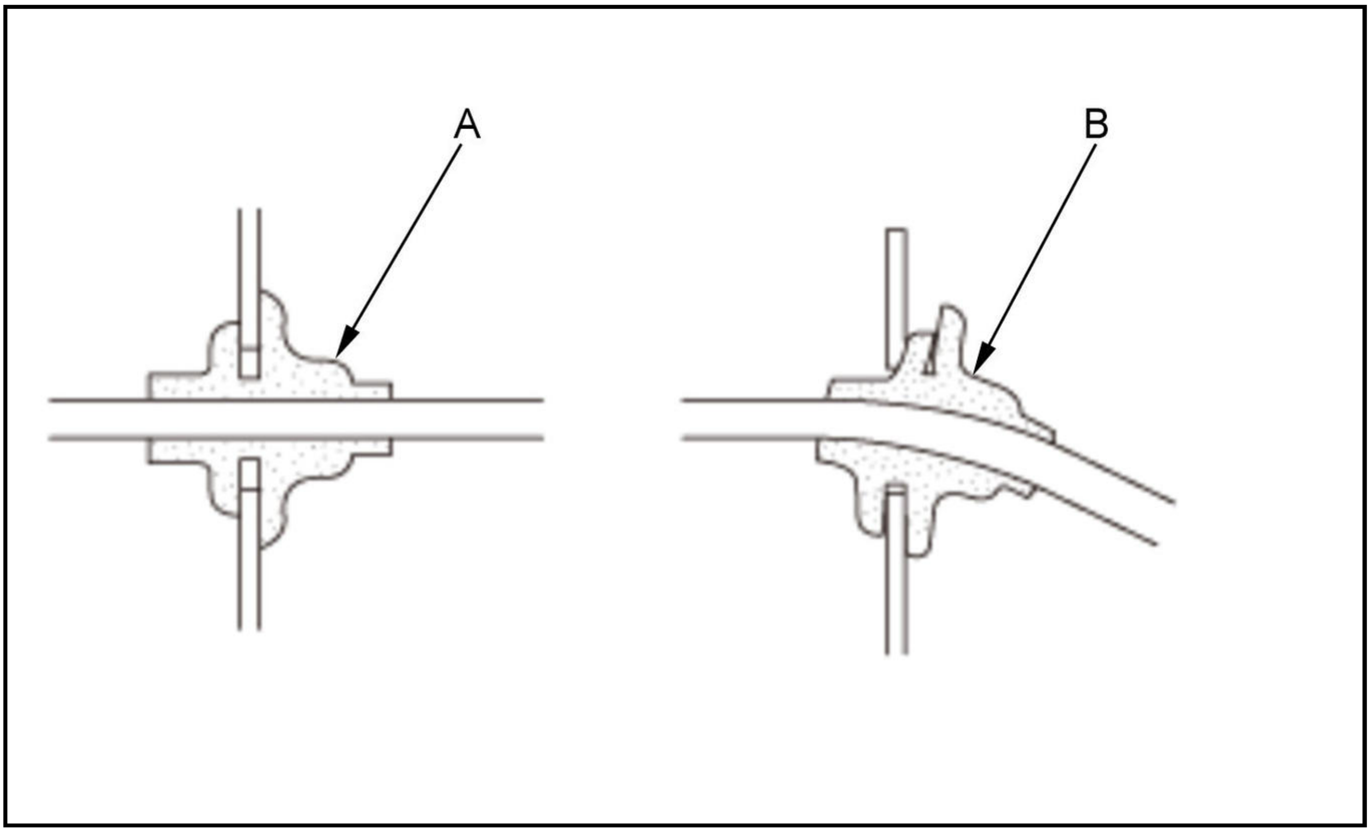


Handling Wires and Harnesses

- Secure wires and wire harnesses to the frame with their respective wire ties at the designated locations.
- Remove clips carefully; do not damage their locks (A).

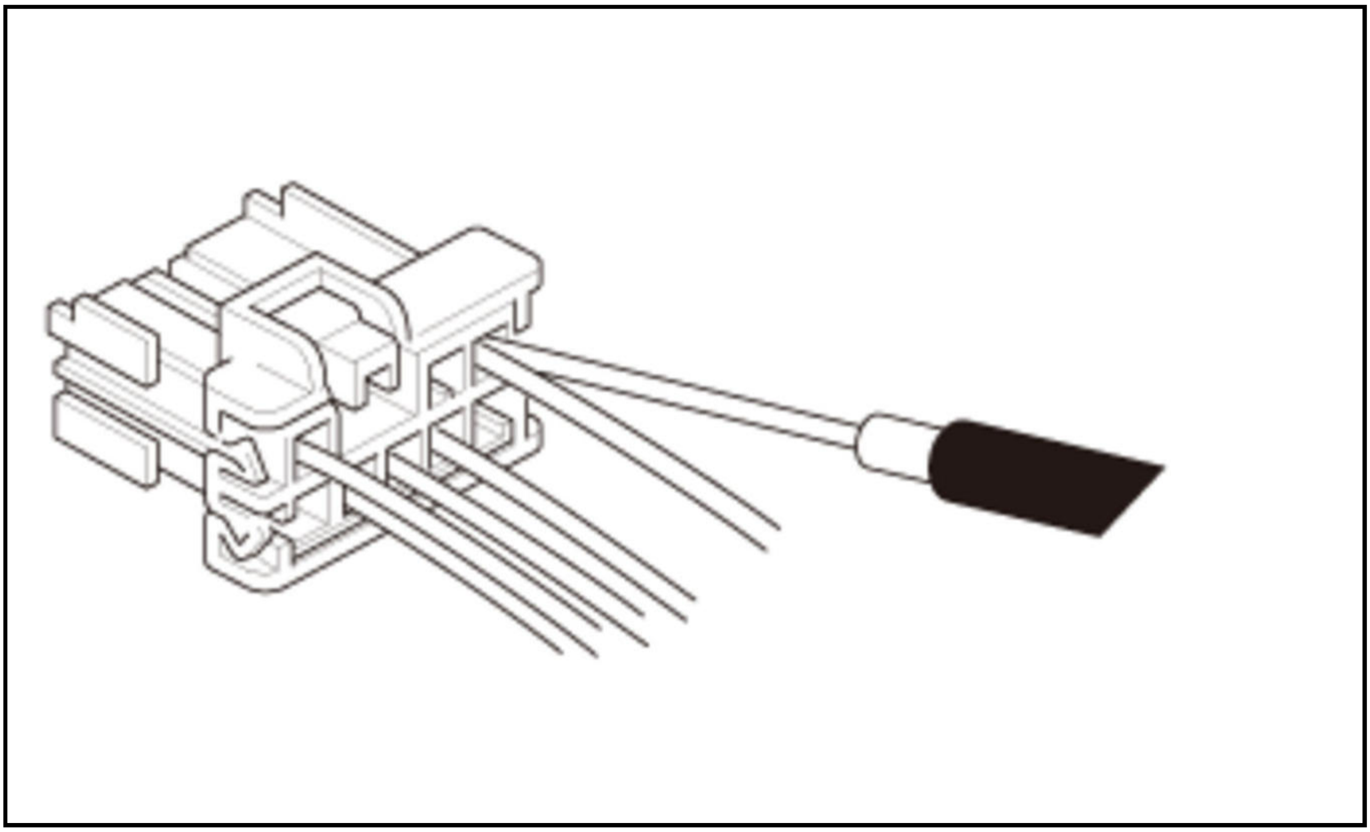


- After installing harness clips, make sure the harness does not interfere with any moving parts.
- Keep wire harnesses away from exhaust components and other hot parts, from sharp edges of brackets and holes, and from exposed screws and bolts.
- Seat grommets in their grooves properly (A). Do not leave grommets distorted (B).

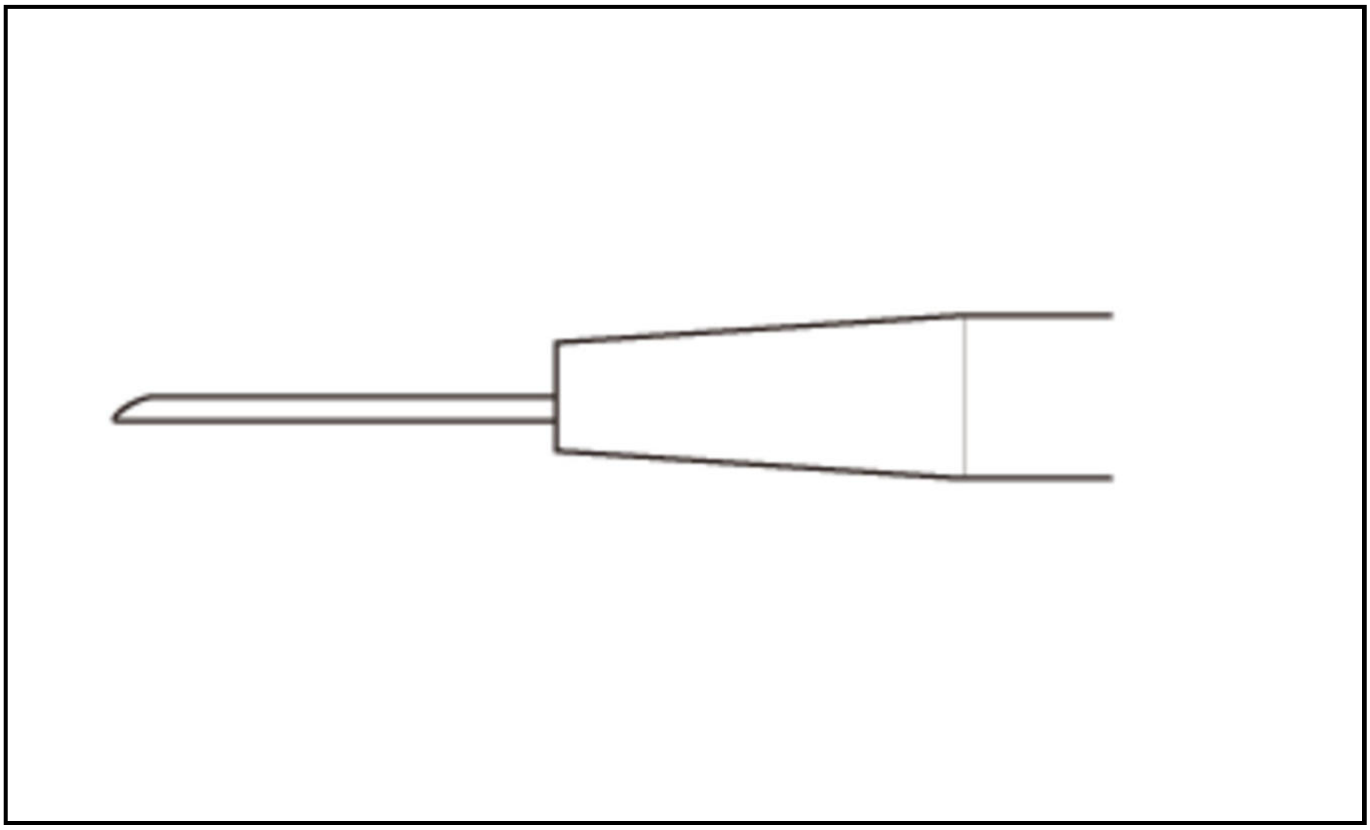


Testing and Repairs

- Do not use wires or harnesses with broken insulation. Replace them or repair them by wrapping the break with electrical tape or shrink tubing.
- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage to the SRS wiring or terminals, replace the harness.
- After installing parts, make sure that no wires are pinched under them.
- When using electrical test equipment, follow the manufacturer's instructions and those described in this manual.
- If possible, insert the probe of the tester from the wire side (except waterproof connectors).



- Use back probe adapter, 17mm 07TAZ-001020A.



- Refer to the instructions in the Honda Terminal Kit for identification and replacement of connector terminals.

Five-Step Troubleshooting

1. Verify The Complaint: Turn on all the components in the problem circuit to verify the customer complaint. Note the symptoms. Do not begin disassembly or testing until you have narrowed down the problem area.

2. Analyze The Schematic: Look up the schematic for the problem circuit. Determine how the circuit is supposed to work by tracing the current paths from the power feed through the circuit components to ground. If several circuits fail at the same time, the fuse or a ground is a likely cause. Based on the symptoms and your understanding of the circuit operation, identify one or more possible causes of the problem.

3. Isolate The Problem By Testing The Circuit: Make circuit tests to check the diagnosis you made in step 2. Keep in mind that a logical, simple procedure is the key to efficient troubleshooting. Test for the most likely cause of failure first. Try to make tests at points that are easily accessible.

4. Fix The Problem: Once the specific problem is identified, make the repair. Be sure to use proper tools and safe procedures.

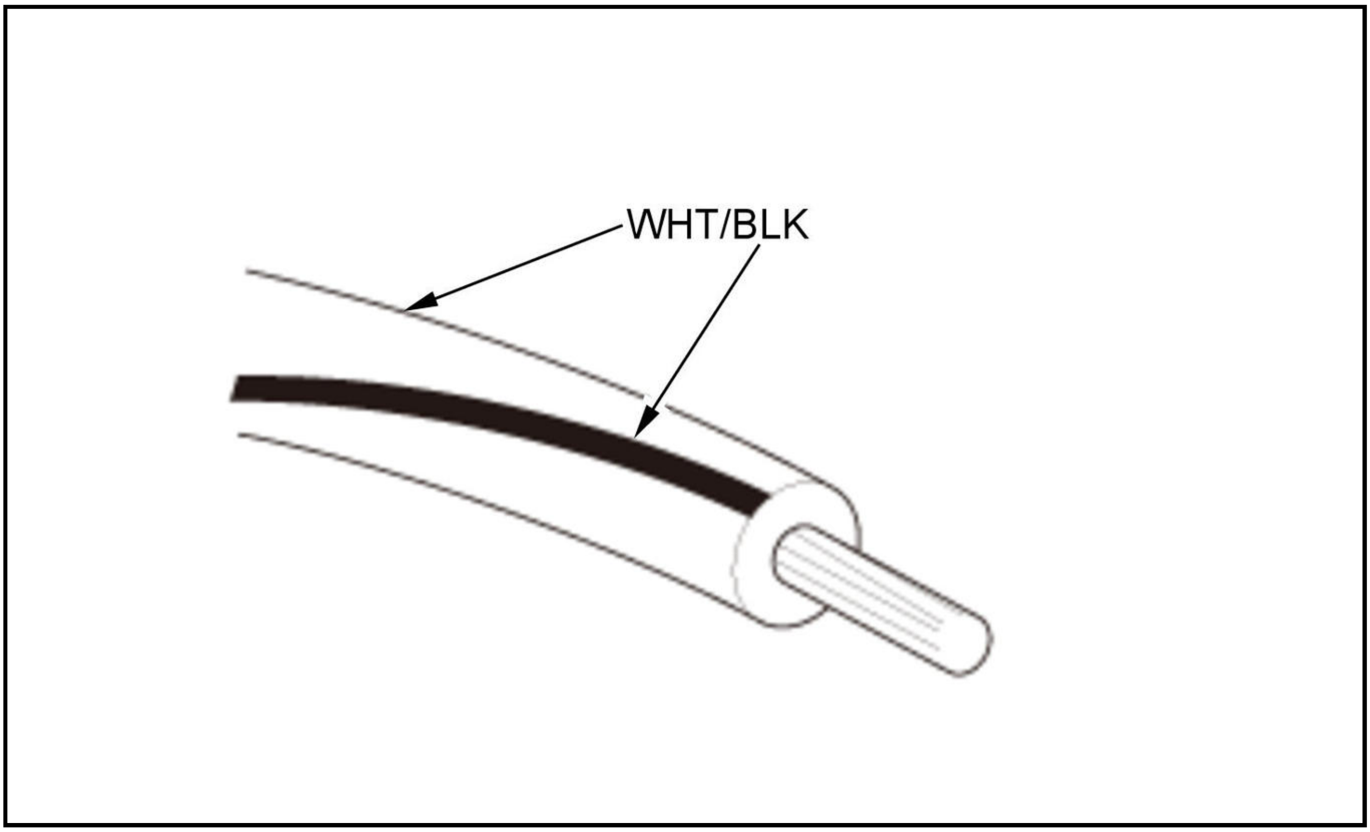
5. Make Sure The Circuit Works: Turn on all components in the repaired circuit in all modes to make sure you've fixed the entire problem. If the problem was a blown fuse, be sure to test all of the circuits on the fuse. Make sure no new problems turn up and the original problem does not recur.

Wire Color Codes

The following abbreviations are used to identify wire colors in the circuit schematics:

WHT..	White
YEL..	Yellow
BLK..	Black
BLU..	Blue
GRN...	Green
RED...	Red
ORN...	Orange
PNK...	Pink
BRN...	Brown
GRY...	Gray
PUR...	Purple
TAN..	Tan
LT BLU...	Light Blue
LT GRN..	Light Green
LT PUR..	Light Purple

The wire insulation has one color or one color with another color stripe. The second color is the stripe.



Troubleshoot the B-CAN Circuit Related Problems

Check the PCM for DTCs and troubleshoot PCM or F-CAN loss of communication errors first.

How to check for DTCs with the HDS (preferred method)

The HDS can check F-CAN and B-CAN communication status, read and clear DTCs, display data list, and perform function tests.

Check for DTCs

1. Connect the HDS to the data link connector (DLC) .

2. Select BODY ELECTRICAL, then select the desired MODE TEL, and check for DTCs. If the DTCs do not pertain to the select menu, select the ALL DTC Check icon to view all Body Electrical DTCs.

NOTE: **For specific operations, refer to the HDS user's manual.**

3. If any DTCs are indicated, go to the indicated DTCs troubleshooting.

NOTE: **If DTC U1280 is stored, troubleshoot DTC U1280 first.**

How to Clear DTCs with the HDS

1. Connect the HDS to the data link connector (DLC)

2. Clear the DTCs with the HDS.

3. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

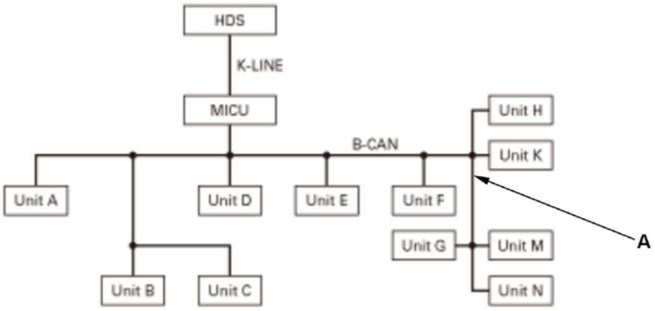
B-CAN Circuit Troubleshooting Information

1. Connect the HDS to the data link connector (DLC) .2. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS. Check that the electronic control units (ECU) are communicating with the HDS.

NOTE:

- **If an ECU is communicating with the HDS, "DETECT" will be displayed.**
- **If an ECU is not communicating, or the vehicle is not equipped with that ECU, "NOT AVAILABLE" will be displayed.**

4. If a control unit is not communicating, confirm which ECUs are communicating, then refer to the B-CAN Communication Line from the Electrical Wiring Diagrams to find the malfunction point. For example, when unit "K" is communicating, but units "G", "M", and "N" are not communicating, that will direct you to the malfunction point (A).



Loss of Communication DTC Cross-ence Chart

When an ECU on the CAN circuit is unable to communicate with other ECUs on the CAN circuit, the other control units will set loss of communication DTCs. Use this chart to find the ECU that is not communicating with the other ECUs on the CAN circuit.

1. Find the Transmitting Control Unit that is in the same row as all of the loss of communication DTCs that you retrieved.

2. Do the input test for the transmitting control unit.

BUS OFF and Internal Error Codes

DTC Type	**Related Unit**

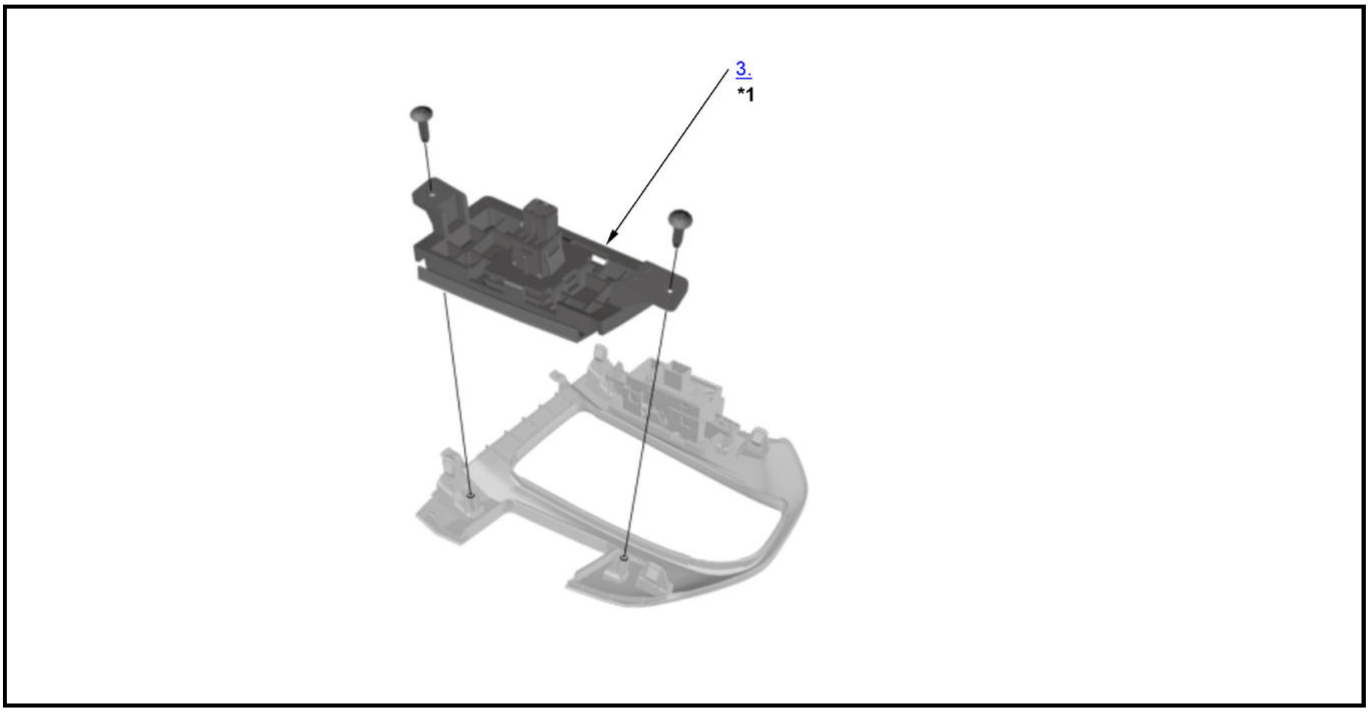
REMOVAL & INSTALLATION TEST

ECON SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



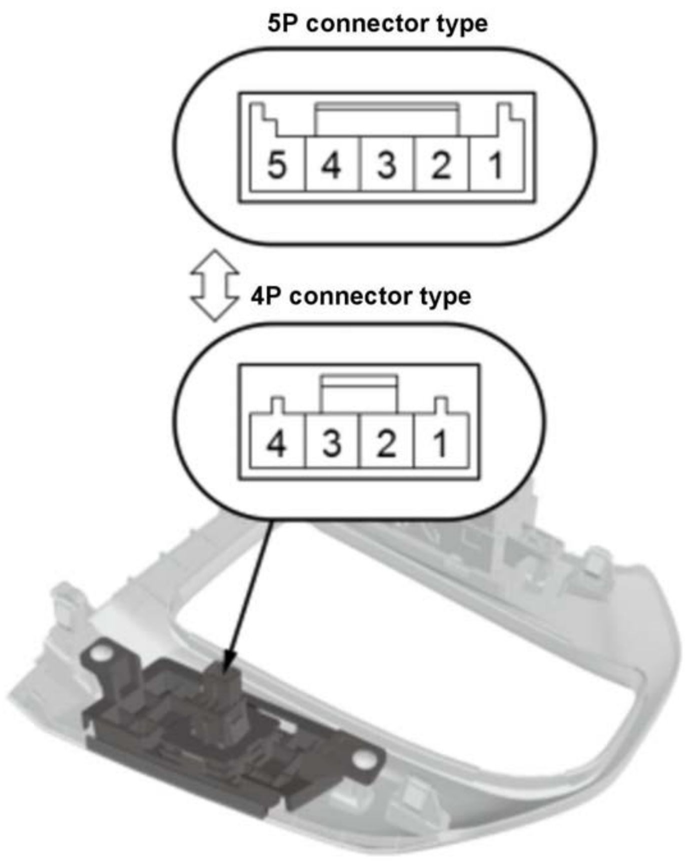
*1	ECON Switch Light: LED

1. Climate Control Panel - Remove
2. Shift Lever Panel - Remove
3. ECON Switch - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. ECON Switch - Test



Terminal / Position/Illumination	1 [2]	2 [3]	3 [4]		4 [5]
Pressed	○	○			
ECON switch light			⊕		⊖

○—○ = Continuity check
⊕—⊖ = Voltage for LED
[ ]: 5P connector type

1. Check the ECON switch according to the table in illustration.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**

2. If the result is not as specified, replace the ECON switch.

2. All Removed Parts - Install

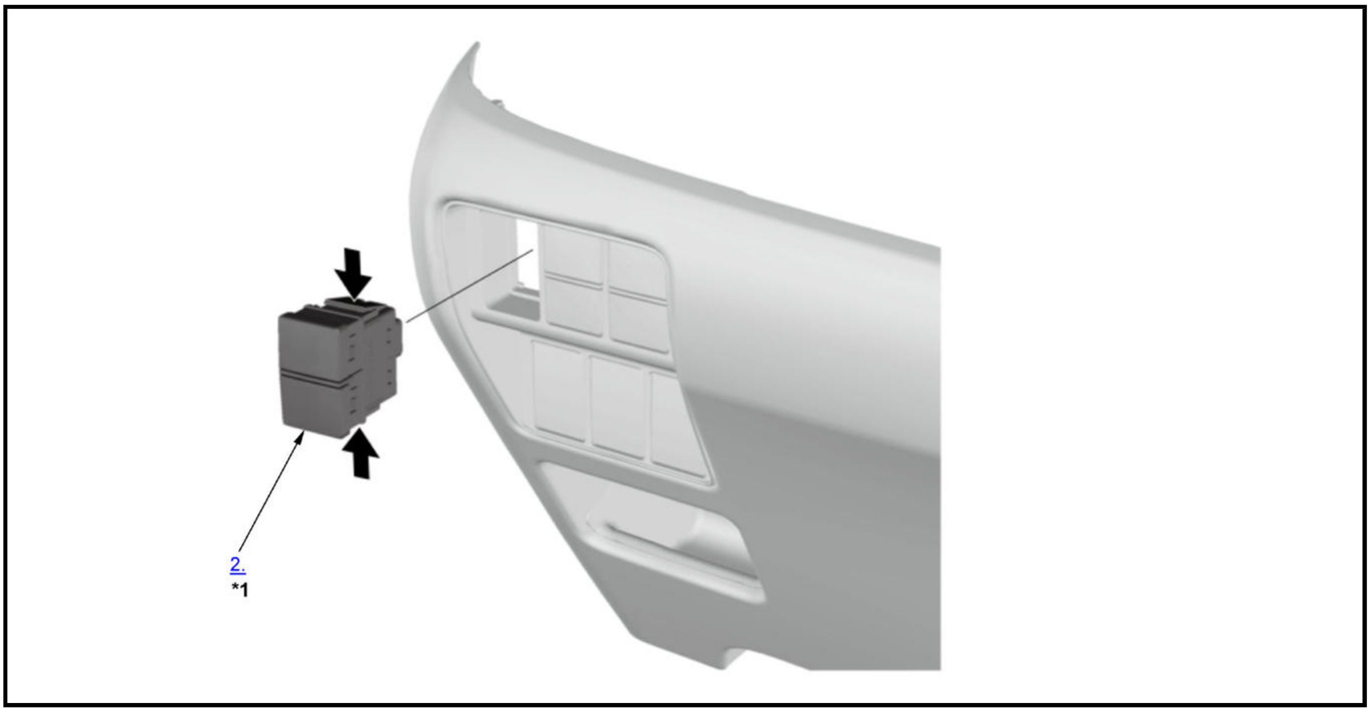
1. Install the parts in the reverse order of removal.

PARKING AND BACK-UP SENSOR SWITCH REMOVAL, INSTALLATION, AND TEST (2020 2021)

Removal and Installation

NOTE: The switch location of the parking and back-up sensor switch is different depending on the model.

1



*1	Parking and Back-Up Sensor Switch Light: LED

1. **Driver's Dashboard Lower Cover - Remove**
2. Parking and Back-Up Sensor Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

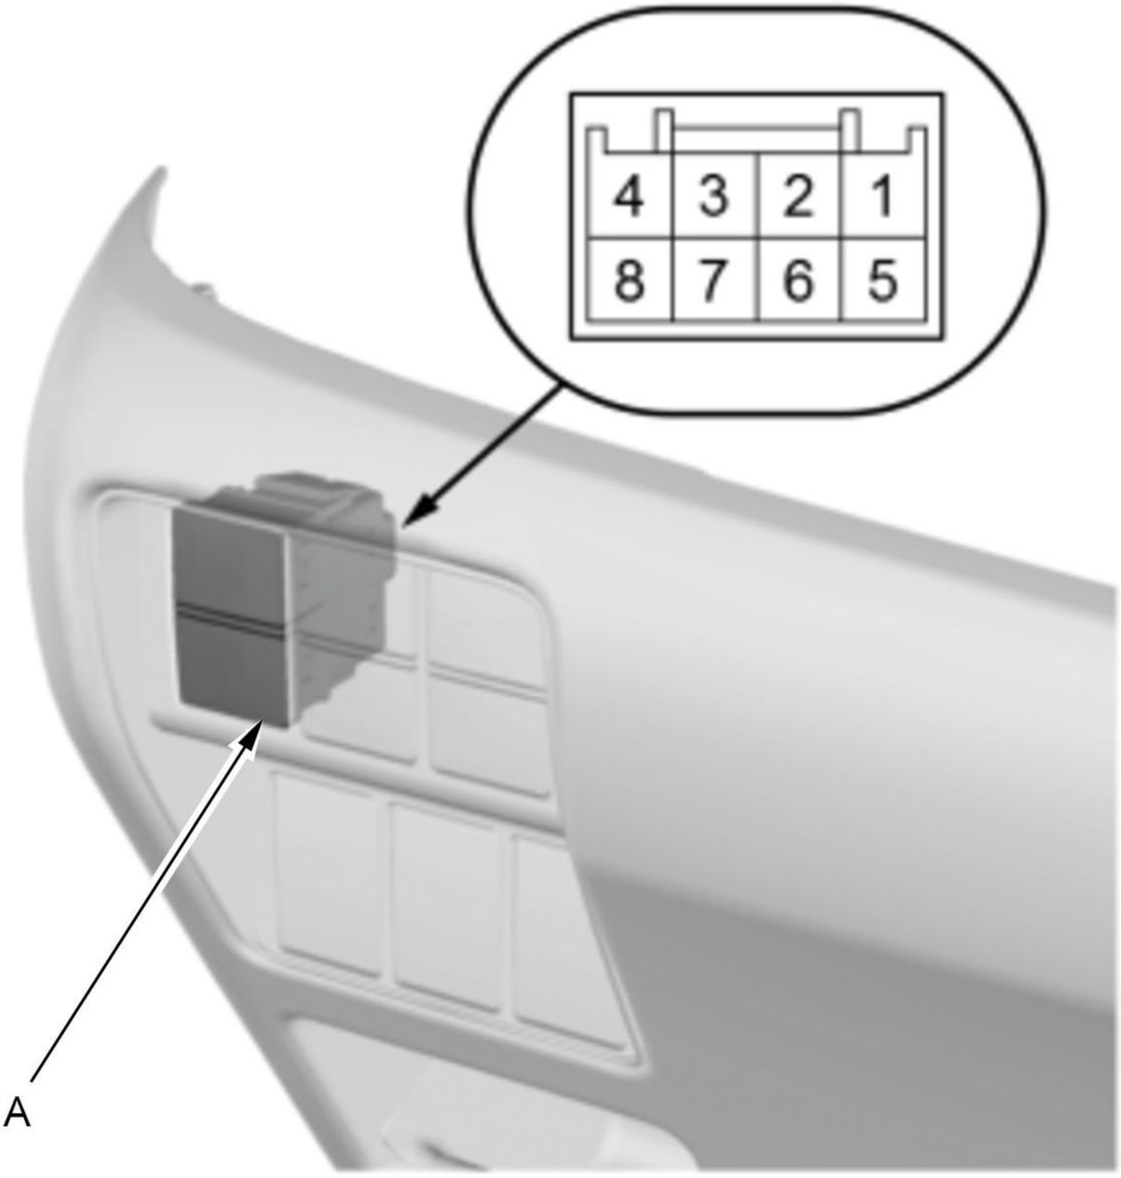
1. Parking and Back-Up Sensor Switch - Test

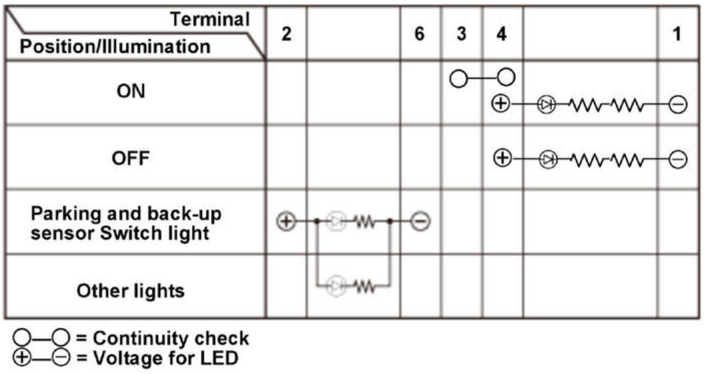
The switch location of the parking and back-up sensor switch (A) is different depending on the model.

1. Check the parking and back-up sensor switch according to the table in illustration.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**
- **Make sure the correct test lead (+or -) is placed on the terminal.**





Terminal / Position/Illumination	2		6	3	4		1
ON				○—	○ ⊕	—⊳|—WW—WW—	⊖
OFF					⊕	—⊳|—WW—WW—	⊖
Parking and back-up sensor Switch light	⊕	—⊳|—WW—	⊖				
Other lights		—⊳|—WW—					

○—○ = Continuity check
⊕—⊖ = Voltage for LED

2. If the result is not as specified, replace the parking and back-up sensor switch.

REMOVAL AND INSTALLATION

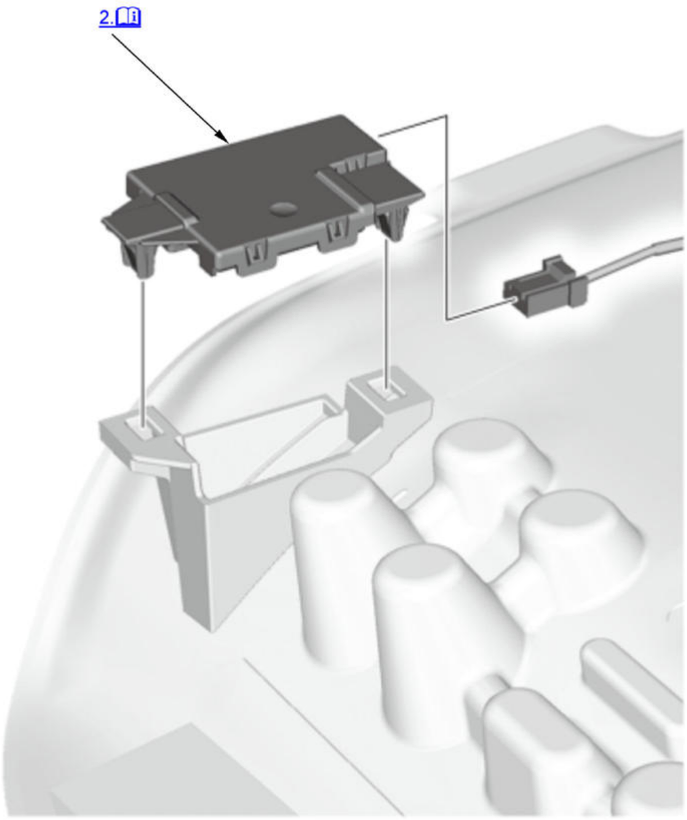
ELECTRICAL COMPASS UNIT REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: Where icon is shown, further information shown below.

1



1. **Headliner - Remove**
2. Electrical Compass Unit - Remove

   NOTE: If you replaced the electrical compass unit, **set the compass zone calibrate** .

3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

FRONT CENTER SENSOR REMOVAL AND INSTALLATION (2020 2021)

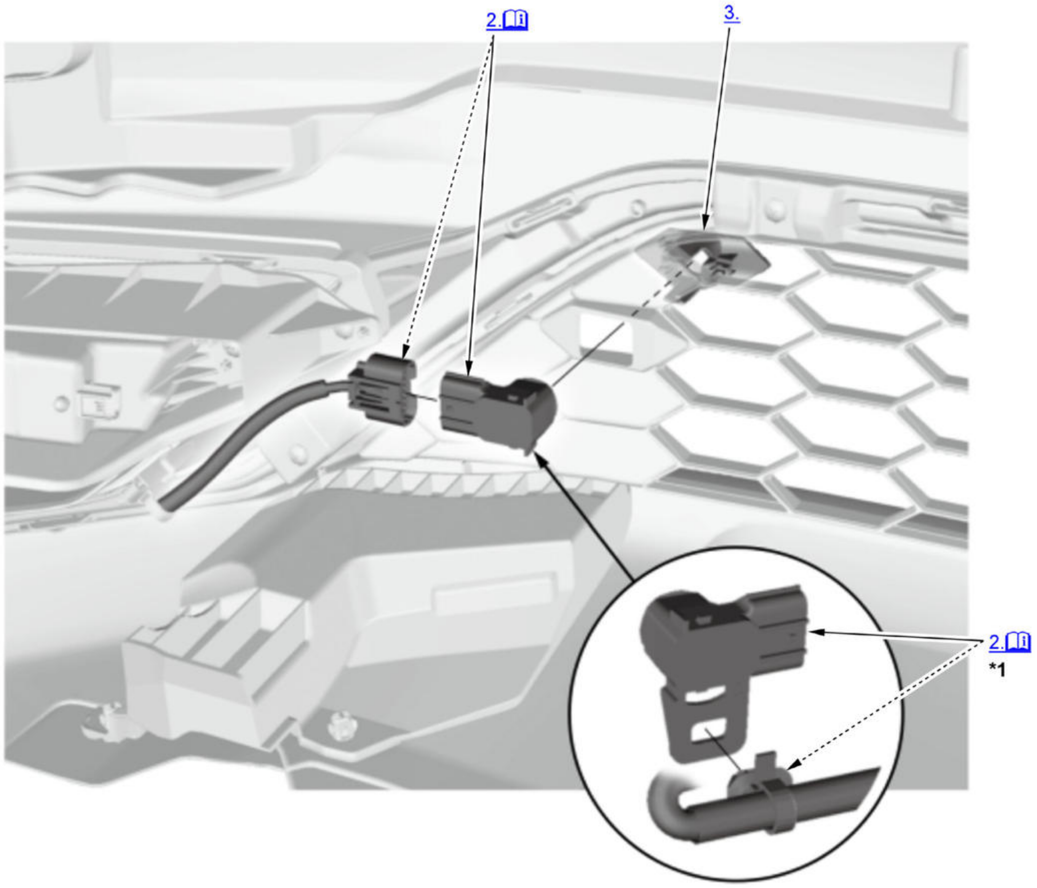
Removal and Installation

NOTE: Where icon is shown, further information shown below.

Reset the parking and back-up sensor control unit after doing any of the following actions:

- When you replace the parking and back-up sensor.
- When you change the parking and back-up sensor mounting location from the original location.

1



ℹ	Detailed information, notes, and precautions
*1	Right side

1. **Front Bumper - Remove**
2. Front Center Sensor - Remove

   1. Right side: Remove the harness clip.

3. Retainer - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

5. **Parking and Back-Up Sensor Control Unit - Reset**

FRONT CORNER SENSOR REMOVAL AND INSTALLATION (2020 2021)

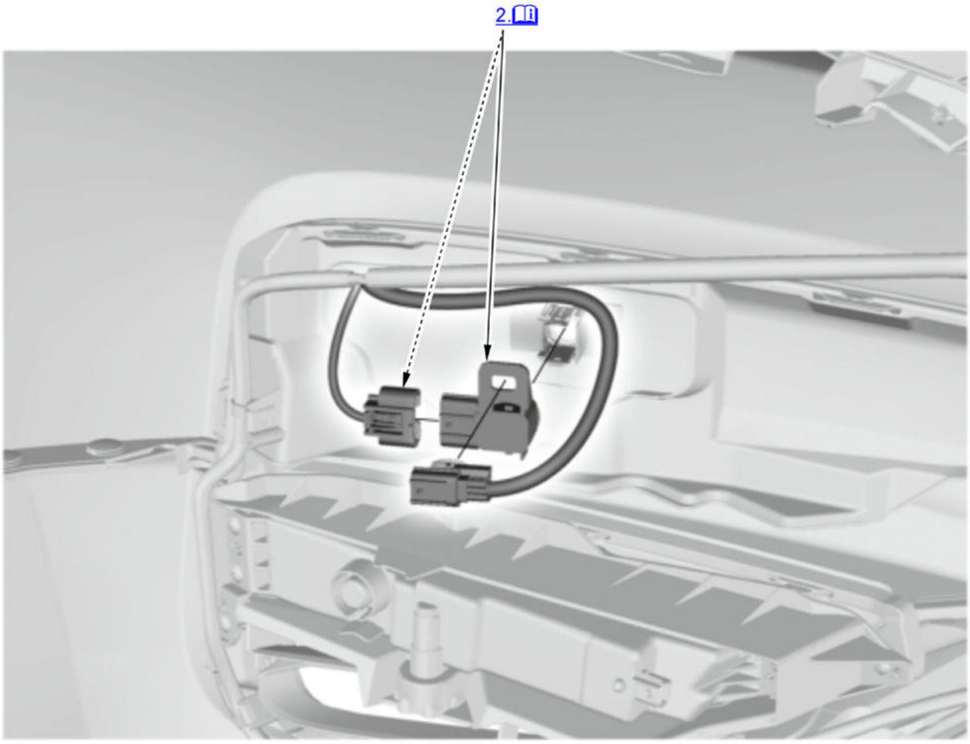
Removal and Installation

NOTE: ℹ Where icon is shown, further information shown below.

Reset the parking and back-up sensor control unit after doing any of the following actions:

- When you replace the parking and back-up sensor.
- When you change the parking and back-up sensor mounting location from the original location.

1



📖	Detailed information, notes, and precautions

1. **Front Bumper - Remove**
2. Front Corner Sensor - Remove

   1. Remove the connector clip as needed.

3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

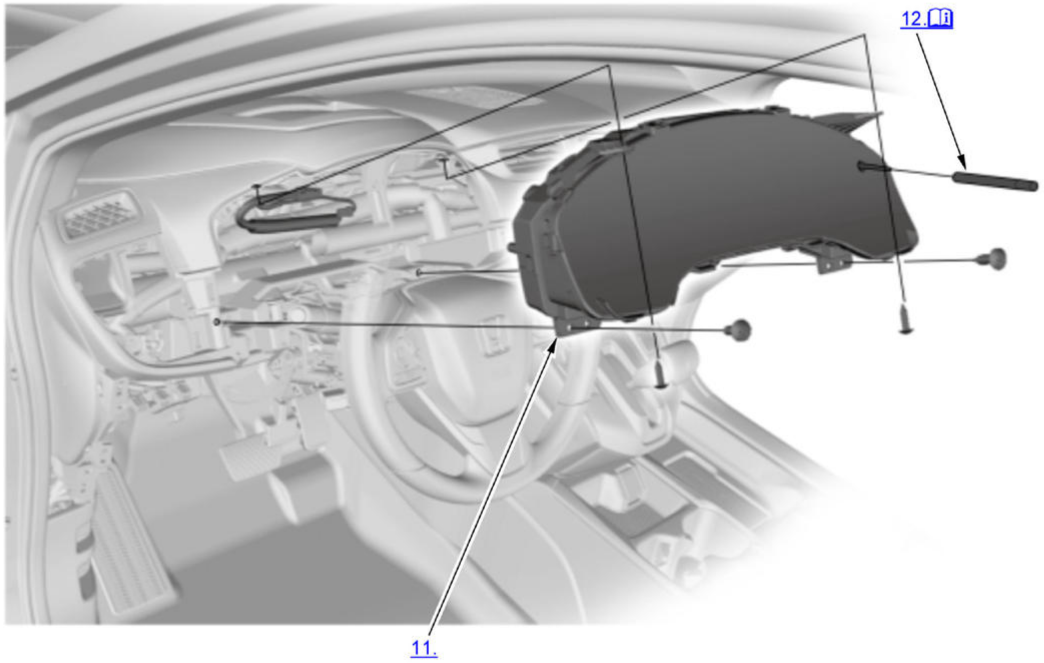
4. **Parking and Back-Up Sensor Control Unit - Reset**

GAUGE CONTROL MODULE REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- 📖 Where icon is shown, further information shown below.
- Before replacing the gauge control module, **retrieve the ODO data from the gauge control module with the HDS** .
- After the gauge control module is removed or reinstalled, **do the Gauge Self-Diagnostic Function procedure** .



ℹ	Detailed information, notes, and precautions

1. Gauge Control Module - Retrieve

NOTE:

- Obtain a new gauge control module before starting the rewriting process. Only new gauges can be rewritten.
- Do not operate anything electrical (headlights, audio system, A/C, power window, door locks etc.) during the process.
- Rewriting is not possible on a gauge control module that will not communicate with the HDS.
- Make sure that the HDS shows the correct VIN for the vehicle you are working on.
- Once you have started this procedure, you must complete it before removing the HDS from the data link connector.
- Connect a 12 volt battery charger to insure that the 12 volt battery voltage is maintained during the process.

1. **Connect the HDS to the data link connector**

2. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.

3. Select GAUGE CONTROL MODULE REPLACEMENT (ODO Rewrite) from the ADJUSTMENT menu, and follow the instructions on the display to retrieve the ODO value.

2. **Meter Visor - Remove**
3. **Driver's Lower Ornament Panel - Remove**
4. **Driver's Outlet - Remove**
5. **Driver's Dashboard Lower Cover - Remove**
6. **Driver's Dashboard Outer Panel - Remove**

7. **Climate Control Panel - Remove**
8. **Audio Unit - Remove (Without Audio-Navigation Unit)**
9. **Audio-Navigation Unit -Remove (With Audio-Navigation Unit)**
10. **Driver's Dashboard Inner Panel - Remove**
11. Gauge Control Module - Remove
12. Select/Reset Knob - Remove

1. Pull out the select/reset knob.

13. All Removed Parts - Install

1. Install the parts in the reverse order of removal. **NOTE:** **If the original gauge control module was installed, confirm that all systems are working properly.**

14. Gauge Control Module - Rewrite

1. Select WRITE DATA and following the instructions on the HDS display, install the ODO value data onto a new gauge control module. If the data transfer fails, **refer to the instructions below to release the locked ODO value** .

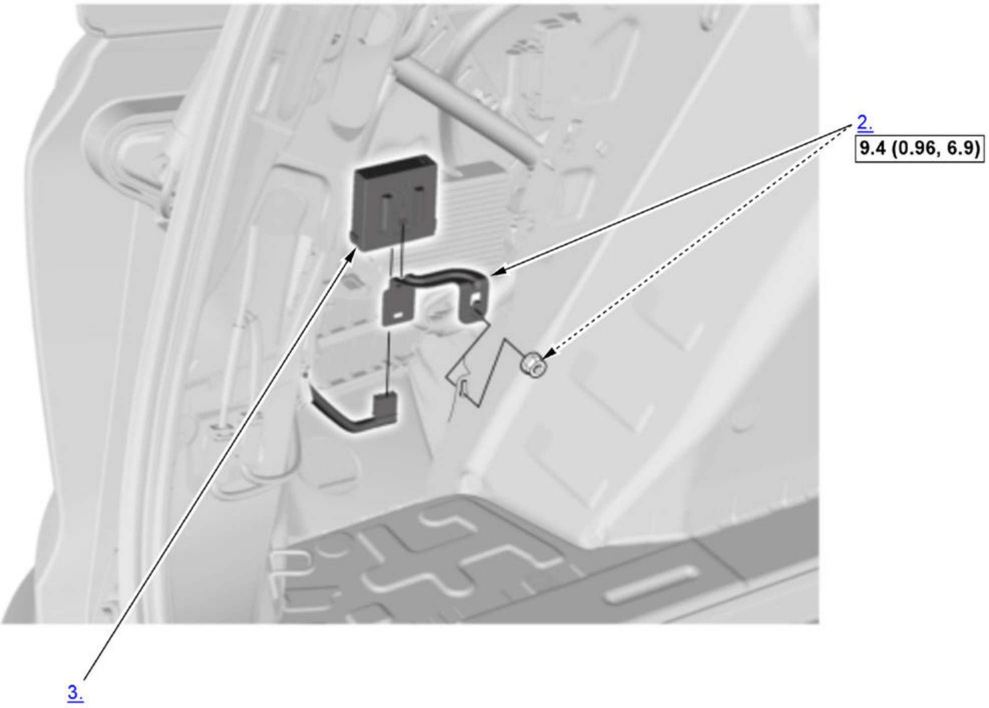
15. Gauge Control Module - Update

NOTE: If replacing the gauge control module, do the gauge control module update procedure.

PARKING AND BACK-UP SENSOR CONTROL UNIT REMOVAL AND INSTALLATION (2020 2021)

Removal and Installation

1



▭	Torque: N.m (kgf.m, lbf.ft)

1. **Left Rear Side Trim Panel - Remove**
2. Bracket - Remove
3. Parking and Back-Up Sensor Control Unit - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

REAR CENTER SENSOR REMOVAL AND INSTALLATION (2020 2021)

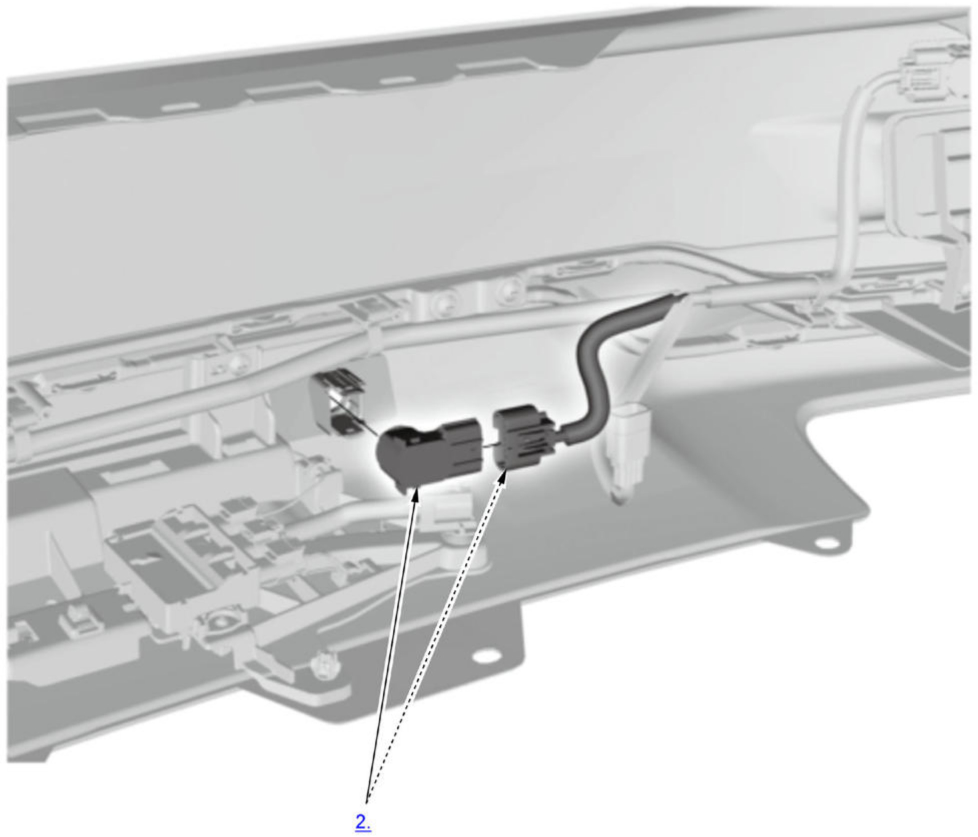
Removal and Installation

NOTE: ℹ Where icon is shown, further information shown below.

Reset the parking and back-up sensor control unit after doing any of the following actions:

- When you replace the parking and back-up sensor.
- When you change the parking and back-up sensor mounting location from the original location.

1



1. **Rear Bumper - Remove**
2. Rear Center Sensor - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

4. **Parking and Back-Up Sensor Control Unit - Reset**

REAR CORNER SENSOR REMOVAL AND INSTALLATION (2020 2021)

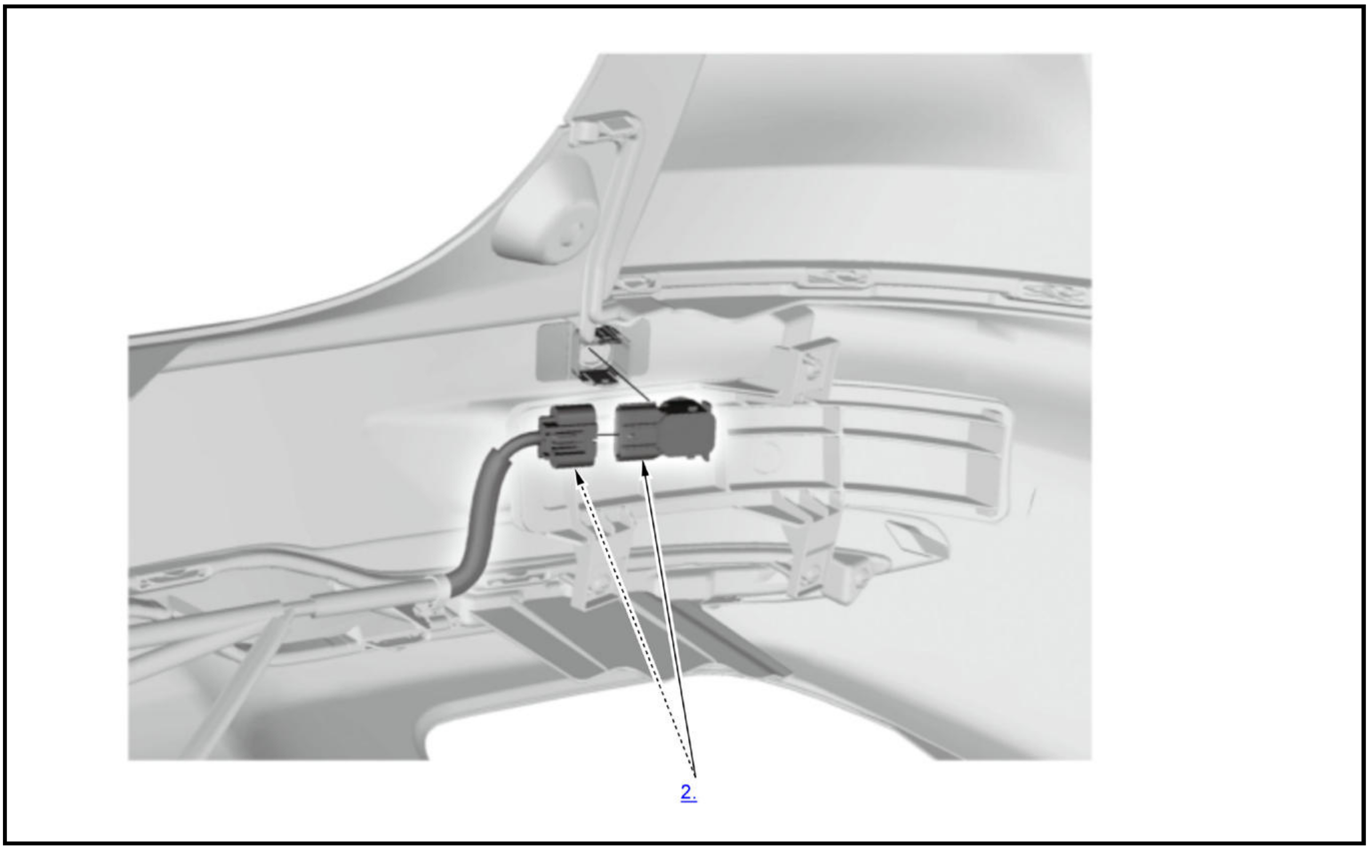
Removal and Installation

NOTE: Where icon is shown, further information shown below.

Reset the parking and back-up sensor control unit after doing any of the following actions:

- When you replace the parking and back-up sensor.
- When you change the parking and back-up sensor mounting location from the original location.

1



1. **Rear Bumper - Remove**
2. Rear Corner Sensor - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

4. **Parking and Back-Up Sensor Control Unit - Reset**

REMOVAL AND INSTALLATION

ACOUSTIC VEHICLE ALERTING CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

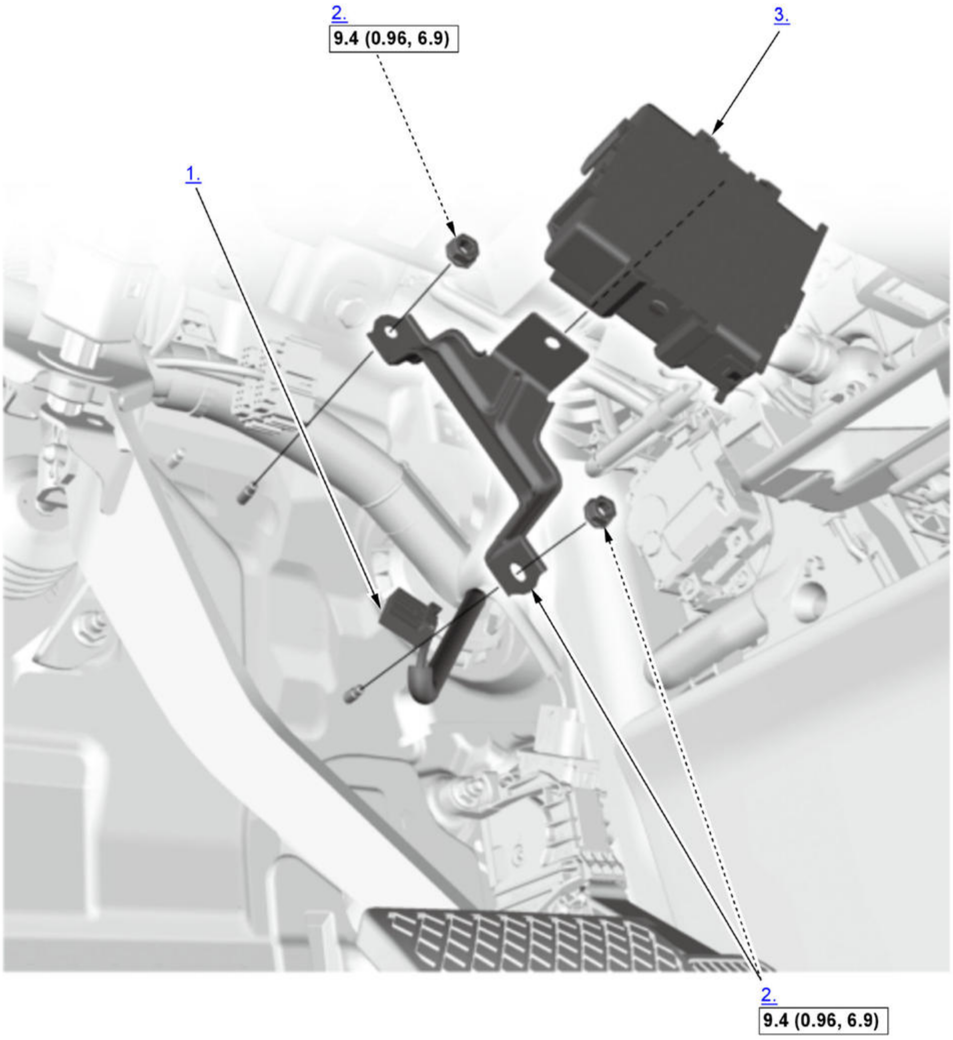


Fig. 1: Exploded View Of Acoustic Vehicle Alerting Control Unit Components

DESCRIPTION AND OPERATION

ELECTRICAL COMPASS SYSTEM DESCRIPTION

Electrical Compass Unit

The electrical compass unit sends the azimuth (direction) information in the 8-directions (N, NE, E, SE, S, SW, W, NW) to the audio unit. The electrical compass unit receives the VSP signal from the gauge control module via the audio unit. The azimuth information is fixed while parked.

Starting Operation

When the vehicle is turned to the ON mode, the electrical compass unit communicates with the audio unit, and the self-test mode begins automatically.

The self-test function checks for the current voltage, non-volatile memory (NVM), and ROM status in the electrical compass unit. If the unit detects a malfunction during the self-test, it indicates a malfunction by flashing the compass information segments (CAL and NW) in the audio unit.

Basic Operation

The electrical compass unit uses the noise filter to the raw magnetic data. The noise filter switches on/off depending on the intensity of surrounding magnetic noise. In the filter mode, the calculation may delay several seconds. After processing the compass data, the unit sends the azimuth (direction) information to the audio unit

The electrical compass unit also receives following signals via the audio unit:

- The electrical compass unit receives the vehicle speed information from the gauge control module via the audio unit. The azimuth information is fixed while the vehicle is parked.
- The electrical compass unit receives the RR DEF on/off information from the climate control unit. The electrical compass unit compensates for magnetic anomalies when the rear window defogger is on.

Self-Calibration

The electrical compass unit has a self-calibration function. It detects and compensates for magnetic anomalies caused by bridges, subways and large steel structures. When the vehicle leaves the area with a strong magnetic interference (2, 400 mG or more), the electrical compass unit automatically begins calibrating. If needed, you can manually calibrate the compass.

Zone Selection

The zone selection is required to compensate for the difference between the magnetic north and the geographic north. This deviation is referred to as a declination. The compass compensates for the declination when you select the zone where the vehicle is located.

GAUGES SYSTEM DESCRIPTION

Self-diagnostic function

The gauge control module is equipped with a function to self-diagnose the inside circuits in the gauge control module.

Speedometer and Tachometer

The PCM provides a vehicle speed signal to the gauge control module using F-CAN and displays the vehicle speed in the speedometer. The PCM provides an engine speed signal to the gauge control module using F-CAN and displays the engine speed in the tachometer.

Fuel Gauge and Fuel Indicator

The gauge control module displays the fuel gauge based on input value from the fuel gauge sending unit. The low fuel indicator turn on in the event that indication of the fuel gauge becomes lower than the minimum tank fill threshold.

Multi-Information Display (MID) (With Multi-Information Display)

The multi-information display (MID) provides the shift position/mode indicator, tachometer, speedometer, average fuel efficiency, instant fuel economy, ODO/trip meter, outside air temperature, instant fuel economy, elapsed time, seat belt reminder, oil life, average speed, eco guide, driver attention monitor, and the status of the keyless access system. In addition, the diagnostic system displays communication errors and the DTCs.

Information Display (Without Multi-Information Display)

The information display provides the ODO/trip meter, outside air temperature, average fuel economy, instant fuel economy, oil life, and seat belt reminder, and the status of keyless access system. In addition, the diagnostic system displays communication errors and DTCs

ODO Meter and Trip Meter

The PCM provides a vehicle speed signal to the gauge control module using the F-CAN. Based on this input, the gauge control module tracks mileage for the odometer and trip meters. The mileage values are displayed in the information display or multi-information display (MID).

Ambient Meter

The ambient meter shows real-time driving information by color on the both sides of the tachometer which promote fuel efficient driving. When the color is close to green, it means low fuel consumption driving. When the color is close to white, it means high fuel consumption driving.

Engine Coolant Temperature Gauge

The PCM provides an engine coolant temperature signal to the gauge control module using the F-CAN. When the engine coolant temperature is high, the gauge control module displays the warning in the multi-information display (MID) or indicator.

Outside Air Temperature

The gauge control module uses measurements from the outside air temperature sensor or the outside air temperature sensor signal from climate control unit via B-CAN. The outside air temperature indicator's displayed temperature can be recalibrated ± 5 deg.F (± 3 deg.C) to meet the customer's expectations.

Average Fuel Economy/Instant Fuel Economy, Range, Elapsed Time Display

The gauge control module receives signals such as fuel consumption, driving distance, vehicle speed, and engine speed from the PCM via F-CAN. It calculates average/instant fuel economy, elapsed time *, average speed *, and range to display the results.

*: With multi-information display (MID)

Select Position

The TCM or PCM sends the transmission shift position/mode to the gauge control module, using the F-CAN.

Gauge Control Module Receives Information

The gauge control module receives information from each control unit via F-CAN and B-CAN to light or flash the indicators. The VSA modulator-control unit (indicator signal), ECON switch, CMBS off switch, cruise control/ACC combination switch, electric parking brake/automatic brake hold switch, VSA OFF switch, washer fluid level switch, TPMS switch and brake fluid level switch are connect directly to the gauge control module. The audio remote-HFL switch signal is transmitted to the gauge control module via LIN.

Keyless Access System Information (With Keyless Access System)

The gauge control module receives information from the body control module the B-CAN to display status of the keyless access system.

Buzzer

The gauge control module includes a buzzer to provide the driver with audible warnings.

Illumination Control

The illumination brightness can be adjusted using the SEL/RESET knob. When the exterior lights are off, the system is off.

PARKING AND BACK-UP SENSOR SYSTEM DESCRIPTION (2020 2021)

Overview

The parking and back-up sensor system measures distances to objects by transmitting ultrasonic waves and receiving the echo from sound waves bouncing off nearby objects. It informs drivers of nearby objects with audible warning signals as well as visual signs through the multi-information display (MID) in the gauge control module.

Parking and Back-Up Sensor System Operation

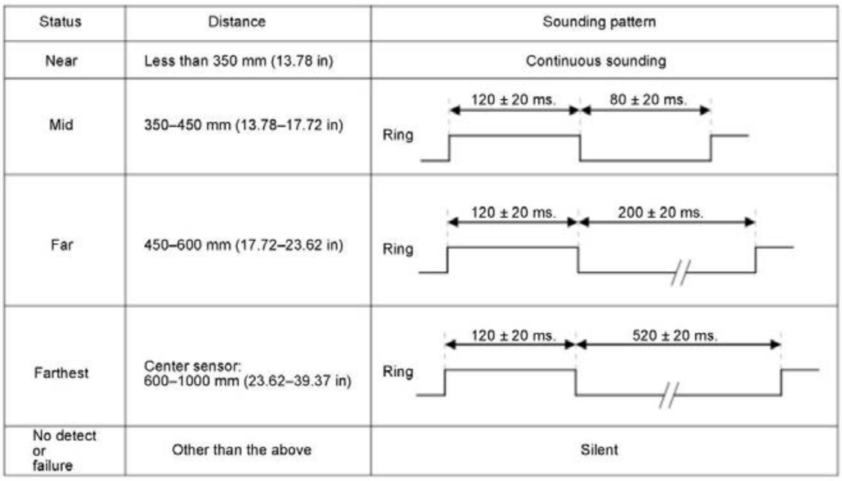
The sensors send out ultrasonic waves, receive waves reflected by an obstacle, determine the distance, and use the buzzer and/or multi-information display (MID) to tell the driver that an obstacle is near.

- The front center and front corner sensors work any time the shift lever is shifted out of P position/mode, until the vehicle reaches about 14 km/h (8.7 mph). They do not come back on until slowing down to about 9 km/h (5.6 mph) or less.
- The rear corner and rear center sensors are only activated in shift to R position/mode.
- With parking and back-up sensor switch: The parking and back-up sensor system is in active with its switch ON.
- The system check is performed each time the parking and back-up sensor switch is turned on with the vehicle in the ON mode.
- The sensors must be free of debris, snow, and ice to work correctly.

Sound Pattern of the Parking and Back-Up Sensor Beeper

Intermittent/continuous alarm sounding is performed by obstacle detection indication requests and alarm sounding requests from the parking sensor system, according to the distance and the display of the obstacle detection location. A magnified warning display is generated in case of a failure of the parking sensor system.

Front



Alarm Sounding Patterns for Forward Detection

Status	Distance	Sounding pattern
Near	Less than 350 mm (13.78 in)	Continuous sounding
Mid	350–450 mm (13.78–17.72 in)	Ring 120 ± 20 ms. 80 ± 20 ms.
Far	450–600 mm (17.72–23.62 in)	Ring 120 ± 20 ms. 200 ± 20 ms.
Farthest	Center sensor: 600–1000 mm (23.62–39.37 in)	Ring 120 ± 20 ms. 520 ± 20 ms.
No detect or failure	Other than the above	Silent

No detect or failure	Other than the above	Silent

PARKING AND BACK-UP SENSOR SYSTEM DESCRIPTION - COMPONENTS (2020 2021)

Parking and Back-Up Sensor Switch

Input to the parking and back-up sensor control unit is performed by operating the parking and back-up sensor switch. The parking and back-up sensor indicator is activated by the parking and back-up sensor control unit.

Parking and Back-Up Sensors

The parking and back-up sensors emit ultrasonic waves, which are reflected by obstacles and then detected by the sensors. The detected ultrasonic waves are converted to digital signals after amplification, and are then transmitted to the parking and back-up sensor control unit.

CALIBRATION CORRECTION

ELECTRICAL COMPASS ZONE SELECTION AND CALIBRATION

Procedure

NOTE:

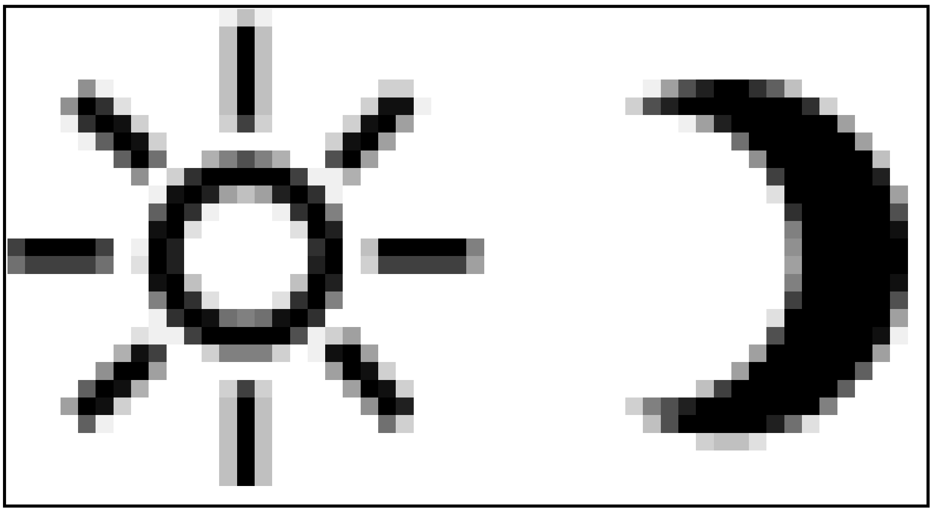
- **Check the vehicle 12 volt battery condition first** .
- You should do this procedure any time the electrical compass unit is replaced.
- You should do this procedure in an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields.
- If you see "--" and the CAL indicator is shown in the audio display, the electrical compass unit is self-calibrating.
- In most areas, there is a variation between magnetic north and true north. The compass zone needs to be set to your geographic zone to compensate for this variation.
- The electrical compass unit may need to be manually calibrated after exposure to a strong magnetic field. If the electrical compass unit seems to be continually showing the wrong direction, and is not self-calibrating, do the following.

1. Electrical Compass Zone Selection and Calibration

   Zone Selection

   1. Turn the vehicle to the ON mode.

   2. Press and hold the DISPLAY MODE (



) button until you hear a beep (about 5 seconds). The display shows the electrical compass setting menu items.

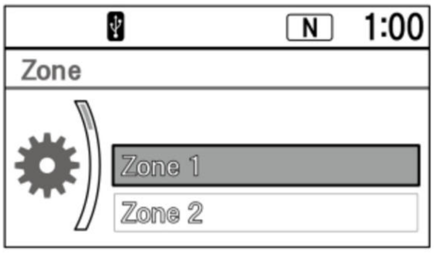
MENU BUTTON

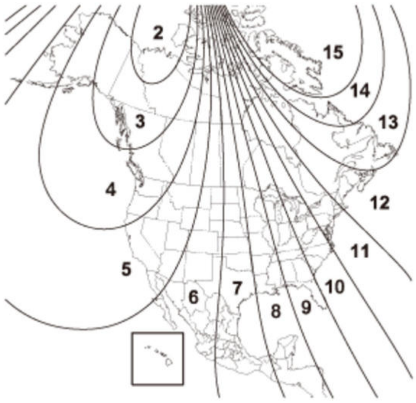
3. Rotate the LIST knob to select Zone (A), and press the SELECT button to enter the selection.

NOTE: If necessary, press the BACK button to return to the previous display. Pressing the MENU button cancels the electrical compass setting mode.

4. The display shows the currently selected zone number between from 1 to 15. Find the zone for your area on the zone map. If the correct zone is not shown, turn the LIST knob to cycle the zone lists up or down.



Zone Map



5. Press the SELECT button to decide the selected zone. Returning to the normal display, the zone selection mode ends.

Calibration

Although the compass is self-calibrating, it may need to be manually calibrated after exposure to a strong magnetic field. If the compass is blinking and CAL is shown on the display, do this to calibrate the compass:

1. Start the engine.

2. Press and hold the DISPLAY MODE (☼☾) button until you hear a beep (about 5 seconds). The display shows the electrical compass setting menu items.

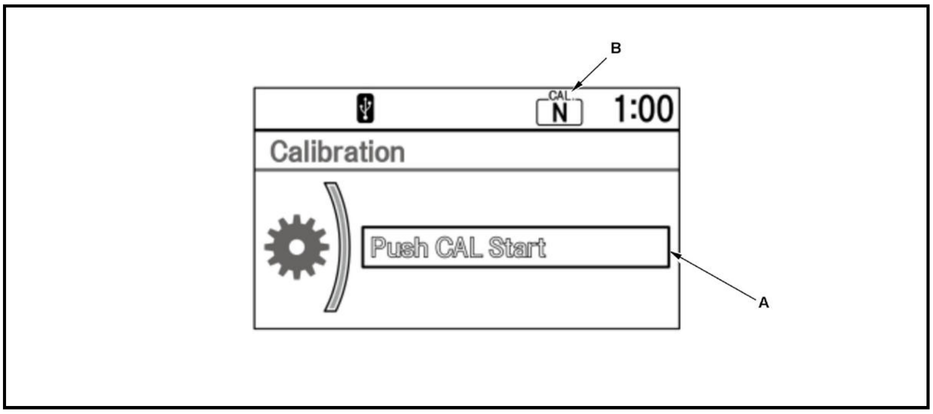
3. Rotate the LIST knob to select Calibration (A) and press the SELECT button to enter the selection.

NOTE: If necessary, press the BACK button to return to the previous display. Pressing the MENU button cancels the electrical compass setting mode.

4. The display shows the Push CAL Start (A). Press the SELECT button to enter the selection.



B
CAL
N
1:00
Calibration
Push CAL Start
A

5. When the display shows Push CAL Start, press the SELECT button. The compass display blinks and the CAL indicator (B) comes on.

6. Drive the vehicle slowly in three complete circles (20 seconds or more per a circle). When the calibration is successfully completed, the compass display stops blinking and the CAL indicator goes off.

NOTE:

- The audio system is not related to the electrical compass system. Even if the electrical compass system is calibrating, the display returns to the normal display which was last selected.
- If the calibration fails, try another location (an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields) and do the calibration procedure again.

OUTSIDE AIR TEMPERATURE INDICATOR CALIBRATION(WITH MULTI-INFORMATION DISPLAY)

Procedure

NOTE: To test the outside air temperature sensor, refer to the outside air temperature sensor test procedure .

1. Outside Air Temperature Indicator - Calibrate

Description

The outside air temperature sensor is located behind the center of the front bumper. The gauge control module uses measurements from this sensor to display the outside air temperature.

Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from surrounding traffic.

These conditions can heat soak the outside air temperature sensor and cause inaccurate readings. Logic has been written into the gauge control module to help prevent abnormal or fluctuating outside air temperature indicator readings.

Outside Air Temperature Indicator Logic

Engine coolant temperature 140 deg.F (60 deg.C) or higher:

If the engine coolant temperature is 140 deg.F (60 deg.C) or higher when the vehicle is turned to the ON mode, the outside air temperature indicates the last temperature it displayed with the vehicle was turned to the OFF (LOCK) mode regardless of the current temperature measured by the outside air temperature sensor.

Engine coolant temperature less than 140 deg.F (60 deg.C):

If the engine coolant temperature is less than 140 deg.F (60 deg.C) or lower when the vehicle is turned to the ON mode, the current temperature measured by the outside air temperature sensor is indicated.

Information Update to the Outside Air Temperature Indicator While Driving

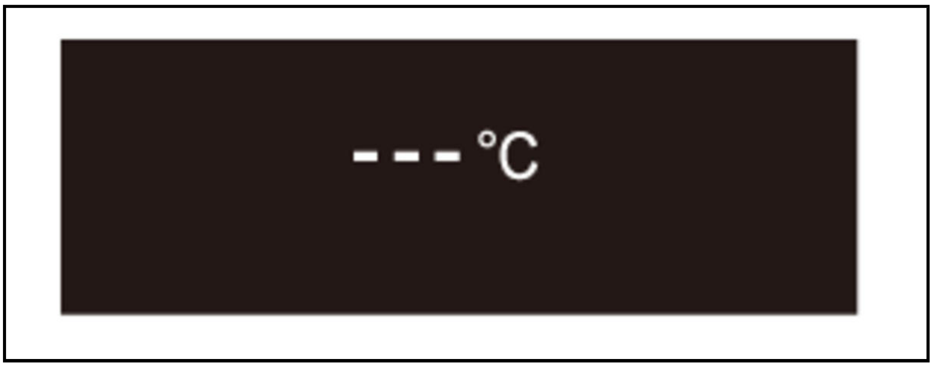
Engine coolant temperature 140 deg.F (60 deg.C) or higher:

If the temperature measured by the outside air temperature sensor is greater than the temperature on the outside air temperature indicator, the outside temperature indicator will increase by 1 deg.F (1 deg.C) per minute after the vehicle speed is greater than 19 mph (30 km/h) for more than 1 minute and 30 seconds. It continues to increase until the current outside air temperature is indicated. So, the first change to the outside air temperature indicator is 1 minute and 30 seconds after the vehicle speed exceeds 19 mph (30 km/h). If the vehicle speed drops below 19 mph (30 km/h), the indicator does not update again until the vehicle speed has increased to 19 mph (30 km/h) or more for more than 1 minute and 30 seconds again.

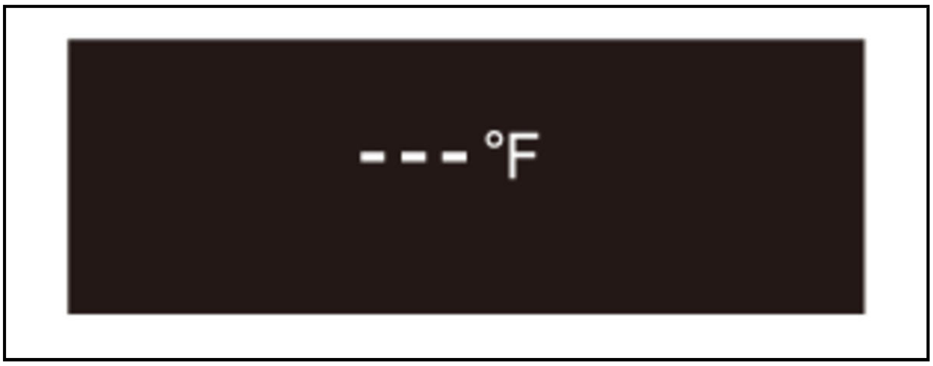
Engine coolant temperature less than 140 deg.F (60 deg.C):

If the outside air temperature is less than the indicated temperature, the temperature decreases 1 deg.F (1 deg.C) every 2 seconds until the current outside air temperature indicated regardless of vehicle speed.

Celsius:



Fahrenheit:



Troubleshooting

If the indicator displays - - - deg.F (- - - deg.C) for more than 2 seconds after selecting the outside air temperature display mode, the gauge is not receiving the outside temperature data from the climate control unit over the B-CAN. Check the climate control system or multiplex integrated control system for DTCs.

Calibration

NOTE:

- The outside air temperature indicator's displayed temperature can be calibrated +/- 5 deg.F (+/- 3 deg.C) to meet the customer's expectations.
- The outside air temperature can be calibrated by audio unit* 1 or audio-navigation unit* 2.

*1: Without navigation

*2: With navigation

1. Turn the vehicle to the ON mode.

2. Select the POWER (⏻) button.

3. Select the HOME button.

4. Select the following icons in turn.

- Settings
- Vehicle
- Meter Setup
- Adjust Outside Temp. Displ

5. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed.

NOTE: The recalibration temperature is not the value the sensor sees. Therefore the temperature can only be adjusted +/- 5 deg.F (+/- 3 deg.C) from the sensors.

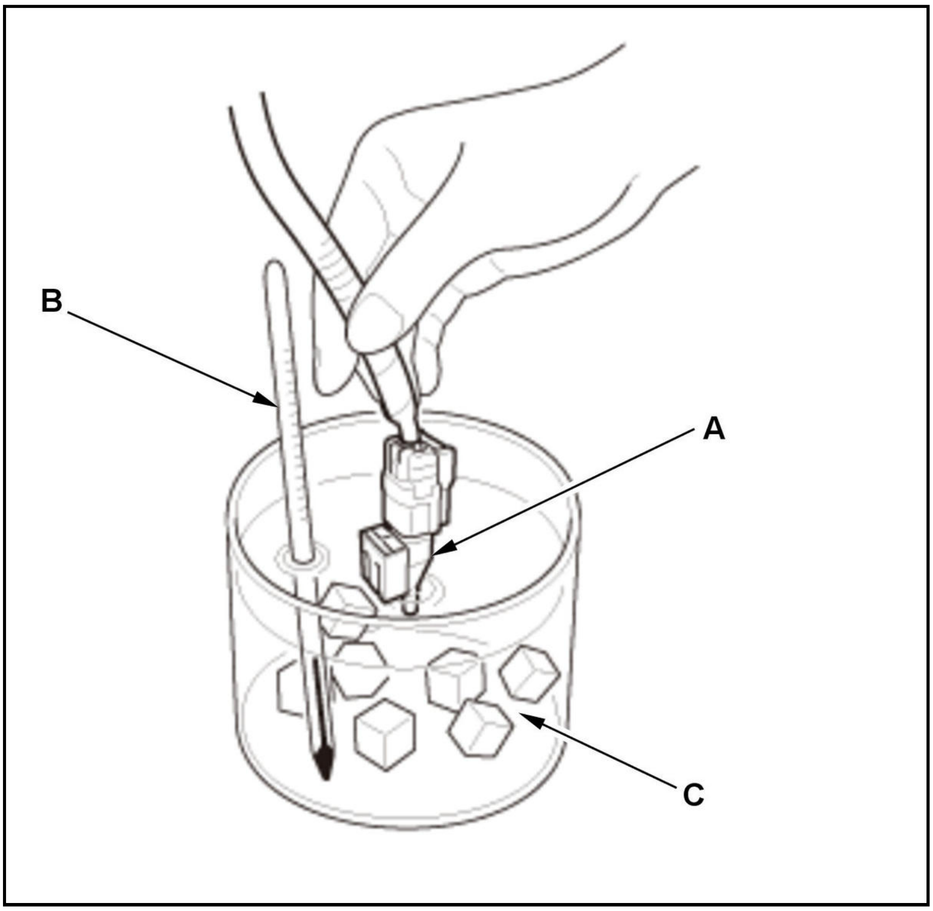
Example:

Incorrect value	=	68 deg.F (20 deg.C)

Desired correction value	=	+2 deg.F (+1 deg.C)
Correct value	=	70 deg.F (21 deg.C)

Desired correction value	=	-2 deg.F (-1 deg.C)
Correct value	=	66 deg.F (19 deg.C)

NOTE: To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.



6. The snow mark is displayed when the temperature is 37 deg.F (3 deg.C) or less the first time you turn the vehicle to the ON mode.

OUTSIDE AIR TEMPERATURE INDICATOR CALIBRATION (WITHOUT MULTI-INFORMATION DISPLAY)

Procedure

NOTE: To test the outside air temperature sensor, refer to the outside air temperature sensor test procedure .

1. Outside Air Temperature Indicator - Calibrate

Description

The outside air temperature sensor is located behind the center of the front bumper. The gauge control module uses measurements from this sensor to display the outside air temperature.

Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from the surrounding traffic.

These conditions can heat soak the outside air temperature sensor and cause inaccurate readings. Logic has been written into the gauge control module to help prevent abnormal or fluctuating outside air temperature indicator readings.

Outside Air Temperature Indicator Logic

Engine coolant temperature 140 deg.F (60 deg.C) or higher:

If the engine coolant temperature is 140 deg.F (60 deg.C) or higher when the vehicle is turned to the ON mode, the outside air temperature indicates the last temperature it displayed with the vehicle was turned to the OFF (LOCK) mode regardless of the current temperature measured by the outside air temperature sensor.

Engine coolant temperature less than 140 deg.F (60 deg.C):

If the engine coolant temperature is less than 140 deg.F (60 deg.C) or lower when the vehicle is turned to the ON mode, the current temperature measured by the outside air temperature sensor is indicated.

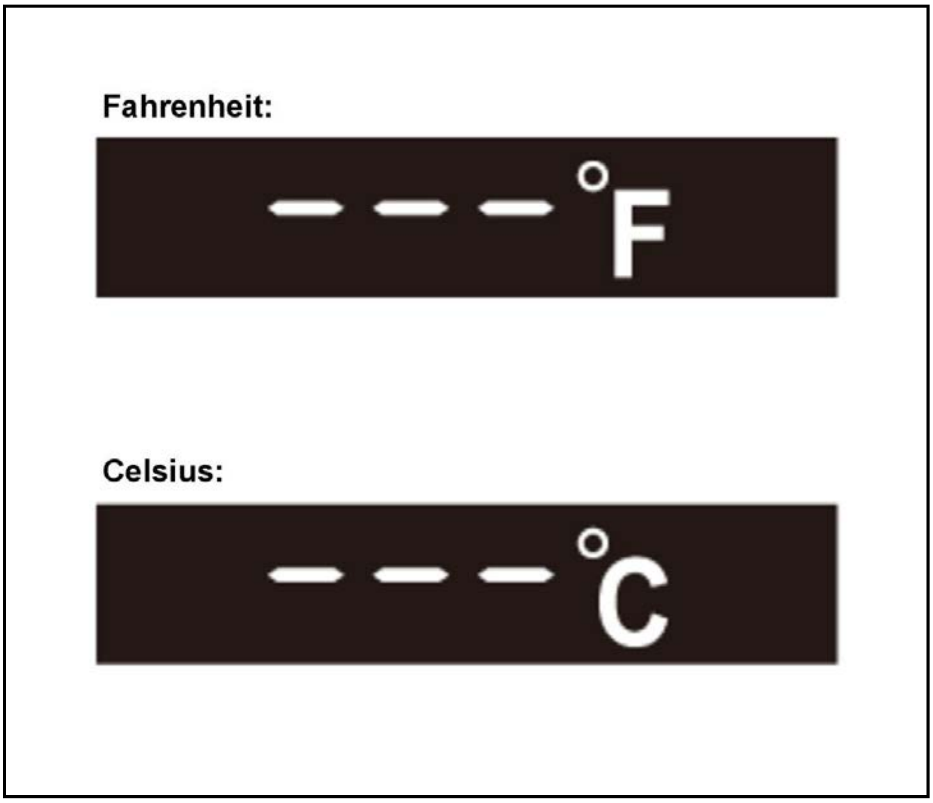
Information Update to the Outside Air Temperature Indicator While Driving

Engine coolant temperature 140 deg.F (60 deg.C) or higher:

If the temperature measured by the outside air temperature sensor is greater than the temperature on the outside air temperature indicator, the outside temperature indicator will increase by 1 deg.F (1 deg.C) per minute after the vehicle speed is greater than 19 mph (30 km/h) for more than 1 minute and 30 seconds. It continues to increase until the current outside air temperature is indicated. So, the first change to the outside air temperature indicator is 1 minute and 30 seconds after the vehicle speed exceeds 19 mph (30 km/h). If the vehicle speed drops below 19 mph (30 km/h), the indicator does not update again until the vehicle speed has increased to 19 mph (30 km/h) or more for more than 1 minute and 30 seconds again.

Engine coolant temperature less than 140 deg.F (60 deg.C):

If the outside air temperature is less than the indicated temperature, the temperature decreases 1 deg.F (1 deg.C) every 2 seconds until the current outside air temperature indicated regardless of vehicle speed.



Troubleshooting

If the indicator displays - - - deg.F (- - - deg.C) for more than 2 seconds after selecting the outside air temperature display mode, the gauge is not receiving the outside temperature data from the climate control unit over the B-CAN. Check the climate control system or multiplex integrated control system for DTCs.

Calibration

NOTE: The outside air temperature indicator's displayed temperature can be recalibrated +/- 5 deg.F (+/- 3 deg.C) to meet the customer's expectations.

1. Turn the vehicle to the ON mode.

2. Select the odometer/trip A or odometer/trip B display.

3. Select the outside air temperature display and press and hold the SELECT/RESET knob for 10 seconds. While you continue to hold the button, the display will scroll through temperature setting from +5 deg.F (+3 deg.C) to -5 deg.F (-3 deg.C) as shown.

4. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed.

NOTE: The recalibration temperature is not the value the sensor sees. Therefore the temperature can only be adjusted +/- 5 deg.F (+/- 3 deg.C) from the sensors.

Example:

Incorrect value	=	68 deg.F (20 deg.C)

Desired correction value	=	+2 deg.F (+1 deg.C)
Correct value	=	70 deg.F (21 deg.C)

Desired correction value	=	-2 deg.F (-1 deg.C)
Correct value	=	66 deg.F (19 deg.C)

NOTE: To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.

INPUT TEST

GAUGE CONTROL MODULE INPUT TEST

NOTE:

- Make sure the fuses associated with the system are OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before testing, do the gauge control module self-diagnostic function, and make sure the B-CAN communication lines are OK.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the gauge control module connector A (32P).

PARKING AND BACK-UP SENSOR CONTROL UNIT INPUT TEST (2020 2021)

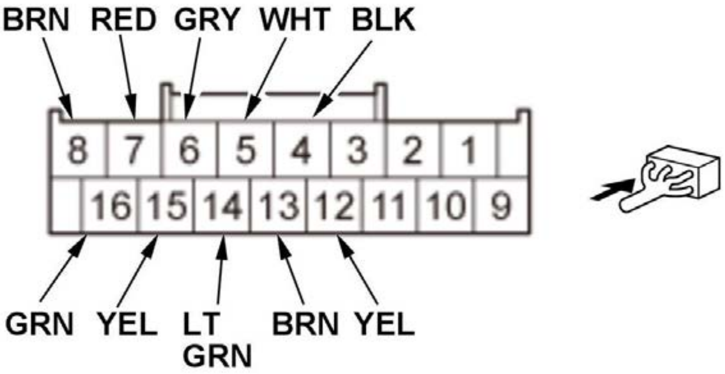
NOTE:

- Make sure the fuses associated with the system are OK.
- Before testing, check for DTCs. If any DTCs are indicated, troubleshoot those DTCs first.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the parking and back-up sensor control unit 16P connector.

Parking and Back-Up Sensor Control Unit 16P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

With the connector still disconnected, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
5	WHT	Vehicle ON mode	Connect to ground with a jumper wire:The parking and back-up sensor switch indicator should come on.	Faulty LED Faulty parking and back-up sensor switch An open or high resistance in the wire
7	RED	Disconnect the right front corner sensor 6P connector	Check for continuity between terminal No. 7 and right front corner sensor 6P connector terminal No. 6: There should be continuity.	An open or high resistance in the wire
			Check for continuity between the terminal No. 7 and body ground: There should be no continuity.	A short to ground in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
6	GRY	Disconnect the right front corner sensor 6P connector	Check for continuity between terminal No. 6 and right front corner sensor 6P connector terminal No. 4: There should be continuity.	An open or high resistance in the wire
			Check for continuity between the terminal No. 6 and body ground: There should be no continuity.	A short to ground in the wire
13	BRN	Disconnect the right front corner sensor 6P connector	Check for continuity between terminal No. 13 and right front corner sensor 6P connector terminal No. 2: There should be continuity.	An open or high resistance in the wire
			Check for continuity between the terminal No. 13 and body ground: There should be no continuity.	A short to ground in the wire
16	GRN	Disconnect the left rear corner sensor 6P connector	Check for continuity between terminal No. 16 and left rear corner sensor 6P connector terminal No. 6: There should be continuity.	An open or high resistance in the wire
			Check for continuity between the terminal No. 16 and body ground: There should be no continuity.	A short to ground in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
12	YEL	Disconnect the left rear corner sensor 6P connector	Check for continuity between terminal No. 12 and left rear corner sensor 6P connector terminal No. 2: There should be continuity.	An open or high resistance in the wire
			Check for continuity between the terminal No. 12 and body ground: There should be no continuity.	A short to ground in the wire
14	LT GRN	Disconnect the left rear corner sensor 6P connector	Check for continuity between terminal No. 14 and left rear corner sensor 6P connector terminal No. 4: There should be continuity.	An open or high resistance in the wire
			Check for continuity between the terminal No. 14 and body ground: There should be no continuity.	A short to ground in the wire

Reconnect the connector, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, replace the parking and back-up sensor control unit .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained

*1: With auto idle stop system

*2: Without auto idle stop system

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A4	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	Poor ground (G401) An open or high resistance in the ground wire
A32	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	Poor ground (G401) An open or high resistance in the ground wire

*1: With auto idle stop system

*2: Without auto idle stop system

10. If multiple failures are found on more than one control unit, replace the body control module . If input failures are related to a particular control unit, replace the control unit.

SAFETY INDICATOR SYSTEM (BODY CONTROL MODULE AND GAUGE CONTROL MODULE) INPUT TEST

NOTE:

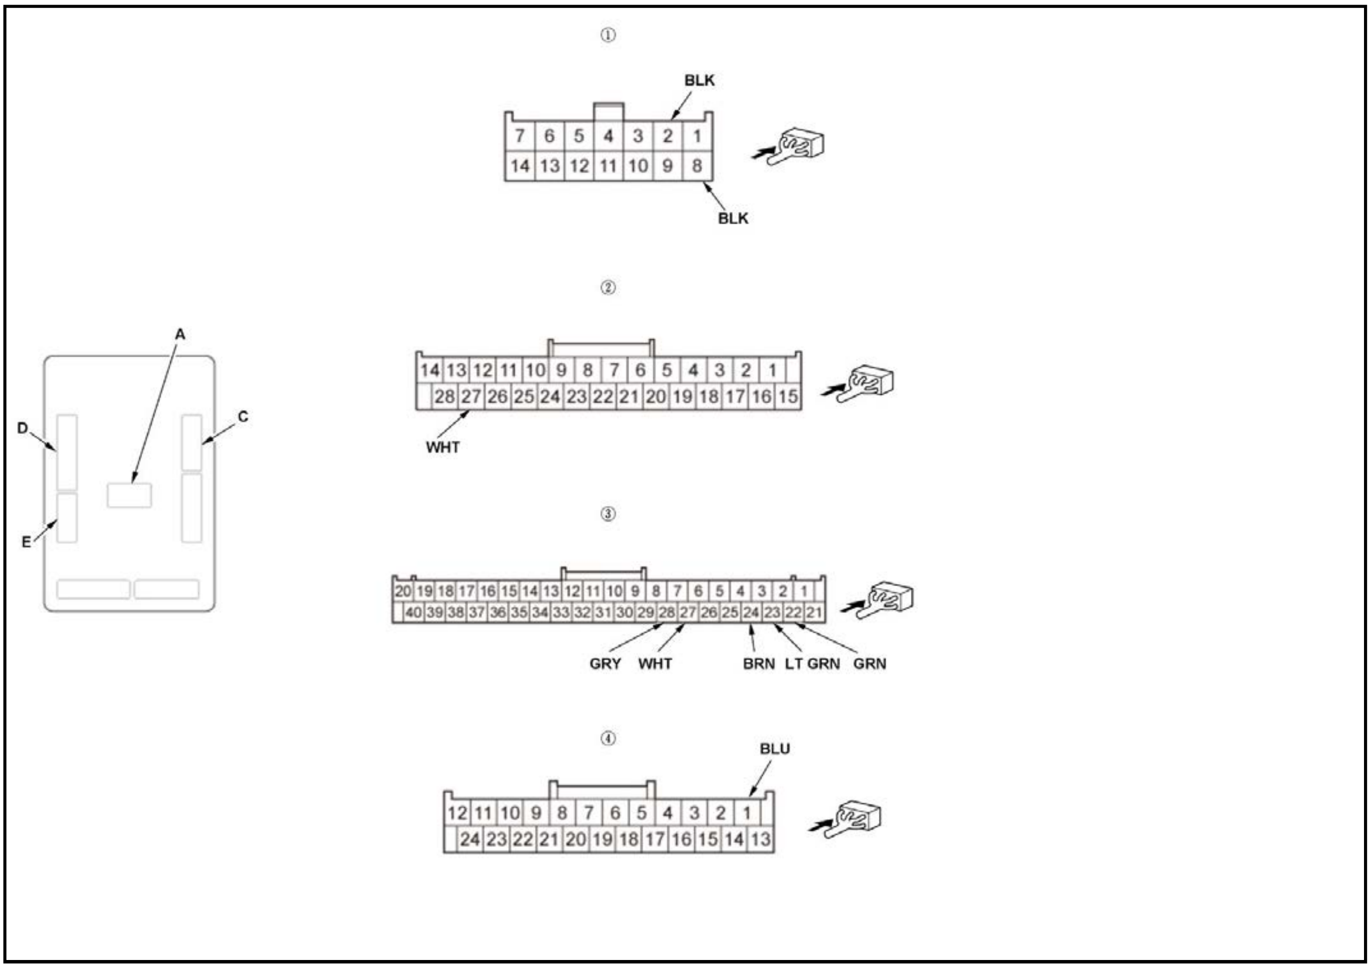
- Make sure the fuses associated with the system are OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before testing, do the gauge control module self-diagnostic function to make sure the beeper and the indicators in the gauge control module work properly and the F-CAN line are OK.

Body Control Module

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect body control module connectors.

Body Control Module Connector A (14P) (female terminals): ① Body Control Module Connector C (28P) (female terminals): ② Body Control Module Connector D (40P) (female terminals): ③ Body Control Module Connector E (24P) (female terminals): ④



3. Inspect the connectors and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

4. Reconnect the connectors to the body control module, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
C27	WHT	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
E1	BLU	Vehicle ON mode	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
A2	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
A8	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
D22	GRN	Driver's door open	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty driver's door switch • Faulty driver's door switch ground • An open or high resistance in the wire
		Driver's door closed	Measure the voltage to ground:There should be battery voltage.	• Faulty driver's door switch • A short to ground in the wire
D23	LT GRN	Front passenger's door open	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty front passenger's door switch • Faulty front passenger's door switch ground • An open or high resistance in the wire
		Front passenger's door closed	Measure the voltage to ground:There should be battery voltage.	• Faulty front passenger's door switch • A short to ground in the wire
D24	BRN	Left rear door open	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty left rear door switch • Faulty left rear door switch ground • An open or high resistance in the wire
		Left rear door closed	Measure the voltage to ground:There should be battery voltage.	• Faulty left rear door switch • A short to ground in the wire
D28	GRY	Right rear door open	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty right rear door switch • Faulty right rear door switch ground • An open or high resistance in the wire
		Right rear door closed	Measure the voltage to ground:There should be battery voltage.	• Faulty right rear door switch • A short to ground in the wire

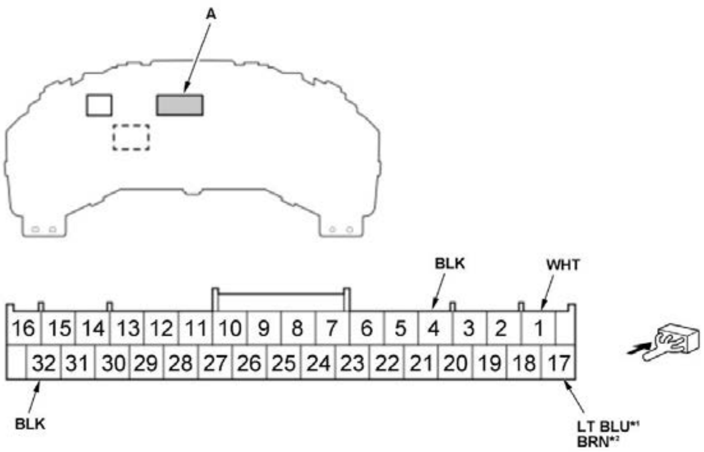
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
D27	WHT	Tailgate open	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty power tailgate closer unit or faulty tailgate latch switch • Poor ground (G505) or an open in the ground wire • An open or high resistance in the wire
		Tailgate closed	Measure the voltage to ground:There should be battery voltage.	• Faulty power tailgate closer unit or faulty tailgate latch switch • A short to ground in the wire

Gauge Control Module

5. Turn the vehicle to the OFF (LOCK) mode.

6. Disconnect the gauge control module connector A (32P).

Gauge Control Module Connector A (32P) (female terminals)



*1: With auto idle stop system
*2: Without auto idle stop system

7. Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 8.

8. Reconnect the connector, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 9.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A1	WHT	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
A17	LT BLU* 1BRN* 2	Vehicle ON mode	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
A4	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
A32	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire

*1: With auto idle stop system

*2: Without auto idle stop system

9. If multiple failures are found on more than one control unit, replace the body control module . If input failures are related to a particular control unit, replace the control unit.

REWRITE

REWRITING THE ODO DATA AND TRANSFERRING THE SERVICE REMINDER SYSTEM DATA TO A NEW GAUGE CONTROL MODULE

Procedure

NOTE:

- Obtain a new gauge control module before starting the rewriting process. Only new gauges can be rewritten.
- Do not operate anything electrical (headlights, audio system, A/C, power window, door locks etc.) during the process.
- Rewriting is not possible on a gauge control module that will not communicate with the HDS.
- Make sure that the HDS shows the correct VIN for the vehicle you are working on.
- Once you have started this procedure, you must complete it before removing the HDS from the data link connector.
- Connect a 12 volt battery charger to insure that the 12 volt battery voltage is maintained during the process.

1. Rewriting the ODO Data on a New Gauge Control Module - Procedure

   Rewriting and Transferring

   1. Before replacing the gauge control module, **connect the HDS**

   2. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT MENU with the HDS.

   3. Select GAUGE CONTROL MODULE REPLACEMENT (ODO Rewrite) from the ADJUSTMENT menu, and follow the instructions on the display to retrieve the ODO value4. **Replace the gauge control module**

   5. Select GAUGE CONTROL MODULE REPLACEMENT (ODO Rewrite) from the ADJUSTMENT menu, and select READ OUT DATA and save ODO value data into HDS.

   6. Connect a 12 volt battery charger to insure that the 12 volt battery voltage is maintained during the process.

   How to Release Locked Odometer Mileage to the Original Gauge Control module.

   If, after you attempt to transfer mileage to a new gauge assembly, the odometer display has dashes (---), is garbled, or shows an incorrect value, the original gauge control module can be unlocked and restored to its original state. In this way, it can be used again for additional attempts to transfer the mileage:

   1. Confirm that you have the latest HDS version of software.

   2. Make sure that the HDS shows the correct VIN for the vehicle you are working on.

   3. With the vehicle in the OFF (LOCK) mode, connect the original gauge control module.

   4. Completely re-boot the HDS.

   5. Clear any stored DTCs.

   6. Navigate to BODY ELECTRIC/GAUGES/GAUGE CONTROL MODULE REPLACEMENT (ODO Rewrite, etc.).

   7. Select 3. RELEASING LOCKED ODO VALUE.

   8. Follow the prompts and the odometer mileage will be restored.

   9. Start over the Rewriting and Transferring procedure from step 2.

LEARNING RESET CLEAR

RESETTING THE PARKING AND BACK-UP SENSOR CONTROL UNIT (2020 2021)

Procedure

1. Parking and Back-Up Sensor Control Unit - Reset

   Reset the parking and back-up sensor control unit after doing any of the following actions:

   - When you replace the parking and back-up sensor.
   - When you change the parking and back-up sensor mounting location from the original location.

   NOTE: Before performing the resetting procedure, make sure that each the parking and back-up sensor is connected.

   Resetting Procedure

   1. Turn the vehicle to the ON mode.

   2. Press the parking and back-up sensor switch 10 times, within 10 seconds.

   NOTE: The parking and back-up sensor switch indicator will blinks.

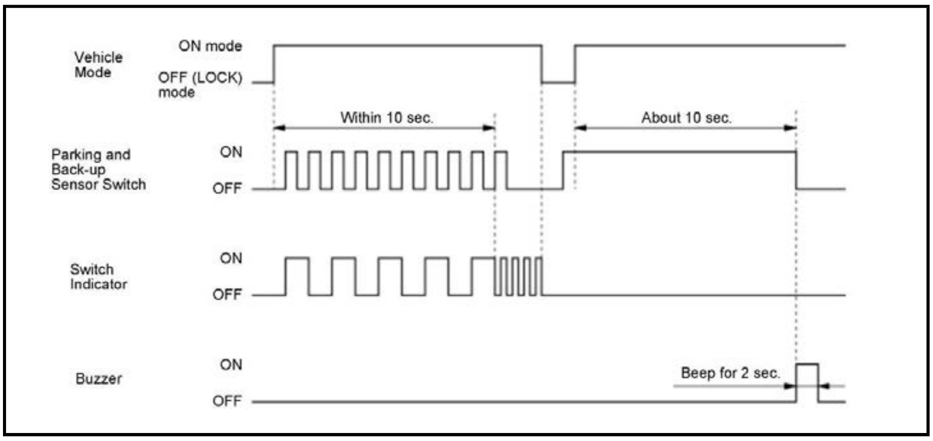
   3. Turn the vehicle to the OFF (LOCK) mode.

   4. Press and hold the parking and back-up sensor switch.

   5. Turn the vehicle to the ON mode.

   6. Wait about 10 seconds.

   NOTE: When the resetting of the parking and back-up sensor control unit is successful, the buzzer sounds for 2 seconds.



7. Press the parking and back-up sensor switch.

8. Make sure that the system works normally.

GENERAL INFORMATION

GAUGES SELF-DIAGNOSTIC FUNCTION

The gauge control module has a self-diagnostic function which consists of the following checks:

- The indicator drive circuit check.
- The switch input check.
- The beeper drive circuit check.
- The LCD/MID segment check.
- The gauge drive circuit check (engine coolant temperature gauge, fuel gauge, and tachometer (without multi-information display)).
- The communication line check (of the body controller area network (B-CAN) communication line and the fast controller area network (F-CAN) communication line between the gauges).

NOTE: Indicators are also controlled via the communication lines.

Entering the Self-Diagnostic Function With the HDS

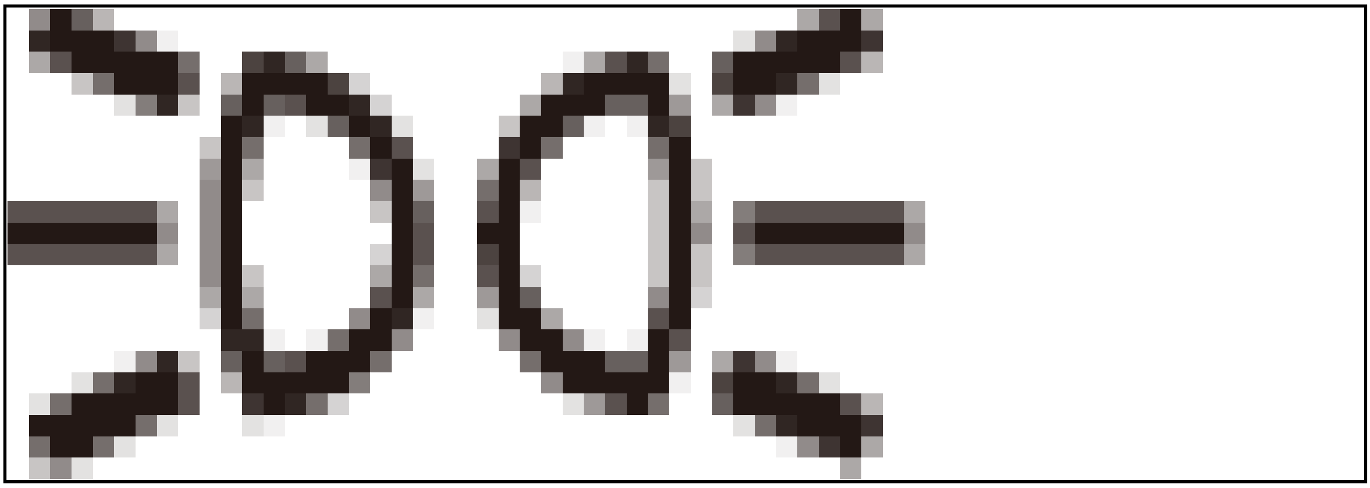
Using the HDS, select BODY ELECTRICAL, GAUGES, then FUNCTIONAL TESTS and do the self-diagnostic function.

Entering the Self-Diagnostic Function (Manual Method)

Before doing the self-diagnostic function, make sure the fuses and relays associated with the system, and check for a short in the related lines.

1. Press and hold the SEL/RESET knob.

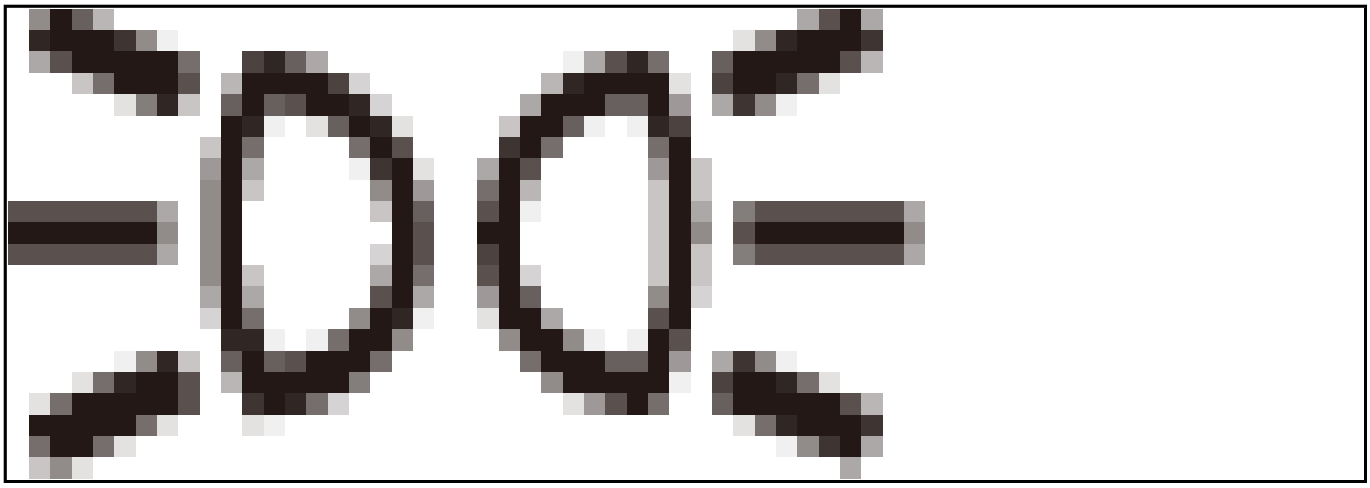
2. Turn the combination light switch to the PARKING position.



3. Turn the vehicle to the ON mode.

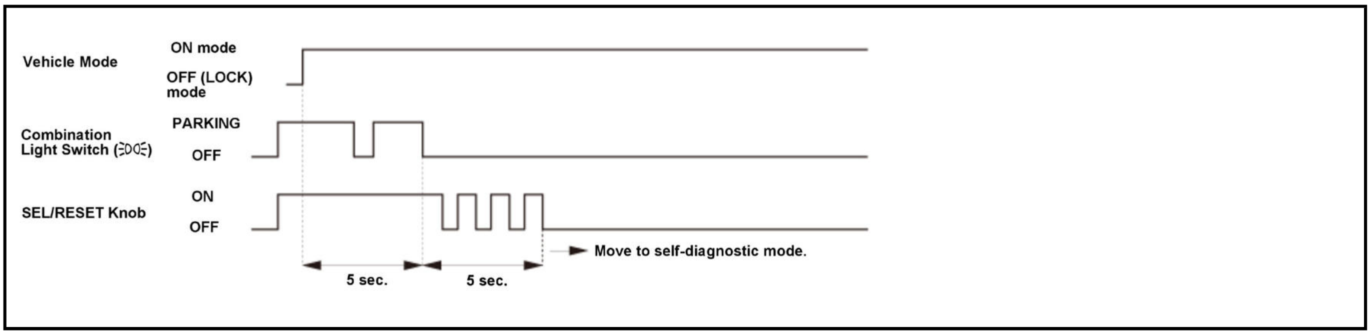
4. Within 5 sec., turn the combination light switch to OFF, then to the PARKING position and OFF again.

5. Within 5 sec., release the SEL/RESET knob, and then repeatedly press and release the knob three times.



NOTE:

- While in the self-diagnostic mode, the dashlights brightness controller operates normally.
- While in the self-diagnostic mode, the SEL/RESET knob is used to start the Beeper Drive Circuit Test and the Gauge Drive Circuit Check.
- If the vehicle speed exceeds 1.2 mph (2 km/h), or turn the vehicle to the OFF (LOCK) mode, the self-diagnostic mode ends.



The Indicator Drive Circuit Check

When entering the self-diagnostic mode, the following indicators (if equipped) blink, **refer to the Gauges Component Index**.

Switch Input Check

At the initial stage of the self-diagnostic function, the beeper sounds intermittently. The beeper sounds continuously when any of the following switch inputs are switched from OFF to ON:ACC combination switch, audio remote-HFL switch, brake fluid level switch, CMBS OFF switch, cruise control combination switch, ECON switch, electric parking brake/automatic brake hold switch, idle stop OFF switch, TPMS switch, VSA OFF switch, and washer fluid level switch.

The Beeper Drive Circuit Check

When entering the self-diagnostic mode, the beeper sounds five times.

The LCD/MID Segment Check

Without multi-information display: When entering the self-diagnostic mode, all the segments blink five times.

With multi-information display: When entering the self-diagnostic mode, the word "CHECKING NOW" shows on the multi-information display, and blinks five times.

The Gauge Drive Circuit Check

When entering the self-diagnostic mode, the tachometer (without multi-information display), the fuel gauge, and the engine coolant temperature gauge sweep from the minimum position to the maximum position, then return to the minimum position.

NOTE: After the beeper stops sounding and the gauge needles return to the minimum position, pressing the SEL/RESET knob starts the Beeper Drive Circuit Check (one beep) and the Gauge Drive Circuit Check again. The check cannot be started again until the gauge needles return to the minimum position.

ON
OFF

The needles sweep from the minimum position to the maximum position, then return to the minimum position.

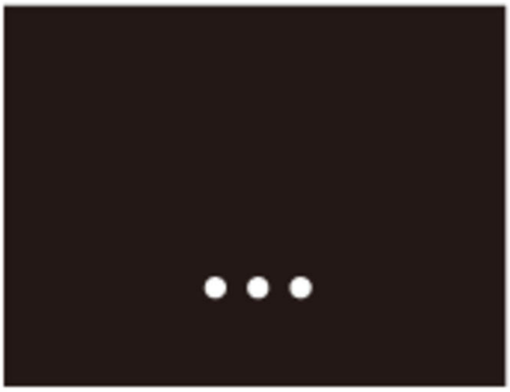
The Communication Line Check (With multi-information display)

While in the self-diagnostic mode, the Communication Line Check starts after the MID Segments Check.

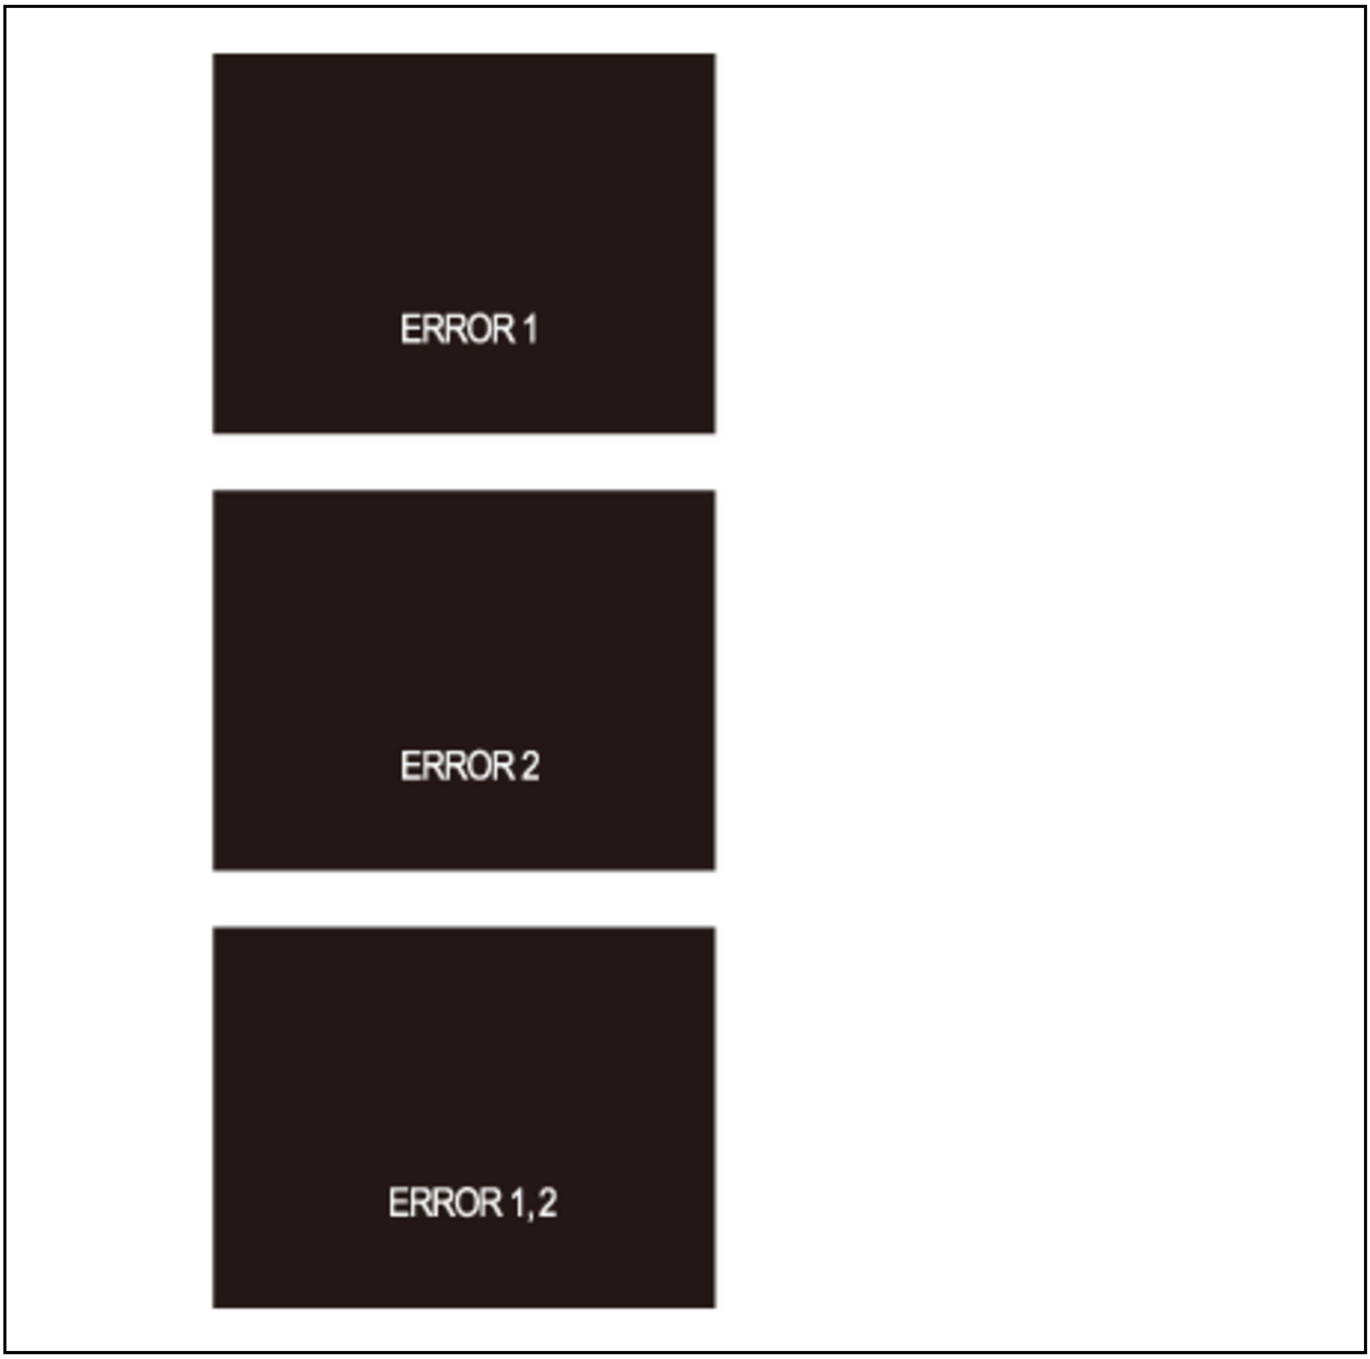


If "..." comes on, the communication line is OK. If there is a communication line error, the word "ERROR" will be indicated on the multi-information display.

Error Code List

Error code	Type of communication line(s) error
ERROR 1	F-CAN communication
ERROR 2	B-CAN communication
ERROR 1, 2	F-CAN and B-CAN communication

Indication Example



- If ERROR 1 is indicated, there is a malfunction in the communication line between the F-CAN and the gauge control module. The B-CAN line is OK at this time. Check for DTCs in the F-CAN connected units and troubleshoot any DTCs.
- If ERROR 2 is indicated, there is a malfunction in the communication line between the B-CAN and the gauge control module. The F-CAN line is OK at this time. Check for DTCs in the B-CAN connected units and troubleshoot any DTCs.
- If ERROR 1, 2 is indicated, there is a malfunction in the communication line between the gauge control module, the F-CAN, and the B-CAN. Check the DTCs in the F-CAN connected units and troubleshoot any DTCs.

The Communication Line Check (Without multi-information display)

While in the self-diagnostic mode, the Communication Line Check starts after the LCD Segments Check.

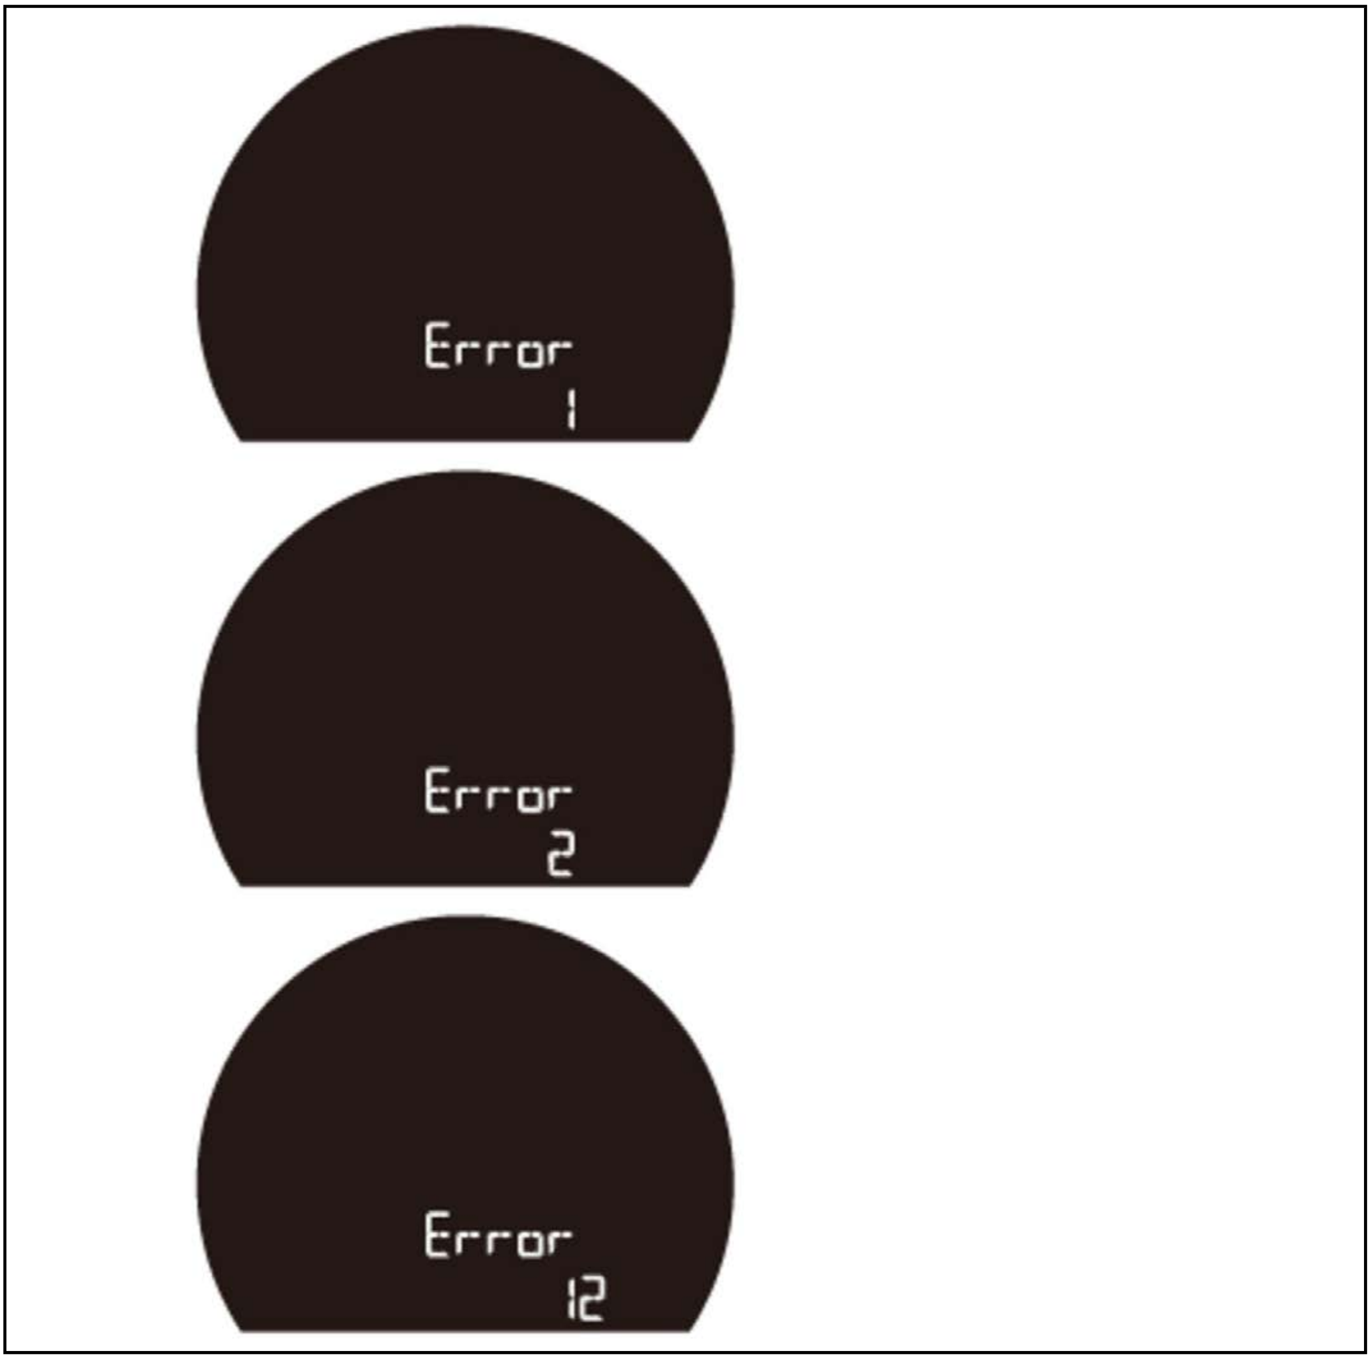
If the communication line is OK, all segments will be indicated on the information display. If there is a communication line error, the word "Error" will be indicated on the information display.

Error Code List

Error code	Type of communication line(s) error
Error 1	F-CAN communication
Error 2	B-CAN communication
Error 12	F-CAN and B-CAN communication

Indication Example



- If Error 1 is indicated, there is a malfunction in the communication line between the F-CAN and the gauge control module. The B-CAN line is OK at this time. Check for DTCs in the F-CAN connected units and troubleshoot any DTCs.
- If Error 2 is indicated, there is a malfunction in the communication line between the B-CAN and the gauge control module. The F-CAN line is OK at this time. Check for DTCs in the B-CAN connected units and troubleshoot any DTCs.
- If Error 12 is indicated, there is a malfunction in the communication line between the gauge control module, the F-CAN, and the B-CAN. Check the DTCs in the F-CAN connected units and troubleshoot any DTCs.

Ending the Self-Diagnostic Function

Turn the vehicle to the OFF (LOCK) mode.

NOTE: If the vehicle speed exceeds 1.2 mph (2 km/h), the self-diagnostic function ends.

SYMPTOM TROUBLESHOOTING

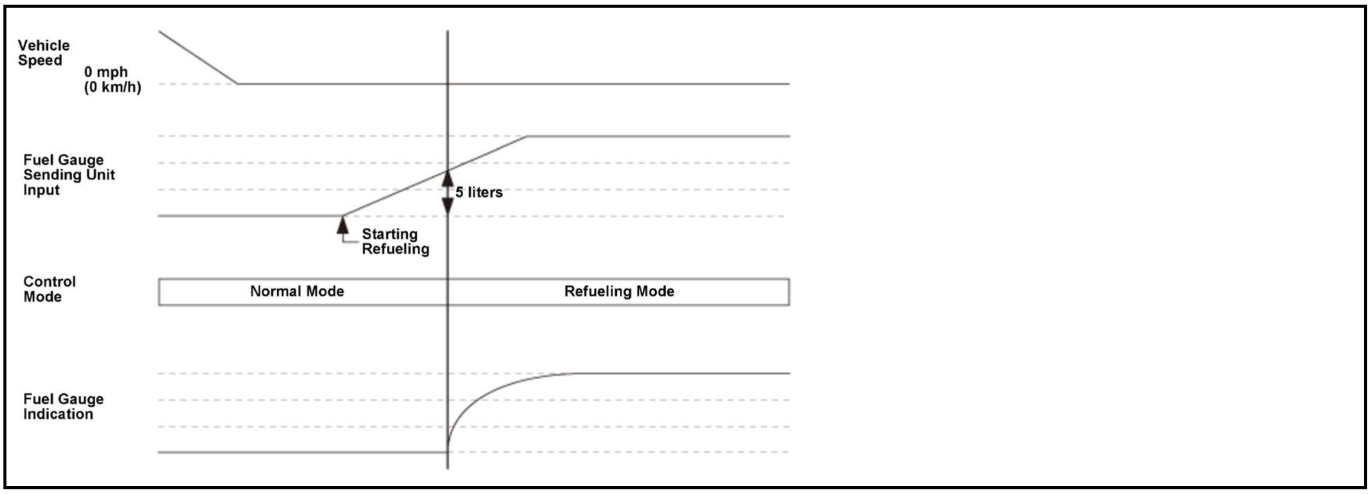
GAUGES SYMPTOM TROUBLESHOOTING

Fuel gauge indication does not rise

NOTE:

- When refueling, the gauge control module shifts to the "refueling mode," moving the fuel gauge indicator only after it detects that 5 liters (approximately 1.25 U.S. gallon) of fuel have been added.
- The fuel gauge indication may not rise when refueling a small quantity of fuel and the control mode does not shift to refueling mode.

Shift to the Refueling Mode



Vehicle Speed
0 mph (0 km/h)
Fuel Gauge Sending Unit Input
5 liters
Starting Refueling
Control Mode
Normal Mode
Refueling Mode
Fuel Gauge Indication

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check the low fuel indicator.

   Does the low fuel indicator flash?

   YES

   Check for DTCs. If any DTCs are indicated, do the indicated DTC's troubleshooting. If no DTCs are indicated, **replace the gauge control module** .

   NO

   Go to step 2.

2. Fuel gauge operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Do the **gauge self-diagnostic function**.

   Is the fuel gauge OK?

   YES

   Go to step 3.

   NO

   Replace the gauge control module .

3. Fuel tank visual check

   -1. Raise the vehicle on a lift.

   -2. Check the fuel tank for damage.

   Is the fuel tank OK?

   YES

   Go to step 4.

   NO

Replace the fuel tank .

4. Fuel gauge sending unit check

-1. Test the fuel gauge sending unit .

Is the fuel gauge sending unit OK?

YES

Confirm the operation of the fuel gauge.

NO

Replace the fuel gauge sending unit .

Outside air temperature indicator does not change

NOTE: Outside air temperature is indicated based on the measurement value of the outside air temperature sensor located behind the center of the front bumper. Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from surrounding traffic. To display the outside air temperature, the gauge control module has an indication mode based on engine coolant temperature and vehicle speed. Some modes do not raise the temperature indication, so the outside air temperature indication may not change when the mode continues.

Outside Air Temperature Indication Mode

Indication Mode	Indication Temperature Increase	Indication Temperature Decrease	Notes
Initial Indication	---	---	• If the current outside air temperature is higher than the indicated outside air temperature the last time the vehicle OFF (LOCK) mode, and the engine coolant temperature is higher than 140 deg.F(60 deg.C): The last outside air temperature that was indicated before the vehicle OFF (LOCK) mode is displayed. • If the current outside air temperature is higher than the indicated outside air temperature the last time the vehicle OFF (LOCK) mode, and the engine coolant temperature is less than 140 deg.F(60 deg.C): The current temperature measured by the outside air temperature sensor is indicated. • If the current outside air temperature is lower than the indicated outside air temperature the last time the vehicle OFF (LOCK) mode: The current temperature measured by the outside air temperature sensor is indicated.
Garage Mode	Increases 1 deg.F every 2 seconds (or 1 deg.C every 1 second) to the current outside air temperature.	Decreases 1 deg.F every 2 seconds (or 1 deg.C every 1 second) to the current outside air temperature.	If the engine coolant temperature is less than 140 deg.F(60 deg.C) when the vehicle is in the ON mode, the mode shifts to the garage mode.

Indication Mode	Indication Temperature Increase	Indication Temperature Decrease	Notes
Traffic Jam Mode	---	If the outside air temperature is less than the indicated temperature, the temperature decreases by 1 deg.F per 2 seconds (or 1 deg.C per 1 second).	• If the engine coolant temperature is more than 140 deg.F(60 deg.C), the mode shifts to the traffic jam mode. • At stable run mode, if the vehicle speed is less than 18.6 mph (30 km/h), the mode shifts to traffic jam mode. **NOTE:** Once entering to the traffic jam mode, the mode does not shift to the garage mode even after the engine coolant temperature goes below 140 deg.F(60 deg.C).
Stable Run Mode	Increases 1 deg.F every 30 seconds (or 1 deg.C every 17 seconds) to the current outside air temperature.	Decreases 1 deg.F every 2 seconds (or 1 deg.C every 1 second) to the current outside air temperature.	If the vehicle speed is at 18.6 mph (30 km/h) for more than 28 seconds, the mode shifts to stable run mode.

1. A/C system DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1227 An open in the outside air temperature sensor circuit	Â
B1228 A short in the outside air temperature sensor circuit	Â

   Is DTC B1227 or B1228 indicated?

   YES

   Go to the indicated DTC troubleshooting.

   NO

   Go to step 2.

2. Outside air temperature sensor check

   -1. **Test the outside air temperature sensor** .

   Is the outside air temperature sensor OK?

   YES

   Confirm the operation of the outside air temperature indicator.

   NO

   Replace the outside air temperature sensor .

The fuel gauge indication fluctuates

NOTE:

- The fuel sending unit float level changes frequently due to acceleration, deceleration, cornering, and slopes. As a result, the fuel gauge reading that is displayed is based on inputs it receives from the fuel sending unit, as well as inputs on fuel injector duration.
- The following conditions may cause fuel gauge fluctuations:
-
    - Driving uphill and downhill for long periods of time.
    - Stopping in a slanted position, such as on a grade.

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check the low fuel indicator.

   Does the low fuel indicator flash?

   YES

   Check for DTCs. If any DTCs are indicated, do the indicated DTC's troubleshooting. If no DTCs are indicated, **replace the gauge control module** .

   NO

   Go to step 2.

2. Fuel gauge sending unit installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check for poor connections and loose terminals** .

   Are the connections OK?

   YES

   Go to step 3.

   NO

   Reconnect the connectors.

3. Fuel gauge sending unit check

-1. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Confirm the operation of the fuel gauge.

NO

Replace the fuel gauge sending unit .

TROUBLESHOOTING

ELECTRICAL COMPASS TROUBLESHOOTING

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Check if the azimuth (direction) information is displayed in the audio display.

   Is the azimuth (direction) information displayed?

   YES

   Go to step 2.

   NO

   Go to step 6.

2. Problem verification 2

   -1. Check if the audio display is flashing the CAL and NW.

   Is the CAL and NW flashing?

   YES

   Replace the electrical compass unit .

   NO

   Go to step 3.

3. Problem verification 3

   -1. **Do the Electrical Compass Calibration**.

   Is the calibration completed?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 4.

4. Determine possible failure area (electrical compass unit, others)

   -1. **Go into the System Diagnostic Mode, and select the Vehicle Status in the System Links to check the vehicle speed pulse** .

   -2. With the help of an assistant, test-drive the vehicle and watch the VSP signal.

   Is the vehicle speed indicated?

   YES

   Replace the electrical compass unit .

NO

Go to step 5.

5. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector A (24P)
Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio unit connector A (24P): disconnected

Â	Gauge control module connector A (32P): disconnected
Test point 1	**Audio unit connector A (24P) No. 14**
Test point 2	**Gauge control module connector A (32P) No. 30**

Test point 1	**Audio unit connector A (24P) No. 24**
Test point 2	**Gauge control module connector A (32P) No. 31**

Is there continuity?

YES

Replace the audio unit .

NO

Repair an open in the wire(s).

6. Open wire check (IG1 METER line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Electrical compass unit 6P connector No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 METER wire is OK. Go to step 7.

NO

Repair an open or high resistance in the wire.

7. Open wire check (GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Electrical compass unit 6P connector No. 5**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

8. Shorted wire check (COMPASS lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector C (32P)
Electrical compass unit 6P connector

-3. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio unit connector C (32P): disconnected
Â	Electrical compass unit 6P connector: disconnected

Connector	Terminal
Electrical compass unit 6P connector	No. 1
	No. 2
	No. 3
	No. 4

Is there continuity?

YES

Repair a short to body ground in the wire(s).

NO

The COMPASS wires are not shorted to ground. Go to step 9.

9. Open wire check (COMPASS lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio unit connector C (32P): disconnected
Â	Electrical compass unit 6P connector: disconnected

Test point 1:Audio unit connector C (32P)	Test point 2:Electrical compass unit 6P connector
No. 12	No. 1
No. 11	No. 2
No. 4	No. 3
No. 3	No. 4

Is there continuity?

YES

The COMPASS wires are OK. Go to step 10.

NO

Repair an open in the wire(s).

10. Electrical compass unit check (substitution)

-1. **Substitute a known-good electrical compass unit** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original electrical compass unit .

NO

Replace the audio unit .

DESCRIPTION & OPERATION

ACOUSTIC VEHICLE ALERTING SYSTEM DESCRIPTION

Overview

The acoustic vehicle alerting system consists of the acoustic vehicle alerting control unit, and the acoustic vehicle alerting speaker. At low speeds, the normal operating sounds of this vehicle is low, so it is equipped with an acoustic vehicle alerting system to inform pedestrians and others of its approach. When the acoustic vehicle alerting system failure occurs, a warning message is displayed in the multi-information display (MID).

Sound Operation

The acoustic vehicle alerting system only functions under these conditions:

- Vehicle in the READY TO DRIVE mode.
- Transmission shifted to other than P position/mode.
- Vehicle driving forward and backward in EV driving mode.
- Vehicle speed above 0.3 mph (0.5 km/h).

If these conditions are not met, the system makes no sound. The pitch of the alert sound varies with the vehicle's speed.

The sound stops when the vehicle speed exceeds about 16 mph (25 km/h), or when the vehicle stops. The sound resumes when the vehicle speed falls below about 14 mph (22 km/h).

ACOUSTIC VEHICLE ALERTING SYSTEM DESCRIPTION - COMPONENTS

Acoustic Vehicle Alerting Speaker

The acoustic vehicle alerting speaker is located below the right headlight. The speaker sounds when it receives the signal from the acoustic vehicle alerting control unit.

ACOUSTIC VEHICLE ALERTING SYSTEM DESCRIPTION - SYSTEM DIAGRAM

ELECTRICAL COMPASS SYSTEM DESCRIPTION

Electrical Compass Unit

The electrical compass unit sends the azimuth (direction) information in the 8-directions (N, NE, E, SE, S, SW, W, NW) to the audio unit. The electrical compass unit receives the VSP signal from the gauge control module via the audio unit. The azimuth information is fixed while parked.

Starting Operation

When the vehicle is turned to the ON mode, the electrical compass unit communicates with the audio unit, and the self-test mode begins automatically.

The self-test function checks for the current voltage, non-volatile memory (NVM), and ROM status in the electrical compass unit. If the unit detects a malfunction during the self-test, it indicates a malfunction by flashing the compass information segments (CAL and NW) in the audio unit.

Basic Operation

The electrical compass unit uses the noise filter to the raw magnetic data. The noise filter switches on/off depending on the intensity of surrounding magnetic noise. In the filter mode, the calculation may delay several seconds. After processing the compass data, the unit sends the azimuth (direction) information to the audio unit

The electrical compass unit also receives following signals via the audio unit:

- The electrical compass unit receives the vehicle speed information from the gauge control module via the audio unit. The azimuth information is fixed while the vehicle is parked.
- The electrical compass unit receives the RR DEF on/off information from the climate control unit. The electrical compass unit compensates for magnetic anomalies when the rear window defogger is on.

Self-Calibration

The electrical compass unit has a self-calibration function. It detects and compensates for magnetic anomalies caused by bridges, subways and large steel structures. When the vehicle leaves the area with a strong magnetic interference (2, 400 mG or more), the electrical compass unit automatically begins calibrating. **If needed, you can manually calibrate the compass**.

Zone Selection

The zone selection is required to compensate for the difference between the magnetic north and the geographic north. This deviation is referred to as a declination. The compass compensates for the declination when you select the zone where the vehicle is located.

GAUGES SYSTEM DESCRIPTION

Self-Diagnostic Function

The gauge control module is equipped with a function to **self-diagnose** the internal circuits in the gauge control module.

Power/Charge Meter

The gauge control module receives information from motor via F-CAN, and displays charging and discharging state of high voltage battery.

State of Charge (SOC) Meter

The gauge control module displays the remaining high voltage battery charge level.

Speedometer

The PCM provides a vehicle speed signal to the gauge control module using the F-CAN. Based on this input, the gauge control module displays the current vehicle speed in the speedometer.

Fuel Gauge and Fuel Indicator

The gauge control module displays the fuel gauge based on input value from the fuel gauge sending unit (fuel tank unit). The low fuel indicator is turn on in the event that indication of the fuel gauge becomes lower than the minimum tank fill threshold.

Multi-Information Display (MID)

The multi-information display (MID) provides the shift position indicator, speedometer, average fuel efficiency, instant fuel economy, ODO/trip meter, outside air temperature, ACC, LKAS, CMBS, elapsed time, seat belt reminder, average speed, eco guide, driver attention monitor, range and the status of keyless access system. In addition, the diagnostic system displays the communication errors and the DTCs.

ODO Meter and Trip Meter

The PCM provides a vehicle speed signal to the gauge control module using the F-CAN. Based on this input, the gauge control module tracks mileage for the odometer and trip meters. The mileage values are displayed in the multi-information display (MID).

Ambient Meter

The ambient meter shows real-time driving information by color on the upper of the power/charge meter which promote fuel efficient driving. When the color is close to green, it means low fuel consumption driving. When the color is close to white, it means high fuel consumption driving. In case of sport mode set, it turns on red.

Outside Air Temperature

The gauge control module uses measurements from the outside air temperature sensor or provided by the outside air temperature sensor signal from the climate control unit via the B-CAN. The outside air temperature indicator's displayed temperature can be recalibrated ± 5 deg.F (± 3 deg.C) to meet the customer's expectations.

Average Fuel Economy/Instant Fuel Economy, Range, Elapsed Time Display, Average Speed Display

The gauge control module receives signals such as fuel consumption, driving distance, vehicle speed, and engine speed from the PCM via F-CAN. It calculates average/instant fuel economy, elapsed time, average speed, and range to display the results.

Select Position

The PCM provides transmission shift position to the gauge control module using the F-CAN. The shift position indicator indicates the shift position based on this data.

Gauge Control Module Receives Information

The gauge control module receives information from each control unit via the F-CAN and the B-CAN to light or flash the indicators. The VSA modulator-control unit (indicator signal), ECON switch, ACC combination switch, CMBS OFF switch, electric parking brake/automatic brake hold switch, VSA OFF switch, EV switch, sport mode switch, and brake fluid level switch are connect directly to the gauge control module. The audio remote-HFL switch signal is transmitted to the gauge control module via the LIN.

Keyless Access System Information

The gauge control module receives information from the body control module via the B-CAN to display status of the keyless access system.

Buzzer

The gauge control module includes a buzzer to provide the driver with audible warnings.

Illumination Control

The illumination brightness can be adjusted using the SEL/RESET knob. When the exterior lights are off, the system is off.

PARKING AND BACK-UP SENSOR SYSTEM DESCRIPTION

Overview

The parking and back-up sensor system measures distances to objects by transmitting ultrasonic waves and receiving the echo from sound waves bouncing off nearby objects. It informs drivers of nearby objects with audible warning signals as well as visual signs through the multi-information display (MID) in the gauge control module.

Parking and Back-Up Sensor System Operation

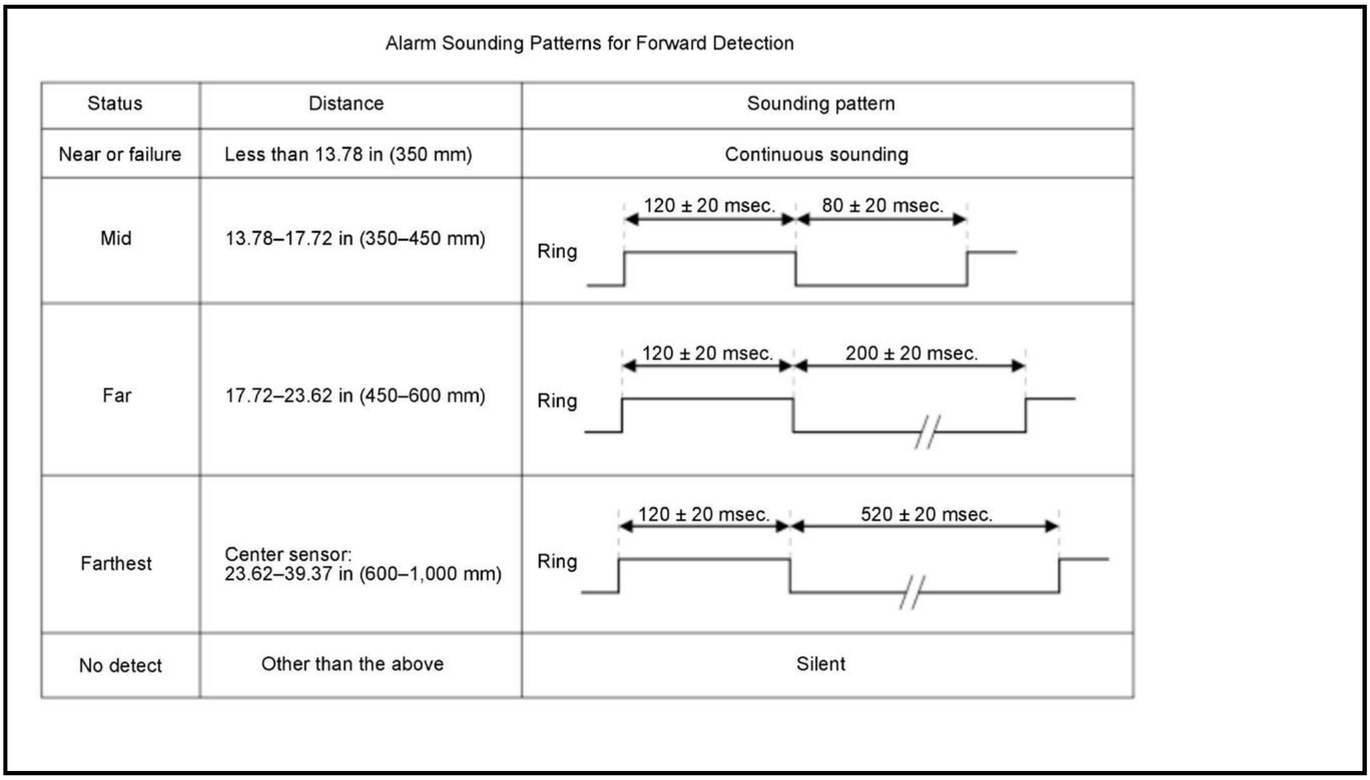
The sensors send out ultrasonic waves, receive waves reflected by an obstacle, determine the distance, and use the buzzer and/or multi-information display (MID) to tell the driver that an obstacle is near.

- The front center and front corner sensors work any time the transmission is shifted out of P position/mode, until the vehicle reaches about 8.7 mph (14 km/h). They do not come back on until slowing down to about 5.6 mph (9 km/h) or less.
- The rear corner and rear center sensors are only activated in the R position/mode.
- The parking and back-up sensor system is active when its switch is ON.
- The system check is performed each time the parking and back-up sensor switch is turned on with the vehicle in the ON mode.
- The sensors must be free of debris, snow, and ice to work correctly.

Sound Pattern of the Parking and Back-Up Sensor Beeper

Intermittent/continuous alarm sounding is performed by obstacle detection indication requests and alarm sounding requests from the parking sensor system, according to the distance and the display of the obstacle detection location. A warning message is generated in case of a failure of the parking sensor system.

Front



Alarm Sounding Patterns for Forward Detection

Status	Distance	Sounding pattern
Near or failure	Less than 13.78 in (350 mm)	Continuous sounding
Mid	13.78–17.72 in (350–450 mm)	Ring 120 ± 20 msec. 80 ± 20 msec.
Far	17.72–23.62 in (450–600 mm)	Ring 120 ± 20 msec. 200 ± 20 msec.
Farthest	Center sensor: 23.62–39.37 in (600–1,000 mm)	Ring 120 ± 20 msec. 520 ± 20 msec.
No detect	Other than the above	Silent

Mid	13.78–17.72 in (350–450 mm)	Ring 120 ± 20 msec. 80 ± 20 msec.
Far	Center sensor: 17.72–23.62 in (450–600 mm) Corner Sensor: 17.72–27.56 in (450–700 mm)	Ring 120 ± 20 msec. 200 ± 20 msec.
Farthest	Center Sensor: 23.62–43.31 in (600–1,100 mm)	Ring 120 ± 20 msec. 520 ± 20 msec.
No detect	Other than the above	Silent

PARKING AND BACK-UP SENSOR SYSTEM DESCRIPTION - COMPONENTS

Parking and Back-Up Sensor Switch

Input to the parking and back-up sensor control unit is performed by operating the parking and back-up sensor switch. The parking and back-up sensor indicator is activated by the parking and back-up sensor control unit.

Parking and Back-Up Sensors

The parking and back-up sensors emit ultrasonic waves, which are reflected by obstacles and then detected by the sensors. The detected ultrasonic waves are converted to digital signals after amplification, and are then transmitted to the parking and back-up sensor control unit.

GENERAL INFORMATION

GAUGES SELF-DIAGNOSTIC FUNCTION

The gauge control module has a self-diagnostic function which consists of the following checks:

- The indicator drive circuit check.
- The switch input check.
- The beeper drive circuit check.
- The LCD/MID segment check.
- The gauge drive circuit check (engine coolant temperature gauge, and fuel gauge).
- The communication line check (of the body controller area network (B-CAN) communication line and the fast controller area network (F-CAN) communication line between the gauges).

NOTE: Indicators are also controlled via the communication lines.

Entering the Self-Diagnostic Function With the HDS

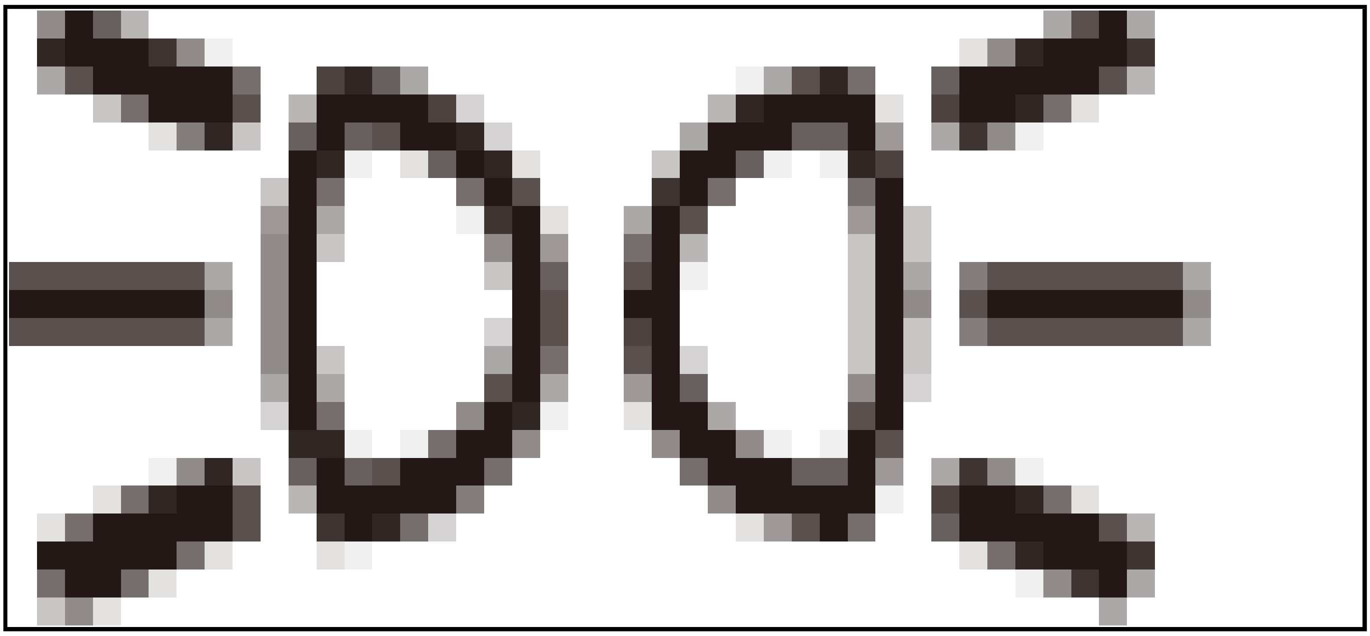
Using the HDS, select BODY ELECTRICAL, GAUGES, then FUNCTIONAL TESTS and do the self-diagnostic function.

Entering the Self-Diagnostic Function (Manual Method)

Before doing the self-diagnostic function, make sure the fuses and relays associated with the Gauges System are OK.

1. Press and hold the SEL/RESET knob.

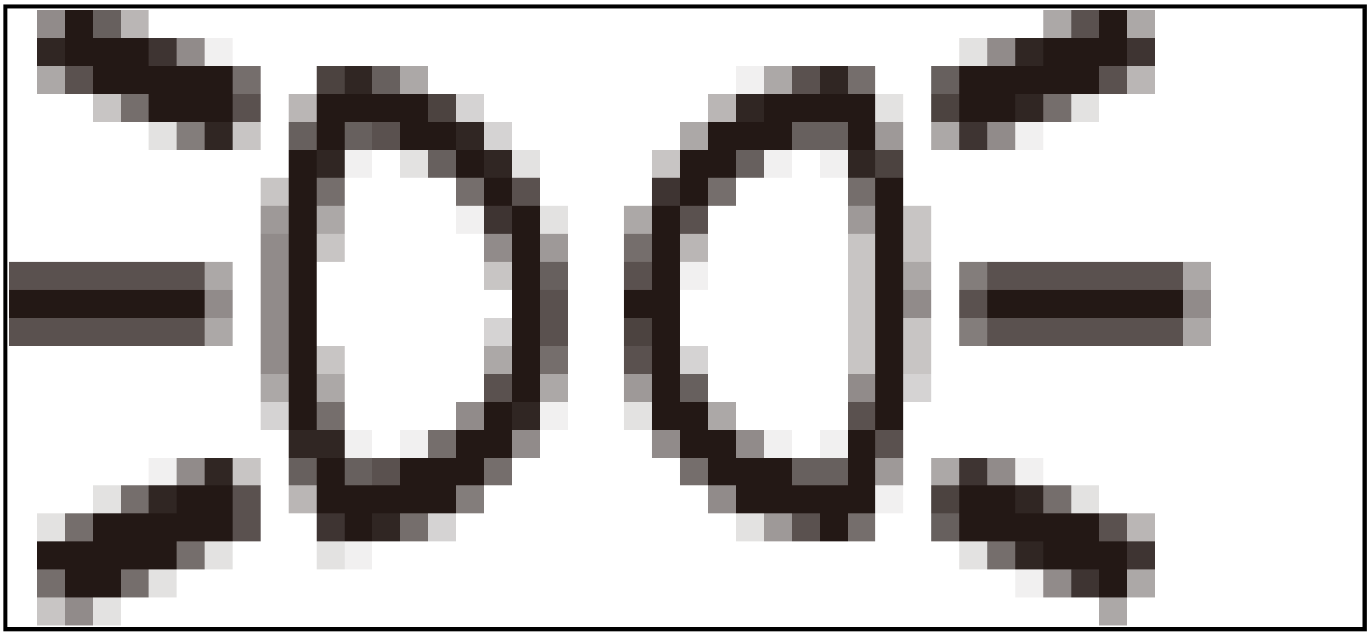
2. Turn the combination light switch to the PARKING position (



).

3. Turn the vehicle to the ON mode.

4. Within 5 sec., turn the combination light switch to OFF, then to the PARKING position (



) and OFF again. Within 5 sec., release the SEL/RESET knob, and then repeatedly press and release the knob three times.

NOTE:

- **While in the self-diagnostic mode, the dashlights brightness controller operates normally.**
- **While in the self-diagnostic mode, the SEL/RESET knob is used to start the Beeper Drive Circuit Test and the Gauge Drive Circuit Check.**
- **If the vehicle speed exceeds 1.2 mph (2 km/h), or turn the vehicle to the OFF (LOCK) mode, the self-diagnostic mode ends.**

OFF
Move to self-diagnostic mode.
5 sec.
5 sec.

The Indicator Drive Circuit Check

When entering the self-diagnostic mode, the following indicators (if equipped) blink, refer to the Gauges Component Location Index.

Switch Input Check

At the initial stage of the self-diagnostic function, the beeper sounds intermittently. The beeper sounds continuously when any of the following switch (if equipped) inputs are switched from OFF to ON:ACC combination switch, audio remote-HFL switch, brake fluid level switch, CMBS OFF switch, ECON switch, electric parking brake/automatic brake hold switch, EV switch, SPORT switch, and VSA OFF switch.

The Beeper Drive Circuit Check

When entering the self-diagnostic mode, the beeper sounds five times.

The LCD/MID Segment Check

When entering the self-diagnostic mode, the word "CHECKING NOW" shows on the multi-information display, and blinks five times.

The Gauge Drive Circuit Check

When entering the self-diagnostic mode, the fuel gauge, and the engine coolant temperature gauge sweep from the minimum position to the maximum position, then return to the minimum position.

NOTE: After the beeper stops sounding and the gauge needles return to the minimum position, pressing the SEL/RESET knob starts the Beeper Drive Circuit Check (one beep) and the Gauge Drive Circuit Check again. The check cannot be started again until the gauge needles return to the minimum position.

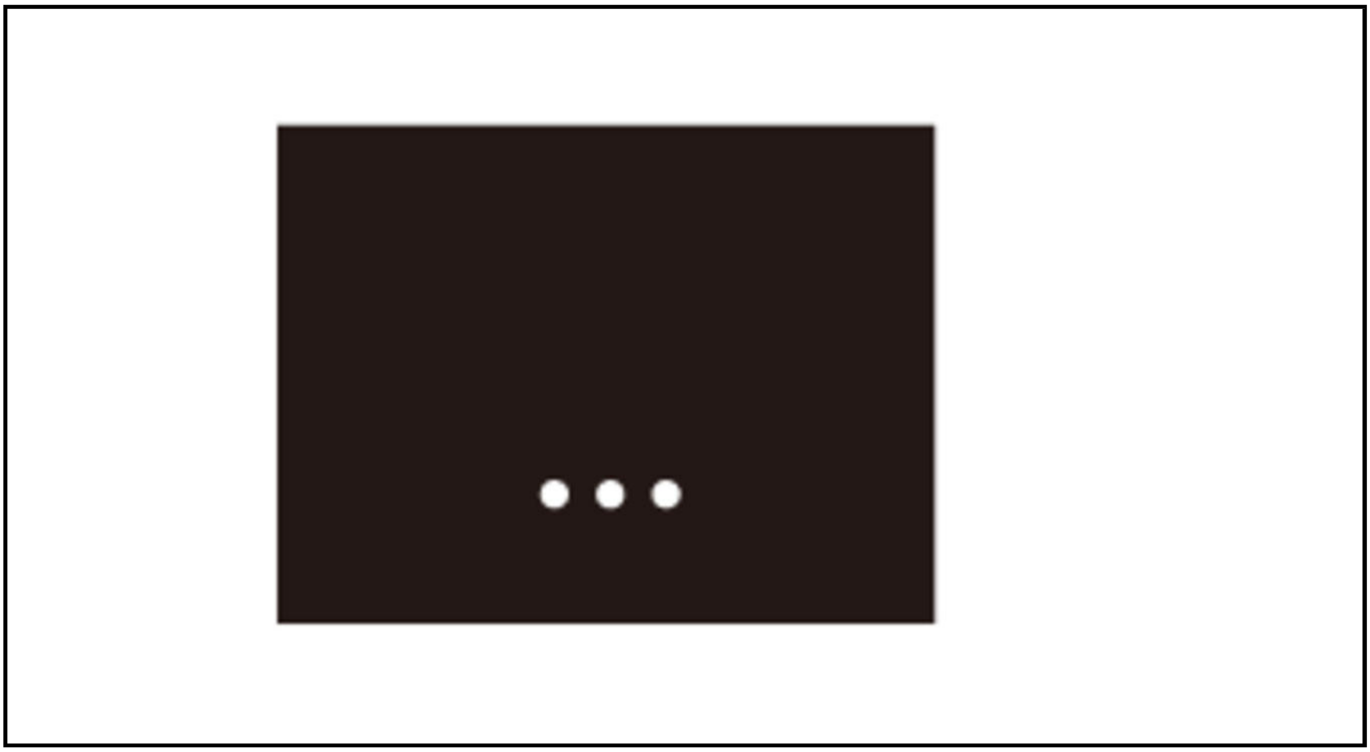
The needles sweep from the minimum position to the maximum position, then return to the minimum position.

The Communication Line Check

While in the self-diagnostic mode, the Communication Line Check starts after the MID Segments Check.

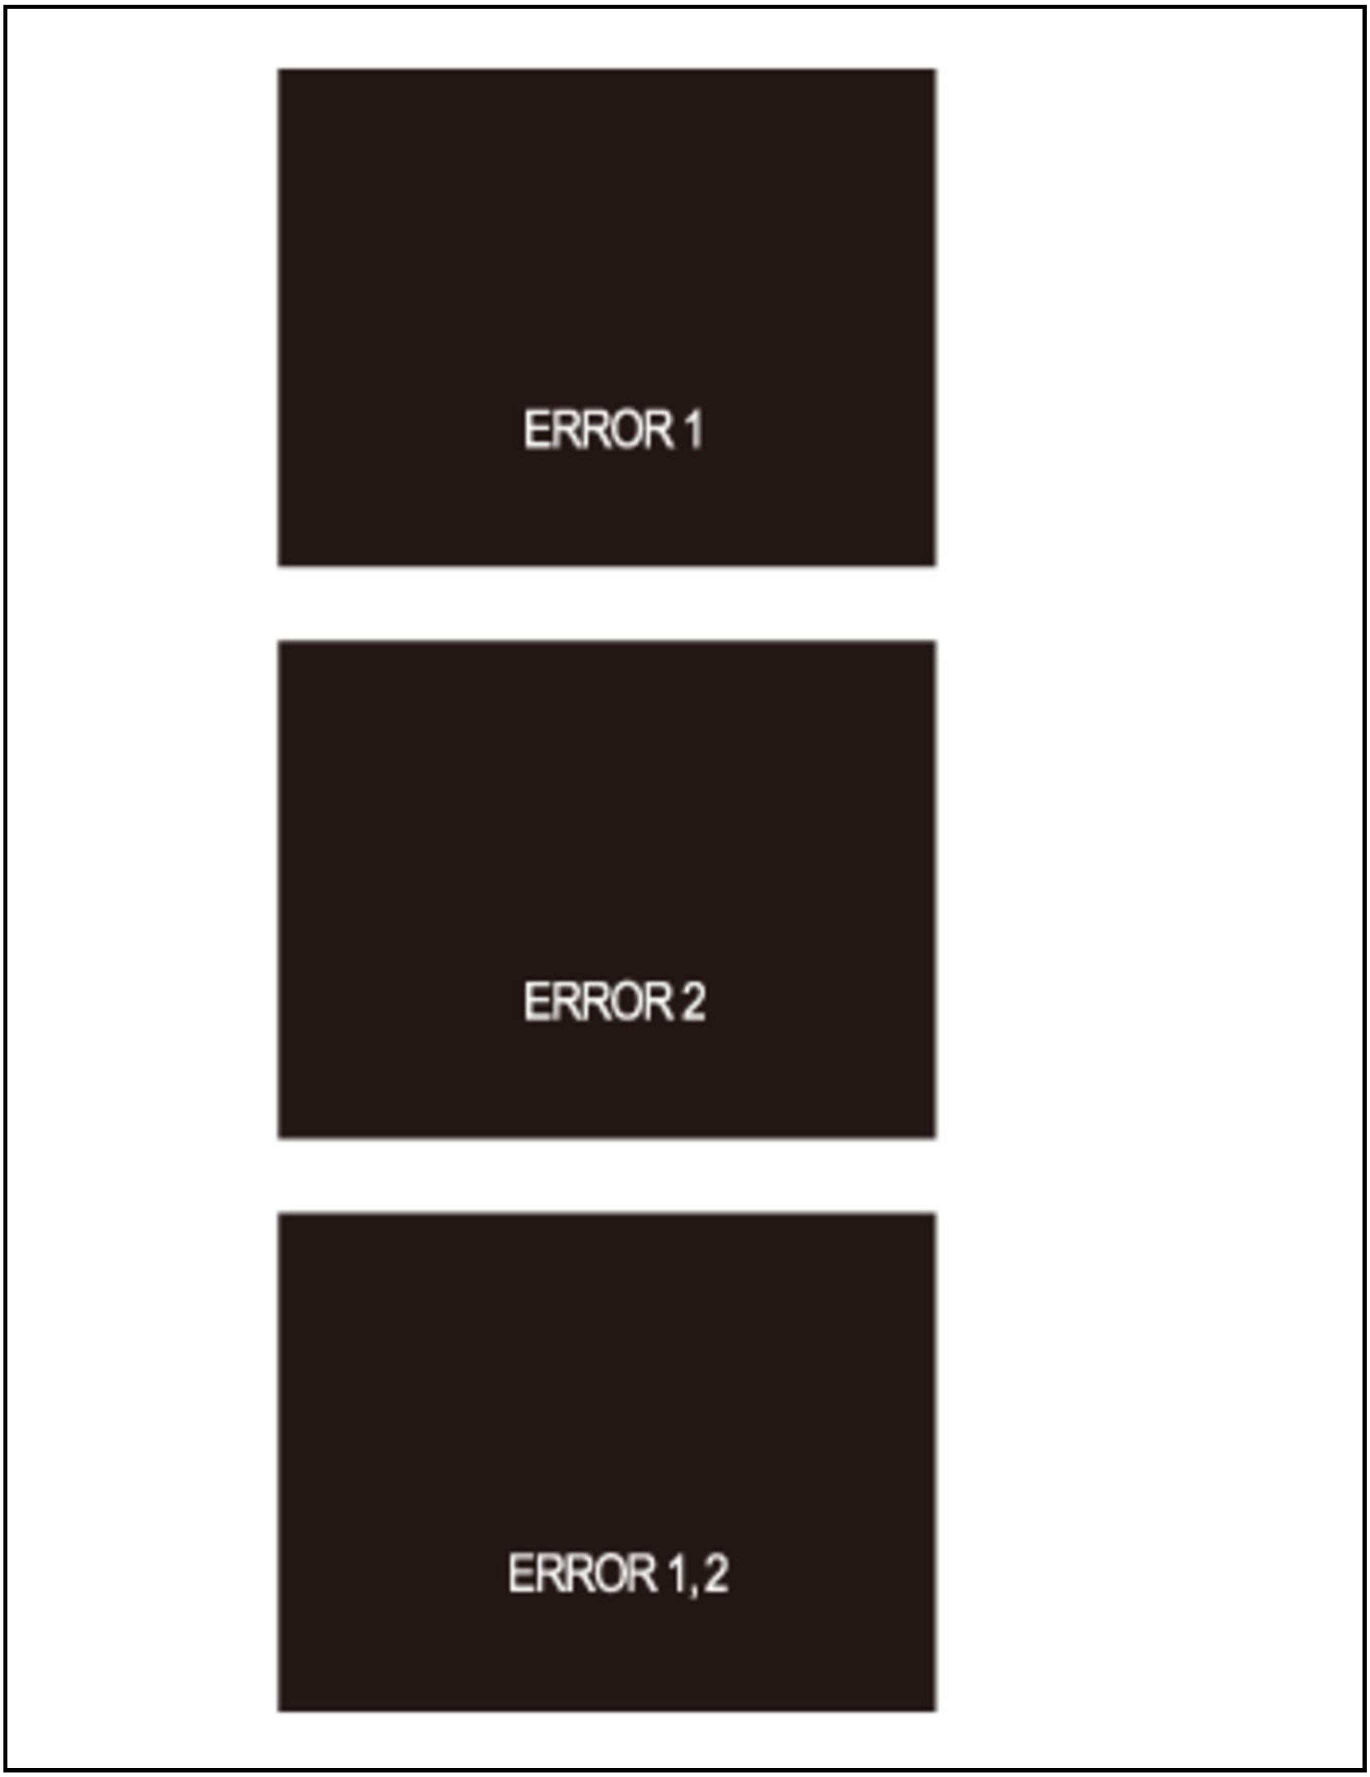


If "..." comes on, the communication line is OK. If there is a communication line error, the word "ERROR" will be indicated on the multi-information display.

Error Code List

Error code	Type of communication line(s) error
ERROR 1	F-CAN communication
ERROR 2	B-CAN communication
ERROR 1, 2	F-CAN and B-CAN communication

Indication Example



- If ERROR 1 is indicated, there is a malfunction in the communication line between the F-CAN and the gauge control module. The B-CAN line is OK at this time. Check for DTCs in the F-CAN connected units and troubleshoot any DTCs.
- If ERROR 2 is indicated, there is a malfunction in the communication line between the B-CAN and the gauge control module. The F-CAN line is OK at this time. Check for DTCs in the B-CAN connected units and troubleshoot any DTCs.

- If ERROR 1, 2 is indicated, there is a malfunction in the communication line between the gauge control module, the F-CAN, and the B-CAN. Check the DTCs in the F-CAN connected units and troubleshoot any DTCs.

Ending the Self-Diagnostic Function

Turn the vehicle to the OFF (LOCK) mode.

NOTE: If the vehicle speed exceeds 1.2 mph (2 km/h), the self-diagnostic function ends.

CALIBRATION CORRECTION

ELECTRICAL COMPASS ZONE SELECTION AND CALIBRATION

Procedure

NOTE:

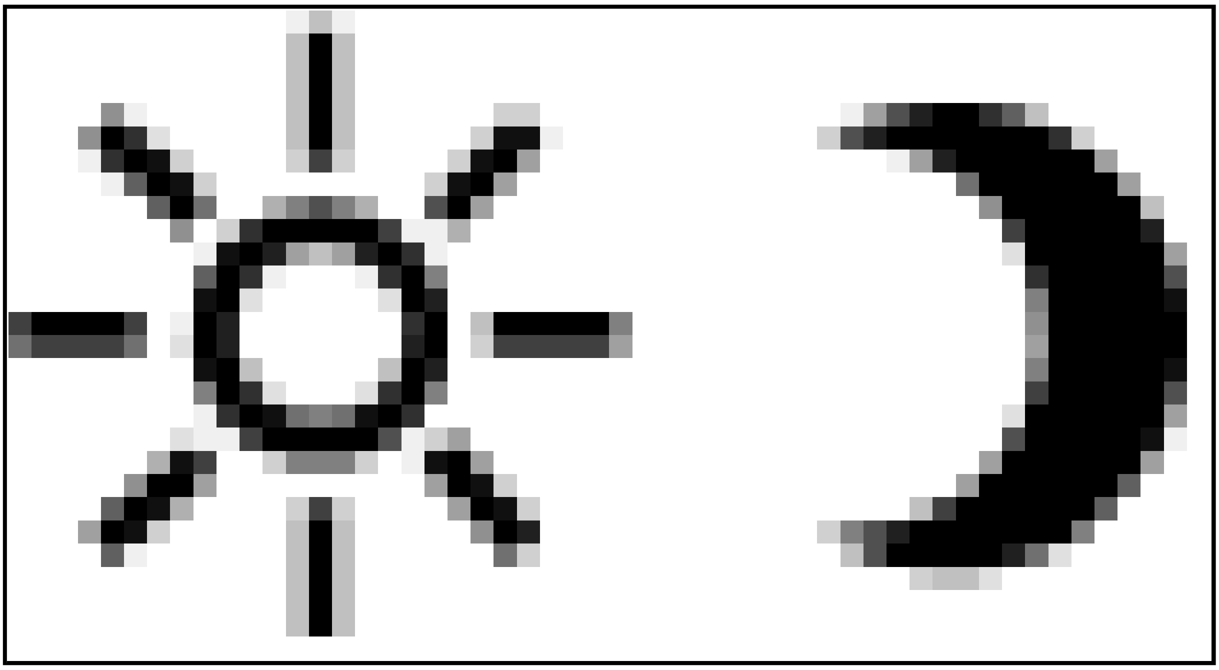
- Check the vehicle 12 volt battery condition first .
- You should do this procedure any time the electrical compass unit is replaced.
- You should do this procedure in an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields.
- If you see "--" and the CAL indicator is shown in the audio display, the electrical compass unit is self-calibrating.
- In most areas, there is a variation between magnetic north and true north. The compass zone needs to be set to your geographic zone to compensate for this variation.
- The electrical compass unit may need to be manually calibrated after exposure to a strong magnetic field. If the electrical compass unit seems to be continually showing the wrong direction, and is not self-calibrating, do the following.

1. Electrical Compass Zone Selection and Calibration

   Zone Selection

   1. Turn the vehicle to the ON mode.

   2. Press and hold the DISPLAY MODE (



) button until you hear a beep (about 5 seconds). The display shows the electrical compass setting menu items.

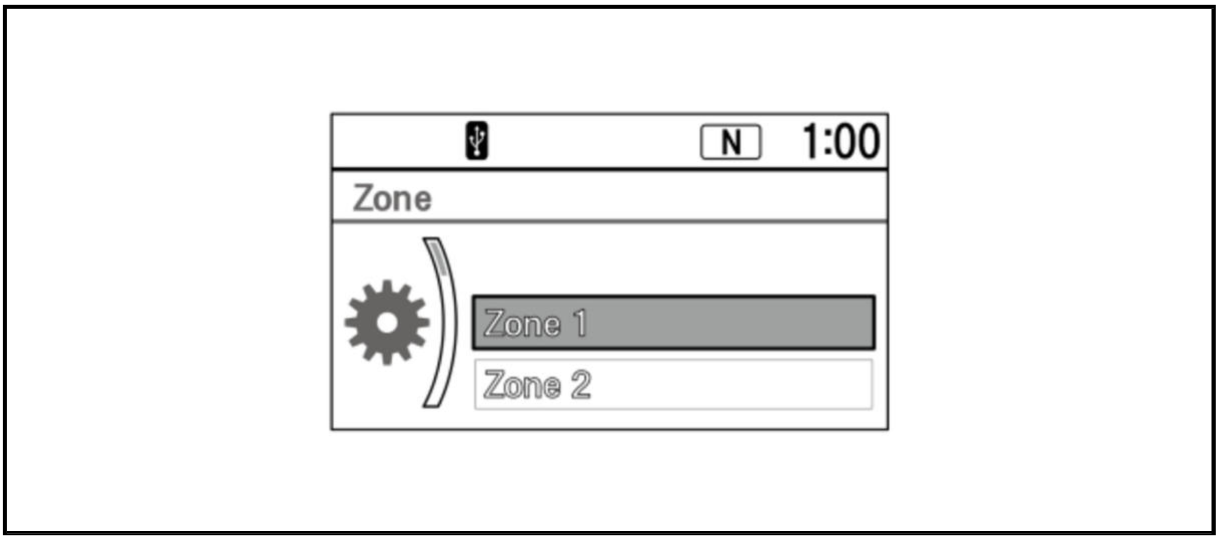
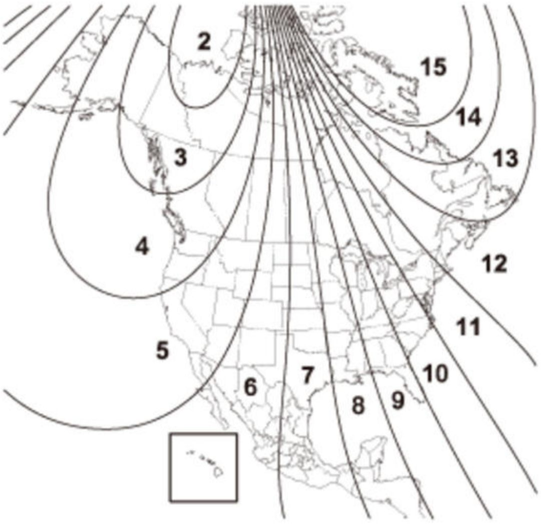
3. Rotate the LIST knob to select Zone (A), and press the SELECT button to enter the selection.

NOTE: If necessary, press the BACK button to return to the previous display. Pressing the MENU button cancels the electrical compass setting mode.

4. The display shows the currently selected zone number between from 1 to 15. Find the zone for your area on the zone map. If the correct zone is not shown, turn the LIST knob to cycle the zone lists up or down.



Zone Map



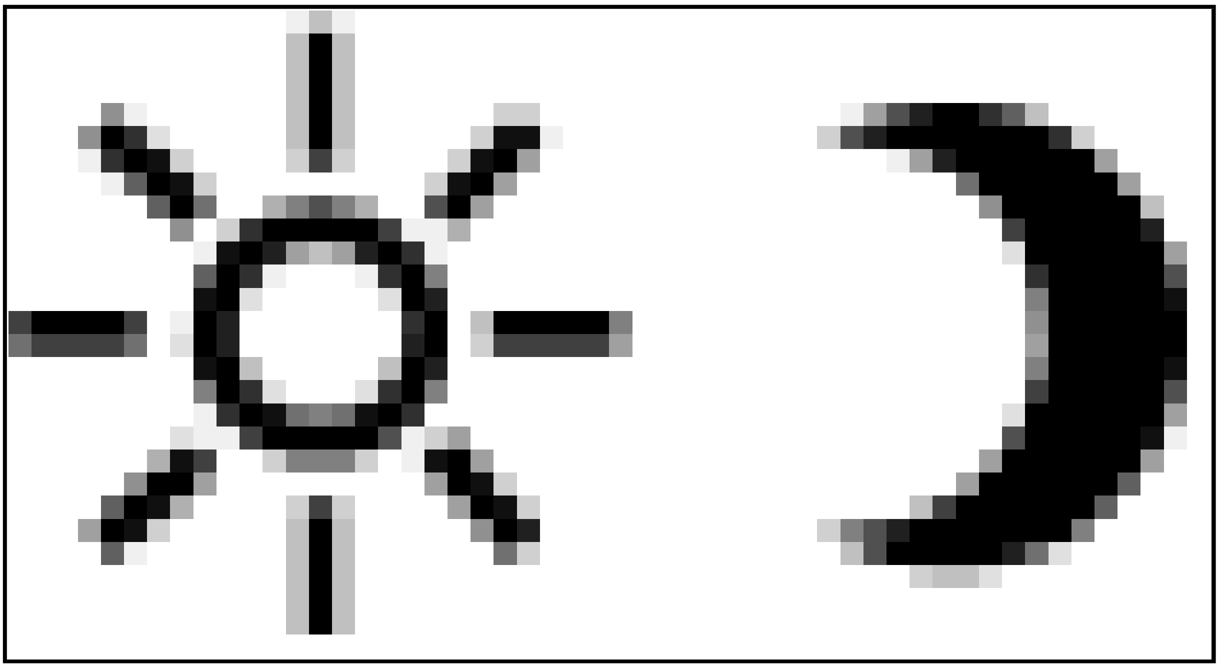
5. Press the SELECT button to decide the selected zone. Returning to the normal display, the zone selection mode ends.

Calibration

Although the compass is self-calibrating, it may need to be manually calibrated after exposure to a strong magnetic field. If the compass is blinking and CAL is shown on the display, do this to calibrate the compass:

1. Start the engine.

2. Press and hold the DISPLAY MODE (



) button until you hear a beep (about 5 seconds). The display shows the electrical compass setting menu items.

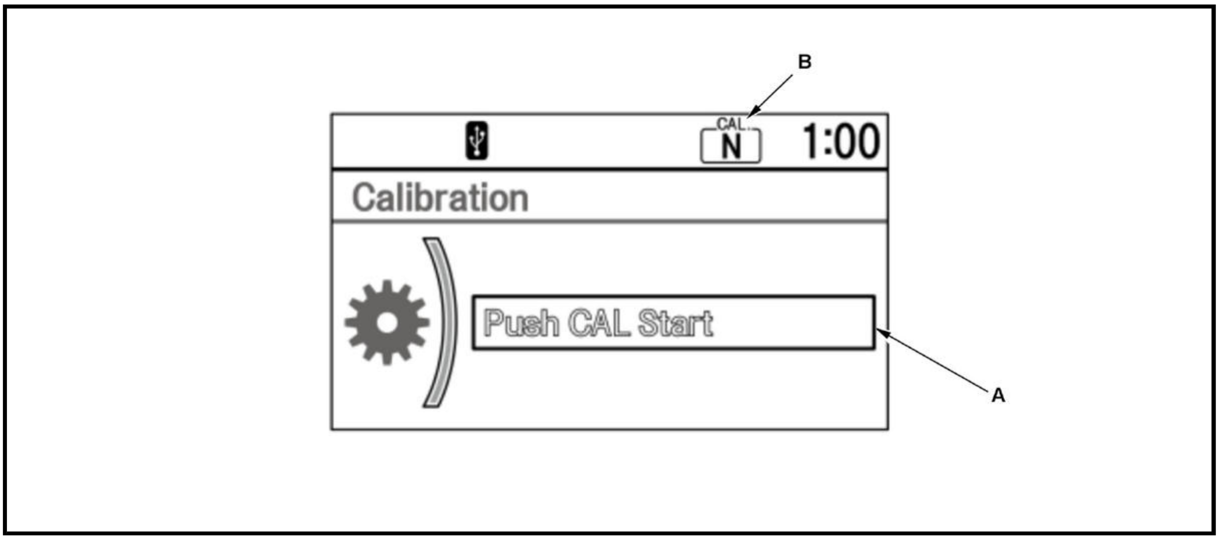
3. Rotate the LIST knob to select Calibration (A) and press the SELECT button to enter the selection.

NOTE: If necessary, press the BACK button to return to the previous display. Pressing the MENU button cancels the electrical compass setting mode.

4. The display shows the Push CAL Start (A). Press the SELECT button to enter the selection.



5. When the display shows Push CAL Start, press the SELECT button. The compass display blinks and the CAL indicator (B) comes on.

6. Drive the vehicle slowly in three complete circles (20 seconds or more per a circle). When the calibration is successfully completed, the compass display stops blinking and the CAL indicator goes off.

NOTE:

- The audio system is not related to the electrical compass system. Even if the electrical compass system is calibrating, the display returns to the normal display which was last selected.
- If the calibration fails, try another location (an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields) and do the calibration procedure again.

OUTSIDE AIR TEMPERATURE INDICATOR CALIBRATION (COLOR AUDIO TYPE)

Procedure

NOTE: To test the outside air temperature sensor, refer to the outside air temperature sensor test procedure .

1. Outside Air Temperature Indicator - Calibrate

Description

The outside air temperature sensor is located behind the center of the front bumper. The gauge control module uses measurements from this sensor to display the outside air temperature.

Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from the surrounding traffic.

These conditions can heat soak the outside air temperature sensor and cause inaccurate readings. Logic has been written into the gauge control module to help prevent abnormal or fluctuating outside air temperature indicator readings.

Outside Air Temperature Indicator Logic

Engine coolant temperature 140 deg.F (60 deg.C) or higher:

If the engine coolant temperature is 140 deg.F (60 deg.C) or higher when the vehicle is turned to the ON mode, the outside air temperature indicates the last temperature it displayed with the vehicle was turned to the OFF (LOCK) mode regardless of the current temperature measured by the outside air temperature sensor.

Engine coolant temperature less than 140 deg.F (60 deg.C) :

If the engine coolant temperature is less than 140 deg.F (60 deg.C) or lower when the vehicle is turned to the ON mode, the current temperature measured by the outside air temperature sensor is indicated.

Information Update to the Outside Air Temperature Indicator While Driving

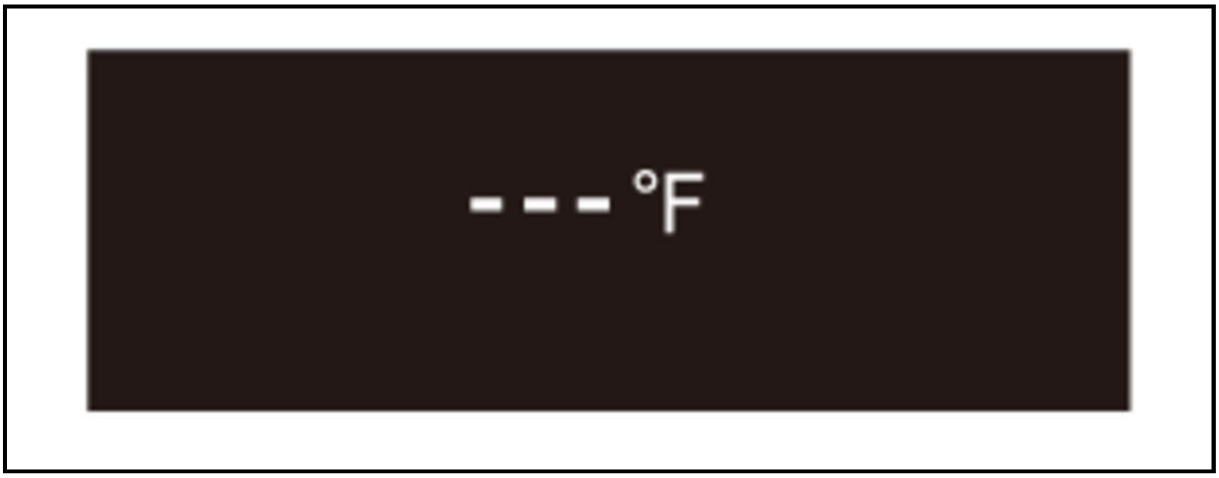
Engine coolant temperature 140 deg.F (60 deg.C) or higher:

If the temperature measured by the outside air temperature sensor is greater than the indicated temperature, the indicated temperature will increase by 1 deg.F (1 deg.C) per minute after the vehicle speed is greater than 19 mph (30 km/h) for more than 1 minute and 30 seconds. It continues to increase until the current outside air temperature is indicated. If the vehicle speed drops below 19 mph (30 km/h), the indicator does not update again until the vehicle speed has increased to 19 mph (30 km/h) or more for more than 1 minute and 30 seconds again.

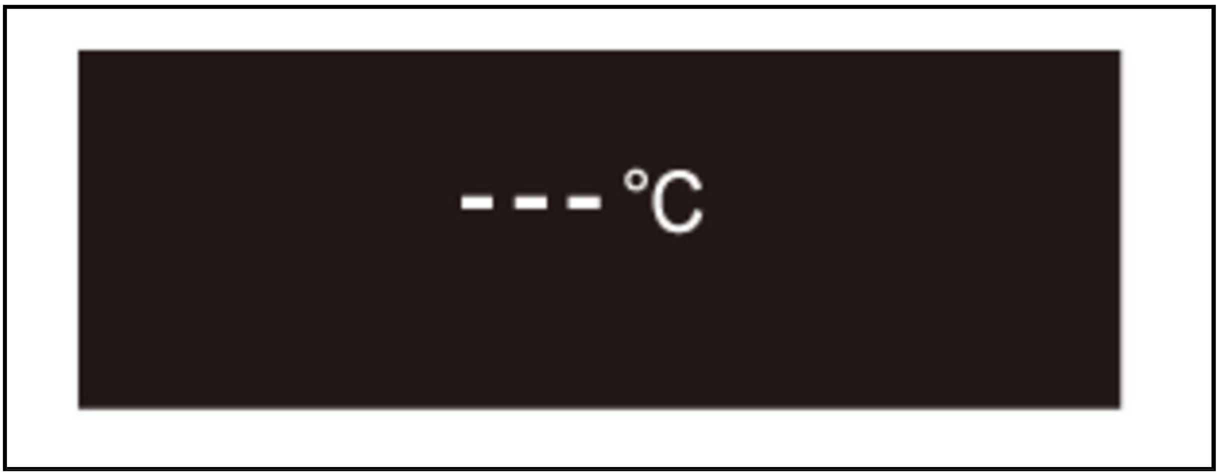
Engine coolant temperature less than 140 deg.F (60 deg.C) :

If the outside air temperature is less than the indicated temperature, the indicated temperature decreases by 1 deg.F (1 deg.C) every 2 seconds until the current outside air temperature indicated regardless of vehicle speed.

Fahrenheit:



Celsius:



Troubleshooting

If the indicator displays - - - deg.F (- - - deg.C) for more than 2 seconds after selecting the outside air temperature display mode, the gauge control module is not receiving the outside temperature data from the climate control unit over the B-CAN. Check the climate control system or multiplex integrated control system for DTCs.

Calibration

NOTE:

- The outside air temperature indicator's displayed temperature can be calibrated +/- 5 deg.F (+/- 3 deg.C) to meet the customer's expectations.
- The outside air temperature can be calibrated by using the audio unit.

1. Turn the vehicle to the ON mode.

2. Select the AUDIO POWER (⏻

) button.

3. Select the HOME button.

4. Select the following icons in sequence.

- Settings
- Vehicle
- Meter Setup
- Adjust Outside Temp. Display

5. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed.

NOTE: The recalibration temperature is not the value the sensor sees. Therefore the temperature can only be adjusted +/- 5 deg.F (+/- 3 deg.C).

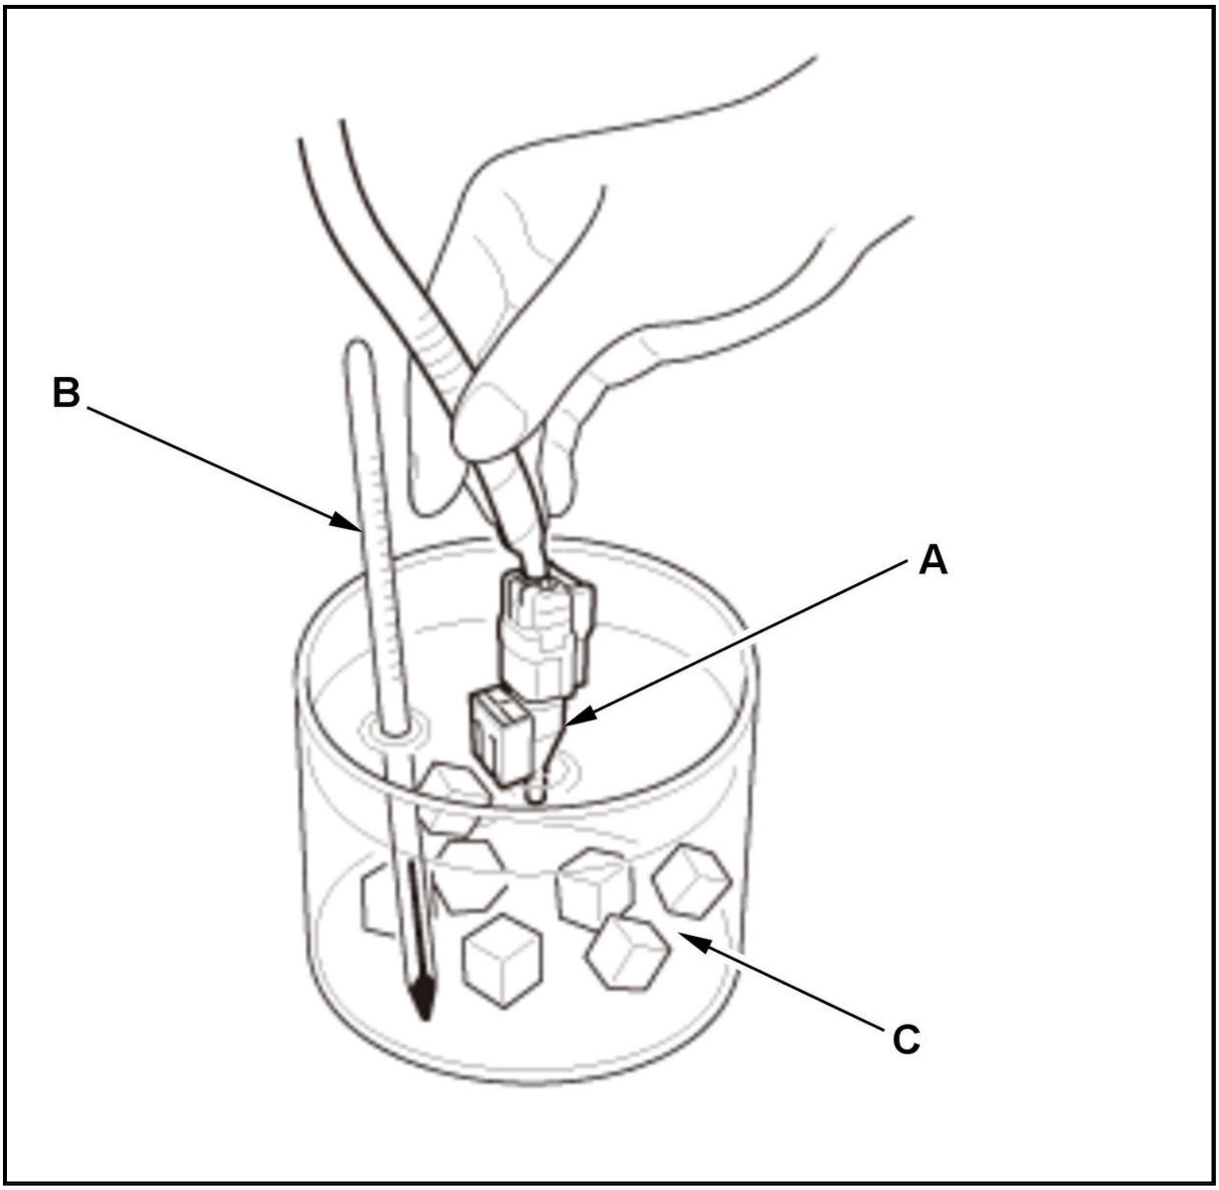
Example:

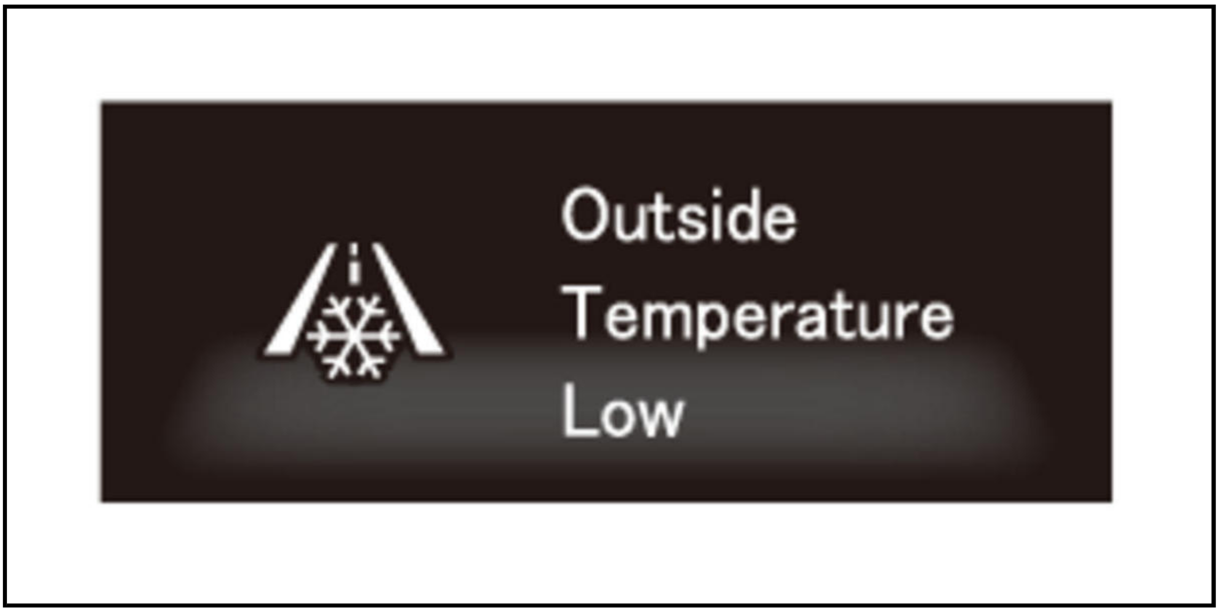
Incorrect value	=	68 deg.F (20 deg.C)

Desired correction value	=	+2 deg.F (+1 deg.C)
Correct value	=	70 deg.F (21 deg.C)

Desired correction value	=	-2 deg.F (-1 deg.C)
Correct value	=	66 deg.F (19 deg.C)

NOTE: To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.





Outside
Temperature
Low

6. The snow mark is displayed when the temperature is 37 deg.F (3 deg.C) or less the first time you turn the vehicle to the ON mode.

OUTSIDE AIR TEMPERATURE INDICATOR CALIBRATION (DISPLAY AUDIO TYPE)

Procedure

NOTE: To test the outside air temperature sensor, **refer to the outside air temperature sensor test procedure** .

1. Outside Air Temperature Indicator - Calibrate

   Description

   The outside air temperature sensor is located behind the center of the front bumper. The gauge control module uses measurements from this sensor to display the outside air temperature.

   Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from the surrounding traffic.

   These conditions can heat soak the outside air temperature sensor and cause inaccurate readings. Logic has been written into the gauge control module to help prevent abnormal or fluctuating outside air temperature indicator readings.

   Outside Air Temperature Indicator Logic

   Engine coolant temperature 140 deg.F (60 deg.C) or higher:

   If the engine coolant temperature is 140 deg.F (60 deg.C) or higher when the vehicle is turned to the ON mode, the outside air temperature indicates the last temperature it displayed with the vehicle was turned to the OFF (LOCK) mode regardless of the current temperature measured by the outside air temperature sensor.

   Engine coolant temperature less than 140 deg.F (60 deg.C) :

   If the engine coolant temperature is less than 140 deg.F (60 deg.C) or lower when the vehicle is turned to the ON mode, the current temperature measured by the outside air temperature sensor is indicated.

   Information Update to the Outside Air Temperature Indicator While Driving

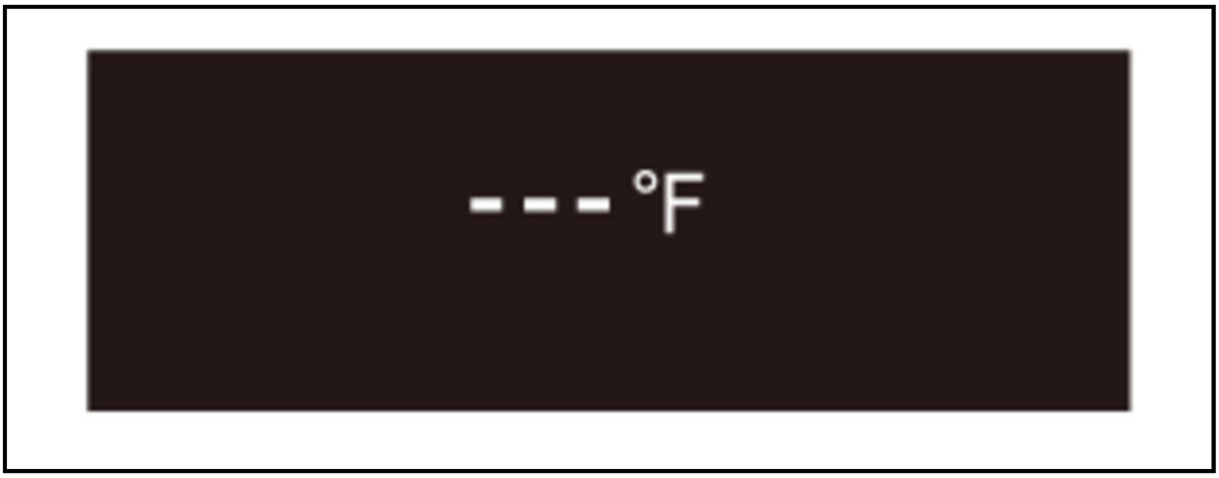
   Engine coolant temperature 140 deg.F (60 deg.C) or higher:

   If the temperature measured by the outside air temperature sensor is greater than the indicated temperature, the indicated temperature will increase by 1 deg.F (1 deg.C) per minute after the vehicle speed is greater than 19 mph (30 km/h) for more than 1 minute and 30 seconds. It continues to increase until the current outside air temperature is indicated. If the vehicle speed drops below 19 mph (30 km/h), the indicator does not update again until the vehicle speed has increased to 19 mph (30 km/h) or more for more than 1 minute and 30 seconds again.

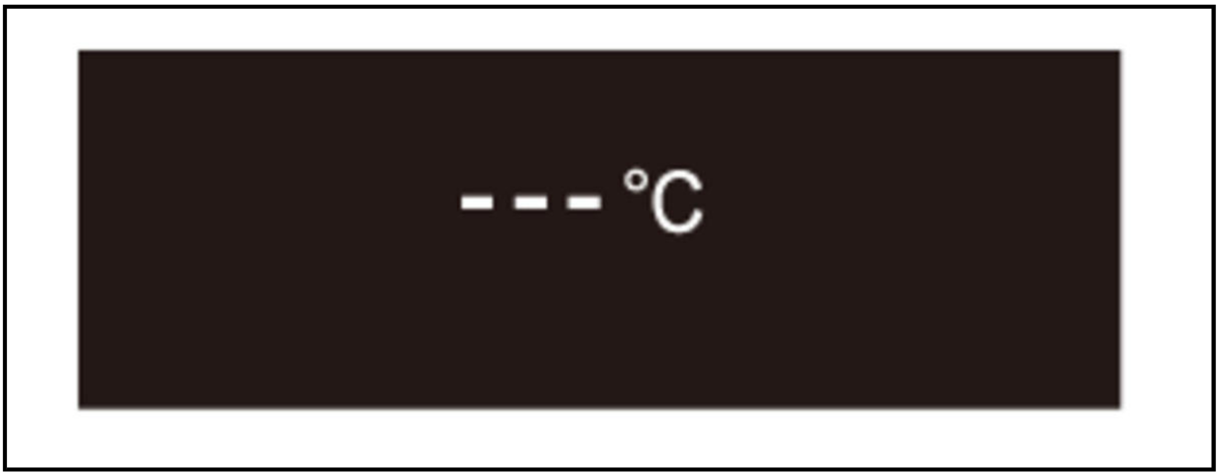
   Engine coolant temperature less than 140 deg.F (60 deg.C) :

   If the outside air temperature is less than the indicated temperature, the indicated temperature decreases by 1 deg.F (1 deg.C) every 2 seconds until the current outside air temperature indicated regardless of vehicle speed.

   Fahrenheit:



Celsius:



Troubleshooting

If the indicator displays - - - deg.F (- - - deg.C) for more than 2 seconds after selecting the outside air temperature display mode, the gauge control module is not receiving the outside temperature data from the climate control unit over the B-CAN. Check the climate control system or multiplex integrated control system for DTCs.

Calibration

NOTE: The outside air temperature indicator's displayed temperature can be recalibrated +/- 5 deg.F (+/- 3 deg.C) to meet the customer's expectations.

1. Turn the vehicle to the ON mode.

2. Press the INFORMATION button.

3. Select the following item in sequence.

- Vehicle Settings
- Meter Setup
- Adjust Outside Temp. Display

4. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed.

NOTE: The recalibration temperature is not the value the sensor sees. Therefore the temperature can only be adjusted +/- 5 deg.F (+/- 3 deg.C).

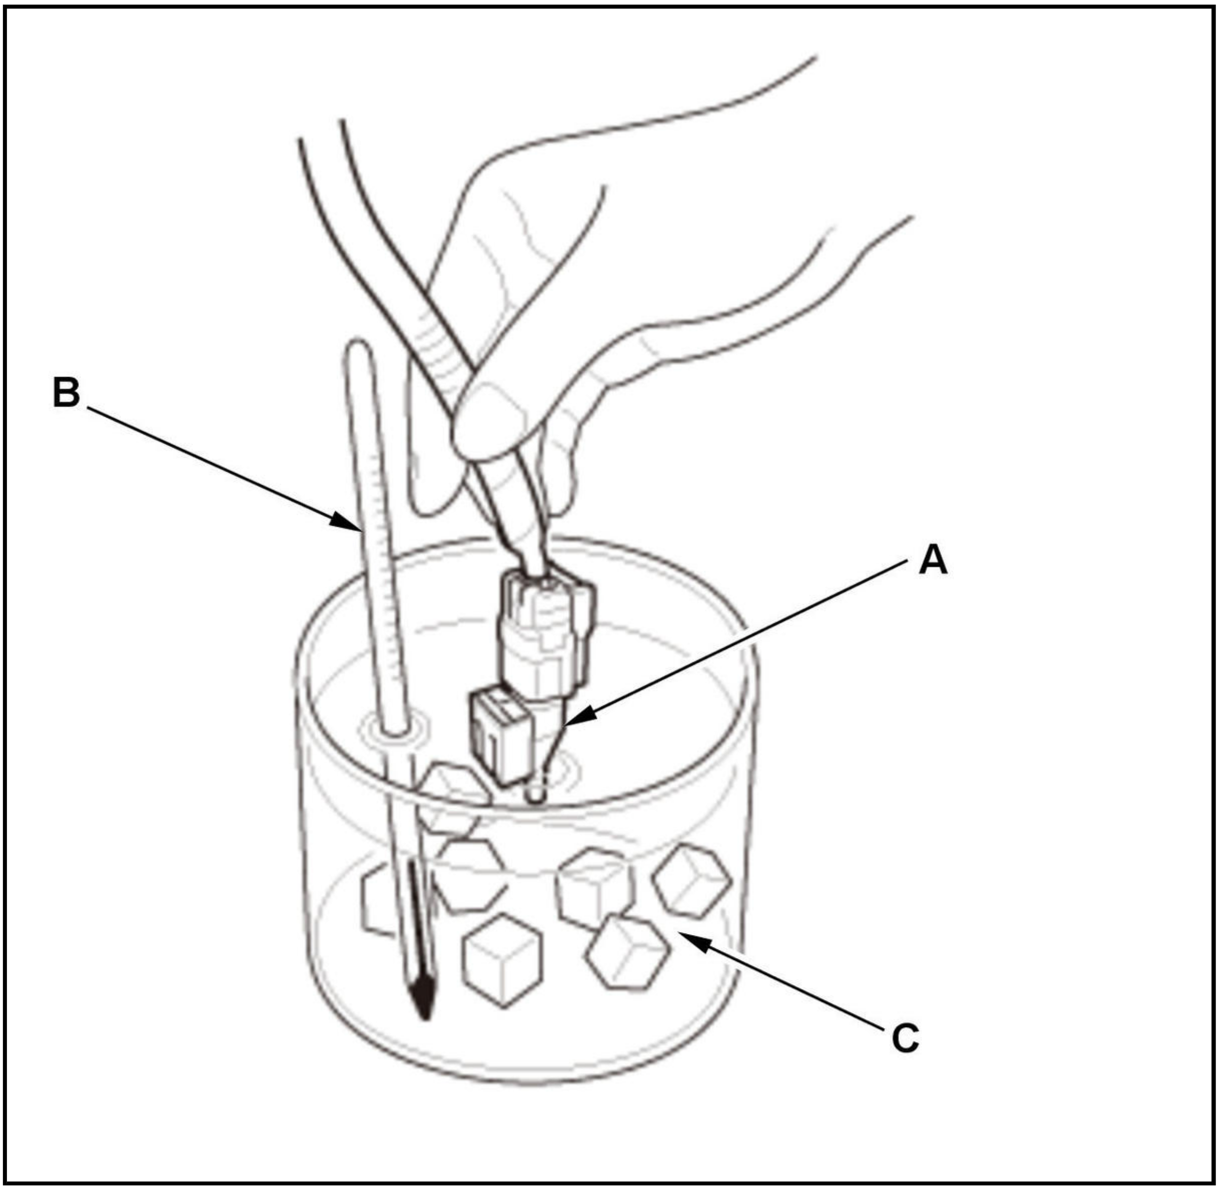
Example:

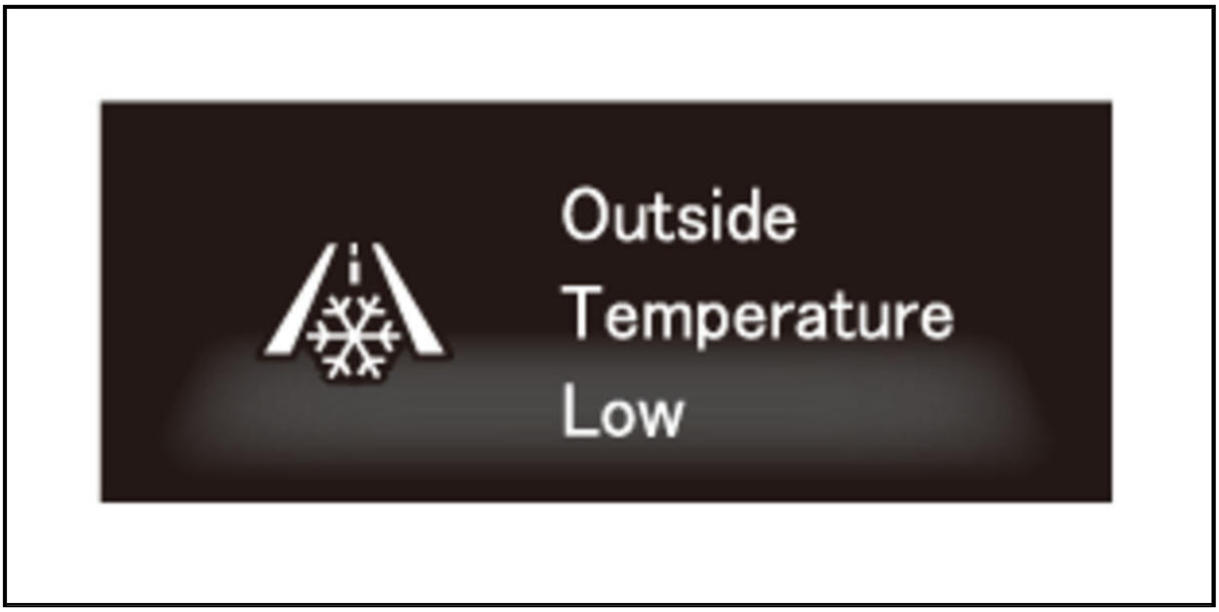
Incorrect value	=	68 deg.F (20 deg.C)

Desired correction value	=	+2 deg.F (+1 deg.C)
Correct value	=	70 deg.F (21 deg.C)

Desired correction value	=	-2 deg.F (-1 deg.C)
Correct value	=	66 deg.F (19 deg.C)

NOTE : To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.





5. The snow mark is displayed when the temperature is 37 deg.F (3 deg.C) or less the first time you turn the vehicle to the ON mode.

SYMPTOM TROUBLESHOOTING INDEX

ELECTRICAL COMPASS SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic Procedure	Also Check for
Azimuth (direction) information is not shown on the display	Electrical Compass Troubleshooting	Blown the fuse associated with the system
Compass shows wrong direction	Electrical Compass Troubleshooting	- Check if the zone setting is correct for the vehicle geographical location - Check for sources of strong magnetic fields near the electrical compass unit (i.e. Non-OEM electronics including radar detectors, toll road transponders, and/or speakers, magnetized tires and body panels, etc.) - Audio unit (B-CAN)
Compass does not calibrate	Electrical Compass Troubleshooting	- Make sure the rear door and the tailgate are closed - Check for sources of strong magnetic fields near the electrical compass unit (i.e. Non-OEM electronics including radar detectors, toll road transponders, and/or speakers, magnetized tires and body panels, etc.) - Audio unit (B-CAN)
Self-test has failed (flashing the CAL and NW)	Electrical Compass Troubleshooting	Reboot the electrical compass unit

REWRITE

GAUGE CONTROL MODULE UPDATE

Procedure

1. Gauge Control Module - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Refer to available service information for the latest information on update devices.

REWRITING THE ODO DATA AND TRANSFERRING THE MAINTENANCE MINDER? DATA TO A NEW GAUGE CONTROL MODULE

Procedure

NOTE:

- Obtain a new gauge control module before starting the rewriting process. Only new gauges can be rewritten.
- Do not operate anything electrical (headlights, audio system, A/C, power window, door locks etc.) during the process.
- Rewriting is not possible on a gauge control module that will not communicate with the HDS.
- Confirm that you have the latest HDS version of software.
- Make sure that the HDS shows the correct VIN for the vehicle you are working on.
- Once you have started this procedure, you must complete it before removing the HDS from the data link connector (DLC).
- Connect a 12 volt battery charger to insure that the battery voltage is maintained during the process.
- If a maintenance minder is equipped, when the ODO data is transferred, also the maintenance minder data would be transferred with the ODO one.

1. Rewriting the ODO Data on a New Gauge Control Module - Procedure

   Rewriting and Transferring

   1. Before replacing the gauge control module, **connect the HDS**

   2. Turn the vehicle to the ON mode.

   3. Select the following menu buttons on the HDS screen in sequence.

      - Body Electrical (System Selection Menu)
      - Gauges
      - Adjustment
      - Gauge Control Module Replacement

   4. Select "Read Out Data" and following the instructions on the HDS display and save value data into HDS.

   5. **Replace the gauge control module**

   6. Select "Write Data" and following the instructions on the HDS display and install the value into replaced gauge control module. If the data transfer fails, refer to the instructions below to release the locked value.

   How to Release Locked Odometer Mileage to the Original Gauge Control Module.

   If, after you attempt to transfer mileage to a new gauge assembly, the odometer display has dashes (---), is garbled, or shows an incorrect value, the original gauge control module can be unlocked and restored to its original state and can be used again for additional attempts to transfer the mileage:

1. With the vehicle in the OFF (LOCK) mode, connect the original gauge control module.

2. Turn the vehicle to the ON mode.

3. Completely re-boot the HDS.

4. Clear any stored DTCs.

5. Select the following menu buttons on the HDS screen in sequence.

    - Body Electrical (System Selection Menu)
    - Gauges
    - Adjustment
    - Gauge Control Module Replacement
    - Odo lock Release

6. Follow the prompts and the odometer mileage will be restored.

7. Start over the Rewriting and Transferring procedure from step 1.

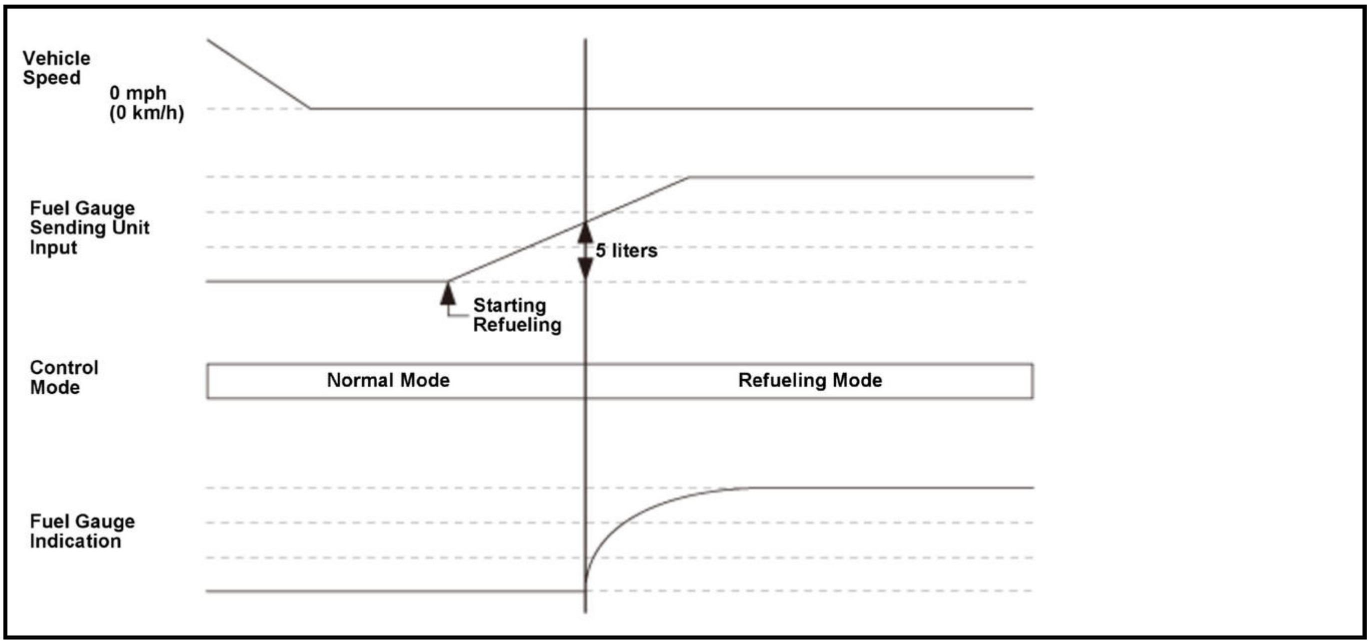
SYMPTOM TROUBLESHOOTING

GAUGES SYMPTOM TROUBLESHOOTING - FUEL GAUGE INDICATION DOES NOT RISE

NOTE:

- When refueling, the gauge control module shifts to the "refueling mode," moving the fuel gauge indicator only after it detects that 5 liters (approximately 1.3 U.S. gallon) of fuel have been added.
- The fuel gauge indication may not rise when refueling a small quantity of fuel and the control mode does not shift to refueling mode.

Shift to the Refueling Mode



Vehicle Speed
0 mph (0 km/h)
Fuel Gauge Sending Unit Input
5 liters
Starting Refueling
Control Mode
Normal Mode
Refueling Mode
Fuel Gauge Indication

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check the low fuel indicator.

Does the low fuel indicator flash?

YES

Check for DTCs. If any DTCs are indicated, do the indicated DTC's troubleshooting. If no DTCs are indicated, **replace the gauge control module** .

NO

Go to step 2.

2. Fuel gauge operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Do the **gauge self-diagnostic function**.

Is the fuel gauge OK?

YES

Go to step 3.

NO

Replace the gauge control module .

3. Fuel tank visual check

-1. Raise the vehicle on a lift.

-2. Check the fuel tank for damage.

Is the fuel tank OK?

YES

Go to step 4.

NO

Replace the fuel tank .

4. Fuel gauge sending unit check

-1. **Test the fuel gauge sending unit**.

Is the fuel gauge sending unit OK?

YES

Confirm the operation of the fuel gauge.

NO

Replace the fuel gauge sending unit .

GAUGES SYMPTOM TROUBLESHOOTING - OUTSIDE AIR TEMPERATURE INDICATOR DOES NOT CHANGE

NOTE: Outside air temperature is indicated based on the measurement value of the outside air temperature sensor located behind the center of the front bumper. Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from surrounding traffic. To display the outside air temperature, the gauge control module has an indication mode based on engine coolant temperature and vehicle speed. Some modes do not raise the temperature indication, so the outside air temperature indication may not change when the mode continues.

Outside Air Temperature Indication Mode

Indication Mode	Indication Temperature Increase	Indication Temperature Decrease	Notes
Initial Indication	---	---	• If the current outside air temperature is higher than the indicated outside air temperature the last time the vehicle OFF (LOCK) mode, and the engine coolant temperature is higher than 140 deg.F(60 deg.C): The last outside air temperature that was indicated before the vehicle OFF (LOCK) mode is displayed. • If the current outside air temperature is higher than the indicated outside air temperature the last time the vehicle OFF (LOCK) mode, and the engine coolant temperature is less than 140 deg.F(60 deg.C): The current temperature measured by the outside air temperature sensor is indicated. • If the current outside air temperature is lower than the indicated outside air temperature the last time the vehicle OFF (LOCK) mode: The current temperature measured by the outside air temperature sensor is indicated.

Indication Mode	Indication Temperature Increase	Indication Temperature Decrease	Notes
Garage Mode	Increases 1 deg.F every 2 seconds (or 1 deg.C every 1 second) to the current outside air temperature.	Decreases 1 deg.F every 2 seconds (or 1 deg.C every 1 second) to the current outside air temperature.	• If the engine coolant temperature is less than 140 deg.F (60 deg.C) when the vehicle is in the ON mode, the mode shifts to the garage mode. • The garage mode continues until the engine coolant

Indication Mode	Indication Temperature Increase	Indication Temperature Decrease	Notes
			temperature reaches 140 deg.F (60 deg.C) or for about 3 minutes after the vehicle speed exceeds 1.2 mph (2 km/h).
Traffic Jam Mode	---	If the outside air temperature is less than the indicated temperature, the temperature decreases by 1 deg.F per 2 seconds (or 1 deg.C per 1 second).	• If the engine coolant temperature is more than 140 deg.F (60 deg.C), the mode shifts to the traffic jam mode. • At stable run mode, if the vehicle speed is less than 19 mph (30 km/h), the mode shifts to traffic jam mode. **NOTE:** Once entering to the traffic jam mode, the mode does not shift to the garage mode even after the engine coolant temperature goes below 140 deg.F (60 deg.C).
Stable Run Mode	Increases 1 deg.F every 30 seconds (or 1 deg.C every 17 seconds) to the current outside air temperature.	Decreases 1 deg.F every 2 seconds (or 1 deg.C every 1 second) to the current outside air temperature.	If the vehicle speed is at 19 mph (30 km/h) for more than 58 seconds, the mode shifts to stable run mode.

1. A/C system DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1227 An open in the outside air temperature sensor circuit	B
B1228 A short in the outside air temperature sensor circuit	B

Is DTC B1227 or B1228 indicated?

YES

Go to the indicated DTC troubleshooting.

NO

Go to step 2.

2. Outside air temperature sensor check

-1. **Test the outside air temperature sensor** .

Is the outside air temperature sensor OK?

YES

Confirm the operation of the outside air temperature indicator.

NO

Replace the outside air temperature sensor .

GAUGES SYMPTOM TROUBLESHOOTING - THE FUEL GAUGE INDICATION FLUCTUATES

NOTE:

- The fuel sending unit float level changes frequently due to acceleration, deceleration, cornering, and slopes. As a result, the fuel gauge reading that is displayed is based on inputs it receives from the fuel sending unit, as well as inputs on fuel injector duration.
- The following conditions may cause fuel gauge fluctuations:
-
    - -

      Driving uphill and downhill for long periods of time.

    - -

      Stopping in a slanted position, such as on a grade.

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check the low fuel indicator.

   Does the low fuel indicator flash?

   YES

   Check for DTCs. If any DTCs are indicated, do the indicated DTC's troubleshooting. If no DTCs are indicated, replace the gauge control module .

   NO

   Go to step 2.

2. Fuel gauge sending unit installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for poor connections and loose terminals .

   Are the connections OK?

   YES

   Go to step 3.

   NO

   Reconnect the connectors.

3. Fuel gauge sending unit check

   -1. Test the fuel gauge sending unit.

   Is the fuel gauge sending unit OK?

YES

Confirm the operation of the fuel gauge.

NO

Replace the fuel gauge sending unit .

TEST

BRAKE FLUID LEVEL SWITCH TEST

Test

NOTE: If both the ABS/VSA indicator and the brake system indicator (red) come on at the same time, **check the VSA system first** .

1. Brake Fluid Level Switch - Test

	1. Disconnect the connector (A). 2. Check for continuity between the brake fluid level switch connector terminals No. 1 and No. 2 with the float in the down position and in the up position. • Remove the brake fluid completely from the reservoir. With the float down, there should be continuity. • Fill the reservoir with brake fluid to the MAX (upper) level (B). With the float up, there should be no continuity. **NOTE:** If the brake fluid level switch is OK, but the brake system indicator (red) does not function, **do the gauge control module self-diagnostic function**. 3. Connect the connector.

FUEL GAUGE SENDING UNIT TEST

Test

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. **HDS - Connect**
2. DTC - Check

1. Check for DTCs with the HDS. If any of the following DTCs are indicated, troubleshoot the indicated DTCs. **NOTE:** If PGM-FI and body electrical DTC(s) are indicated at the same time, troubleshoot the PGM-FI DTC(s) first.

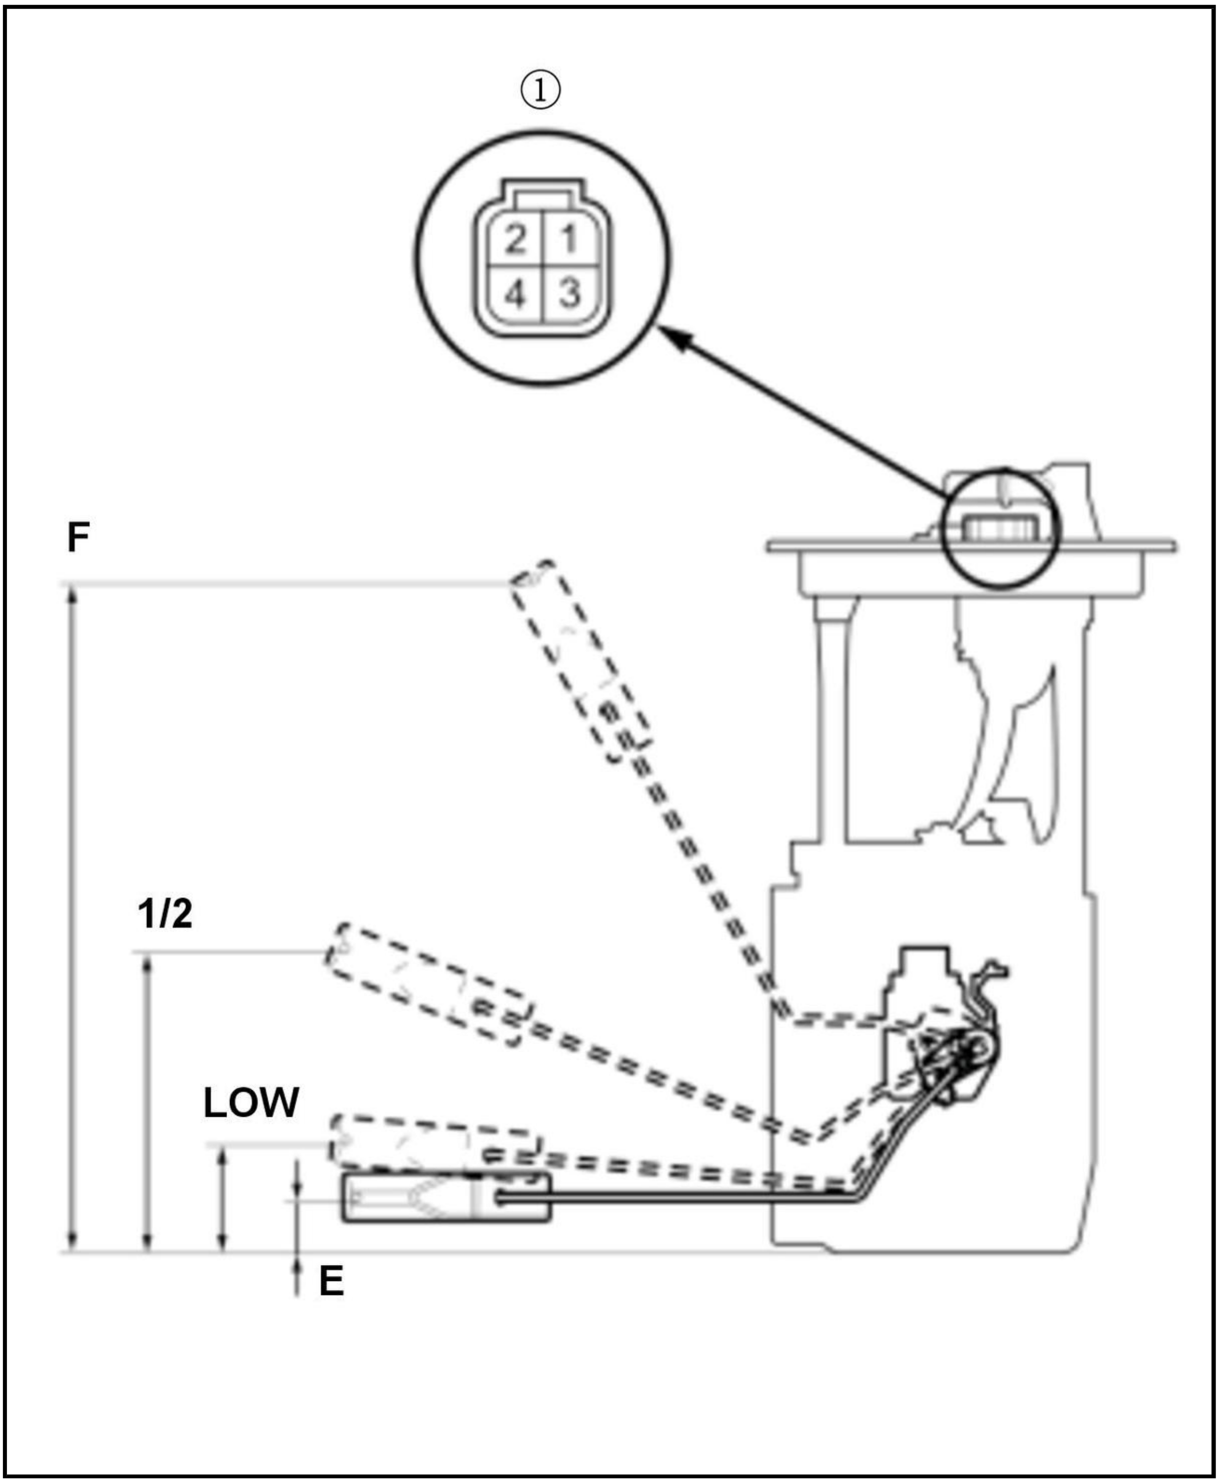
- PGM-FI system: P0462, P0463
- Body electrical system: B1175, B1176

3. **Fuel Tank Unit - Remove**
4. Fuel Gauge Sending Unit - Test

1. Measure the resistance between the following terminals with the float at E (EMPTY), LOW (LOW FUEL INDICATOR), 1/2 (HALF FULL), and F (FULL) positions. If you do not get the following readings, **replace the fuel gauge sending unit** .

Test circuit	Connector	Terminal
FUEL_GAUGE+	Fuel tank unit 4P connector (male terminals): ①	No. 2
FUEL_GAUGE-		No. 4

Float Position	F8.815 in (223.9 mm)	1/23.929 in (99.8 mm)	LOW1.350 in (35.3 mm)	E0.642 in (16.3 mm)
Resistance (Ω)	19 to21	193 to 203	464.4 to 656.6	772 to788



2. Reconnect the fuel tank unit connector.

3. Move the float to F, then turn the vehicle to the ON mode.

4. Check that the fuel gauge indicates F with the float at F.

- If the fuel gauge does not indicate F, **replace the gauge control module** .
- If the gauge is OK, the test is complete.

5. Turn the vehicle to the OFF mode and remove the **No. A18 fuse** and the **No. D7 fuse** for at least 10 seconds after completing the test, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.

LOW FUEL INDICATOR TEST

Test

1. Low Fuel Indicator - Test

1. Do the gauge control module self-diagnostic function.
    - If the low fuel indicator flashes, go to step 2.
    - If the low fuel indicator does not flash, replace the gauge control module .
2. Check for body electrical system DTCs.
    - If any DTCs are indicated, do the indicated DTC's troubleshooting.
    - If no DTCs are indicated, go to step 3.
3. Do the fuel gauge sending unit test.

TROUBLESHOOTING

ELECTRICAL COMPASS TROUBLESHOOTING

NOTE:

- Check the vehicle 12 volt battery condition first .
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check if the azimuth (direction) information is displayed in the audio display.

Is the azimuth (direction) information displayed?

YES

Go to step 2.

NO

Go to step 6.

2. Problem verification 2

   -1. Check if the audio display is flashing the CAL and NW.

   Are the CAL and NW flashing?

   YES

   Replace the electrical compass unit .

   NO

   Go to step 3.

3. Problem verification 3

   -1. **Do the Electrical Compass Calibration**.

   Is the calibration completed?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 4.

4. Determine possible failure area (electrical compass unit, others)

   -1. **Go into the System Diagnostic Mode, and select the Vehicle Status in the System Links to check the vehicle speed pulse** .

   -2. With the help of an assistant, test-drive the vehicle and watch the VSP signal.

   Is the vehicle speed indicated?

   YES

   Replace the electrical compass unit .

   NO

   Go to step 5.

5. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector A (24P)
Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected

B	Gauge control module connector A (32P): disconnected
Test point 1	**Audio unit connector A (24P) No. 14**
Test point 2	**Gauge control module connector A (32P) No. 30**

Test point 1	**Audio unit connector A (24P) No. 24**
Test point 2	**Gauge control module connector A (32P) No. 31**

Is there 1.0 Ω or less?

YES

Replace the audio unit .

NO

Repair an open in the wire(s).

6. Open wire check (IG1_METER line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Electrical compass unit 6P connector No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1_METER wire is OK. Go to step 7.

NO

Repair an open or high resistance in the wire.

7. Open wire check (GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Electrical compass unit 6P connector No. 5**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

8. Shorted wire check (COMPASS lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector C (32P)
Electrical compass unit 6P connector

-3. Measure the resistance between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector C (32P): disconnected
B	Electrical compass unit 6P connector: disconnected

Connector	**Terminal**
Electrical compass unit 6P connector	No. 1
	No. 2
	No. 3
	No. 4

Is there 1.0 MΩ or more?

YES

The COMPASS wires are not shorted to ground. Go to step 9.

NO

Repair a short to body ground in the wire(s).

9. Open wire check (COMPASS lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector C (32P): disconnected
B	Electrical compass unit 6P connector: disconnected

Test point 1:Audio unit connector C (32P)	**Test point 2:Electrical compass unit 6P connector**
No. 12	No. 1
No. 11	No. 2
No. 4	No. 3
No. 3	No. 4

Is there 1.0 Ω or less?

YES

The COMPASS wires are OK. Go to step 10.

NO

Repair an open in the wire(s).

10. Electrical compass unit check (substitution)

    -1. **Substitute a known-good electrical compass unit** .

    -2. Reconnect all the connectors, and recheck.

    Does the symptom go away?

    YES

    Replace the original electrical compass unit .

    NO

    Replace the audio unit .

PADDLE SHIFTER CIRCUIT TROUBLESHOOTING

SRS components are located in this area. **Review the SRS component locations** and **the precautions and procedures** before doing repair or service.

NOTE: Information marked with an asterisk (*1) applies to the paddle shifter + line, and an asterisk (*2) applies to the paddle shifter - line.

1. Problem verification

    -1. **Connect the HDS to the DLC** .

    -2. Turn the vehicle to the ON mode.

    -3. Check the parameter(s) below with the HDS when repeatedly pressing and releasing the paddle shifter.

Signal	Current conditions	
	Values	Unit
Upshift Switch (ST)	B	B
Downshift Switch (ST)	B	B

    Is ON indicated when you are pressing the paddle shifter and OFF with the paddle shifter released?

    YES

    Intermittent failure, the system is OK at this time.

    NO

    The failure is duplicated. Go to step 2.

2. Paddle shifter check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. **Remove the paddle shifter** .

    -3. **Test the paddle shifter** .

Is the paddle shifter OK?

YES

The paddle shifter is OK. Go to step 3.

NO

Replace the paddle shifter .

3. Determine possible failure area (PADDLE_SW_UP line* 1/PADDLE_SW_DOWN line* 2, others):-1.

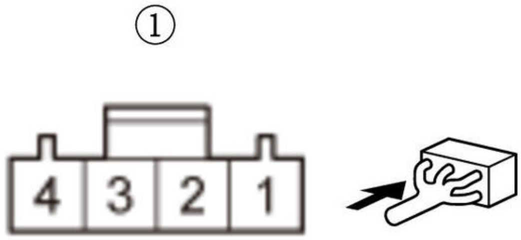
Temporarily install the steering wheel, then connect the following connector.

Cable reel connector D (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Paddle shifter + 4P connector* 1: disconnected
B	Paddle shifter - 4P connector* 2: disconnected
Test point 1	Paddle shifter + 4P connector (female terminals) No. 2* 1: ①
B	Paddle shifter - 4P connector (female terminals) No. 3* 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

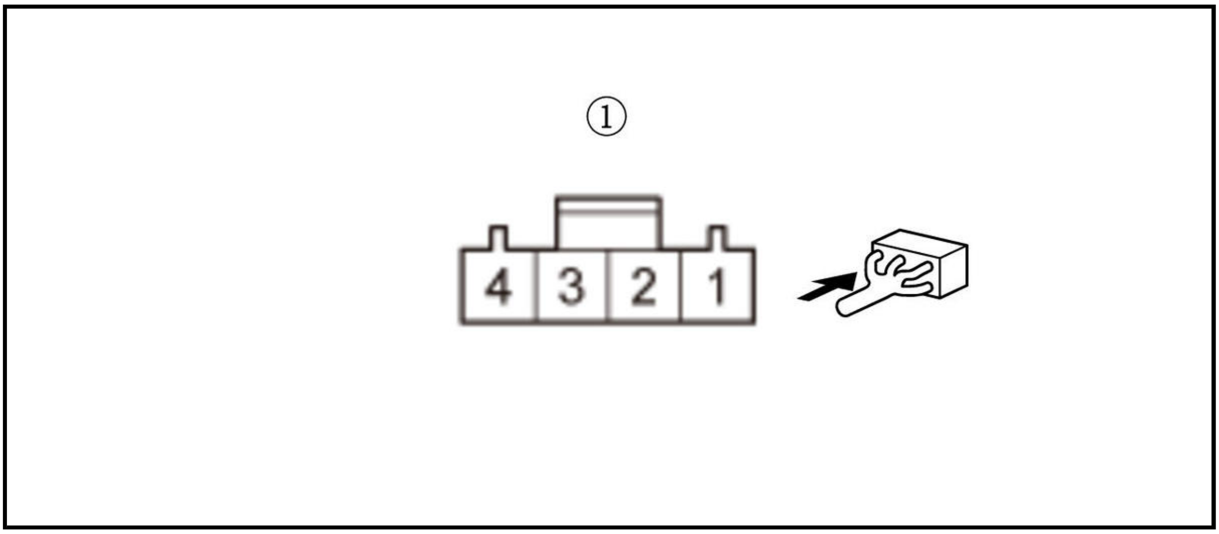
Go to step 5.

4. Open wire check (STRG_GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Paddle shifter + 4P connector* 1: disconnected
B	Paddle shifter - 4P connector* 2: disconnected
Test point 1	Paddle shifter + 4P connector (female terminals) No. 4* 1: ①
B	Paddle shifter - 4P connector (female terminals) No. 1* 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The STRG_GND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the STRG_GND wire between the paddle shifter and ground (G401), or repair poor ground (G401).

5. Shorted wire check (PADDLE_SW_UP line* 1/PADDLE_SW_DOWN line* 2):-1.

Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

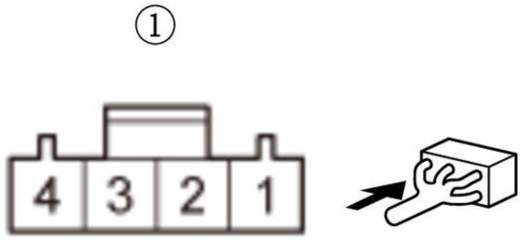
-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Paddle shifter + 4P connector* 1: disconnected
B	Paddle shifter - 4P connector* 2: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Paddle shifter + 4P connector (female terminals) No. 2* 1: ①

B	Paddle shifter - 4P connector (female terminals) No. 3* 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PADDLE_SW_UP wire* 1/PADDLE_SW_DOWN wire* 2 is not shorted. Go to step 6.

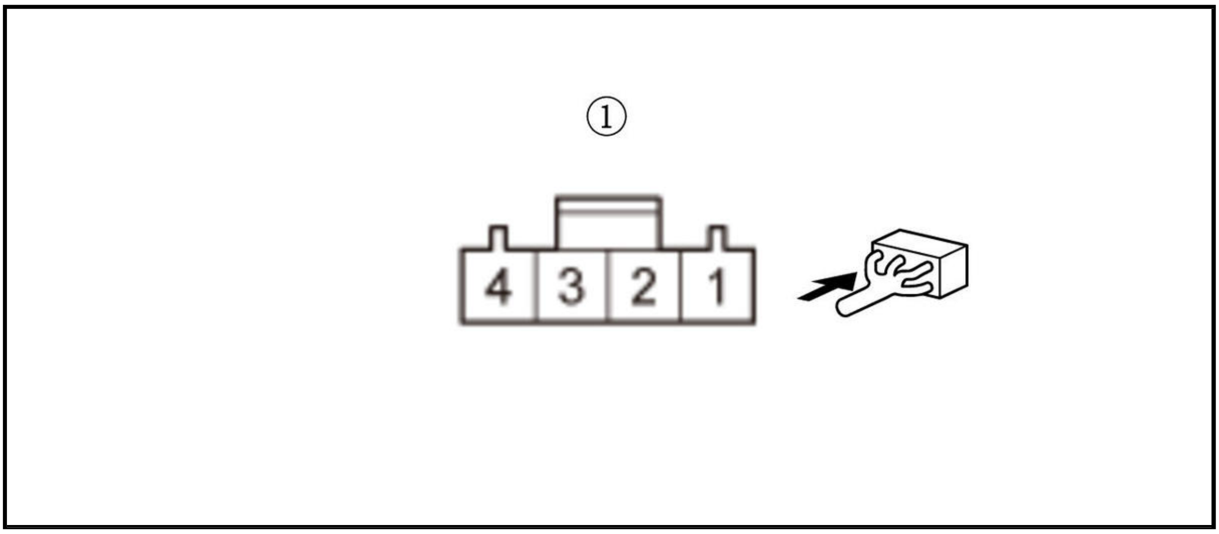
NO

Repair a short to ground in the PADDLE_SW_UP wire* 1/PADDLE_SW_DOWN wire* 2 between the paddle shifter and the PCM.

6. Open wire check (PADDLE_SW_UP line* 1/PADDLE_SW_DOWN line* 2):-1.

Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Paddle shifter + 4P connector* 1: disconnected
B	Paddle shifter - 4P connector* 2: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Paddle shifter + 4P connector (female terminals) No. 2* 1: ①
Test point 2	**PCM connector A (50P) No. 12** * 1
B	B
Test point 1	Paddle shifter - 4P connector (female terminals) No. 3* 2: ①
Test point 2	**PCM connector A (50P) No. 29** * 2



Is there 1.0 Ω or less?

YES

The PADDLE_SW_UP wire* 1/PADDLE_SW_DOWN wire* 2 is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the PADDLE_SW_UP wire* 1/PADDLE_SW_DOWN wire* 2 between the paddle shifter and the PCM.

LEARNING RESET CLEAR

RESETTING THE LIFETIME POINTS

Procedure

NOTE:

- Do steps 1 through 5 within 30 seconds.
- If the "Fuel Efficiency Backlight" is "OFF" to "ON" in the custom setting, by following the instruction in the Owner's Manual.

1. Lifetime Points - Reset

1. Turn the vehicle to the ON mode.

2. Make sure that it is not the ECON mode by viewing the indicator.

NOTE: If the vehicle is in the ECON mode, turn off the ECON mode, then turn the vehicle to the OFF (LOCK) mode, then repeat this step again.

3. Press and release the brake pedal twice.

4. Press the ECON switch once, then press the ECON switch once again.

5. Confirm that the eco ambient meter color disappears.

6. Turn the vehicle to the OFF (LOCK) mode.

NOTE: The ECO score and the ECO stage indicator are not displayed unless idling for 3 minutes or driving for at least 656 ft (200 m) is done.

RESETTING THE PARKING AND BACK-UP SENSOR CONTROL UNIT

Procedure

1. Parking and Back-Up Sensor Control Unit - Reset

Reset the parking and back-up sensor control unit after doing any of the following actions:

- When you replace the parking and back-up sensor.
- When you change the parking and back-up sensor mounting location from the original location.

NOTE: Before performing the resetting procedure, make sure that each the parking and back-up sensor is connected.

Resetting Procedure

1. Turn the vehicle to the ON mode.

2. Press the parking and back-up sensor switch 10 times, within 10 seconds.

NOTE: The parking and back-up sensor switch indicator will blink.

3. Turn the vehicle to the OFF(LOCK) mode.

4. Press and hold the parking and back-up sensor switch.

5. Turn the vehicle to the ON mode.

6. Wait about 10 seconds.

NOTE: When the resetting of the parking and back-up sensor control unit is successful, the buzzer sounds for 2 seconds.

Beep for 2 sec.

7. Press the parking and back-up sensor switch.

8. Make sure that the system works normally.

HandsFreeLink System - Diagnostics - Introduction - CR-V (Except Hybrid)

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE HANDSFREELINK SYSTEM

Introduction

The HandsFreeLink (HFL) system works only with Honda approved BluetoothB®-enabled cell phones with a hands-free profile. If you are not sure if your cell phone is compatible with the HFL system or if it is configured correctly, Honda has a dedicated HandsFreeLink Customer Service and web site handsfreelink.honda.com (USA models) or handsfreelink.ca (Canada models) to answer your questions.

Always call the HandsFreeLink Customer Service first, not Tech Line because the HandsFreeLink Customer Service has the latest information about cell phone software versions, settings and other issues.

Most HFL complaints are due to pairing, configuration, or compatibility issues. Contact the HandsFreeLink Customer Service before replacing the audio-navigation unit or the audio unit.

General Operation

The HFL gives the user the convenience of hands free operation. It cannot control the cell phone's performance (call quality and signal strength). To avoid performance problems, do not put the cell phone in a metal briefcase or in a purse under the seat.

If you want a complete description of this system (how to pair a cell phone to the HFL and make and receive calls, and how to use simple voice tags), please refer to the Owner's Manual.

Checking Cell Phone Compatibility

The most important step in troubleshooting HFL issues is to identify the customer's cell phone model, the software version, and the cellular carrier that experiences the HFL problem. Not all cell phones with the Bluetooth feature and a hands-free profile are compatible with the Honda HFL system.

Go to handsfreelink.honda.com (USA models) or handsfreelink.ca (Canada models), or call the HandsFreeLink Customer Service (see web site), and check if the customer's cell phone is approved to work with the Honda HFL system.

NOTE:

- The approved cell phone list is constantly changing, so check them frequently.
- Cell Phones may be removed from the approved list if a software bug is discovered that makes the cell phone incompatible.

Pairing a Cell Phone (Display audio type)

NOTE:

- To pair a cell phone, the vehicle has to be parked by applying the parking brake.
- The screens detail indicated may change depending on equipment or specification.

1. Make sure the cell phone you are pairing is on and in its discovery mode.

2. Turn the vehicle to the ACCESSORY mode, and select OK on the disclaimer screen.

3. Press the HOME button, then select the Phone icon from the HOME screen.

NOTE: **Before pairing a cell phone, set the Automatic Phone Sync to ON or OFF.**

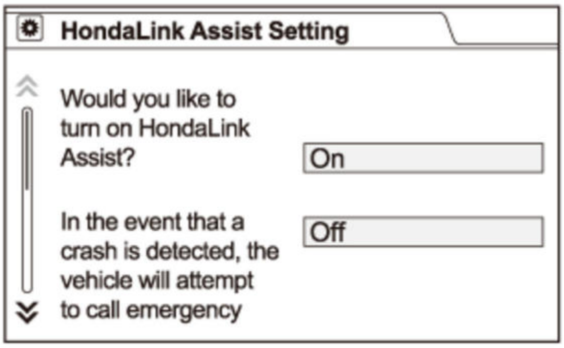
Disconnect

10. If the HondaLink Assist Setting screen appears on the display, select On or Off, then press the BACK button to exit the screen.



HondaLink Assist Setting

Would you like to turn on HondaLink Assist? On

In the event that a crash is detected, the vehicle will attempt to call emergency Off

Pairing Troubleshooting

Many pairing issues are resolved by altering the customer's cell phone settings.

If you cannot get an approved HFL phone to pair, go to handsfreelink.honda.com (USA models) or handsfreelink.ca (Canada models), or contact the HandsFreeLink Customer Service.

Dropped Calls

Customers may perceive dropped calls as being an HFL system fault, but most dropped calls are resultant from phone and cell phone carrier issues.

Always confirm with the customer if the number of dropped calls is higher while using the HFL system as opposed to using the cell phone only. Customers often confuse problems with their cell phone or carrier as a problem with the HFL system. The HFL system cannot control or determine the following issues:

- Cellular connection quality
- Signal strength
- Cellular coverage
- Ambient weather conditions that affect cellular signals

When a customer complains about dropped calls, ask questions about when or where the calls are dropped, such as:

- Do you drive the same route on a regular basis?
- Does the call drop in the same location?
- Where do you keep your cell phone?
- Have you compared the number of dropped calls using the HFL versus making calls from the handset?

There are many reasons for a dropped call that are not related to the HFL system. Here are some causes for dropped calls:

- If the quantity of dropped calls is about the same when the customer uses the HFL system versus the handset, the issue is likely due to the cellular phone or carrier.
- If the cell phone is equipped with a retractable antenna, it needs to be extended to maximize signal strength.
- If a customer also notices that the calls tend to drop in the same areas, the HFL system may be operating normally, but something about the area diminishes cellular coverage to a point where the call drops.
- Hills or mountains can block or interfere with cellular signals.
- High-rise buildings, bridges, or other large structures may block or interfere with cellular signals.
- Electrical storms, heavy rain, or overcast conditions interfere with signal strength.
- Placing the phone in a purse, in a metal briefcase, under the seat, in the glove box, or in the trunk can all affect signal reception.

- There are coverage gaps in the mobile service. When driving, a call is typically passed from one tower to another. If the customer drives through an area where there is a coverage gap between towers, the call drops.
- The cell phone battery's state of change can affect signal reception. A low battery may reduce the cell phone's ability to boost the antenna's power and function properly, especially in low signal strength areas. Some phone manufacturers trade off signal transmission and reception strength for battery life. As the battery weakens, the signal strength may also weaken. Some phones may operate more effectively than others in low signal strength areas especially with a partially charged battery.

DESCRIPTION & OPERATION

HANDSFREELINK SYSTEM DESCRIPTION

The HandsFreeLink (HFL) automatically connects (pairs) to a linked phone when the vehicle is in the ACCESSORY or ON mode. The HFL also synchronizes with the paired cell phone's phone book to automatically update any changes. Depending on the functions of the cell phone, the automatic update may not work.

HandsFreeLink Control Unit

The audio-navigation unit or the audio unit has the HFL circuit and the BluetoothB® transceiver. The HFL microphone in the roof console is connected directly to the audio-navigation unit or the audio unit. The HFL functions are controlled by the HFL switch.

Diagnostic Function

The audio-navigation unit or the audio unit can check the HFL system components by the System Diagnostic Mode:

- Display audio type: Checks the connection between the audio/navigation system and the internal BluetoothB® module.
- Display audio type: Checks the voice input level of the HFL microphone.
- Color audio type: Checks the connection between the audio unit and the HFL microphone.
- Checks the status of the HFL switch detection.

Pairing a Cell Phone

The audio-navigation unit or the audio unit can be paired with a Honda approved cell phone by BluetoothB® communication. Pairing procedures vary by the connection history and Bluetooth version of the cell phone. Refer to the Owner's Manual.

When the BluetoothB® cell phone that supports PBAP and AT Command is connected, the phone book data in the cell phone is transferred to the audio-navigation unit or the audio unit automatically. A function to delete an item in the phone book is not supported.

General Operation

The HFL switch on the steering wheel is used to answer incoming calls, to make outgoing calls, or to end a call.

- With multi-information display: The HFL switch signal is sent to the gauge control module using a serial bus (LIN), then the signal is sent to the audio-navigation unit or the audio unit using the B-CAN. The HFL information is sent to the gauge control module to display on the multi-information display (MID) using the dedicated digital signal line (LVDS2).
- Without multi-information display: The HFL switch signal from the resistor divider circuit is sent to the audio unit directly.

The HFL microphone picks up the driver's voice, and sends the signal to the audio-navigation unit or the audio unit. The signal is then sent from the BluetoothB® module to the cell phone.

The caller's voice signal is sent from the cell phone to the BluetoothB® transceiver. The audio-navigation unit or the audio unit outputs the voice signal through the front door speakers.

Muting Logic

When you are talking on the cell phone using the HFL system, the front speakers provide the HFL sound and the rear speakers are muted. **Refer to the Audio System Description** for muting signal logic with the audio-navigation unit or the audio unit.

Voice Tag Function (Display Audio type)

The audio-navigation unit or the audio unit can store voice tag on the memory for making a HFL call by voice recognition possible. The voice tag stored on the audio-navigation unit or the audio unit is related with Speed Dial.

Voice Control Function

The audio unit has voice recognition function about the HFL. Using the TALK button on the steering wheel to activate the voice control. The customer can make a call by talking a number or a contact name*. As for vehicles with navigation, the audio-navigation unit controls the HFL by the navigation voice control system.

*: Display audio type

Fan Mute Operation

When the voice recognition is in use, the audio-navigation unit or the audio unit sends the fan mute signal to the climate control unit using the B-CAN. The blower fan operating voltage may be reduced depending on the current fan speed.

Text/e-Mail (Display Audio Type)

The audio-navigation unit or the audio unit processes the short message service (SMS) data sent from the cell phone. When the BluetoothB® cell phone that supports Message Access Profile (MAP) is connected, the audio-navigation unit or the audio unit processes the Multimedia message service (MMS) and the e-Mail data sent from the cell phone.

The text message information is displayed on the center display unit. Also, the MID in the gauge control module displays the Text/e-Mail status by pop-up screen.

The audio-navigation unit or the audio unit can read out the text message using the Text-to-Speech (TTS) engine. The voice outputs to driver's and front passenger's speakers.

Operation Restriction

The audio-navigation unit or the audio unit has a function that restricts certain operation of HFL system that may affect safe driving.

HFL Switch

The HFL switch and the audio remote switch are integrated to the audio remote-HFL switch. **Refer to the Audio System Description** .

HFL Microphone

The HFL microphone receives voice command or HFL speech, and transmits them to the audio-navigation unit or the audio unit.

Array Microphone

The HFL microphone consist of two microphones. These microphones detects the driver's voice and the passenger's voice separately.

For display audio type, the microphone is switching the directivity by the voltage change on the HFT MUTE line.

B	Description	HFT MUTE Signal
HFL/NAVI voice recognition mode	When using the HFL voice tag function, HFL voice control function, or the navigation voice recognition function that is embedded into the audio-navigation unit or the audio unit, this mode suppresses noises from the passenger's side to achieve the voice recognition enhancement.	0 - 1.5 V
HFL telephone mode	When using the HandsFreeLink via the audio-navigation unit or the audio unit, this mode achieves low-latency using digital processing to voice signal from bidirectional microphones.	3 - 5 V
Server voice recognition mode	When using the voice recognition system via an external device (like smartphone), this mode suppresses background noise to achieve the voice recognition enhancement.	7 - 9.5 V

TROUBLESHOOTING

HANDSFREELINK SYSTEM TROUBLESHOOTING

NOTE:

- Check the vehicle 12 volt battery condition first .
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .
- Make sure the Bluetooth cell phone is Honda approved and configured correctly. Online, go to handsfreelink.honda.com, or call the HandsFreeLink Customer Service at 888-528-7876.
- You must be able to duplicate the customer's concern to successfully diagnose the problem.
- Always use the customer's Bluetooth cell phone to successfully diagnose the problem.

1. Determine possible failure area (Bluetooth cell phone, others) 1

   -1. Make sure the Bluetooth cell phone is approved by checking handsfreelink.honda.com, or call the HandsFreeLink Customer Service at 888-528-7876.

   Is the Bluetooth cell phone approved?

   YES

The failure is duplicated, go to step 2.

NO

Explain to the customer that the Bluetooth cell phone is not approved. Recommend they get an approved Bluetooth cell phone. Go to handsfreelink.honda.com for a list of approved Bluetooth cell phones.

2. Determine possible failure area (Bluetooth cell phone, others) 2

   -1. Check if the Bluetooth cell phone has any special requirements (software version, configuration, etc.).

   Is the correct software version loaded and is the Bluetooth cell phone properly configured?

   YES

   Go to step 3.

   NO

   Explain to your customer that the Bluetooth cell phone software needs to be updated or the Bluetooth cell phone needs to be configured properly. If the HandsFreeLink Customer Service is able to help you configure the phone, explain the proper settings, otherwise direct your customer to contact their Bluetooth cell phone manufacturer or carrier.

3. Determine possible failure area (Bluetooth cell phone, others) 3

   -1. Check the features of the approved Bluetooth cell phone.

   Are all the features approved?

   YES

   Go to step 4.

   NO

   Check and see if the feature that is not approved is the same as the customer complaint. If the complaint is about the feature that is not approved, the vehicle is OK. Explain to the customer that the feature is not approved to work with the HFL.

4. Problem verification

   -1. Try to duplicate the problem or have the customer demonstrate the problem.

   Can you duplicate the problem?

   YES

   Go to step 5.

   NO

   Intermittent failure, the system is OK at this time.

5. HFL module check

   -1. Pair the Bluetooth cell phone to a known-good vehicle (same model, year, and trim), and try duplicate the problem.

   Does the Bluetooth cell phone have the same problem on the known-good vehicle?

YES

Call the HandsFreeLink Customer Service at 888-528-7876 to make sure the Bluetooth cell phone is configured correctly and has the correct software. If the Bluetooth cell phone is configured correctly, it is either a characteristic of the HFL system, or a characteristic of the particular approved Bluetooth cell phone being used. Explain to your customer that this is a system characteristic. Another Bluetooth cell phone from the approved Bluetooth cell phone list may give more favorable results.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

SYMPTOM TROUBLESHOOTING

HANDSFREELINK SYSTEM SYMPTOM TROUBLESHOOTING - HFL DOES NOT WORK PROPERLY

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- You must be able to duplicate the customer's concern to successfully diagnose the problem. If you cannot duplicate the issue, have the customer demonstrate it.
- Check the connectors for poor connections or loose terminals.
- The front HFL-navigation-ANC/active sound control microphone and the front HFL-ANC/active sound control microphone are the same parts.

1. HFL switch input check

   -1. Turn the vehicle to the ON mode.

Display audio type: Go into the System Diagnostic Mode, and use the Hard Key to check the HFL switch (PICK-UP button, HANG-UP/BACK button, TALK button);

- **With navigation**
- **Without navigation**

Color audio type: **Go into the System Diagnostic Mode, and use the Knob Check in the Version/System to check the HFL switch (PICK-UP button, HANG-UP/BACK button, TALK button)** .

Does all the HFL switch buttons respond?

YES

Go to step 2.

NO

Go to Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting .

2. Bluetooth module check:

   Display audio type: Go into the System Diagnostic Mode, and use the HFL/Mic to check the Bluetooth Connection Diagnosis;

   - **With navigation**
   - **Without navigation**

   Color audio type: **Go into the System Diagnostic Mode, and use the Version Display in the Version/System to check the Bluetooth module** .

   Does the status indicate OK?

   YES: Display audio type

   Go to step 3.

   YES: Color audio type

   Go to step 4.

   NO: With navigation

   Replace the audio-navigation unit .

   NO: Without navigation

   Replace the audio unit .

3. Microphone input check (display audio type):

   Go into the System Diagnostic Mode, and use the HFL/Mic to check the microphone;

   - **With navigation**
   - **Without navigation**

   -2. Press the TALK button, then say "testing" in front of the microphone to check the Mic level.

   Is the microphone level OK?

YES

Go to step 5.

NO

Go to step 7.

4. In Line Diag check (color audio type)

   -1. **Go into the System Diagnostic Mode, and use the In Line Diag in the Version/System to check the microphone connection** .

   Does the HFL MIC indicate OK?

   YES

   Go to step 5.

   NO

   Go to step 7.

5. Mobile phone connection check (known-good phone)

   -1. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

   -2. Pair a known-good cell phone with Bluetooth to the customer's vehicle.

   Can you pair the cell phone?

   YES

   Go to step 6.

   NO: With navigation

   Replace the audio-navigation unit .

   NO: Without navigation

   Replace the audio unit .

6. Problem verification

   -1. Pair the customer's cell phone with Bluetooth to the customer's vehicle.

   Can you pair the cell phone, and does it operate normally?

   YES

   The HFL system is OK at this time. Inquire if there are any known issues for the problem.

   NO

   The customer's cell phone is defective or not compatible.

7. Determine possible failure area (microphone signal circuit, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

HFL microphone 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**HFL microphone 8P connector No. 1**
Test point 2	**HFL microphone 8P connector No. 2**

Is there about 8.0 V?

YES

Go to step 8.

NO

Go to step 11.

8. Determine possible failure area (MIC PWR line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**HFL microphone 8P connector No. 4**
Test point 2	Body ground

Is there about 8.0 V?

YES

Replace the HFL microphone .

NO

Go to step 9.

9. Open wire check (MIC PWR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 7**
B	**Audio unit connector C (32P) (without navigation) No. 7**
Test point 2	Body ground

Is there about 8.0 V?

YES

Repair an open in the wire.

NO

The MIC PWR wire is not open. Go to step 10.

10. Shorted wire check (MIC PWR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector C (32P) (with navigation)Audio unit connector C (32P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	HFL microphone 8P connector: disconnected
B	Audio-navigation unit connector C (32P) (with navigation): disconnectedAudio unit connector C (32P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 7**
B	**Audio unit connector C (32P) (without navigation) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

11. Determine possible failure area (MIC GND line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected

Test point 1	**HFL microphone 8P connector No. 2**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

Go to step 12.

12. Open wire check (MIC+ line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The MIC+ wire is not open. Go to step 13.

13. Shorted wire check (MIC+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector C (32P) (with navigation)Audio unit connector C (32P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	HFL microphone 8P connector: disconnected
B	Audio-navigation unit connector C (32P) (with navigation): disconnectedAudio unit connector C (32P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The MIC+ wire is not shorted to ground. Go to step 14.

14. Shorted wire check (MIC+ line to MIC GND line, SH MIC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	HFL microphone 8P connector: disconnected
B	Audio-navigation unit connector C (32P): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 6**
B	**Audio unit connector C (32P) (without navigation) No. 6**
Test point 2	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**

Test point 1	Audio-navigation unit connector C (32P) (with navigation) No. 22
B	Audio unit connector C (32P) (without navigation) No. 22
Test point 2	Audio-navigation unit connector C (32P) (with navigation) No. 23
B	Audio unit connector C (32P) (without navigation) No. 23

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

The Honda approved Bluetooth cell phone is having problems pairing to the vehicle	**HFL System Troubleshooting**	B
The Honda approved Bluetooth cell phone cannot use all its functions	**HFL System Troubleshooting**	B
The Honda approved Bluetooth cell phone does not place or receive calls using the HFL system	**HFL System Troubleshooting**	B

DESCRIPTION & OPERATION

HANDSFREELINK SYSTEM DESCRIPTION

The HandsFreeLink (HFL) automatically connects (pairs) to a linked phone when the vehicle is in the ACCESSORY or ON mode. The HFL also synchronizes with the paired cell phone's phone book to automatically update any changes. Depending on the functions of the cell phone, the automatic update may not work.

HandsFreeLink Control Unit

The audio-navigation unit or the audio unit has the HFL circuit and the BluetoothB® transceiver. The HFL microphone in the roof console is connected directly to the audio-navigation unit or the audio unit. The HFL functions are controlled by the HFL switch.

Diagnostic Function

The audio-navigation unit or the audio unit can check the HFL system components by the System Diagnostic Mode:

- Display audio type: Checks the connection between the audio/navigation system and the internal BluetoothB® module.
- Display audio type: Checks the voice input level of the HFL microphone.
- Color audio type: Checks the connection between the audio unit and the HFL microphone.
- Checks the status of the HFL switch detection.

Pairing a Cell Phone

The audio-navigation unit or the audio unit can be paired with a Honda approved cell phone by BluetoothB® communication. Pairing procedures vary by the connection history and Bluetooth version of the cell phone. Refer to the Owner's Manual.

When the BluetoothB® cell phone that supports PBAP and AT Command is connected, the phone book data in the cell phone is transferred to the audio-navigation unit or the audio unit automatically. A function to delete an item in the phone book is not supported.

General Operation

The HFL switch on the steering wheel is used to answer incoming calls, to make outgoing calls, or to end a call.

The HFL switch signal is sent to the gauge control module using a serial bus (LIN), then the signal is sent to the audio-navigation unit or the audio unit using the B-CAN. The HFL information is sent to the gauge control module to display on the multi-information display (MID) using the dedicated digital signal line (LVDS2).

The HFL microphone picks up the driver's voice, and sends the signal to the audio-navigation unit or the audio unit. The signal is then sent from the BluetoothB® module to the cell phone.

The caller's voice signal is sent from the cell phone to the BluetoothB® transceiver. The audio-navigation unit or the audio unit outputs the voice signal through the front door speakers.

Muting Logic

When you are talking on the cell phone using the HFL system, the front speakers provide the HFL sound and the rear speakers are muted. **Refer to the Audio System Description** for muting signal logic with the audio-navigation unit or the audio unit.

Voice Tag Function (Display Audio type)

The audio-navigation unit or the audio unit can store voice tag on the memory for making a HFL call by voice recognition possible. The voice tag stored on the audio-navigation unit or the audio unit is related with Speed Dial.

Voice Control Function

The audio unit has voice recognition function about the HFL. Using the TALK button on the steering wheel to activate the voice control. The customer can make a call by talking a number or a contact name*. As for vehicles with navigation, the audio-navigation unit controls the HFL by the navigation voice control system.

*: Display audio type

Fan Mute Operation

When the voice recognition is in use, the audio-navigation unit or the audio unit sends the fan mute signal to the climate control unit using the B-CAN. The blower fan operating voltage may be reduced depending on the current fan speed.

Text/e-Mail (Display Audio Type)

The audio-navigation unit or the audio unit processes the short message service (SMS) data sent from the cell phone. When the BluetoothB® cell phone that supports Message Access Profile (MAP) is connected, the audio-navigation unit or the audio unit processes the Multimedia message service (MMS) and the e-Mail data sent from the cell phone.

The text message information is displayed on the center display unit. Also, the MID in the gauge control module displays the Text/e-Mail status by pop-up screen.

The audio-navigation unit or the audio unit can read out the text message using the Text-to-Speech (TTS) engine. The voice outputs to driver's and front passenger's speakers.

Operation Restriction

The audio-navigation unit or the audio unit has a function that restricts certain operation of HFL system that may affect safe driving.

HFL Switch

The HFL switch and the audio remote switch are integrated to the audio remote-HFL switch. **Refer to the Audio System Description** .

HFL Microphone

The HFL microphone receives voice command or HFL speech, and transmits them to the audio-navigation unit or the audio unit.

Array Microphone

The HFL microphone consist of two microphones. These microphones detects the driver's voice and the passenger's voice separately.

For display audio type, the microphone is switching the directivity by the voltage change on the HFT MUTE line.

B	Description	HFT MUTE Signal
HFL/NAVI voice recognition mode	When using the HFL voice tag function, HFL voice control function, or the navigation voice recognition function that is embedded into the audio-navigation unit or the audio unit, this mode suppresses noises from the passenger's side to achieve the voice recognition enhancement.	0 - 1.5 V
HFL telephone mode	When using the HandsFreeLink via the audio-navigation unit or the audio unit, this mode achieves low-latency using digital processing to voice signal from bidirectional microphones.	3 - 5 V
Server voice recognition mode	When using the voice recognition system via an external device (like smartphone), this mode suppresses background noise to achieve the voice recognition enhancement.	7 - 9.5 V

The approved Bluetooth cell phone does not place or receive calls using the HFL system	HFL System Troubleshooting	B

HANDSFREELINK SYSTEM SYMPTOM SYMPTOM TROUBLESHOOTING

HFL DOES NOT WORK PROPERLY

HFL does not work properly

NOTE:

- Check the vehicle 12 volt battery condition first .
- You must be able to duplicate the customer's concern to successfully diagnose the problem. If you cannot duplicate the issue, have the customer demonstrate it.
- Check the connectors for poor connections or loose terminals.
- The front HFL-navigation-ANC/active sound control microphone and the front HFL-ANC/active sound control microphone are the same parts.

1. HFL switch input check

   -1. Turn the vehicle to the ON mode.

   Display audio type: Go into the System Diagnostic Mode, and use the Hard Key to check the HFL switch (PICK-UP button, HANG-UP/BACK button, TALK button);

   - With navigation
   - Without navigation

   Color audio type: Go into the System Diagnostic Mode, and use the Knob Check in the Version/System to check the HFL switch (PICK-UP button, HANG-UP/BACK button, TALK button) .

   Do the all HFL switch buttons respond?

   YES

   Go to step 2.

   NO

   Go to Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting .

2. Bluetooth module check:

   Display audio type: Go into the System Diagnostic Mode, and use the HFL/Mic to check the Bluetooth Connection Diagnosis;

- **With navigation**
- **Without navigation**

Color audio type: **Go into the System Diagnostic Mode, and use the Version Display in the Version/System to check the Bluetooth module** .

Does the status indicate OK?

YES: Display audio type

Go to step 3.

YES: Color audio type

Go to step 4.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

3. Microphone input check (display audio type):

   Go into the System Diagnostic Mode, and use the HFL/Mic to check the microphone;

   - **With navigation**
   - **Without navigation**

   -2. Press the TALK button, then say "testing" in front of the microphone to check the Mic level.

   Is the microphone level OK?

   YES

   Go to step 5.

   NO

   Go to step 7.

4. In Line Diag check (color audio type)

   -1. **Go into the System Diagnostic Mode, and use the In Line Diag in the Version/System to check the microphone connection** .

   Does the HFL MIC indicate OK?

   YES

   Go to step 5.

   NO

   Go to step 7.

5. Mobile phone connection check (known-good phone)

   -1. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-2. Pair a known-good cell phone with Bluetooth to the customer's vehicle.

Can you pair the cell phone?

YES

Go to step 6.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

6. Problem verification

-1. Pair the customer's cell phone with Bluetooth to the customer's vehicle.

Can you pair the cell phone, and does it operate normally?

YES

The HFL system is OK at this time. Inquire if there are any known issues for the problem.

NO

The customer's cell phone is defective or not compatible.

7. Determine possible failure area (microphone signal circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

HFL microphone 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**HFL microphone 8P connector No. 1**
Test point 2	**HFL microphone 8P connector No. 2**

Is there about 8.0 V?

YES

Go to step 8.

NO

Go to step 11.

8. Determine possible failure area (MIC_PWR line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**HFL microphone 8P connector No. 4**
Test point 2	Body ground

Is there about 8.0 V?

YES

Replace the HFL microphone .

NO

Go to step 9.

9. Open wire check (MIC_PWR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 7**
B	**Audio unit connector C (32P) (without navigation) No. 7**
Test point 2	Body ground

Is there about 8.0 V?

YES

Repair an open in the wire.

NO

The MIC_PWR wire is not open. Go to step 10.

10. Shorted wire check (MIC_PWR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	HFL microphone 8P connector: disconnected
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 7**
B	**Audio unit connector C (32P) (without navigation) No. 7**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

11. Determine possible failure area (MIC_GND line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected

Test point 1	**HFL microphone 8P connector No. 1**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

Go to step 12.

12. Open wire check (MIC+ line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	HFL microphone 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The MIC+ wire is not open. Go to step 13.

13. Shorted wire check (MIC+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	HFL microphone 8P connector: disconnected
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The MIC+ wire is not shorted to ground. Go to step 14.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

14. Shorted wire check (MIC+ line to MIC_GND line, SH_MIC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	HFL microphone 8P connector: disconnected
B	Audio-navigation unit connector C (32P): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 6**
B	**Audio unit connector C (32P) (without navigation) No. 6**
Test point 2	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**

Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 22**
B	**Audio unit connector C (32P) (without navigation) No. 22**
Test point 2	**Audio-navigation unit connector C (32P) (with navigation) No. 23**
B	**Audio unit connector C (32P) (without navigation) No. 23**

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

There is a short in the wires. Replace the affected shielded harness.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE HANDSFREELINK SYSTEM

Introduction

The HandsFreeLink (HFL) system works only with approved BluetoothB®-enabled cell phones with a hands-free profile. If you are not sure if your cell phone is compatible with the HFL system or if it is configured correctly, Honda has a dedicated HandsFreeLink Customer Service and web site handsfreelink.honda.com (USA models) or handsfreelink.ca (Canada models) to answer your questions.

Always call the HandsFreeLink Customer Service first, not Tech Line because the HandsFreeLink Customer Service has the latest information about cell phone software versions, settings and other issues.

Most HFL complaints are due to pairing, configuration, or compatibility issues. Contact the HandsFreeLink Customer Service before replacing the audio-navigation unit or the audio unit.

General Operation

The HFL gives the user the convenience of hands free operation. It cannot control the cell phone's performance (call quality and signal strength). To avoid performance problems, do not put the cell phone in a metal briefcase or in a purse under the seat.

If you want a complete description of this system (how to pair a cell phone to the HFL and make and receive calls, and how to use simple voice tags), please refer to the Owner's Manual.

Checking Cell Phone Compatibility

The most important step in troubleshooting HFL issues is to identify the customer's cell phone model, the software version, and the cellular carrier that experiences the HFL problem. Not all cell phones with the Bluetooth feature and a hands-free profile are compatible with the Honda HFL system.

Go to handsfreelink.honda.com (USA models) or handsfreelink.ca (Canada models), or call the HandsFreeLink Customer Service (see web site), and check if the customer's cell phone is approved to work with the Honda HFL system.

NOTE:

- The approved cell phone list is constantly changing, so check them frequently.
- Cell Phones may be removed from the approved list if a software bug is discovered that makes the cell phone incompatible.

Pairing a Cell Phone (Display audio type)

NOTE:

- To pair a cell phone, the vehicle has to be parked by applying the parking brake.
- The screens detail indicated may change depending on equipment or specification.

1. Make sure the cell phone you are pairing is on and in its discovery mode.

2. Turn the vehicle to the ACCESSORY mode, and select OK on the disclaimer screen.

3. Press the HOME button, then select the Phone icon from the HOME screen.

NOTE: Before pairing a cell phone, set the Automatic Phone Sync to ON or OFF.

crash is detected, the
vehicle will attempt
to call emergency

Pairing Troubleshooting

Many pairing issues are resolved by altering the customer's cell phone settings.

If you cannot get an approved HFL phone to pair, go to handsfreelink.honda.com (USA models) or handsfreelink.ca (Canada models), or contact the HandsFreeLink Customer Service.

Dropped Calls

Customers may perceive dropped calls as being an HFL system fault, but most dropped calls are resultant from phone and cell phone carrier issues.

Always confirm with the customer if the number of dropped calls is higher while using the HFL system as opposed to using the cell phone only. Customers often confuse problems with their cell phone or carrier as a problem with the HFL system. The HFL system cannot control or determine the following issues:

- Cellular connection quality
- Signal strength
- Cellular coverage
- Ambient weather conditions that affect cellular signals

When a customer complains about dropped calls, ask questions about when or where the calls are dropped, such as:

- Do you drive the same route on a regular basis?
- Does the call drop in the same location?
- Where do you keep your cell phone?
- Have you compared the number of dropped calls using the HFL versus making calls from the handset?

There are many reasons for a dropped call that are not related to the HFL system. Here are some causes for dropped calls:

- If the quantity of dropped calls is about the same when the customer uses the HFL system versus the handset, the issue is likely due to the cellular phone or carrier.
- If the cell phone is equipped with a retractable antenna, it needs to be extended to maximize signal strength.
- If a customer also notices that the calls tend to drop in the same areas, the HFL system may be operating normally, but something about the area diminishes cellular coverage to a point where the call drops.
- Hills or mountains can block or interfere with cellular signals.
- High-rise buildings, bridges, or other large structures may block or interfere with cellular signals.
- Electrical storms, heavy rain, or overcast conditions interfere with signal strength.
- Placing the phone in a purse, in a metal briefcase, under the seat, in the glove box, or in the trunk can all affect signal reception.
- There are coverage gaps in the mobile service. When driving, a call is typically passed from one tower to another. If the customer drives through an area where there is a coverage gap between towers, the call drops.
- The cell phone battery's state of change can affect signal reception. A low battery may reduce the cell phone's ability to boost the antenna's power and function properly, especially in low signal strength areas. Some phone manufacturers trade off signal transmission and reception strength for battery life. As the battery weakens, the signal strength may also weaken. Some phones may operate more effectively than others in low signal strength areas especially with a partially charged battery.

HANDSFREELINK SYSTEM TROUBLESHOOTING

TROUBLESHOOTING

HandsFreeLink System Troubleshooting

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information**.
- Make sure the Bluetooth cell phone is approved and configured correctly. Online, go to handsfreelink.honda.com, or call the HandsFreeLink Customer Service at 888-528-7876.
- You must be able to duplicate the customer's concern to successfully diagnose the problem.
- Always use the customer's Bluetooth cell phone to successfully diagnose the problem.

1. Determine possible failure area (Bluetooth cell phone, others) 1

   -1. Make sure the Bluetooth cell phone is approved by checking handsfreelink.honda.com, or call the HandsFreeLink Customer Service at 888-528-7876.

   Is the Bluetooth cell phone approved?

   YES

   The failure is duplicated, go to step 2.

   NO

   Explain to the customer that the Bluetooth cell phone is not approved. Recommend they get an approved Bluetooth cell phone. Go to handsfreelink.honda.com for a list of approved Bluetooth cell phones.

2. Determine possible failure area (Bluetooth cell phone, others) 2

   -1. Check if the Bluetooth cell phone has any special requirements (software version, configuration, etc.).

   Is the correct software version loaded and is the Bluetooth cell phone properly configured?

   YES

   Go to step 3.

   NO

   Explain to your customer that the Bluetooth cell phone software needs to be updated or the Bluetooth cell phone needs to be configured properly. If the HandsFreeLink Customer Service is able to help you configure the phone, explain the proper settings, otherwise direct your customer to contact their Bluetooth cell phone manufacturer or carrier.

3. Determine possible failure area (Bluetooth cell phone, others) 3

   -1. Check the features of the approved Bluetooth cell phone.

   Are all the features approved?

   YES

   Go to step 4.

   NO

Check and see if the feature that is not approved is the same as the customer complaint. If the complaint is about the feature that is not approved, the vehicle is OK. Explain to the customer that the feature is not approved to work with the HFL.

4. Problem verification

   -1. Try to duplicate the problem or have the customer demonstrate the problem.

   Can you duplicate the problem?

   YES

   Go to step 5.

   NO

   Intermittent failure, the system is OK at this time.

5. HFL module check

   -1. Pair the Bluetooth cell phone to a known-good vehicle (same model, year, and trim), and try duplicate the problem.

   Does the Bluetooth cell phone have the same problem on the known-good vehicle?

   YES

   Call the HandsFreeLink Customer Service at 888-528-7876 to make sure the Bluetooth cell phone is configured correctly and has the correct software. If the Bluetooth cell phone is configured correctly, it is either a characteristic of the HFL system, or a characteristic of the particular approved Bluetooth cell phone being used. Explain to your customer that this is a system characteristic. Another Bluetooth cell phone from the approved Bluetooth cell phone list may give more favorable results.

DTC TROUBLESHOOTING

DTC B1901

DTC B1901 : Immobilizer Unit Internal error (CPU error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1901 Immobilizer Unit Internal error (CPU error)	B

DTC (Immobilizer-Keyless Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1901 Immobilizer Unit Internal error (CPU error)	B

   Is DTC B1901 indicated?

   YES

   Replace the immobilizer-keyless control unit .

   NO

   Intermittent failure, the system is OK at this time.

DTC B1902

DTC B1902 : Immobilizer Unit Internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1902 Immobilizer Unit Internal error (EEPROM error)	B

DTC (Immobilizer-Keyless Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1902 Immobilizer Unit Internal error (EEPROM error)	B

Is DTC B1902 indicated?

YES

Replace the immobilizer-keyless control unit .

NO

Intermittent failure, the system is OK at this time.

DTC U0155, U0199, U1281, U128D (IMMOBILIZER-KEYLESS CONTROL UNIT)

DTC U0155 : Immobilizer-keyless control unit lost communication with gauge control module

DTC U0199 : Immobilizer-keyless control unit lost communication with door multiplex control unit

DTC U1281 : Lost communication with MICU (MICU frame)

DTC U128D : Lost communication with METER

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0155 Immobilizer-keyless control unit lost communication with gauge control module	B
U0199 Immobilizer-keyless control unit lost communication with door multiplex control unit	B
U1281 Lost communication with MICU (MICU frame)	B
U128D Lost communication with METER	B

DTC (Immobilizer-Keyless Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0155 Immobilizer-keyless control unit lost communication with gauge control module	B

DTC Description	DTC
U0199 Immobilizer-keyless control unit lost communication with door multiplex control unit	B
U1281 Lost communication with MICU (MICU frame)	B
U128D Lost communication with METER	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Immobilizer-keyless control unit 7P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0155	Gauge control module connector A (32P)
U0199	Power window master switch 37P connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Immobilizer-keyless control unit 7P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0155	B-CAN_H	Immobilizer-keyless control unit 7P connector	No. 4	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 5		No. 31
U0199	B-CAN_H	Immobilizer-keyless control unit 7P connector	No. 4	Power window master switch 37P connector	No. 32
	B-CAN_L		No. 5		No. 31
U1281	B-CAN_H	Immobilizer-keyless control unit 7P connector	No. 4	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 5		No. 21
U128D	B-CAN_H	Immobilizer-keyless control unit 7P connector	No. 4	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 5		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0155	Gauge control module
U0199	Power window master switch
U1281	Body control module
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (IMMOBILIZER-KEYLESS CONTROL UNIT)

DTC U1280 : Communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

DTC (Immobilizer-Keyless Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

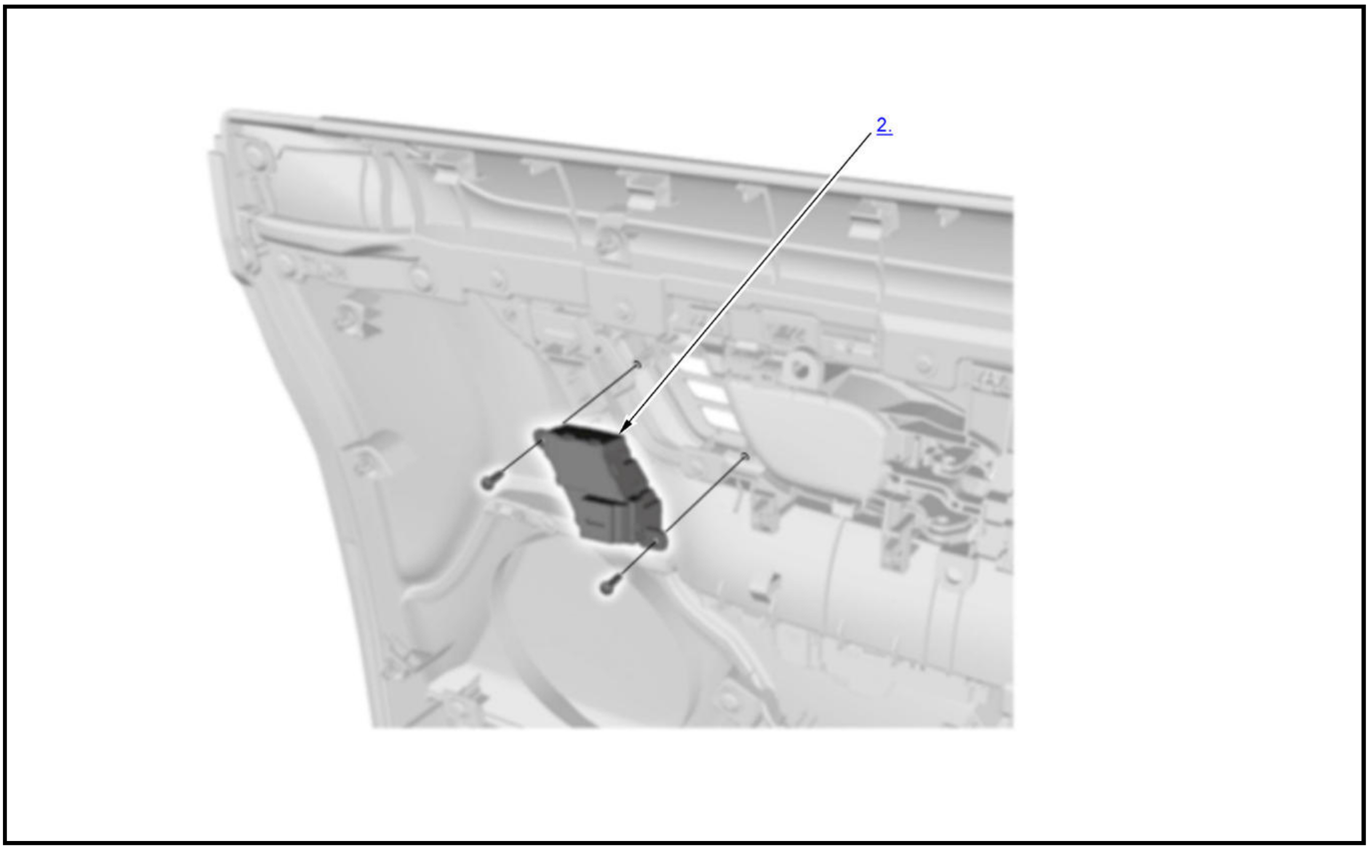
Intermittent failure, the system is OK at this time. Check for loose or poor connections.

REMOVAL & INSTALLATION TEST

DRIVING POSITION MEMORY SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



1. Driver's Door Panel - Remove
2. Driving Position Memory Switch - Remove
3. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

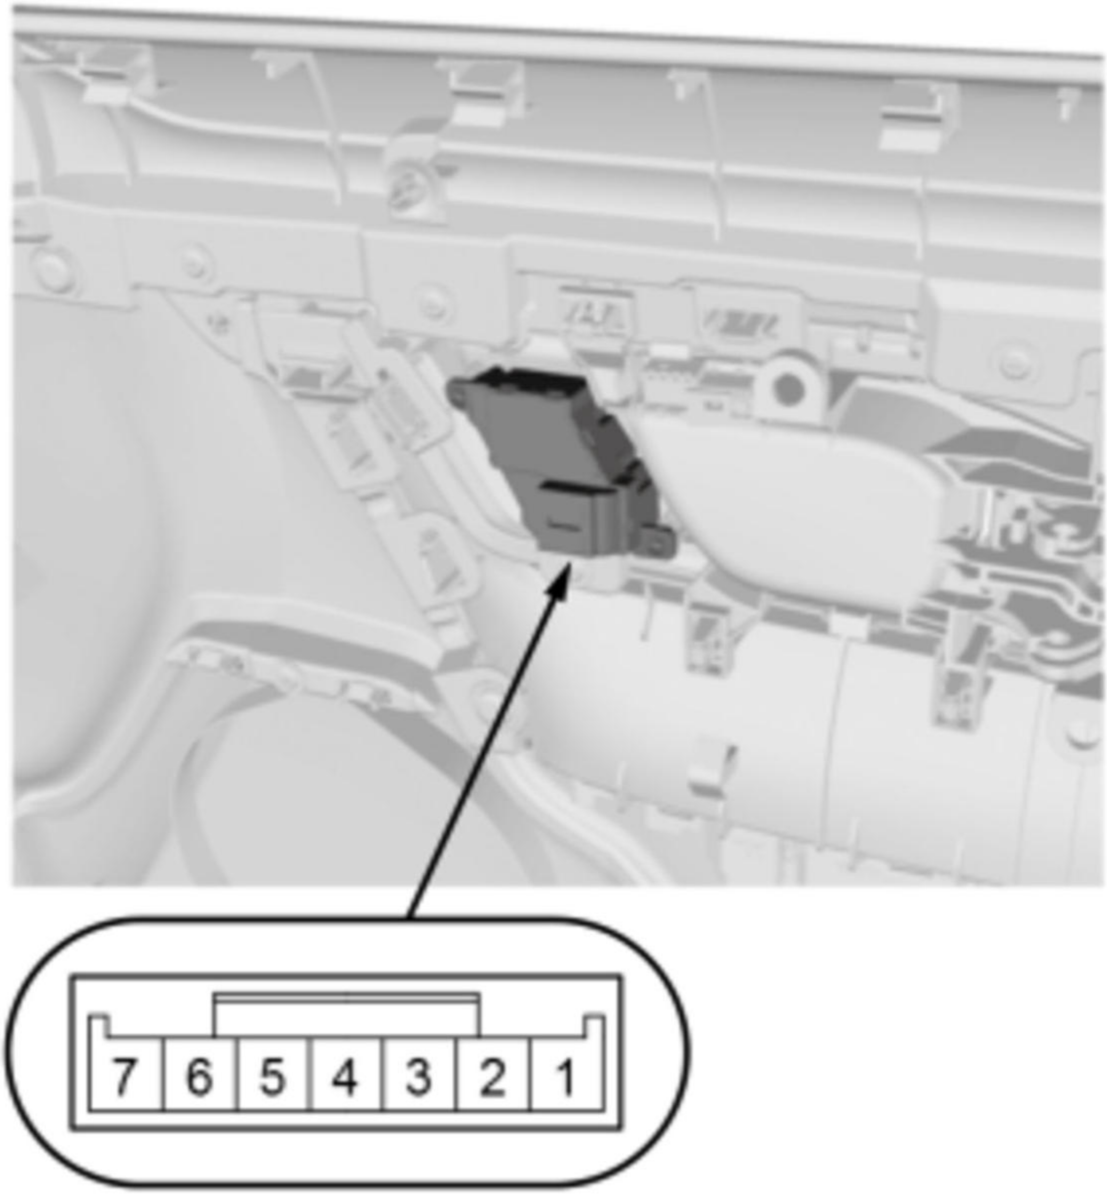
Test

1. Driving Position Memory Switch - Test

    1. Check the driving position memory switch according to the table.

NOTE:

- **Before testing, make sure not to short the driving position memory switch circuit.**
- **When an LED is located between terminals, check if the LED lights by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**



Terminal / Position		1	3	4	5	6	7		2
SET button	OFF								
	ON				○				○
Position 1 button	OFF								
	ON						○		○
Position 2 button	OFF								
	ON					○			○
Indicator 1				⊕				-ʍʍ-▷-	⊖
Indicator 2			⊕					-ʍʍ-▷-	⊖
Illumination		⊕						-ʍʍ-▷-	⊖

○—○ = Continuity check

⊕—⊖ = Voltage for LED

2. If the result is not as specified, replace the driving position memory switch.

REMOVAL AND INSTALLATION

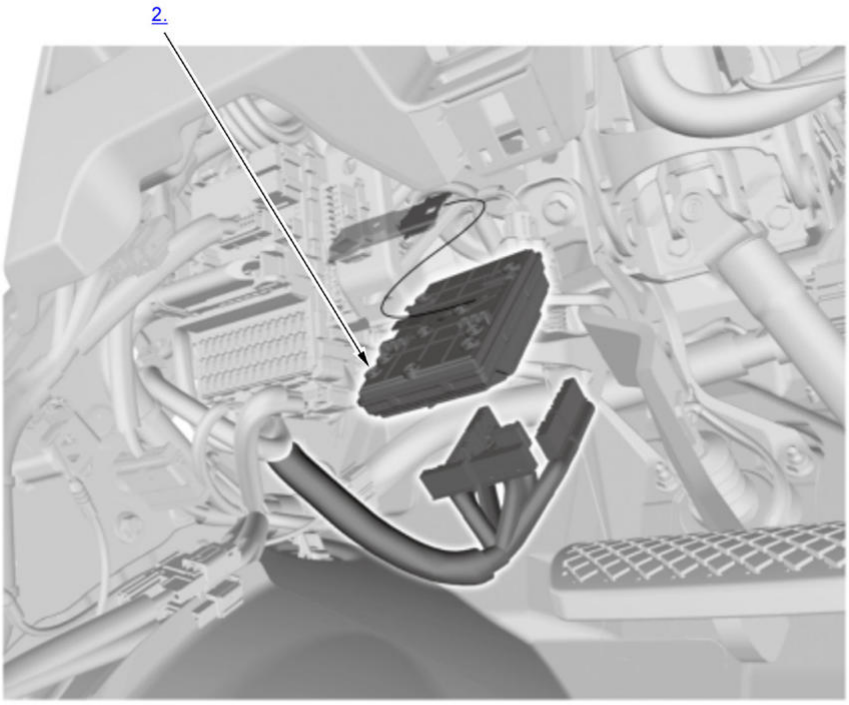
BODY CONTROL MODULE REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Without keyless access system: If the body control module is replaced, **do the immobilizer system registration** . If the original body control module is installed, confirm that all systems work properly.
- With keyless access system: If the body control module is replaced, **do the keyless access system registration** . If the original body control module is installed, confirm that all systems work properly.
- The body control module has a component of the immobilizer system. The body control module must be registered when the body control module is replaced, or the vehicle will not start.

1



1. **Driver's Dashboard Undercover - Remove**
2. Body Control Module - Remove
3. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

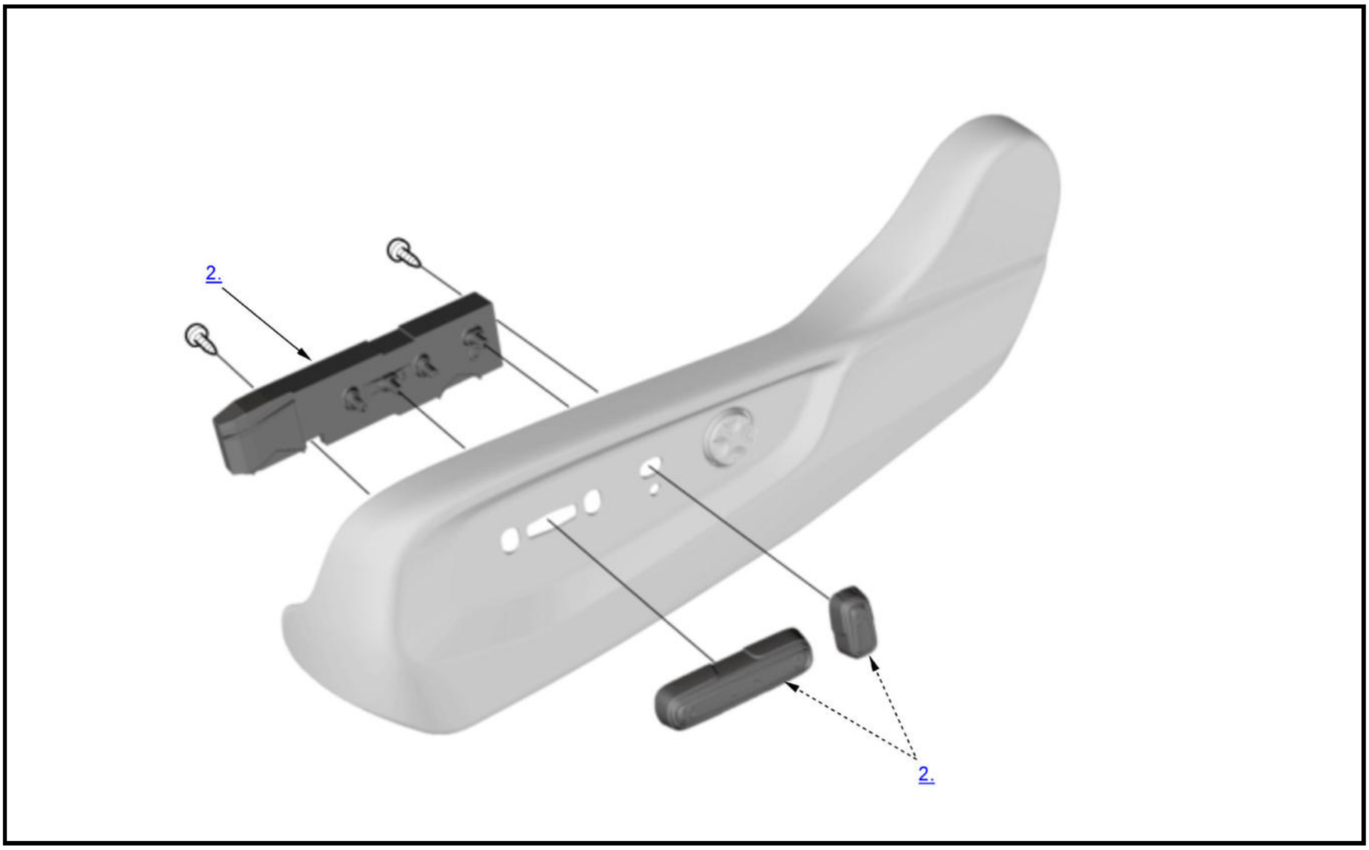
4. **Immobilizer System - Register (Without Keyless Access System)**
5. **Keyless Access System - Register (With Keyless Access System)**

POWER SEAT CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: If the replaced control unit is not a new one, **clear the driving position memory** . If the original control unit is installed, confirm that all systems work properly.

1



1. **Driver's Seat Recline Cover - Remove**

   NOTE: If you are removing the driver's seat recline cover, you do not need to remove the driver's seat.

2. Power Seat Control Unit/Power Seat Adjustment Switch - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

4. Driving Position Memory - Clear

   1. If the replaced power seat control unit is not a new one, **clear the driving position memory** .

REMOVAL AND INSTALLATION

BODY CONTROL MODULE REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- If the body control module is replaced, do the keyless access system registration . If the original body control module is installed, confirm that all systems work properly.
- The body control module has a component of the immobilizer system. The body control module must be registered when the body control module is replaced, or the vehicle will not start.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

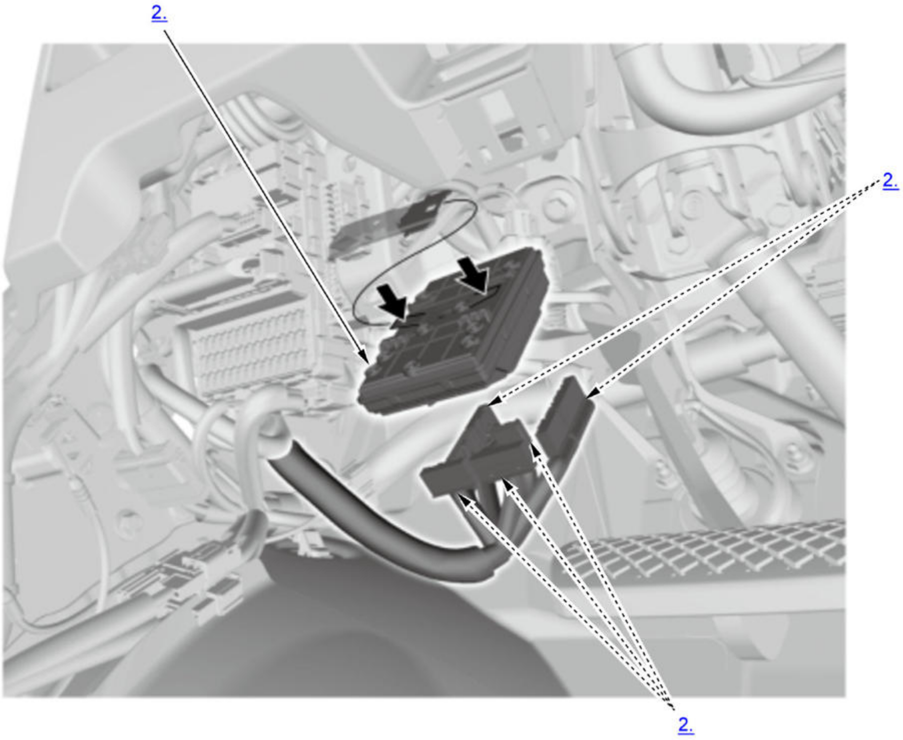


Fig. 1: Exploded View Of Body Control Module Components
Courtesy of HONDA, U.S.A., INC.

1. Driver's Dashboard Undercover - Remove
2. Body Control Module - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. Keyless Access System - Register
5. Body Control Module - Update

POWER SEAT CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE: If you are substituting a known-good power seat control unit, clear the driving position memory . If the original control unit is installed, confirm that all systems work properly.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

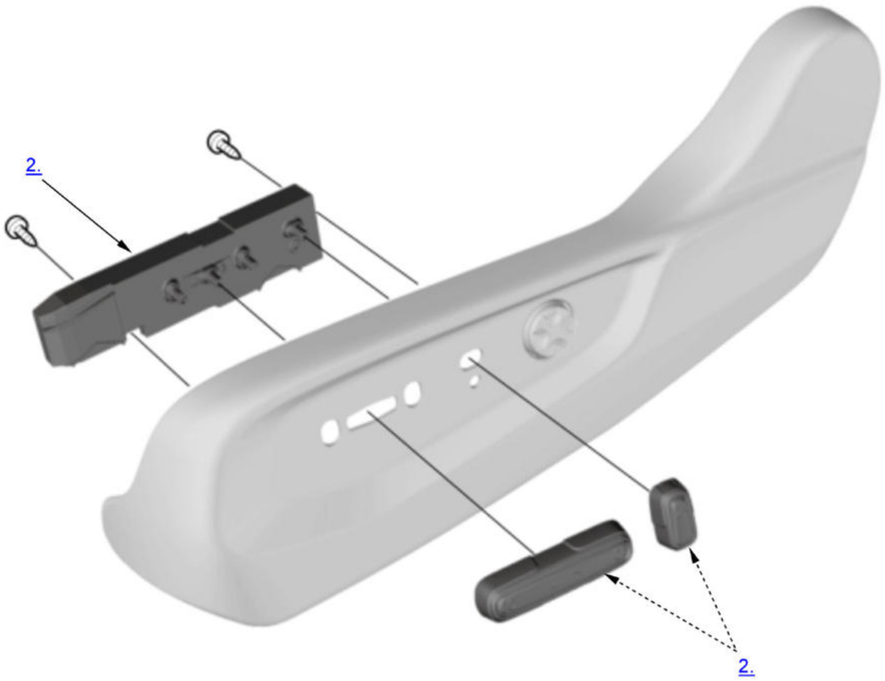

Fig. 2: Exploded View Of Power Seat Control Unit Components
Courtesy of HONDA, U.S.A., INC.

1. Driver's Seat Recline Cover - Remove

   NOTE: If you are removing the driver's seat recline cover, you do not need to remove the driver's seat.

2. Power Seat Control Unit/Power Seat Adjustment Switch - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

4. Driving Position Memory - Clear

   When substituting a known-good power seat control unit, clear the driving position memory .

REMOVAL, INSTALLATION & TEST

DRIVING POSITION MEMORY SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

	ON						○		○
Position 2 button	OFF								
	ON					○			○
Indicator 1				⊕					⊖
Indicator 2			⊕						⊖
Illumination		⊕							⊖

○—○ = Continuity check

⊕—⊖ = Voltage for LED

2. If the result is not as specified, replace the driving position memory switch.

DESCRIPTION & OPERATION

DRIVING POSITION MEMORY SYSTEM DESCRIPTION

Overview

The driving position memory system (DPMS) can automatically store the driver's seat and power mirrors positions to one of two memorized presets. Drivers can activate the system using the driving position memory switch or the remote.

Along with the seat, the power door lock settings will also be memorized based on which remote (Driver 1 or Driver 2) is used.

Memorizing a Seat Position

Turn the vehicle to the ON mode, and then move the seat to the desired position. Press the SET button on the driving position memory switch, then both of the green LED will begin to flash. Press No. 1 or No. 2 to match the remote that is to be used. There will be two more beeps confirming that the seat position have been memorized. The LED will remain lit, unless the seat is moved from the memorized position.

Memorized Position Recall with the Remotes

After the seat position is memorized, the seat moves to the memorized position when the appropriate remote UNLOCK button is pressed and the driver's door is opened. When the seat moves to the memorized position, the green LED corresponding with that remote stays lit until the position is changed or the vehicle is turned to the OFF (LOCK) mode.

Memorized Customized Setting Recall with the Remotes

Customize settings are controlled independently between the Driver 1 and 2 remotes.

Fail-safe Function

If a failure occurs related to the power supply and B-CAN inputs, the control unit detects an abnormal condition and enters a fail-safe mode stopping control of the functions.

DRIVING POSITION MEMORY SYSTEM DESCRIPTION - COMPONENTS

Power Seat Adjustment Switch

The power seat adjustment switch is located in the recline cover and combines the slide, recline, and the height switch.

Power Seat Motors/Seat Position Sensors

Each motor has a sensor that detects motor rotation and sends a pulse to the power seat control unit when the motor rotates. The control unit stores the number of pulses in its memory and uses it to memorize the seat position.

MULTIPLEX INTEGRATED CONTROL SYSTEM DESCRIPTION

Overview

The body control module is one of the F-CAN and the B-CAN components. The body control module controls many systems related to the body controller area and security system, and also works as a gateway to diagnose the other B-CAN connected ECUs with the HDS.

Self-Diagnostic Function

The body control module provides the self-diagnostic function for checking the communication and input systems.

Communication Check (Test Mode 1):

When the B-CAN BUS or the connection to the gauge control module is disconnected, an error code is shown with the number of blinks of the individual map light.

Switch Input Check (Test Mode 2):

When the input of a switch or a sensor to the body control module has changed, diagnosis of the input system can be performed on the basis of the individual map light flashing count.

HDS Diagnostics

The HDS connects to the data link connector (DLC) to communicate with the vehicle's control units. This allows the HDS to retrieve DTCs, diagnostic data, or transmit forced commands during output function tests.

Customize Memory Function

The body control module has a feature that allows the settings of certain outputs to be customized to user preferences with the HDS.

Fail-safe Function

Hardware Fail-safe Control

When a CPU problem or an abnormal power supply voltage is detected, the body control module moves to the hardware fail-safe mode, and each system output load is set to the pre-programmed fail-safe value.

Software Fail-safe Control

When any of the data from the B-CAN circuit cannot be received within a specified time, or an unusual combination of the data is recognized, the body control module moves to the software fail-safe mode. The data that cannot be received is forced to a pre-programmed value.

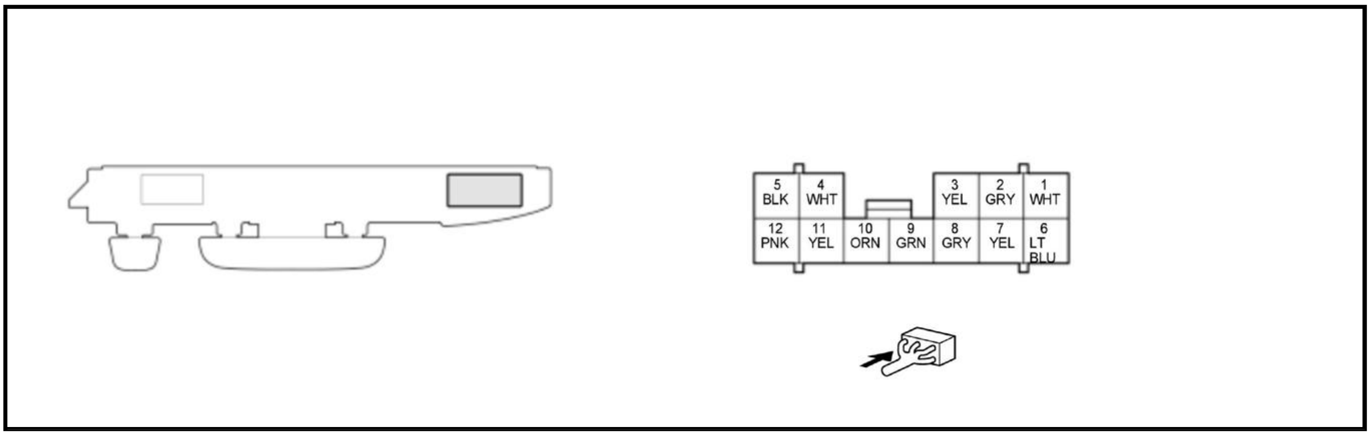
16	B-CAN_H	Communication line	---
17	B-CAN_L	Communication line	---
18	---	Not used	---
19	SEG	Ground for position sensors	Less than 0.2 V at all times
20	S GND	Power seat control unit ground	Less than 0.2 V at all times

Power Seat Control Unit Connector B (12P) (female terminals)



Terminal number	Terminal name	Description	Signal
1	SLIDE RR	Drives slide motor	With slide motor operation (rear side): about battery voltage
2	GND/P-SEAT1	Power seat control unit ground	Less than 0.2 V at all times
3	SLIDE FR	Drives slide motor	With slide motor operation (front side): about battery voltage
4	HEIGHT DOWN	Drives rear up-down motor	With rear up-down motor operation (down): about battery voltage
5	GND/P-SEAT2	Power seat control unit ground	Less than 0.2 V at all times
6	+B/P-SEAT1	+B power source	About battery voltage at all times
7	TILT DOWN	Drives front up-down motor	With front up-down motor operation (down): about battery voltage
8	REC FR	Drives recline motor	With recline motor operation (front side): about battery voltage
9	HEIGHT UP	Drives rear up-down motor	With rear up-down motor operation (up): about battery voltage
10	TILT UP	Drives front up-down motor	With front up-down motor operation (up): about battery voltage

Terminal number	Terminal name	Description	Signal
11	REC RR	Drives recline motor	With recline motor operation (rear side): about battery voltage
12	+B/P-SEAT1	+B power source	About battery voltage at all times

INPUT TEST

DRIVING POSITION MEMORY SYSTEM (DOOR MULTIPLEX CONTROL UNIT AND POWER SEAT CONTROL UNIT) INPUT TEST

NOTE:

- SRS components are located in this area. **Review the SRS component locations** and **the precautions and procedures** before doing repairs or service.
- Make sure the fuses associated with the system is OK.
- Before testing, check for DTCs. If any DTCs are indicated, troubleshoot those DTCs first.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

Power Seat Control Unit

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the power seat control unit connectors.

Power Seat Control Unit Connector A (20P) (female terminals): ① Power Seat Control Unit Connector B (12P) (female terminals): ②

Inspect the connectors and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 4.

Reconnect the connectors to the power seat control unit, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A13	PNK	Vehicle ON mode	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A11	BLU	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
B6	LT BLU	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
B12	PNK	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
B2	GRY	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G501) • An open or high resistance in the ground wire
B5	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G501) • An open or high resistance in the ground wire
A20	GRN	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G501) • An open or high resistance in the ground wire
A1	PUR	Shift position/mode in P	Check for continuity to ground:There should be continuity.	• Faulty transmission range switch • An open or high resistance in the wire
		Shift position/mode in any other than P	Check for continuity to ground:There should be no continuity.	• Faulty transmission range switch • A short to ground in the wire
A6	PUR	Vehicle ON mode	Measure the voltage to ground:There should be at least about 10 V.	• Faulty position sensor • A short to ground in the wire
A10A19	REDORN	Run the recline motor	Measure the voltage between terminals A10	• Faulty position sensor

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
			(+) and A19 (-):There should be about 2.5 V average.	• An open or high resistance in the wire • A short to ground in the wire
A8A19	BRNORN	Run the slide motor	Measure the voltage between terminals A8 (+) and A19 (-):There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire
A7A19	PNKORN	Run the front up-down motor	Measure the voltage between terminals A7 (+) and A19 (-):There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire
A9A19	YELORN	Run the rear up-down motor	Measure the voltage between terminals A9 (+) and A19 (-):There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire

5. Turn the vehicle to the OFF (LOCK) mode.Disconnect the connectors from the power seat control unit, and do these input tests at the following connectors:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B3B1	YELWHT	Under all conditions	Connect terminals B6 and B3, and terminals B1 and B2:The seat should slide forward.	• Faulty slide motor • An open or high resistance in the wire
			Connect terminals B6 and B1, and terminals B3 and B2:The seat should slide backward.	
B8B11	GRYYEL	Under all conditions	Connect terminals B12 and B8, and terminals B11 and B5:The seat should recline forward.	• Faulty recline motor • An open or high resistance in the wire
			Connect terminals B12 and B11, and terminals B8 and B5:The seat should recline backward.	
B10B7	ORNYEL	Under all conditions	Connect terminals B6 and B10, and terminals	• Faulty front up-down motor

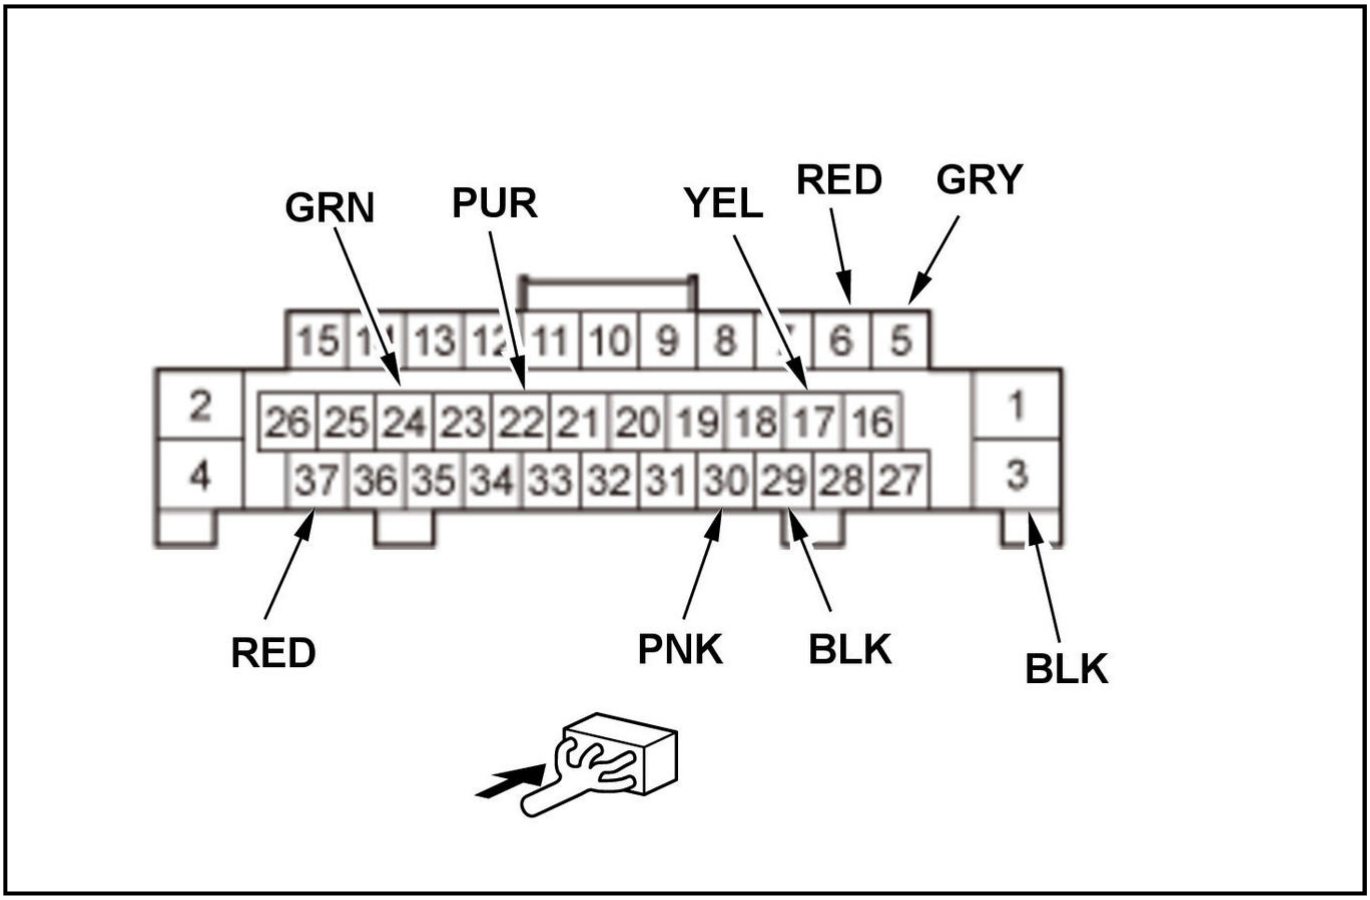
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
			B7 and B2:The front of seat should move up.	- An open or high resistance in the wire
			Connect terminals B6 and B7, and terminals B10 and B2:The front of seat should move down.	
B9B4	GRNWHT	Under all conditions	Connect terminals B12 and B9, and terminals B4 and B5:The rear of seat should move up.	- Faulty rear up-down motor - An open or high resistance in the wire
			Connect terminals B12 and B4, and terminals B9 and B5:The rear of seat should move down.	

Door Multiplex Control Unit (Power Window Master Switch)

7. Turn the vehicle to the OFF (LOCK) mode.

8. Disconnect the power window master switch 37P connector.

Power Window Master Switch 37P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 10.

Reconnect the connector to the power window master switch, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 11.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
37	RED	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
3	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
29	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
5	GRY	Vehicle ON mode, POSITION 1 button pressed	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty driving position memory switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Vehicle ON mode, POSITION 1 button released	Measure the voltage to ground:There should be about 5 V.	• Faulty driving position memory switch • A short to ground in the wire
6	RED	Vehicle ON mode, POSITION 2 button pressed	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty driving position memory switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Vehicle ON mode, POSITION 2 button released	Measure the voltage to ground:There should be about 5 V.	• Faulty driving position memory switch • A short to ground in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
17	YEL	Vehicle ON mode, SET button pressed	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty driving position memory switch • Poor ground (G501) or an open in the ground wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
				- An open or high resistance in the wire
		Vehicle ON mode, SET button released	Measure the voltage to ground:There should be about 5 V.	- Faulty driving position memory switch - A short to ground in the wire

11. Turn the vehicle to the OFF (LOCK) mode.Disconnect the connector from the power window master switch, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 13.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
22	PUR	Under all conditions	Connect terminals No. 22 and No. 37 with a jumper wire:The driving position memory switch INDICATOR 1 should come on.	- Faulty LED - Faulty driving position memory switch - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire
24	GRN	Under all conditions	Connect terminals No. 24 and No. 37 with a jumper wire:The driving position memory switch INDICATOR 2 should come on.	- Faulty LED - Faulty driving position memory switch - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire
30	PNK	Under all conditions	Connect terminals No. 30 and No. 37 with a jumper wire:The driving position memory switch lights should come on.	- Faulty LED - Faulty driving position memory switch - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire

13. If multiple failures are found on more than one control unit, **replace the power seat control unit** . If input failures are related to a particular control unit, replace the control unit.

TEST

MULTIPLEX INTEGRATED CONTROL SYSTEM SLEEP AND WAKE-UP MODE TEST

Shift to the sleep mode:Close all doors. Turn the vehicle to the OFF (LOCK) mode, then open and close the driver's door. If the body control module receives no signals from the inputs listed below, it will go into sleep mode in less than 40 seconds.

- IG1 power supply
- IG2 power supply
- B-CAN data
- Hazard warning switch (ON)

2. Confirm sleep mode:

NOTE: **Check the official Honda service website for more service information about parasitic draw at the 12 volt battery.Check the parasitic draw at the 12 volt battery while entering sleep mode; amperage should change from about 200 mA to less than 35 mA in less than 40 seconds.Shift to wake-up mode:When turning the vehicle to the ON mode, the body control module, the gauge control module, the power window master switch, and the PCM will wake-up at the same time without "talking" to each other through the communication lines. When any switch in the multiplex integrated control system is turned on, it wakes up its related control unit which, in turn, wakes up the other units. After confirming the sleep mode, look in the following table for the switch most related to the problem. Operate that switch and see if its control unit wakes up.**

NOTE: **If any control unit is faulty and does not wake up, several circuits in the system malfunction at the same time. Below is a list of the switches and input signals that wake them up.**

- IG1 power supply
- IG2 power supply
- ACC power supply
- B-CAN data
- F-CAN data
- Driver's door lock switch (LOCK/UNLOCK)
- Front passenger's door lock switch (LOCK/UNLOCK)
- Driver's door switch (door open)
- Front passenger's door switch (door open)
- Left rear door switch (door open)
- Right rear door switch (door open)
- Tailgate latch switch (tailgate open)
- Tailgate opener switch (ON)
- Tailgate outer handle switch (ON)
- Hood latch switch (hood closed)
- Driver's door key cylinder switch (LOCK/UNLOCK)
- Driver's door lock knob switch (LOCK/UNLOCK)
- Front passenger's door lock knob switch (LOCK/UNLOCK)
- Left rear door lock knob switch (UNLOCK)
- Right rear door lock knob switch (UNLOCK)

- Hazard warning switch (ON)
- Combination light switch (Parking, Headlight, Dimmer, Passing, Fog ON)
- Transmission range switch (P)
- Audio security switch (ON)

REWRITE

BODY CONTROL MODULE UPDATE

Procedure

1. Body Control Module - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Refer to available service information for the latest information on update devices.

LEARNING RESET CLEAR

DRIVING POSITION MEMORY CLEAR

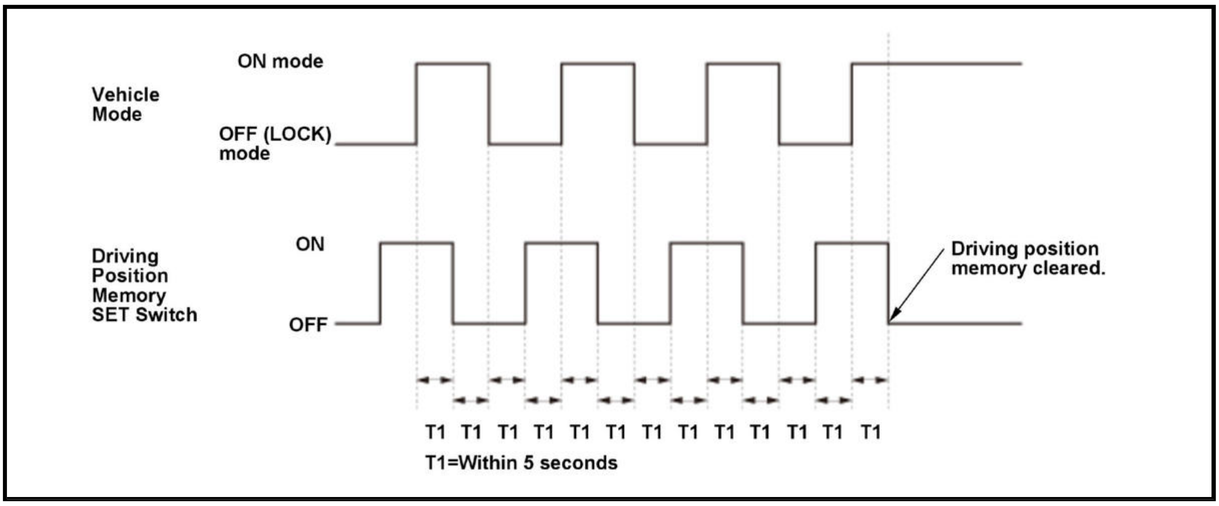
Procedure

Clear the driving position memory after doing any of the following actions:

- Power seat motor test or replacement.
- Substituting a known-good power seat control unit.

NOTE: When the driving position is cleared from the power seat control unit, the driving positions for both Position 1 and 2 are also cleared.

1. Driving Position Memory - Clear
    1. Turn the vehicle to the OFF (LOCK) mode.



2. Press and hold the SET button of the driving position memory switch.

3. Turn the vehicle to the ON mode.

4. Release the SET button of the driving position memory switch.

5. Repeat steps 1-4 three more times.

NOTE:

- **Once the memory is successfully cleared, the driving position memory switch indicator 1 and 2 turn on for 3 seconds.**
- **If the indicators do not turn on, go back to step 1 and repeat the procedure.**

DESCRIPTION & OPERATION

INTERIOR LIGHTS SYSTEM DESCRIPTION

System Function

Driver's door lock knob switch link

When the driver's door lock knob switch moves from the lock/unlock position, the body control module detects a driver's door open/close position, and the relay control module controls the interior lights.

Input			Output Control	
Driver's Door Lock Knob Switch (ON: LOCK)	**Each Door Switch**	**Vehicle Mode**	**Before Input Change**	**After Input Change**
ON -> OFF	All OFF (Door close)	Remote Engine Start	Lighting ON	Lights ON by timer condition 1
			Lighting OFF	Lights ON by timer condition 5
		OFF (LOCK)	Lighting ON	Lights ON by timer condition 1
			Lighting OFF	Lights ON by timer condition 5
		ACC	--	Continue the status before input change
	Any ON (Door open)	--		
OFF -> ON	All OFF (Door close)	Remote Engine Start	--	Lights OFF
		OFF (LOCK) or ACC	--	
	Any ON (Door open)	OFF (LOCK) or ACC	--	Continue the status before input change

NOTE: The "--" means that it is not used on this system.

Each door switch link

Anytime a door switch closes (ON signal), the body control module provides a ground to the interior lights.

Input			Output Control	
Each Door Switch	**Driver's Door Lock Knob Switch (ON: LOCK)**	**Vehicle Mode**	**Before Input Change**	**After Input Change**
Any ON (Door open) -> All OFF (Door close)	OFF	Remote Engine Start	Lighting ON	Lights ON by timer condition 2
			Lighting OFF	Continue the status before input change
		OFF (LOCK)	Lighting ON	Lights ON by timer condition 2
			Lighting OFF	Continue the status before input change

Input			Output Control	
Each Door Switch	Driver's Door Lock Knob Switch (ON: LOCK)	Vehicle Mode	Before Input Change	After Input Change
		ACC or ON	--	Lights OFF
	ON	--	--	
Any OFF (Door close) -> ON (Door open)	--	Remote Engine Start	Lighting ON	Lights ON by timer condition 3 (Timer restart)
			Lighting OFF	Lights ON by timer condition 3
		OFF (LOCK)	Lighting ON	Lights ON by timer condition 3 (Timer restart)
			Lighting OFF	Lights ON by timer condition 3
		ACC or ON	--	Lights ON

NOTE: The "--" means that it is not used on this system.

Remote link

When the system detects that the key is inserted into the remote is inside the vehicle, the body control module provides a ground to the interior lights.

Input		Output Control	
Vehicle Mode	Each Door Switch	Before Input Change	After Input Change
ACC -> OFF (LOCK)	All Door Switch OFF (Close)	Lighting ON	Lights ON by timer condition 1
		Lighting OFF	Lights ON by timer condition 5
	Any Door Switch ON (Open)	--	Lights ON by timer condition 3
OFF (LOCK) -> ACC	All Door Switch OFF (Close)	--	Continue the status before input change
	Any Door Switch ON (Open)	--	Lights ON

NOTE: The "--" means that it is not used on this system.

Engine start/stop switch link

When the vehicle is turned to the ACCESSORY mode or the ON mode with the doors closed and the entry light control system illuminating the start/stop switch lights, the relay control module gradually turns the lights off.

Input		Output Control	
Vehicle Mode	Each Door Switch	Before Input Change	After Input Change
Remote Engine Start	All OFF	--	Lights OFF
	Any ON	--	Lights ON by timer condition 3
ON -> ACC	--	--	Continue the status before input change
ACC -> ON	All OFF	--	Lights OFF

Input		Output Control	
Vehicle Mode	**Each Door Switch**	**Before Input Change**	**After Input Change**
ON	Any ON	--	Lights ON
	All OFF	--	Lights OFF
	Any ON	--	Lights ON

NOTE: The "--" means that it is not used on this system.

Keyless link

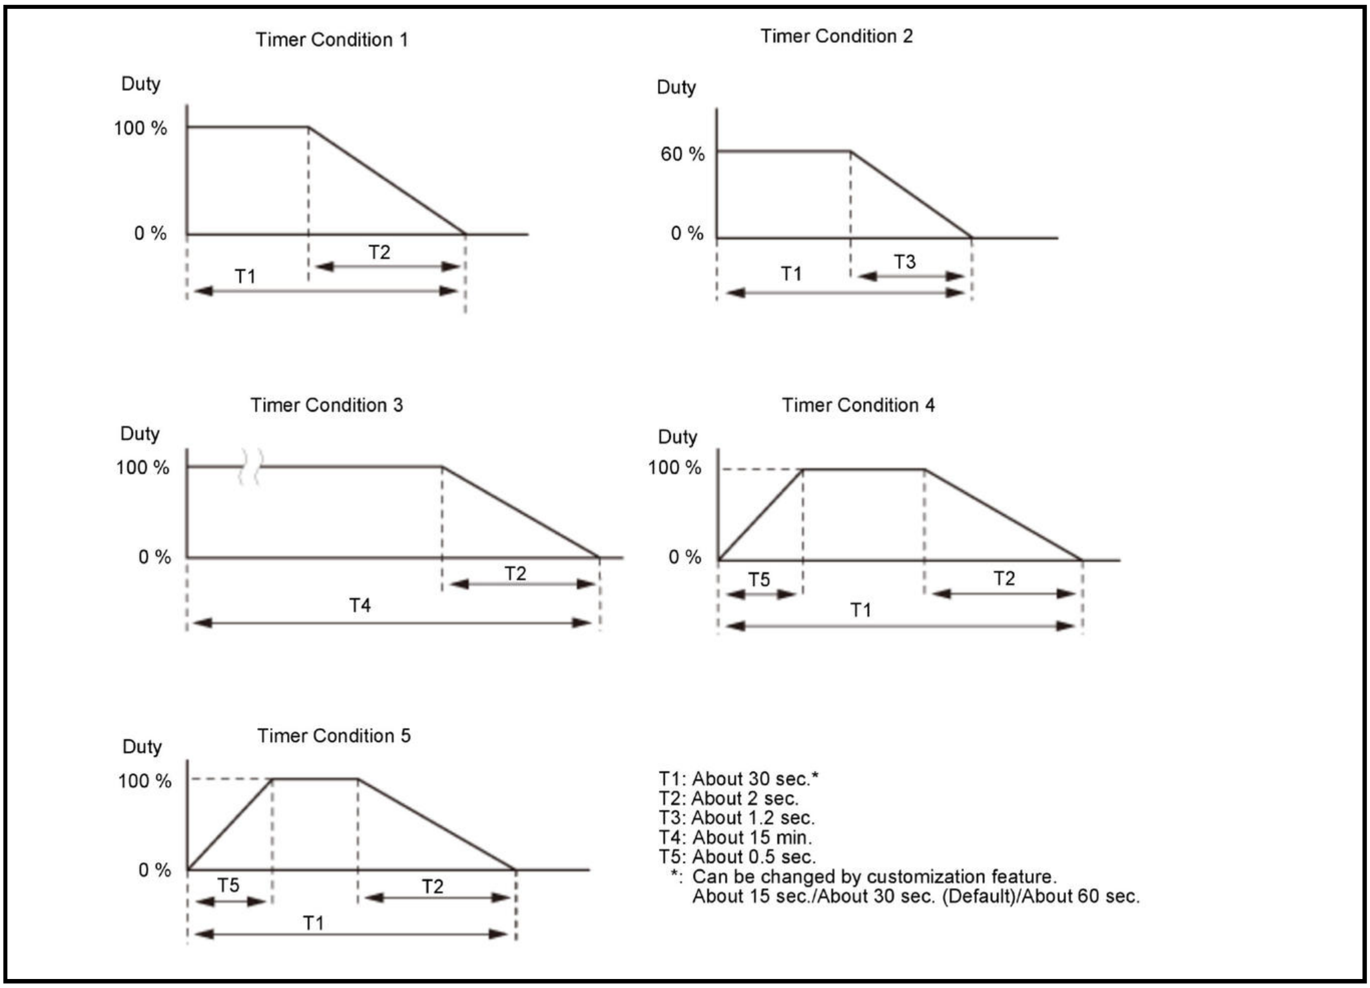
When the body control module receives an unlock signal from the remote, it provides a ground to the interior lights.

Input			Output Control	
Keyless Door LOCK/UNLOCK Signal	**Each Door Switch**	**Driver's Door Lock Knob Switch (ON: LOCK)**	**Before Input Change**	**After Input Change**
UNLOCK signal	All OFF (Door close)	ON -> OFF or OFF	--	Lights ON by timer condition 4
		ON	--	Continue the status before input change
	Any ON (Door open)	--	--	Lights ON by timer condition 3
LOCK signal	All OFF (Door close)	OFF -> ON or ON	--	Lights OFF
		OFF	--	Continue the status before input change
	Any ON (Door open)	--	--	Continue the status before input change

NOTE: The "--" means that it is not used on this system.

Timer Control

The chart shows lighting duration, along with the dimming function that occurs at the end of the timer period.



T1: About 30 sec.*
T2: About 2 sec.
T3: About 1.2 sec.
T4: About 15 min.
T5: About 0.5 sec.
*: Can be changed by customization feature.
About 15 sec./About 30 sec. (Default)/About 60 sec.

Tailgate Link Control

The body control module controls the cargo area lights ON, OFF based on the tailgate latch switch or full latch switch signals.

INTERIOR LIGHTS SYSTEM DESCRIPTION - COMPONENTS

Individual Map Light

The individual map light can be turned on and off by pressing on the map light lens. A mechanical switch illuminates the individual map light regardless of conditions.

Ambient Light

The ambient light is built into the interior light switch, linked with the combination light switch.

Ceiling Light

The ceiling light is placed in the center of the headliner, linked with the entry light control system.

Cargo Area Lights

The cargo area lights are placed in the cargo area and illuminates when the tailgate opens.

Vanity Mirror Lights (With Vanity Mirror Light)

The vanity mirror lights built into both sunvisors and illuminates when the vanity mirror cover opens.

Door Inner Handle Lights (With Door Inner Handle Light)

The door inner handle lights are placed in each door panel, linked with the combination light switch. Brightness of the door inner handle lights can be adjusted.

Footwell Lights (With Footwell Light)

The footwell lights are placed under the dashboard around the driver's and passenger's feet and is linked with the combination light switch.

REMOVAL & INSTALLATION TEST

AMBIENT LIGHT REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: The ambient lights are built into the moonroof switch (with moonroof), roof console module (with panoramic glass roof), and rear individual map light (with panoramic glass roof).

Front

1. Front Individual Map Light (With Moonroof) - Remove
2. Roof Console Module (With Panoramic Glass Roof)- Remove
3. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

    Rear

4. Rear Individual Map Light - Remove
5. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

Test

1. Ambient Light - Test

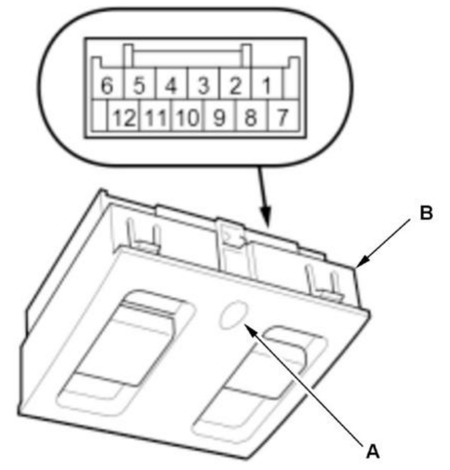
    Front (With Moonroof)

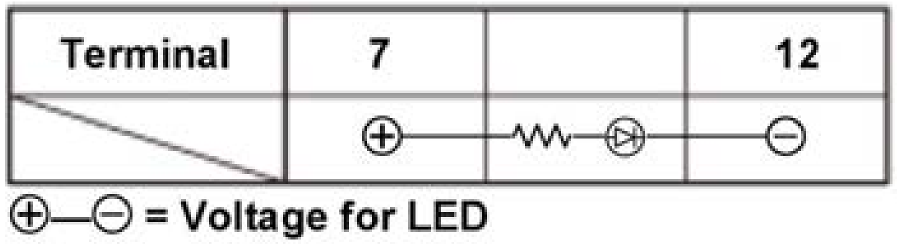
    NOTE: The ambient light (A) is built into the interior light switch (B).

    1. Check the lights according to the chart below.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**





Terminal	7		12
	⊕		⊖

⊕—⊖ = Voltage for LED

2. If the ambient light does not come on, the LED is faulty; **replace the interior light switch assembly**.

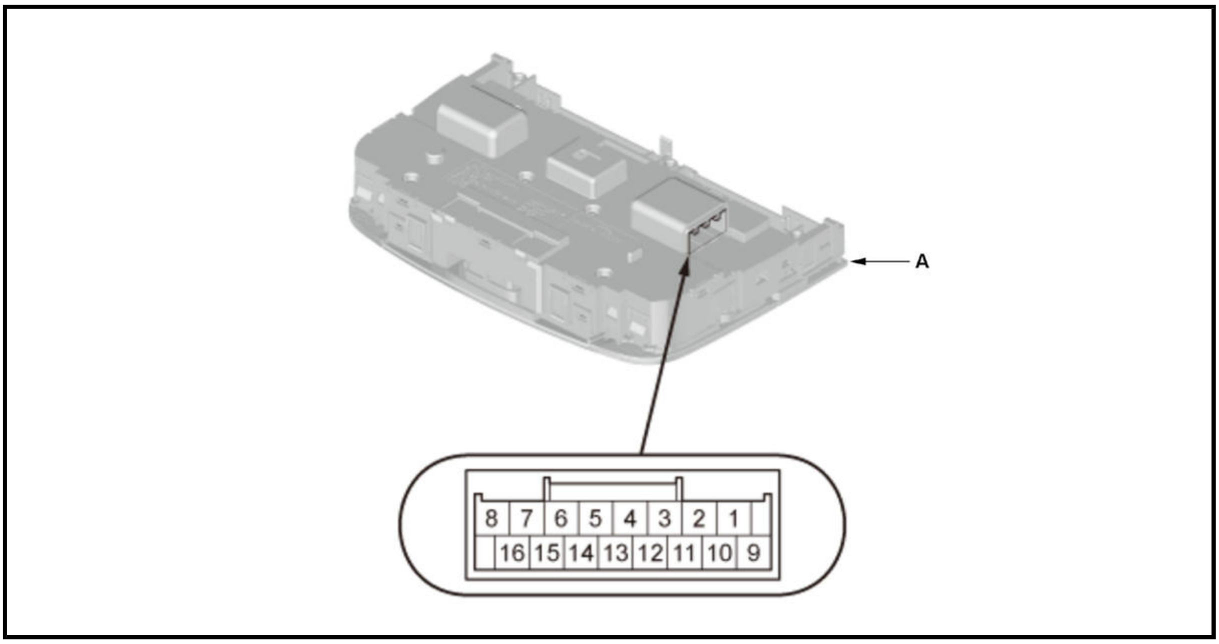
Front (With Panoramic Glass Roof)

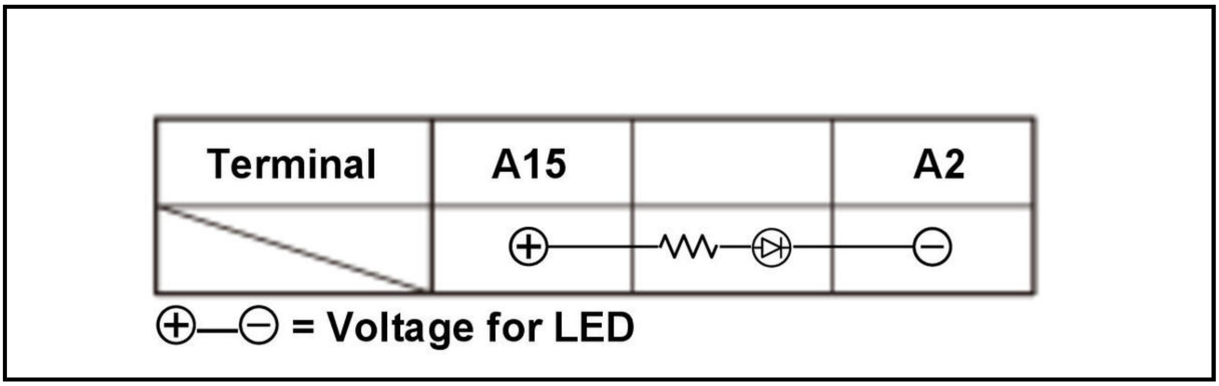
NOTE: The ambient light is built into the roof console module (A).

1. Check the lights according to the chart below.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**





Terminal	A15		A2
	⊕	—⋀⋁⋀—⊳|—	⊖

⊕—⊖ = Voltage for LED

2. If the ambient light does not come on, the LED is faulty; replace the roof console module.

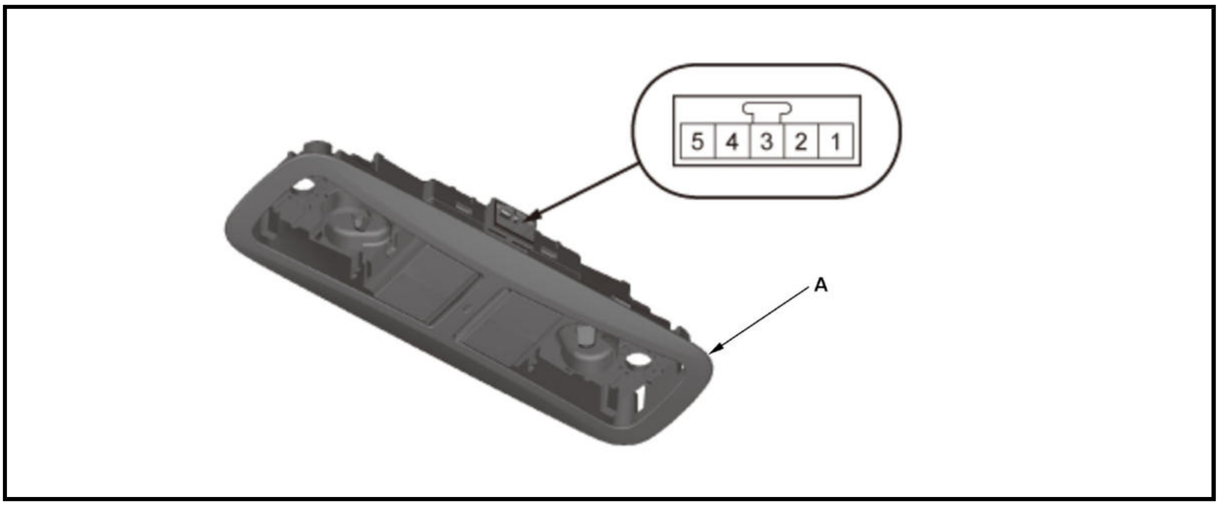
Rear

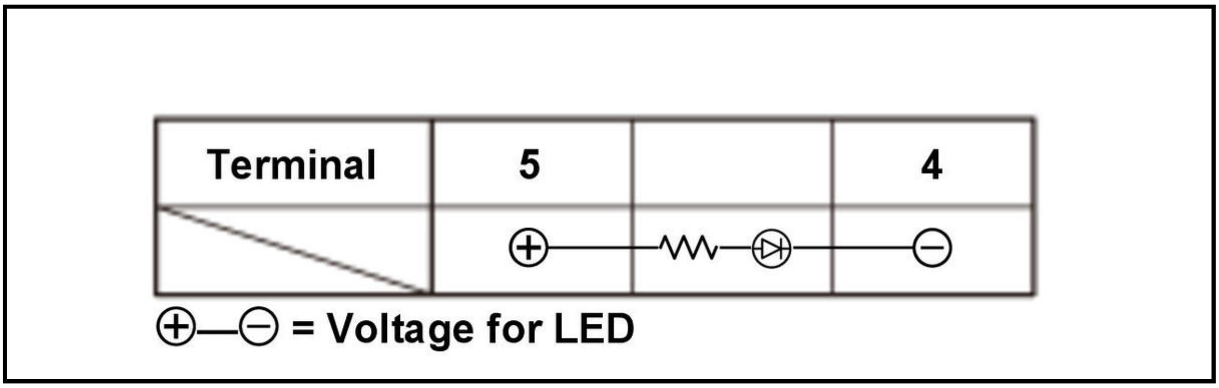
NOTE: The ambient light is built into the rear individual map light (A).

1. Check the lights according to the chart below.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**





Terminal	5		4
	⊕	—ʌʌʌ—⊕▷—	⊖

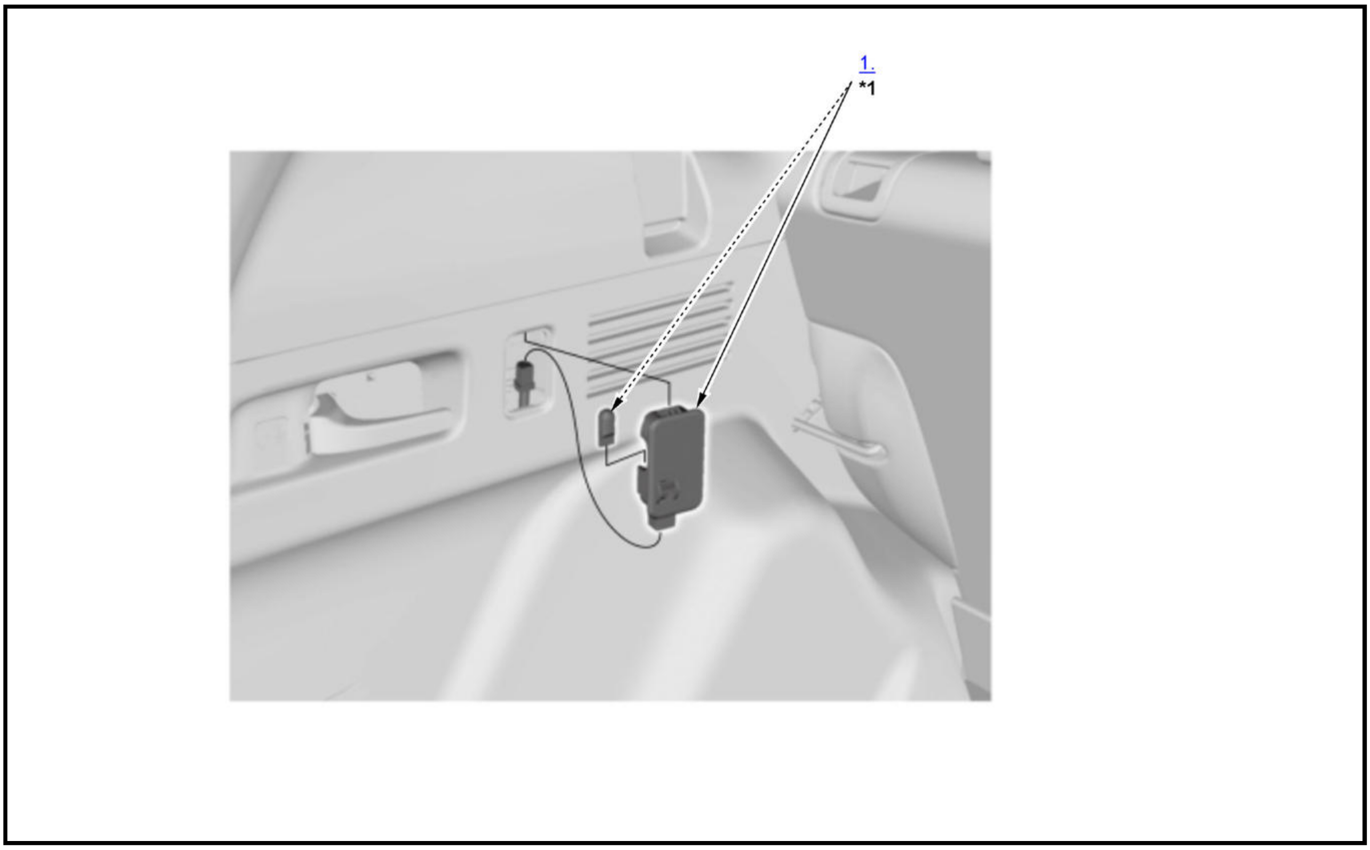
⊕—⊖ = Voltage for LED

2. If the ambient light does not come on, the LED is faulty; replace the rear individual map light.

CARGO AREA LIGHT REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



*1	Cargo Area Light: 5 W

3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

Test

1. Roof Console Module - Test

   NOTE: The interior light switch and the individual map light switch are built into the roof console module (A).

   1. Check the interior light switch and the individual map light switch according to the chart below.

NOTE:

- **When an LED is located between terminals, check if the LED lights by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**

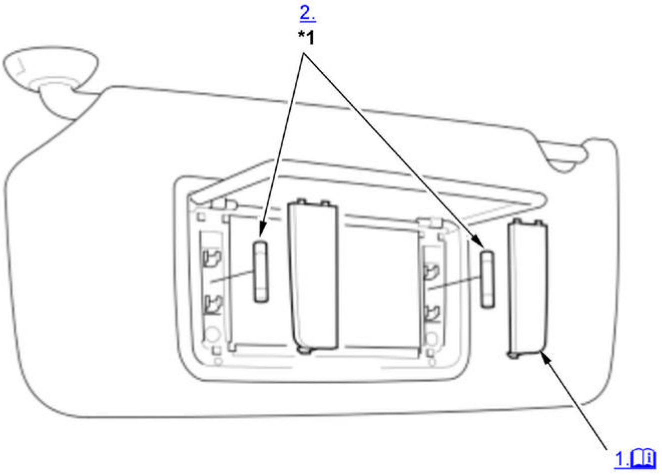
VANITY MIRROR LIGHT REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: Where icon is shown, further information shown below.

1

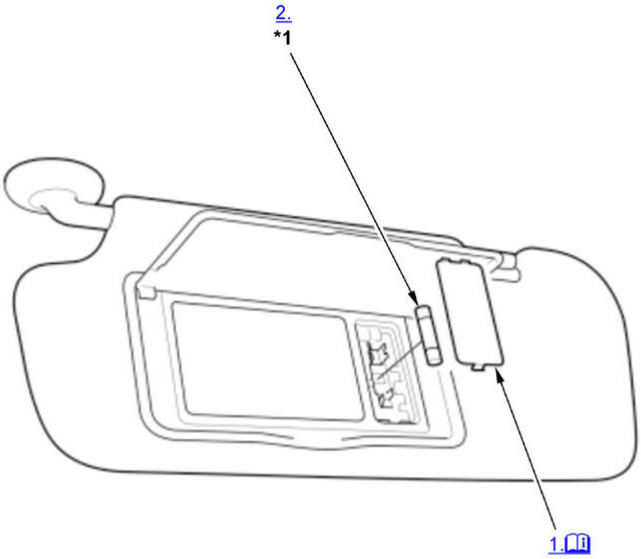
Type A



🛈	Detailed information, notes, and precautions
*1	Vanity Mirror Light: 1CP

2

Type B



🛈	Detailed information, notes, and precautions
*1	Vanity Mirror Light: 1.4 W

1. Lens - Remove

   Carefully pry off the lenses.

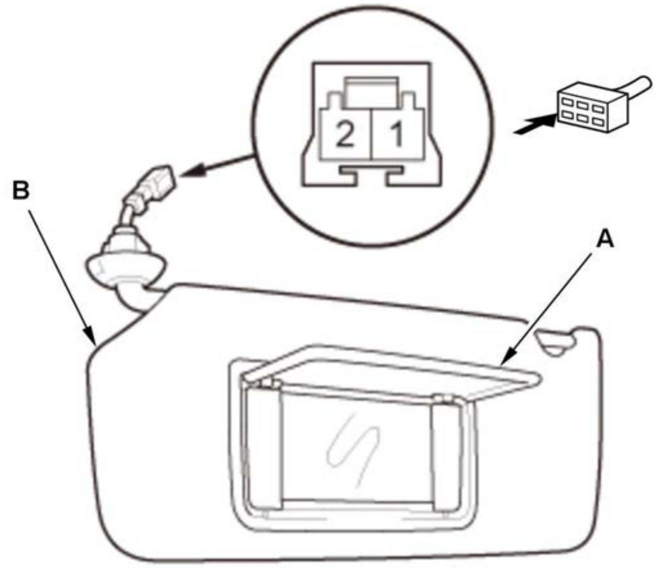
2. Vanity Mirror Light - Remove

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

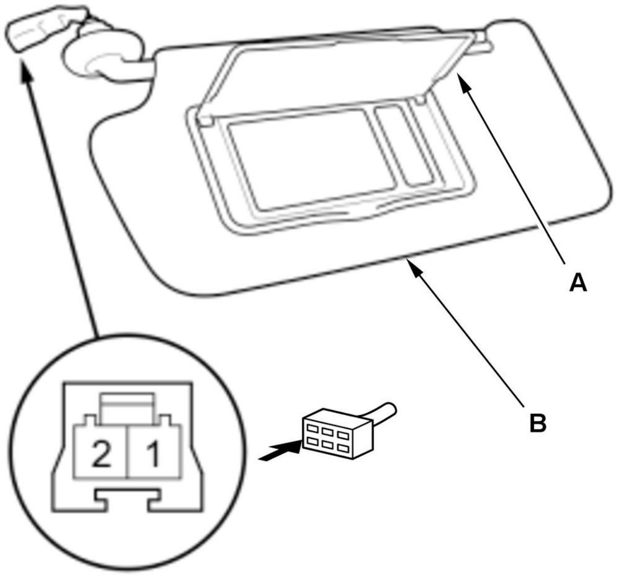
Test

1. **Sunvisor - Remove**
2. Vanity Mirror Light - Test



Type A

Type B



Terminal / Position	1		2
OPENED	○—	—⊗—	—○
CLOSED			

NOTE: When doing the vanity mirror light test, make sure the bulbs are installed correctly and not damaged or burnt out.

1. Check for continuity between the terminals in each vanity mirror cover (A) position according to the table in illustration.

2. If the continuity is not as specified, replace the bulb(s).

3. If the continuity is still not as specified, **replace the sunvisor**

(B).

3. All Removed Parts - Install

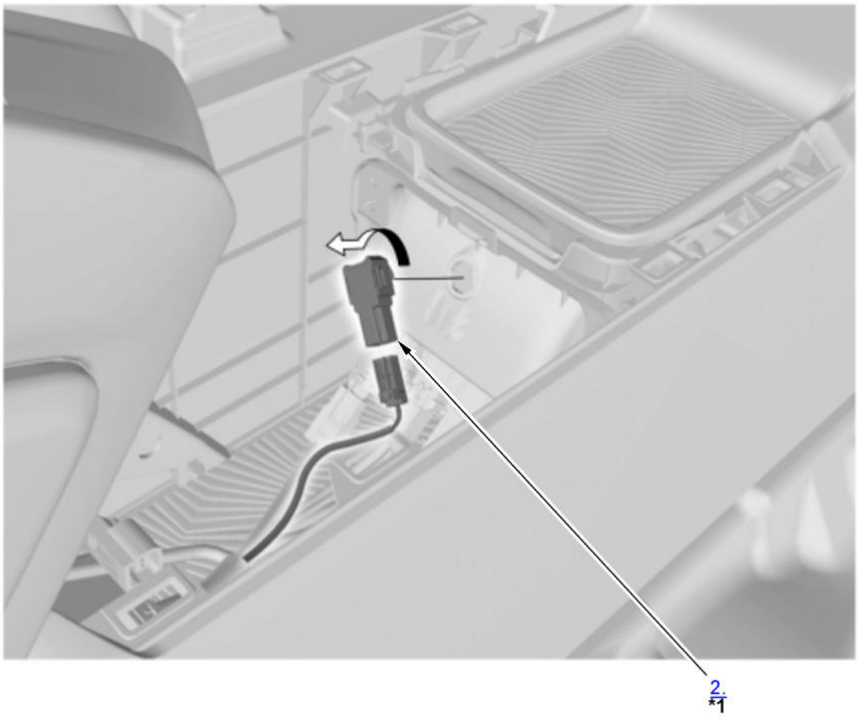
1. Install the parts in the reverse order of removal.

REMOVAL AND INSTALLATION

CONSOLE BOX LIGHT REMOVAL AND INSTALLATION

Removal and Installation

1



*1	Console Box Light: LED

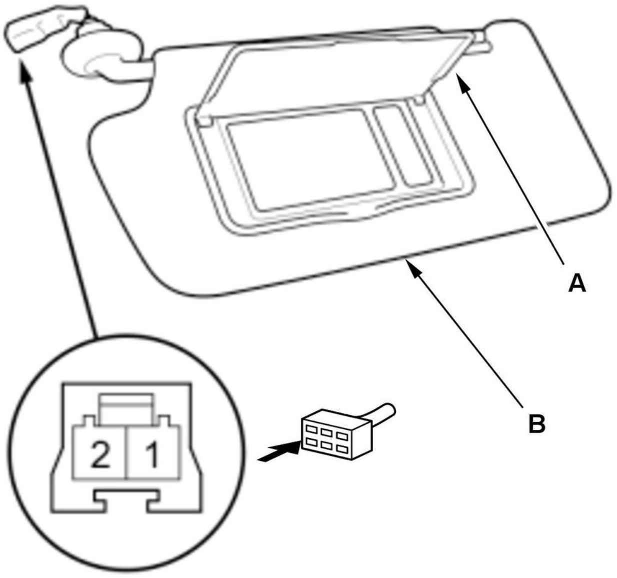
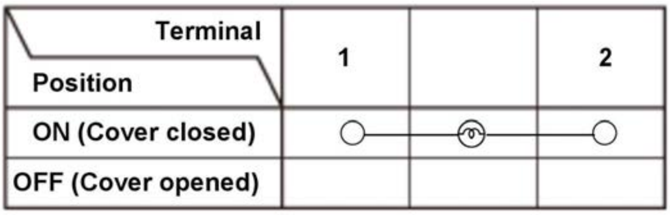
1. **Sunvisor - Remove**
2. Vanity Mirror Light - Test





Terminal / Position	1		2
ON (Cover closed)	○—	—⊗—	—○
OFF (Cover opened)			

NOTE: When doing the vanity mirror light test, make sure the bulbs are installed correctly and not damaged or burnt out.

1. Check for continuity between the terminals in each vanity mirror cover (A) position according to the table.

2. If the continuity is not as specified, replace the bulb(s).

3. If the continuity is still not as specified, **replace the sunvisor** (B).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

DESCRIPTION & OPERATION

INTERIOR LIGHTS SYSTEM DESCRIPTION

System Function

Driver's door lock knob switch link

When the driver's door lock knob switch moves from the lock/unlock position, the body control module detects a driver's door open/close position, and the relay control module controls the interior lights.

Input			Output Control	
Driver's Door Lock Knob Switch (ON: LOCK)	**Each Door Switch**	**Vehicle Mode**	**Before Input Change**	**After Input Change**
ON -> OFF	All OFF (Door close)	Remote Engine Start	Lighting ON	Lights ON by timer condition 1
			Lighting OFF	Lights ON by timer condition 5
		OFF (LOCK)	Lighting ON	Lights ON by timer condition 1
			Lighting OFF	Lights ON by timer condition 5
		ACC	--	Continue the status before input change
	Any ON (Door open)	--		
OFF-> ON	All OFF (Door close)	Remote Engine Start	--	Lights OFF
		OFF (LOCK) or ACC	--	
	Any ON (Door open)	OFF (LOCK) or ACC	--	Continue the status before input change

NOTE: The "--" means that it is not used on this system.

Each door switch link

Anytime a door switch closes (ON signal), the body control module provides a ground to the interior lights.

Input			Output Control	
Each Door Switch	**Driver's Door Lock Knob Switch (ON: LOCK)**	**Vehicle Mode**	**Before Input Change**	**After Input Change**
Any ON (Door open)->All OFF (Door close)	OFF	Remote Engine Start	Lighting ON	Lights ON by timer condition 2
			Lighting OFF	Continue the status before input change
		OFF (LOCK)	Lighting ON	Lights ON by timer condition 2
			Lighting OFF	Continue the status before input change

Input			Output Control	
Each Door Switch	**Driver's Door Lock Knob Switch (ON: LOCK)**	**Vehicle Mode**	**Before Input Change**	**After Input Change**
		ACC or ON	--	Lights OFF
	ON	--	--	
Any OFF (Door close)->ON (Door open)	--	Remote Engine Start	Lighting ON	Lights ON by timer condition 3 (Timer restart)
			Lighting OFF	Lights ON by timer condition 3
		OFF (LOCK)	Lighting ON	Lights ON by timer condition 3 (Timer restart)
			Lighting OFF	Lights ON by timer condition 3
		ACC or ON	--	Lights ON

NOTE: The "--" means that it is not used on this system.

Ignition key switch/remote link

When the system detects that the key is inserted into the ignition key switch or the remote is inside the vehicle, the body control module provides a ground to the interior lights.

Input		Output Control	
Vehicle Mode	**Each Door Switch**	**Before Input Change**	**After Input Change**
ACC -> OFF (LOCK)	All Door Switch OFF (Close)	Lighting ON	Lights ON by timer condition 1
		Lighting OFF	Lights ON by timer condition 5
	Any Door Switch ON (Open)	--	Lights ON by timer condition 3
OFF (LOCK) -> ACC	All Door Switch OFF (Close)	--	Continue the status before input change
	Any Door Switch ON (Open)	--	Lights ON

NOTE: The "--" means that it is not used on this system.

Engine start/stop switch link

When the vehicle is turned to the ACCESSORY mode or the ON mode with the doors closed and the entry light control system illuminating the start/stop switch lights, the relay control module gradually turns the lights off.

Input		Output Control	
Vehicle Mode	**Each Door Switch**	**Before Input Change**	**After Input Change**
Remote Engine Start	All OFF	--	Lights OFF
	Any ON	--	Lights ON by timer condition 3
ON -> ACC	--	--	Continue the status before input change
ACC -> ON	All OFF	--	Lights OFF

Input		Output Control	
Vehicle Mode	**Each Door Switch**	**Before Input Change**	**After Input Change**
ON	Any ON	--	Lights ON
	All OFF	--	Lights OFF
	Any ON	--	Lights ON

NOTE: The "--" means that it is not used on this system.

Keyless link

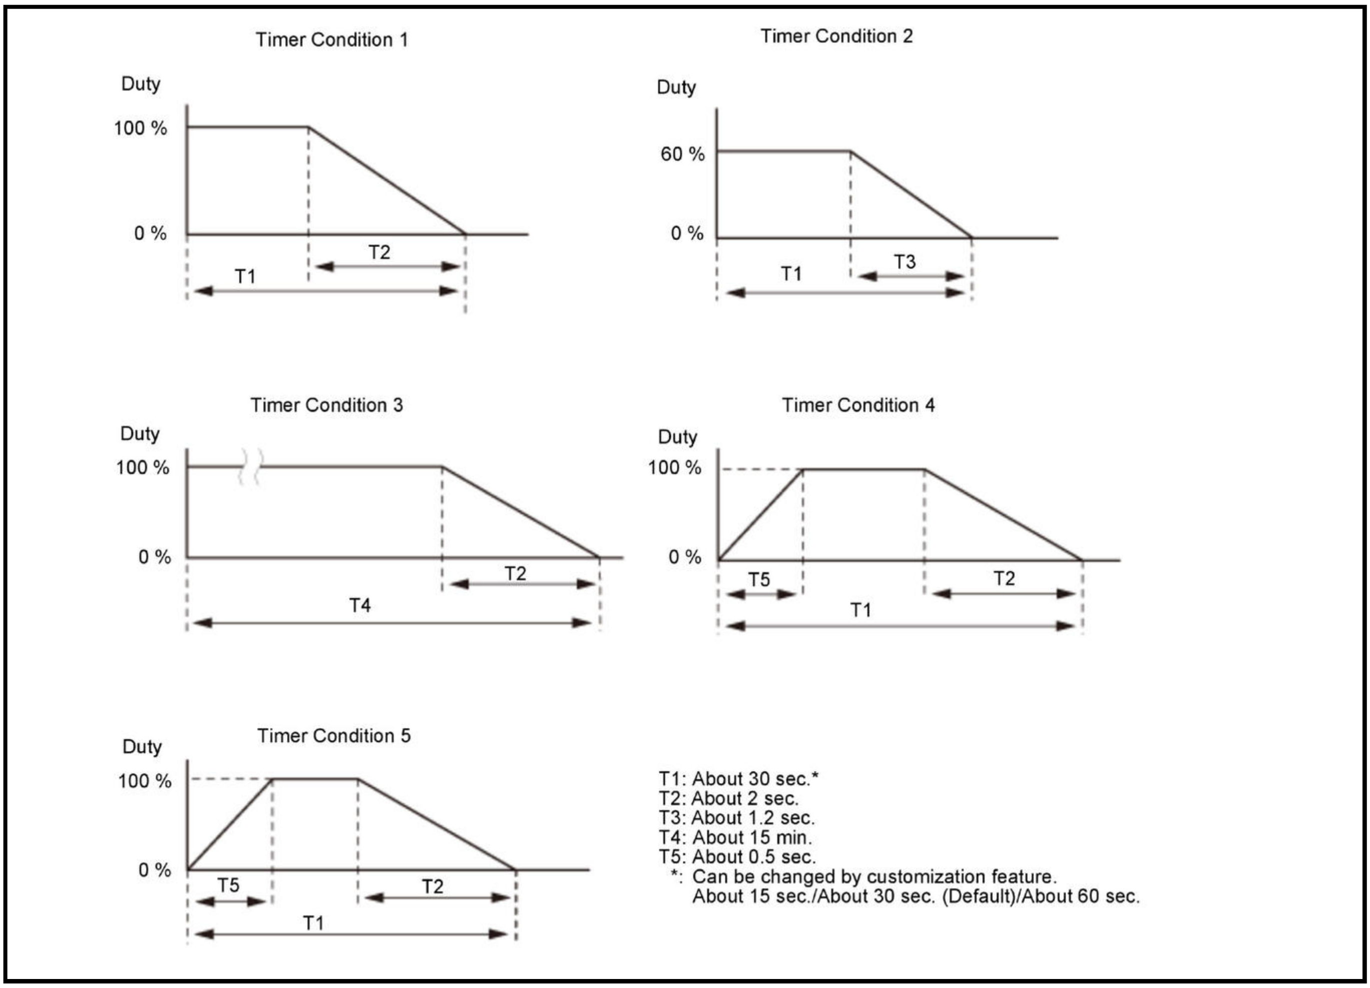
When the body control module receives an unlock signal from the keyless transmitter or remote, the body control module provides a ground to the interior lights.

Input			Output Control	
Keyless Door LOCK/UNLOCK Signal	**Each Door Switch**	**Driver's Door Lock Knob Switch (ON: LOCK)**	**Before Input Change**	**After Input Change**
UNLOCK signal	All OFF (Door close)	ON -> OFF or OFF	--	Lights ON by timer condition 4
		ON	--	Continue the status before input change
	Any ON (Door open)	--	--	Lights ON by timer condition 3
LOCK signal	All OFF (Door close)	OFF -> ON or ON	--	Lights OFF
		OFF	--	Continue the status before input change
	Any ON (Door open)	--	--	Continue the status before input change

NOTE: The "--" means that it is not used on this system.

Timer Control

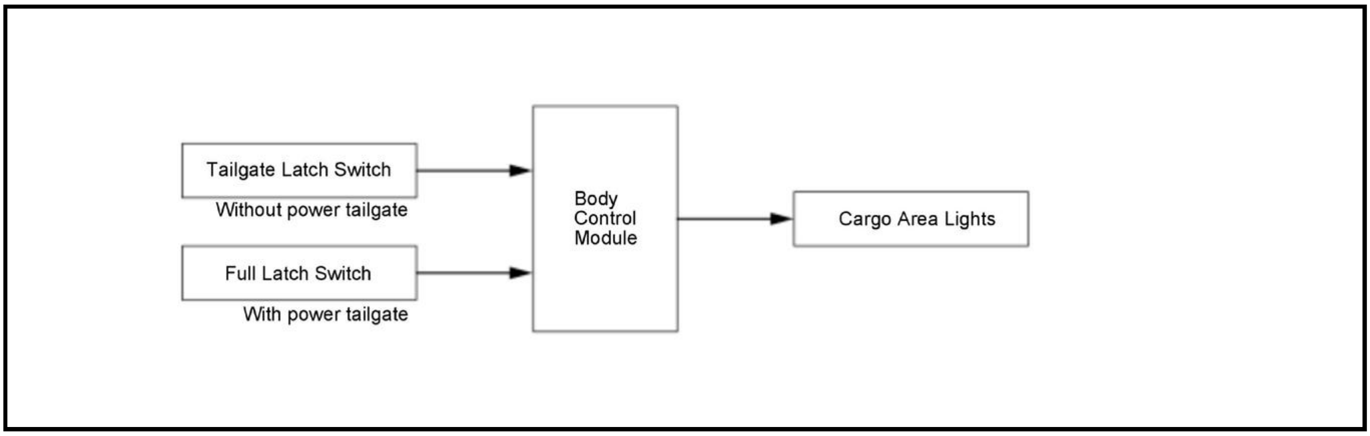
The chart shows lighting duration, along with the dimming function that occurs at the end of the timer period.



T1: About 30 sec.*
T2: About 2 sec.
T3: About 1.2 sec.
T4: About 15 min.
T5: About 0.5 sec.
*: Can be changed by customization feature.
About 15 sec./About 30 sec. (Default)/About 60 sec.

Tailgate Link Control

The body control module controls the cargo area lights ON, OFF based on the tailgate latch switch or full latch switch signals.



Tailgate Latch Switch
Without power tailgate
Full Latch Switch
With power tailgate
Body Control Module
Cargo Area Lights

INTERIOR LIGHTS SYSTEM DESCRIPTION - COMPONENTS

Individual Map Light

The individual map light can be turned on and off by pressing on the map light lens. A mechanical switch illuminates the individual map light regardless of conditions.

Ambient Light

The ambient light is built into the interior light switch and rear individual map light, linked with the combination light switch.

Ceiling Light (Without Panoramic Glass Roof)

The ceiling light is placed in the center of the headliner, linked with the entry light control system.

Cargo Area Lights

The cargo area lights are placed in the cargo area and illuminates when the tailgate opens.

Vanity Mirror Lights

Some models are equipped with the vanity mirror lights built into both sunvisors and illuminates when the vanity mirror cover opens.

Door Inner Handle Lights

The door inner handle lights are placed in each door panel, linked with the combination light switch. Brightness of the door inner handle lights can be adjusted.

Footwell Lights

The footwell lights are placed under the dashboard around the driver's and passenger's feet and is linked with the combination light switch.

Console Box Light (With Console Box Light)

The console box light is placed in center console, linked with the combination light switch.

INPUT TEST

ENTRY LIGHTS CONTROL SYSTEM (BODY CONTROL MODULE AND DOOR MULTIPLEX CONTROL UNIT) INPUT TEST

NOTE:

- Make sure the fuses associated with the system is OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

Body Control Module

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect body control module connectors.

Body Control Module Connector A (14P) (female terminals): ① Body Control Module Connector C (28P) (female terminals): ② Body Control Module Connector D (40P) (female terminals): ③ Body Control

Module Connector E (24P) (female terminals): ④

Inspect the connectors and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 4.

Reconnect the connectors to the body control module, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, then go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
C27	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
E1	BLU	Vehicle ON mode	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A2	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
A8	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
D22	GRN	Driver's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door switch • Faulty driver's door switch ground • An open or high resistance in the wire
		Driver's door closed	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's door switch • A short to ground in the wire
D23	LT GRN	Front passenger's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty front passenger's door switch • Faulty front passenger's door switch ground • An open or high resistance in the wire
		Front passenger's door closed	Measure the voltage to ground: There should be battery voltage.	• Faulty front passenger's door switch • A short to ground in the wire
D24	BRN	Left rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty left rear door switch • Faulty left rear door switch ground • An open or high resistance in the wire
		Left rear door closed	Measure the voltage to ground: There should be battery voltage.	• Faulty left rear door switch • A short to ground in the wire

*: Without keyless access system

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
D28	GRY	Right rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty right rear door switch • Faulty right rear door switch ground • An open or high resistance in the wire
		Right rear door closed	Measure the voltage to ground: There should be battery voltage.	• Faulty right rear door switch • A short to ground in the wire
D26*	PNK	Ignition key inserted into the ignition key switch	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty ignition key switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Ignition key removed from the ignition key switch	Measure the voltage to ground: There should be battery voltage.	• Faulty ignition key switch • A short to ground in the wire

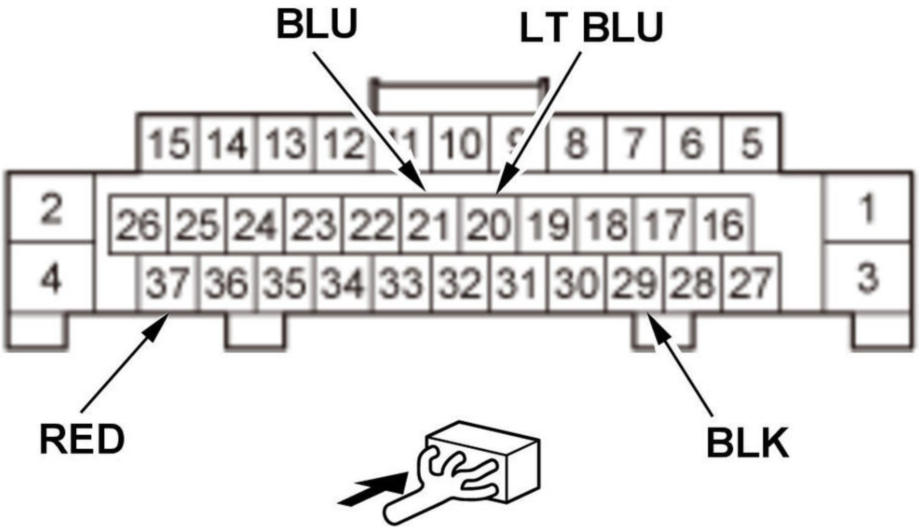
*: Without keyless access system

Door Multiplex Control Unit (Power Window Master Switch)

5. Turn the vehicle to the OFF (LOCK) mode.

6. Disconnect the power window master switch 37P connector.

Power Window Master Switch 37P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 8.

Reconnect the connectors to the power window master switch; do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 9.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
37	RED	Under all conditions	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
29	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
21	BLU	Driver's door lock knob switch in LOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door lock knob switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door lock knob switch in UNLOCK	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's door lock knob switch

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
				- A short to ground in the wire
20	LT BLU	Driver's door lock knob switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	- Faulty driver's door lock knob switch - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire
		Driver's door lock knob switch in LOCK	Measure the voltage to ground: There should be battery voltage.	- Faulty driver's door lock knob switch - A short to ground in the wire

9. If multiple failures are found on more than one control unit, **replace the body control module** . If input failures are related to a particular control unit, replace the control unit.

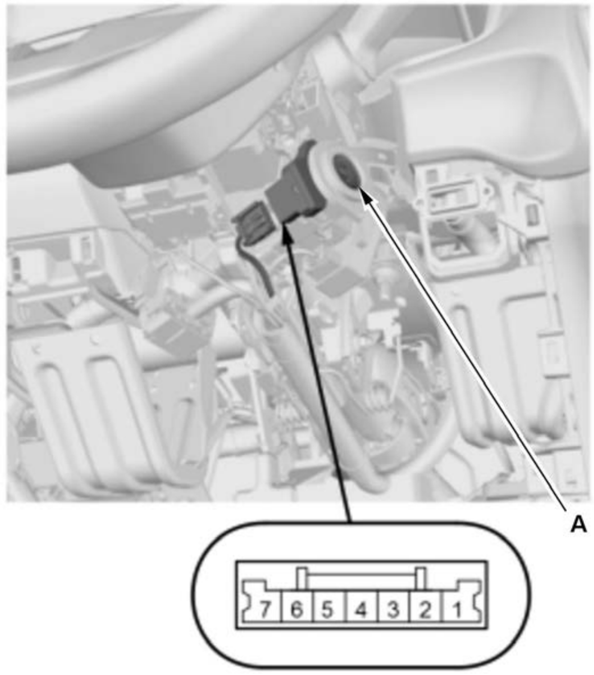
TEST

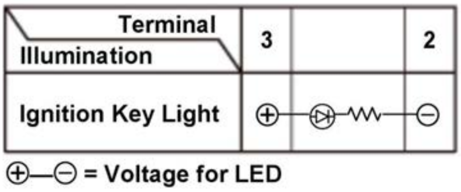
IGNITION KEY LIGHT TEST

Test

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Column Covers - Remove**
2. Ignition Key Light - Test





Terminal Illumination	3		2
Ignition Key Light	⊕	—⊳|—ʍ—	⊖

⊕—⊖ = Voltage for LED

1. Disconnect the connector.

2. Check the light according to the table.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**

3. If the result is not as specified, the ignition key light is faulty; replace the steering lock (A).

3. All Removed Parts - Install

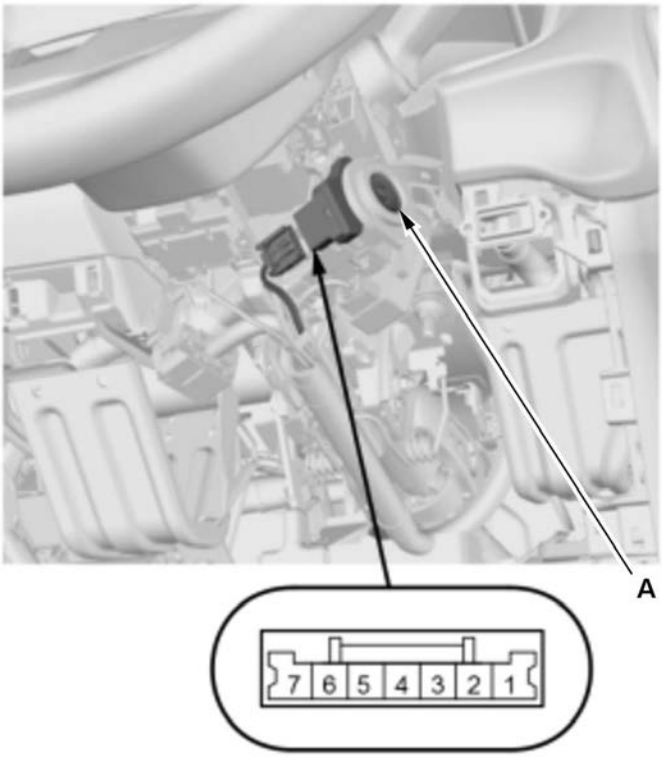
1. Install the parts in the reverse order of removal.

IGNITION KEY SWITCH TEST

Test

NOTE: SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Column Covers - Remove
2. Ignition Key Switch - Test



Terminal / Condition	6	7
Key inserted	○	○
Key removed		

1. Disconnect the connector.

2. Check for continuity between the terminals in each switch condition according to the table.

3. If the continuity is not as specified, the ignition key switch is faulty; **replace the steering lock**

(A).

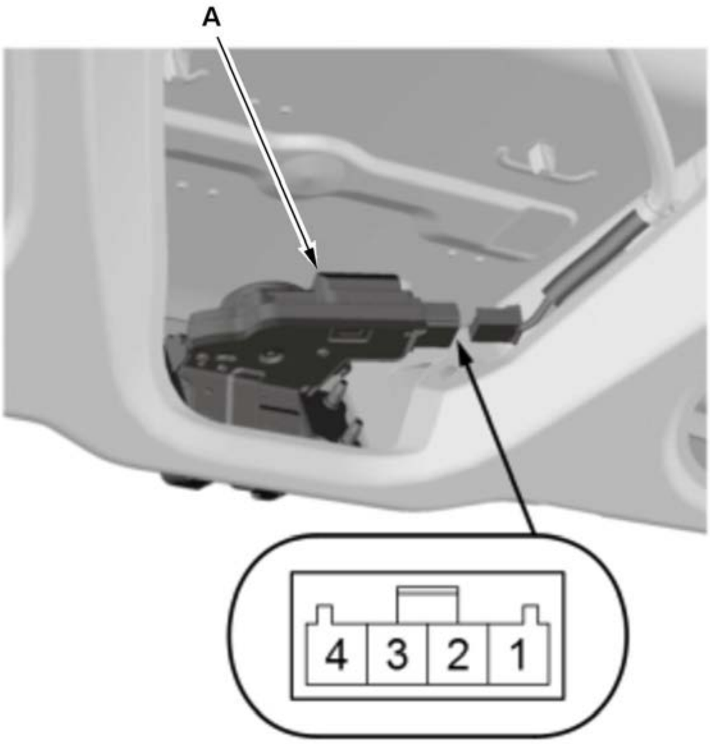
3. All Removed Parts - Install

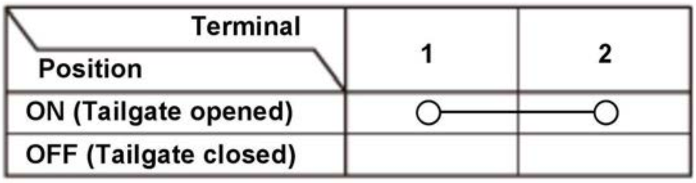
1. Install the parts in the reverse order of removal.

TAILGATE LATCH SWITCH TEST

Test

1. **Tailgate Lower Trim Panel - Remove**
2. Tailgate Latch Switch - Test





Terminal / Position	1	2
ON (Tailgate opened)	○	○
OFF (Tailgate closed)		

1. Disconnect the connector.

2. Check for continuity between the terminals in each switch position according to the table.

3. If the continuity is not as specified, the tailgate latch switch is faulty; **replace the tailgate latch**

(A).

3. All Parts Removed - Install

1. Install the parts in the reverse order of removal.

13. Loosen the special bolts (A, B, C) until they disengage from the threads on the hanger beam (D), and engage the inside threads of the collar bolts (E). The thread lock on the special bolts makes the special bolts and the collar bolts turn together.

14. Continue to loosen the special bolts to turn the collar bolts into the fixed space adjusters (F) until the collar bolts

engage the adjuster brackets. This creates a gap (G) between the collar bolts and the body.

15. Remove the special bolts.

NOTE: The special bolt (A) remains in the body side.

	16. Check that the collar bolt (A) are seated in the fixed space adjusters (B). **NOTE:** If either collar bolt was not seated, replace the special bolts.

	17. Remove the dashboard/steering hanger beam (A).

12. Center Lower Bracket - Remove

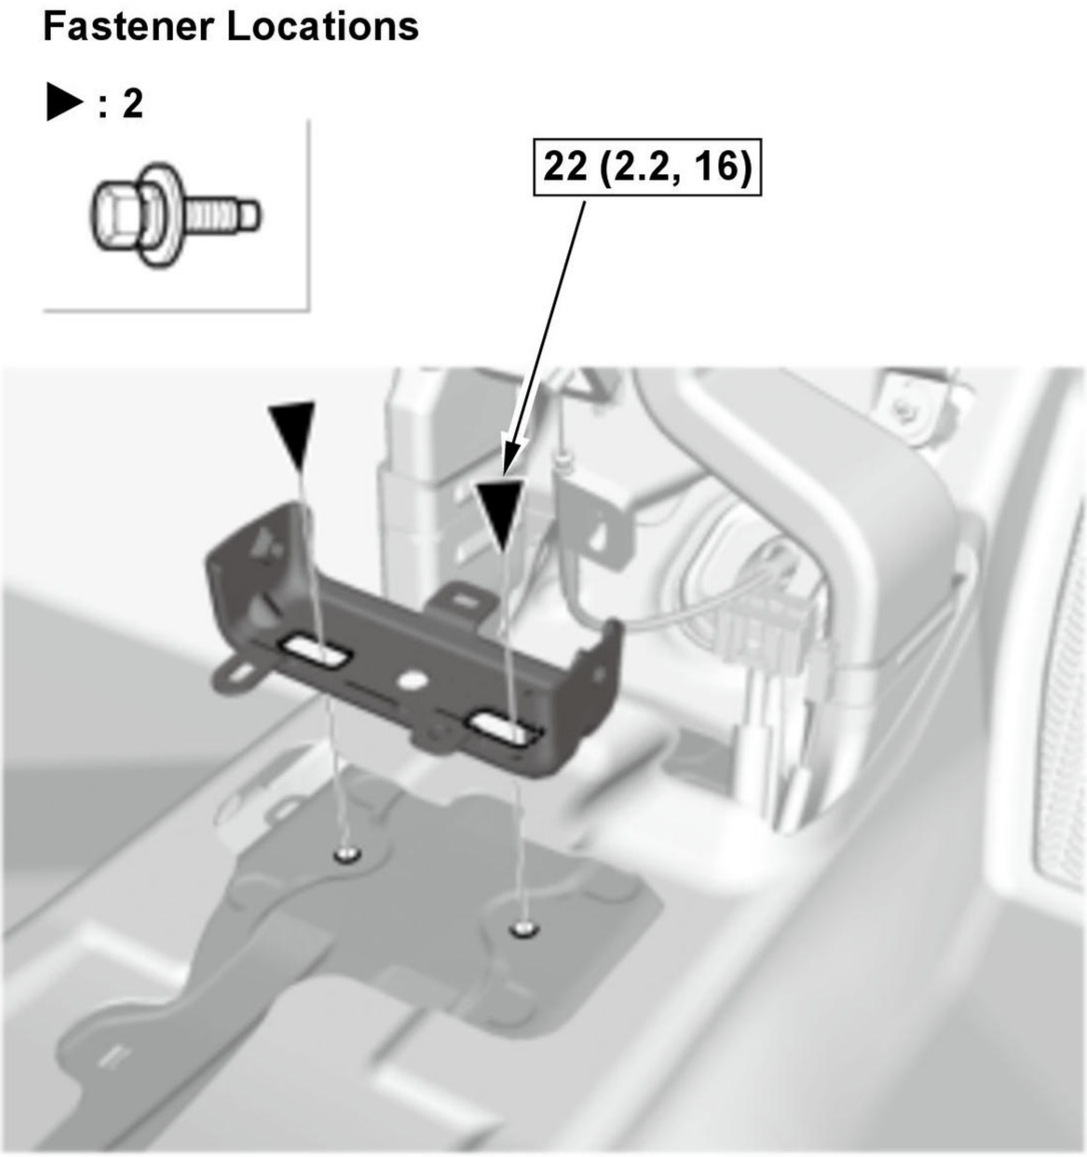

Fig. 29: Center Lower Bracket With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

13. All Removed Parts - Install

Special Bolt Tightening 	1. Install the parts in the reverse order of removal, and note these items: **NOTE:** • Before reinstalling the dashboard, screw the special bolt (A) into the collar bolt (B), and check that they turn together. If they do not turn together, replace the special bolts. • Before reinstalling the dashboard, be sure the collar bolts can be screwed/unscrewed lightly by hand, and then screw them into the fixed space adjusters (C) fully by hand. Do not tighten them with any tools. • Make sure the dashboard fits onto the guide pins correctly. • Before tightening the bolts, make sure the wire harnesses are not pinched. • Make sure the connectors are plugged in properly.

	• After setting the dashboard in the body, reinstall all of the mounting bolts but do not tighten them. First tighten the driver's side mounting bolts to the specified torque, then tighten the remaining special bolts. As you tighten the bolts, the collar bolts screw out of the space adjuster until they contact the body. Continue tightening the special bolts to the specified torque. • As you tighten the bolts, the collar bolts screw out of the space adjuster until they contact the body. Continue tightening the special bolts to the specified torque. • Do the 12 volt battery terminal connection procedure . • Check for any DTCs that may have been set during repairs, and clear them.

14. Steering Column - Inspect
15. Brake Pedal Position Switch - Adjust

DEFOGGER VENT TRIM REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

    1. Install the parts in the reverse order of removal.

GRAB HANDLE REMOVAL AND INSTALLATION

Removal

1. Grab Handle - Remove

	1. Lower the grab handle (A). 2. Remove the caps (B). 3. Squeeze the clips (C) with pliers, then remove the grab handle.

Inspection

1. Grab Handle - Check

	1. If the side curtain airbag has not deployed, inspect the grab handle (A) for damage. A damaged grab handle may cause the side curtain airbag to deploy improperly, possibly causing injury. Replace the grab handle if it has any of the following damage: • Any cracks or breakage in the grab handle • Any cracks or stress-whitening in the caps (B)

Installation

1. Grab Handle - Install

	1. Position the grab handle (A) on the grab handle bracket (B). 2. Push on the grab handle until the clips (C) snap into place securely. 3. Install the caps (D) fully into the clips.

HEADLINER REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes before starting work.

2. Both A-Pillar Trims - Remove

INTERIOR TRIM REMOVAL AND INSTALLATION - PILLAR AREAS

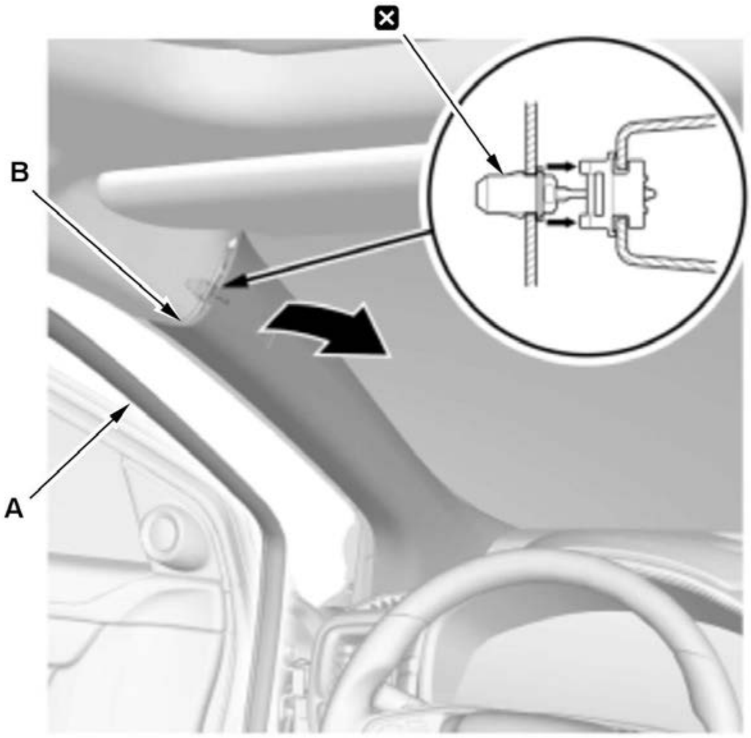
Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: If the side airbags and/or side curtain airbags have deployed, the affected pillar area trim and attachment clips must be replaced. **Refer to Component Replacement/Inspection After Deployment** .

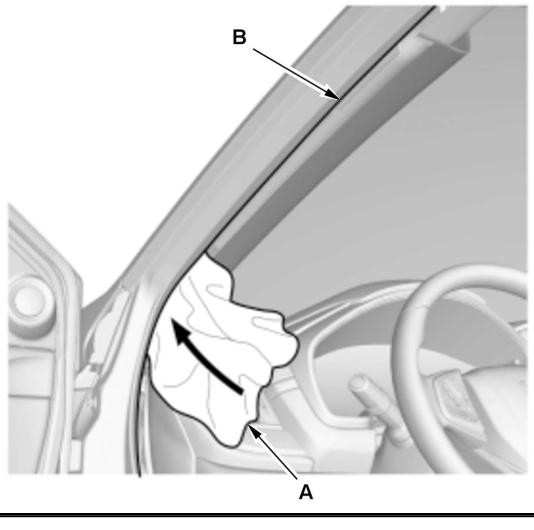
A-Pillar Trim

1. A-Pillar Trim - Remove



1. Remove the front door opening seal (A) as needed.

2. Pull out the A-pillar trim (B).

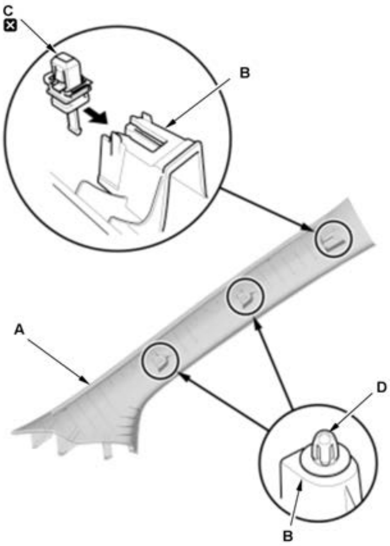


3. Put a shop towel (A) in the opening between the A-pillar trim (B) and the dashboard to prevent the A-pillar clips from falling.

 Fastener Locations B ▷ : 1 C ▷ : 2 B C C A	4. Remove the A-pillar trim (A). **NOTE:** The upper clips (B, C) will stay in the body.

	5. Remove the upper clip (A).

2. A-Pillar Trim - Check



1. If the side curtain airbag has deployed, replace the A-pillar trim (A) and all the clips on the trim with new parts.

2. If the side curtain airbag has not deployed, check the A-pillar trim and note the following items:

- To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the A-pillar trim and replace it with a new one if it has any of the following damage:
-
    - Any cracks, deformations, or stress-whitened areas in the A-pillar trim.
    - Any cracks or stress-whitening in the clip seating surfaces (B).
- After checking and adjusting the overlap between the headliner and the A-pillar trim, replace the upper clip (C) with a new one.
- If the clips (D) are damaged or stress-whitened, replace them with new ones.
- Make sure the side curtain airbag is not tucked under the clips or the trim ribs.
- Do not push too hard on the A-pillar trim. If you push too hard, the clip will be damaged, and it will not hold the trim properly.
- Gently tug on the A-pillar trim to verify that all clips are securely fastened

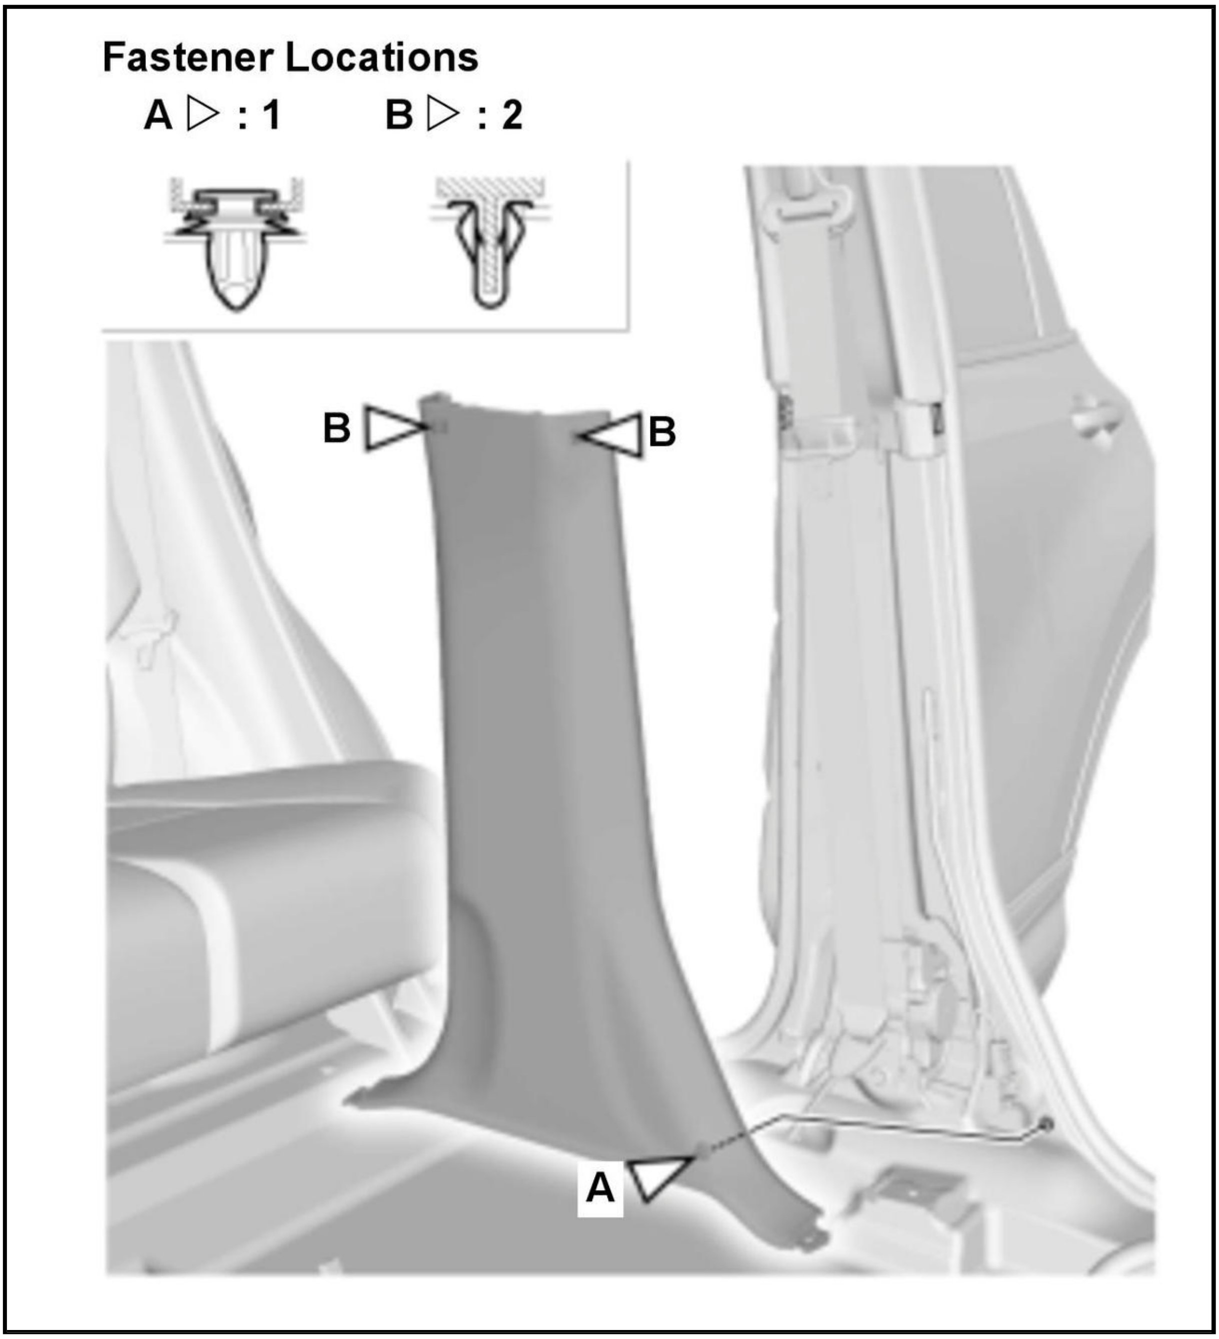
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **Headliner/Pillar Trim Overlap - Check**

B-pillar Upper/Lower Trim

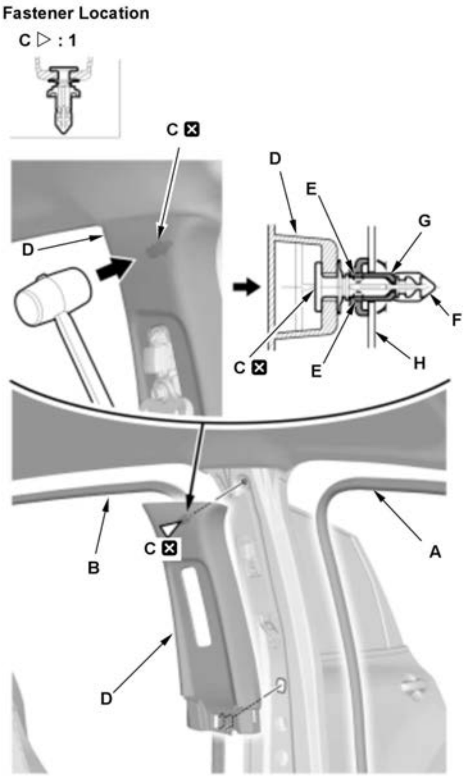
1. **Front Door Sill Trim - Remove**
2. **Rear Door Sill Trim - Remove**
3. B-pillar Lower Trim - Remove



Fastener Locations
A ▷ : 1
B ▷ : 2
B
B
A

4. [Front Seat Belt Upper Anchor Bolt - Remove]

5. B-pillar Upper Trim - Remove

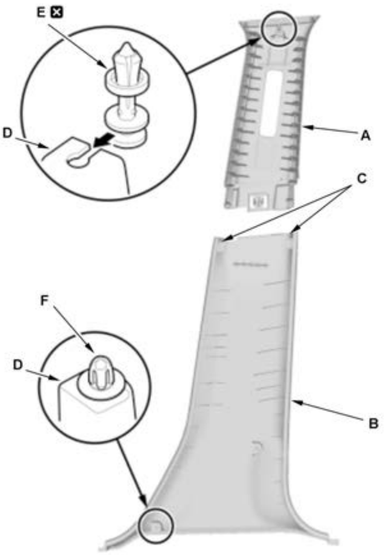


1. Remove the front and the rear door opening seals (A, B) as needed.

2. Hit the upper clip (C) in the B-pillar upper trim (D) with a rubber mallet. Hitting the clip breaks the projections (E) on the pin (F), and pushes it into the grommet (G) on the body (H).

NOTE: The upper clip must be replaced with a new one when the B-pillar trim is reinstalled.

6. B-pillar Upper/Lower Trim - Check



1. If the side curtain airbag has deployed, replace the B-pillar upper trim (A), the B-pillar lower trim (B), and all clips on the trim with new parts.

2. If the side curtain airbag has not deployed, check the B-pillar upper/lower trim and note the following items:

- To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the B-pillar upper/lower trims and replace them with new ones if they have any of the following damage:
-
    - Any cracks or deformations in the B-pillar lower trim, or any breakages in the hooks (C) fitted with the B-pillar upper trim.
    - Any cracks or stress-whitening areas in the clip seating surface (D).
- After checking and adjusting the overlap between the headliner and the B-pillar trim, replace the upper clip (E) with a new one.
- If the clip (F) is damaged or stress-whitened, replace it with a new one.

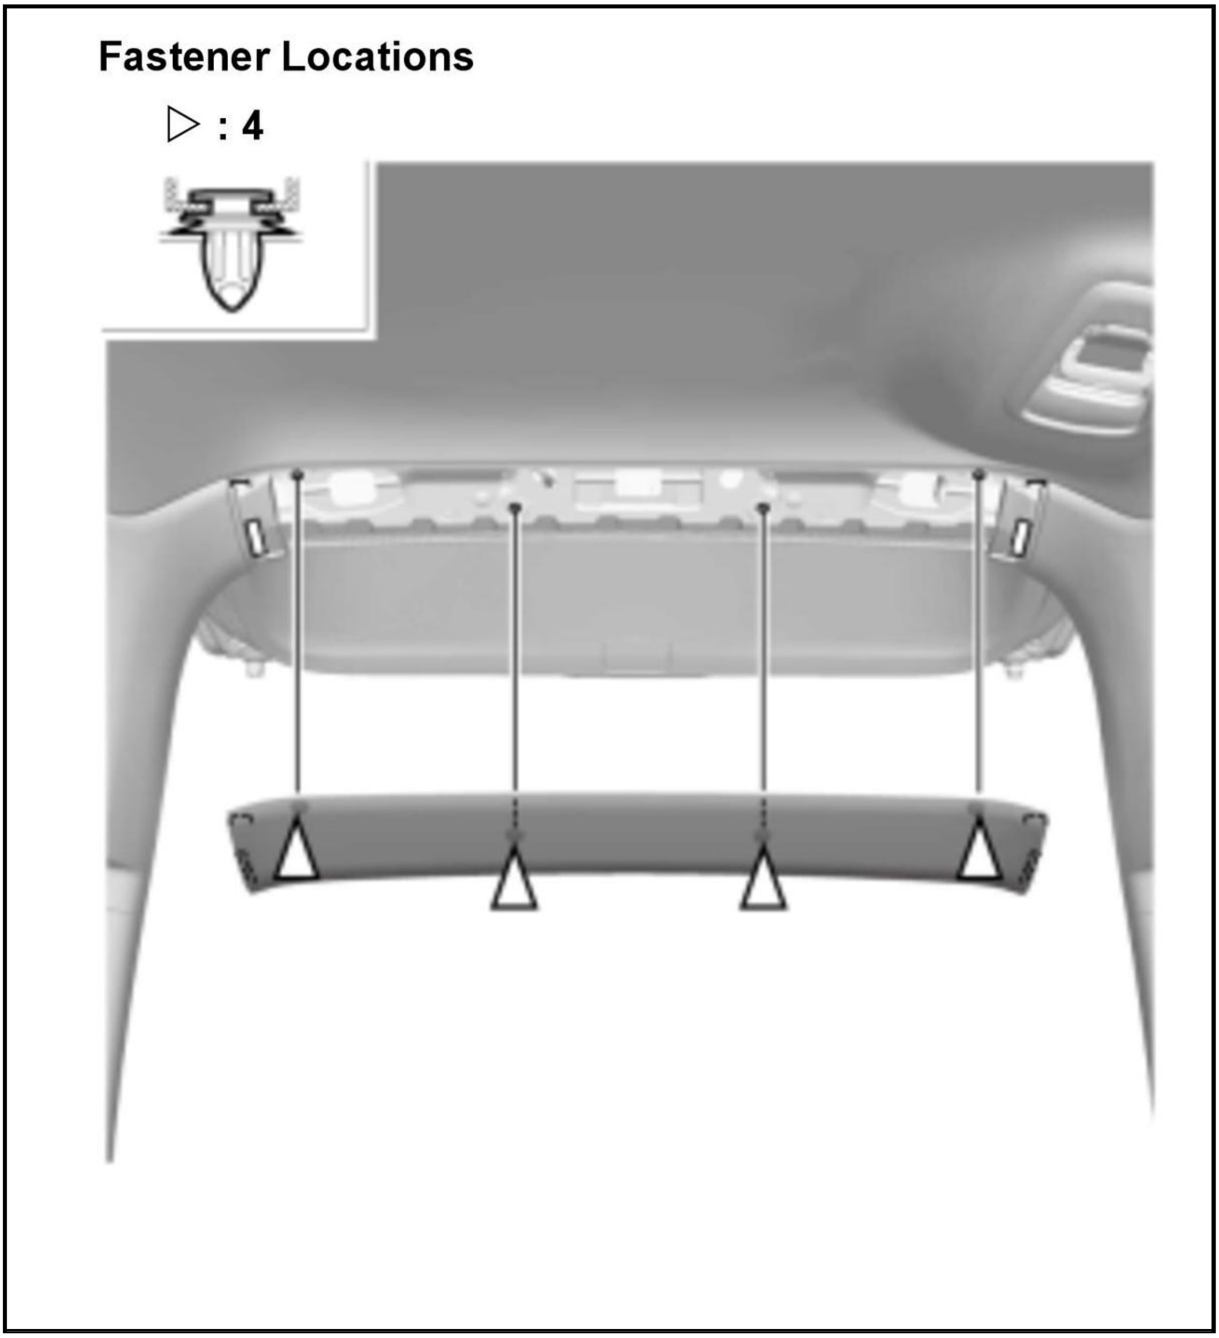
7. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

8. **Headliner/Pillar Trim Overlap - Check**

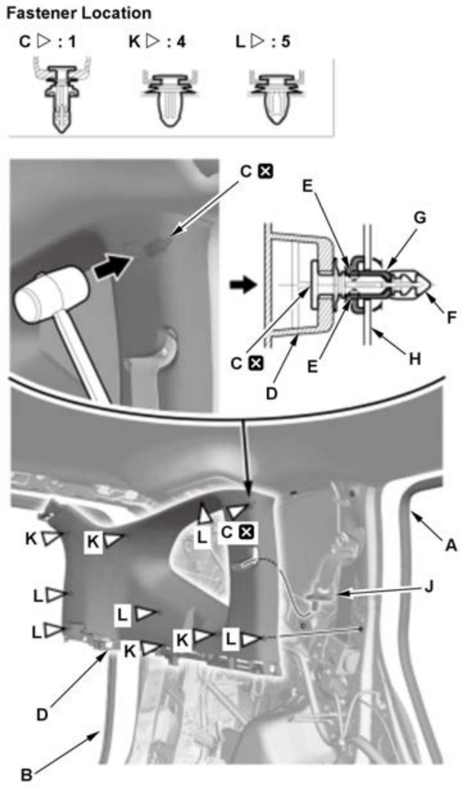
Quarter Pillar Trim

1. Rear Roof End Trim - Remove



Fastener Locations
▷ : 4

2. **Rear Seat Belt Lower Anchor Bolt - Remove**
3. **Rear Side Trim Panel - Remove**
4. Quarter Pillar Trim - Remove



1. Remove the rear door opening seal (A) and the tailgate weatherstrip (B) as needed.

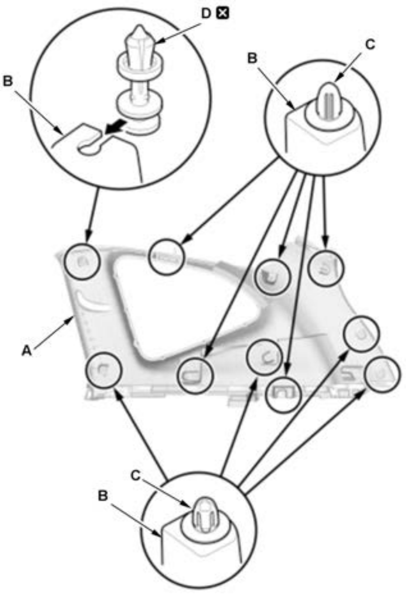
2. Hit the upper clip (C) in the quarter pillar trim (D) with a rubber mallet. Hitting the clip breaks the projections (E) on the pin (F), and pushes it into the grommet (G) on the body (H).

NOTE: The upper clip must be replaced with a new one when the quarter pillar trim is reinstalled.

3. Pull back the quarter pillar trim.

4. Pass the rear seat belt lower anchor (J) through the hole in the quarter pillar trim.

5. Quarter Pillar Trim - Check



1. If the side curtain airbag has deployed, replace the quarter pillar trim (A) and all clips on the trim with new parts.

2. If the side curtain airbag has not deployed, check the quarter pillar trim and note the following items:

- To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the quarter pillar trim and replace it with a new one if it has any of the following damage:
-
    - Any cracks, deformations, or stress-whitened areas in the quarter pillar trim.
    - Any cracks or stress-whitening in the clip seating surfaces (B).
- If the clips (C) are damaged or stress-whitened, replace them with new ones.
- After checking and adjusting the overlap between the headliner and the quarter pillar trim, replace the upper clip (D) with a new ones.
- Make sure the side curtain airbag is not tucked under the clips or the trim ribs.
- Gently tug on the quarter pillar trim to verify that all clips are securely fastened.

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

7. **Headliner/Pillar Trim Overlap - Check**

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

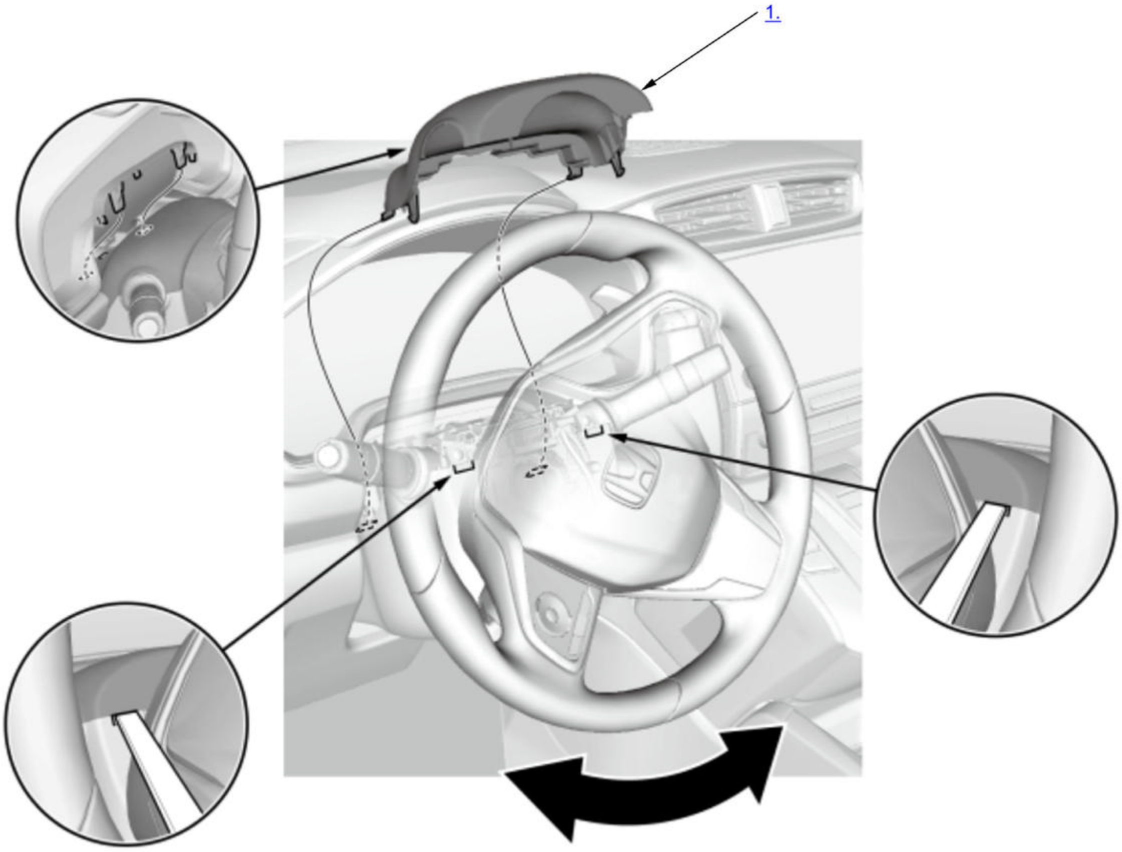

Fig. 38: Upper Steering Column Cover Components
Courtesy of HONDA, U.S.A., INC.

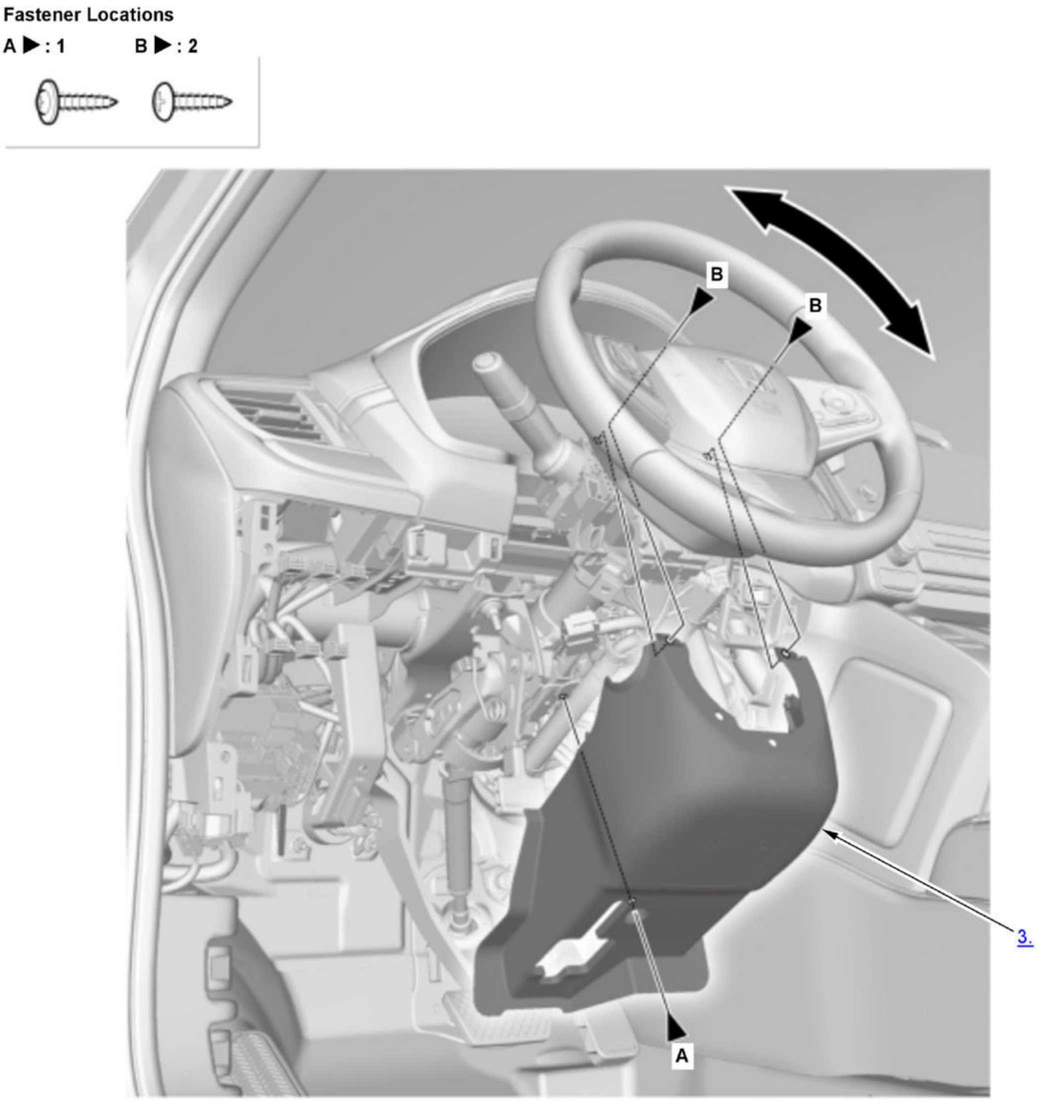

Fig. 39: Lower Steering Column Cover Components
Courtesy of HONDA, U.S.A., INC.

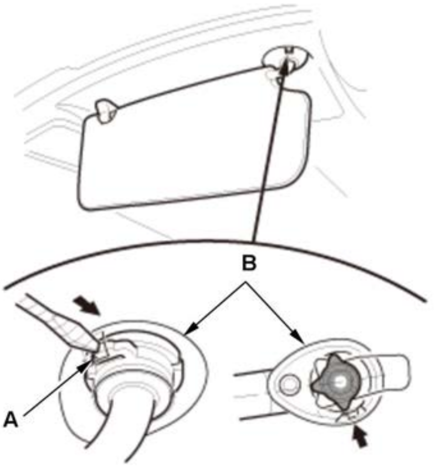
1. Upper Column Cover - Remove
2. **Driver's Dashboard Lower Cover - Remove**
3. Lower Column Cover - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

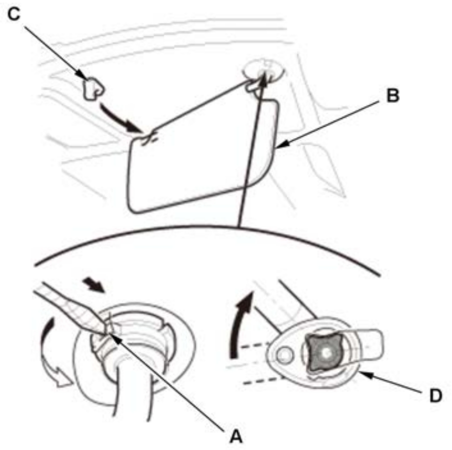
SUNVISOR REMOVAL AND INSTALLATION

Removal and Installation

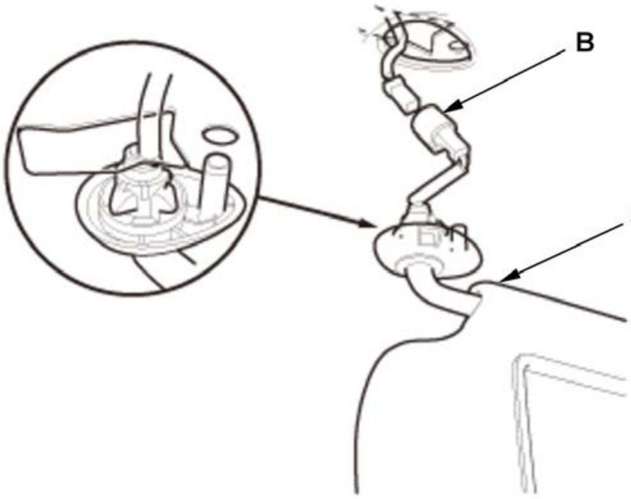
1. Sunvisor - Remove



1. Push the hook (A) with a flat-tip screwdriver through the hole in the front side of the bracket cover (B).



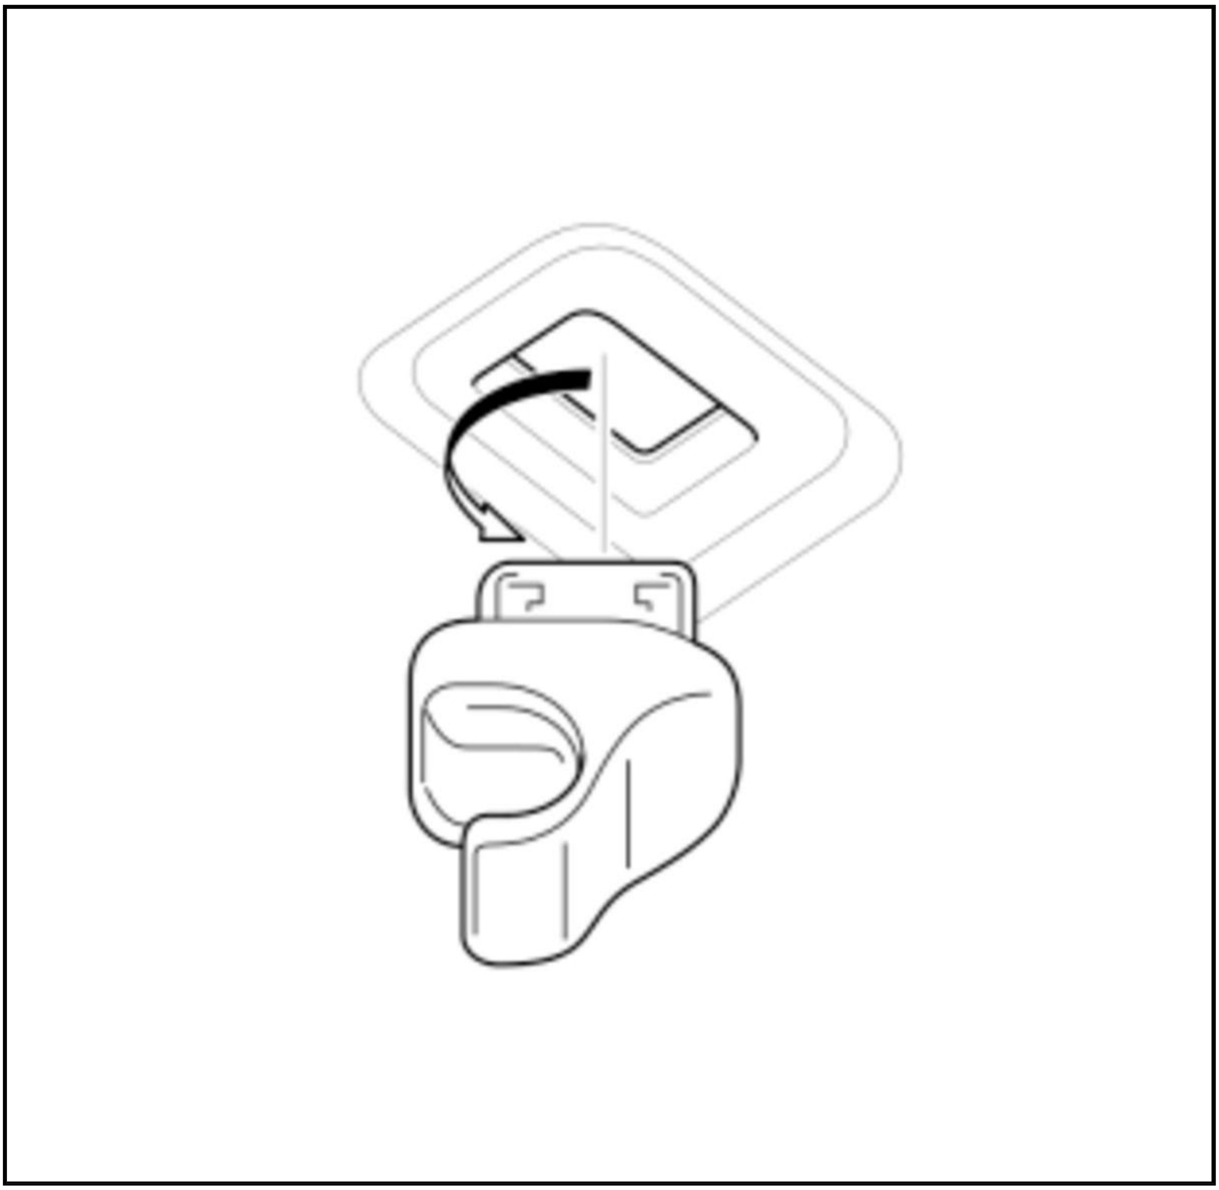
2. While pushing in the hook (A) with a flat-tip screwdriver, release the sunvisor (B) from the holder (C), and rotate the sunvisor backward 45Â°.
NOTE: Make sure the hook slides into the bracket cover (D) as you rotate the sunvisor.



3. Remove the sunvisor (A).

4. For some models: Disconnect the connector (B).

2. Sunvisor Holder - Remove



3. Sunvisor - Check

	1. If the side curtain airbag has deployed, replace the sunvisor, along with the other parts listed for side curtain airbag deployment. 2. If the side curtain airbag has not deployed, inspect the sunvisor for damage. A damaged sunvisor may cause the side curtain airbags to deploy improperly, possibly causing injury. Replace the sunvisor if it has any of the following damage: • Any cracks in the sunvisor bracket (A) • Any cracks in the sunvisor bracket cover (B) • Any bends or cracks in the sunvisor shaft (C) • Any cracks in the sunvisor base (D) • Any cracks in the vanity mirror base (E) 3. If the sunvisor holder is damaged or stress-whitened, replace it with new one.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

INTERIOR TRIM REMOVAL AND INSTALLATION - PILLAR AREAS

Removal and Installation

NOTE:

- SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.
- If the side airbags and/or side curtain airbags have deployed, the affected pillar area trim and attachment clips must be replaced. **Refer to Component Replacement/Inspection After Deployment** .

A-Pillar Trim

1. A-Pillar Trim - Remove

	1. Remove the front door opening seal (A) as needed. 2. Pull out the A-pillar trim (B).

	3. Put a shop towel (A) in the opening between the A-pillar trim (B) and the dashboard to prevent the A-pillar clips from falling.

 Fastener Locations B ▷ : 1 C ▷ : 2 B ☒ C C A	4. Remove the A-pillar trim (A). **NOTE:** **The upper clip (B, C) will stay in the body.**

	5. Remove the upper clip (A).

2. A-Pillar Trim - Check

 	1. If the side curtain airbag has deployed, replace the A-pillar trim (A) and all the clips on the trim with new parts. 2. If the side curtain airbag has not deployed, check the A-pillar trim and note the following items: • To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the A-pillar trim and replace it with a new one if it has any of the following damage: • • - Any cracks, deformations, or stress-whitened areas in the A-pillar trim. • - Any cracks or stress-whitening in the clip seating surfaces (B). • After checking and adjusting the overlap between the headliner and the A-pillar trim, replace the upper clip (C) with a new one. • If the clips (D) are damaged or stress-whitened, replace them with new ones. • Make sure the side curtain airbag is not tucked under the clips or the trim ribs. • Do not push too hard on the A-pillar trim. If you push too hard, the clip will be damaged, and it will not hold the trim properly. • Gently tug on the A-pillar trim to verify that all clips are securely fastened

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **Headliner/Pillar Trim Overlap - Check**

B-pillar Upper/Lower Trim

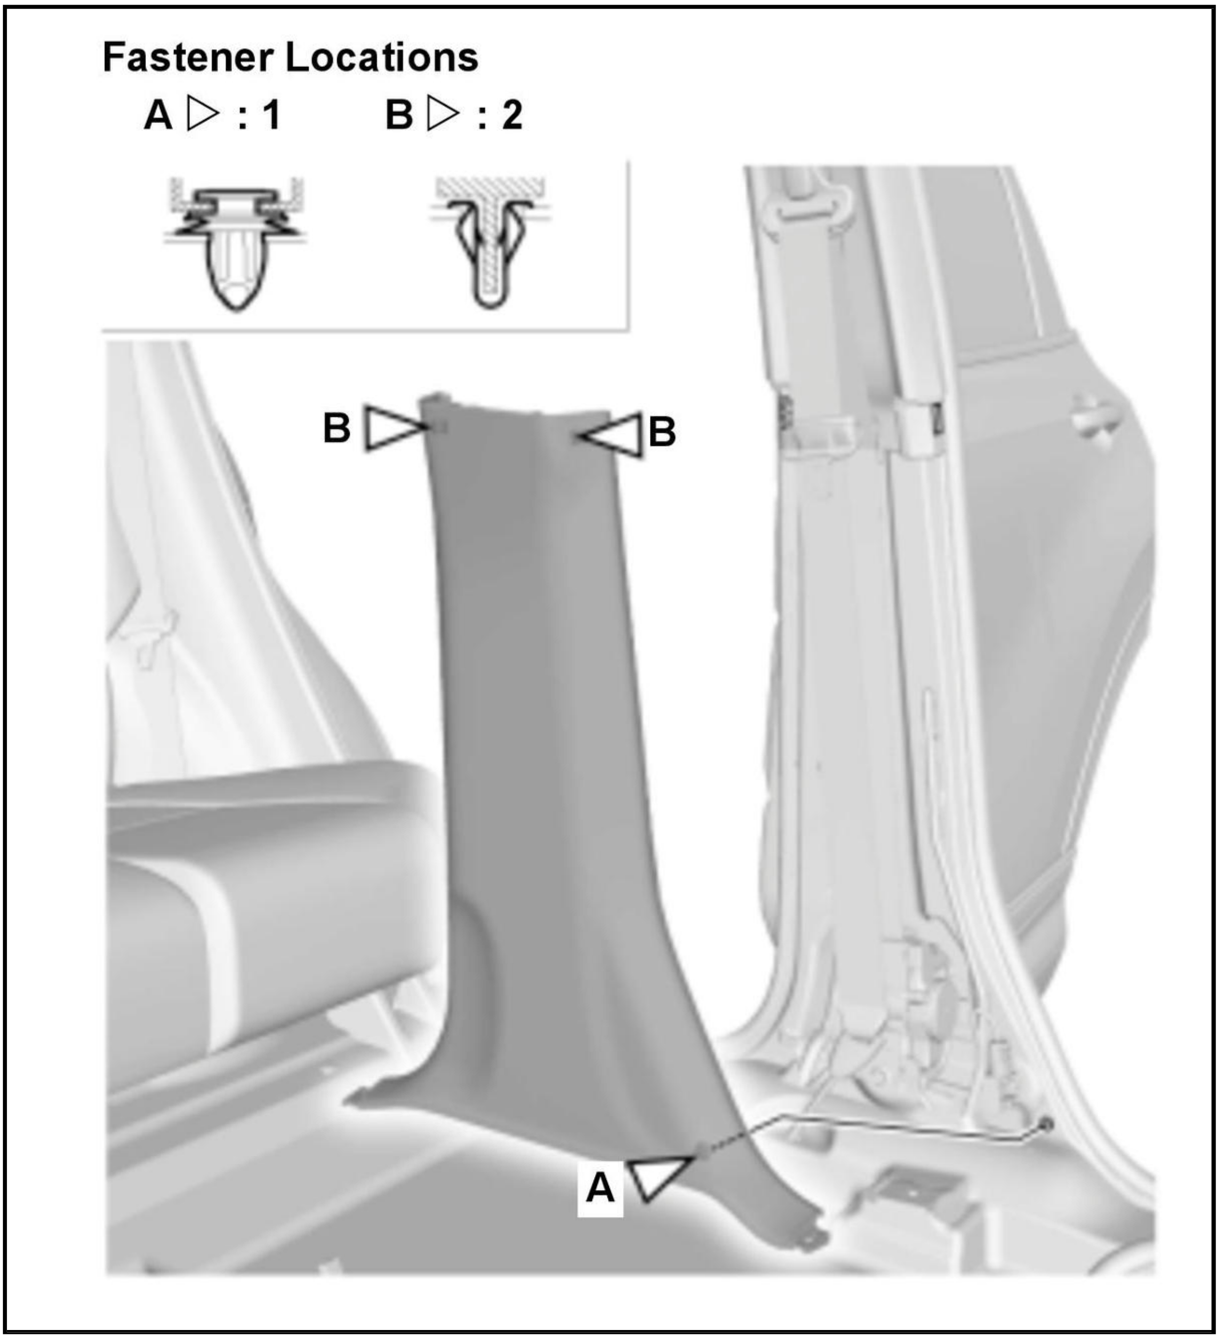
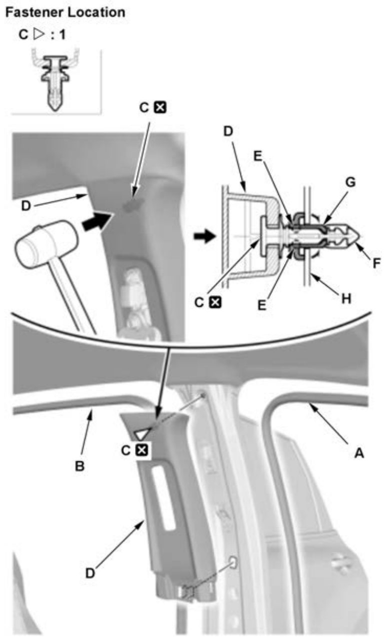
6. **Rear Door Sill Trim - Remove**
7. B-pillar Lower Trim - Remove



Fastener Locations
A ▷ : 1
B ▷ : 2
B
B
A

8. **Front Seat Belt Upper Anchor Bolt - Remove**

9. B-pillar Upper Trim - Remove

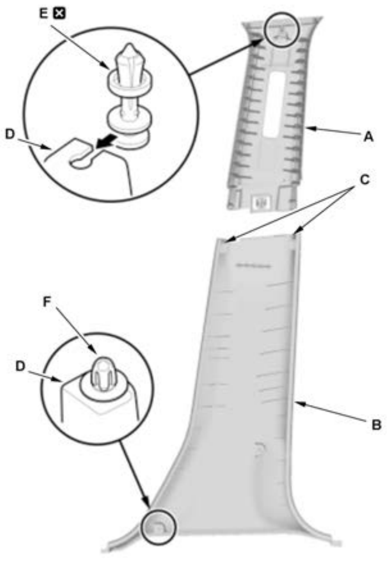


1. Remove the front and the rear door opening seals (A, B) as needed2. Hit the upper clip (C) in the B-pillar upper trim (D) with a rubber mallet. Hitting the clip breaks the projections (E) on the pin (F), and pushes it into the grommet (G) on the body (H).

NOTE:

The upper clip must be replaced with a new one when the B-pillar trim is reinstalled.

10. B-pillar Upper/Lower Trim - Check



1. If the side curtain airbag has deployed, replace the B-pillar upper trim (A), the B-pillar lower trim (B), and all clips on the trim with new parts.

2. If the side curtain airbag has not deployed, check the B-pillar upper/lower trim and note the following items:

- To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the B-pillar upper/lower trims and replace them with new ones if they have any of the following damage:
-
  - -

    Any cracks or deformations in the B-pillar lower trim, or any breakages in the hooks (C) fitted with the B-pillar upper trim.

  - -

    Any cracks or stress-whitening areas in the clip seating surface (D).

- After checking and adjusting the overlap between the headliner and the B-pillar trim, replace the upper clip (E) with a new one.
- If the clip (F) is damaged or stress-whitened, replace it with a new one.

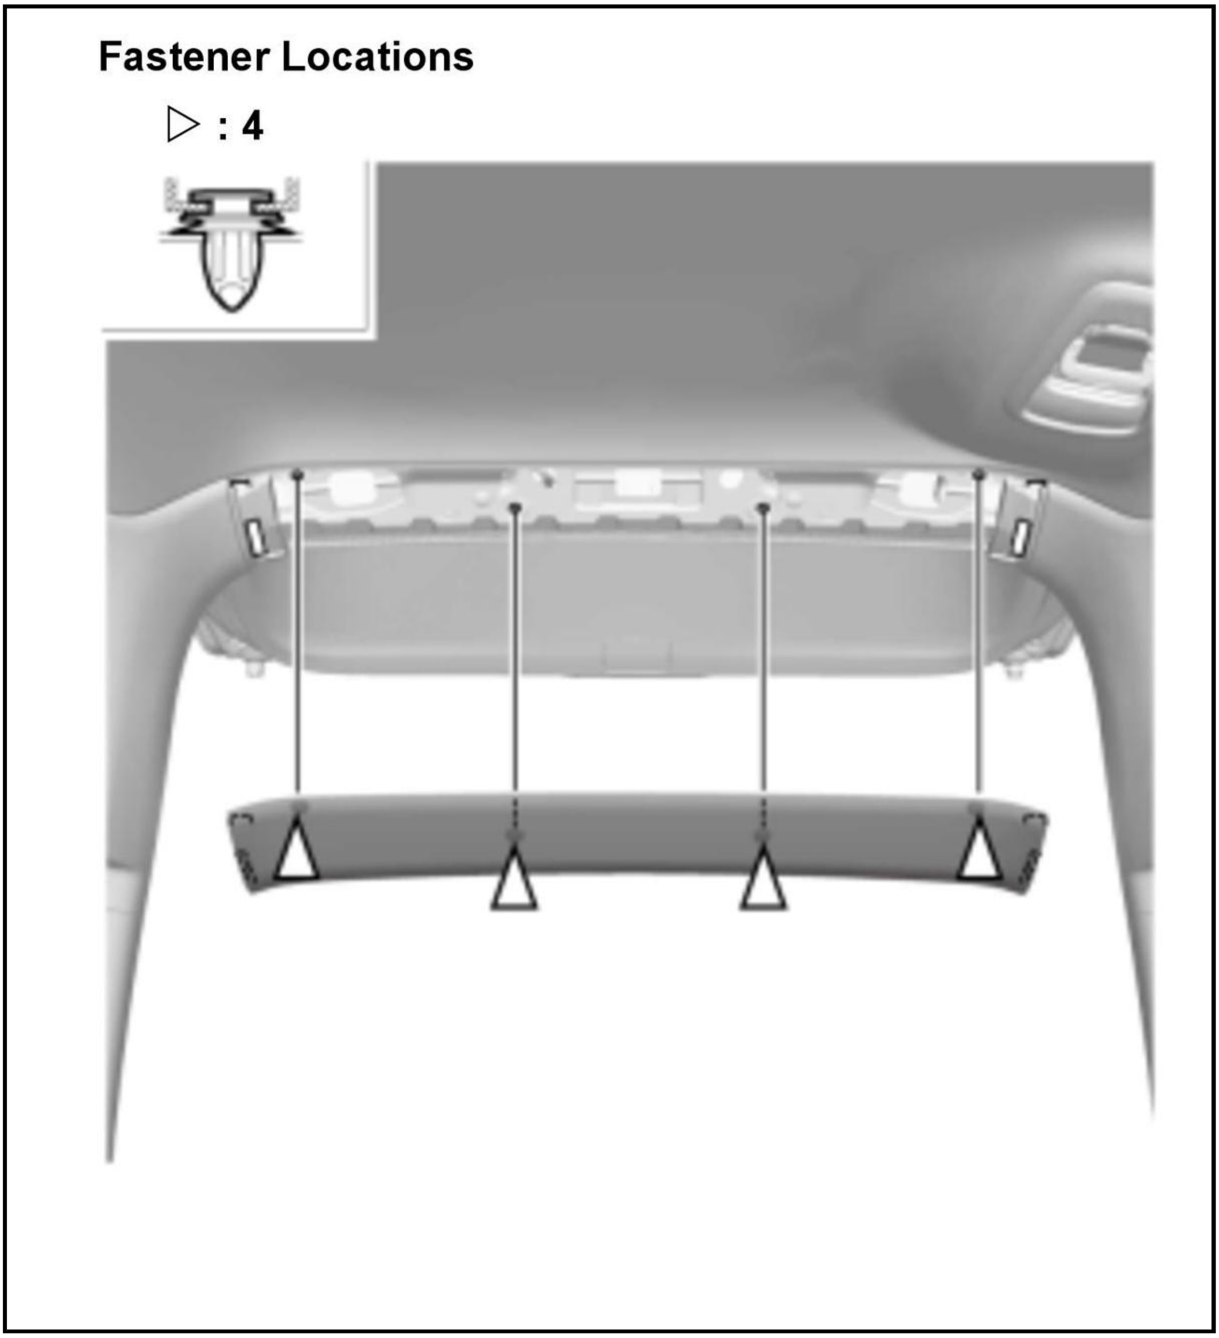
11. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

12. Headliner/Pillar Trim Overlap - Check

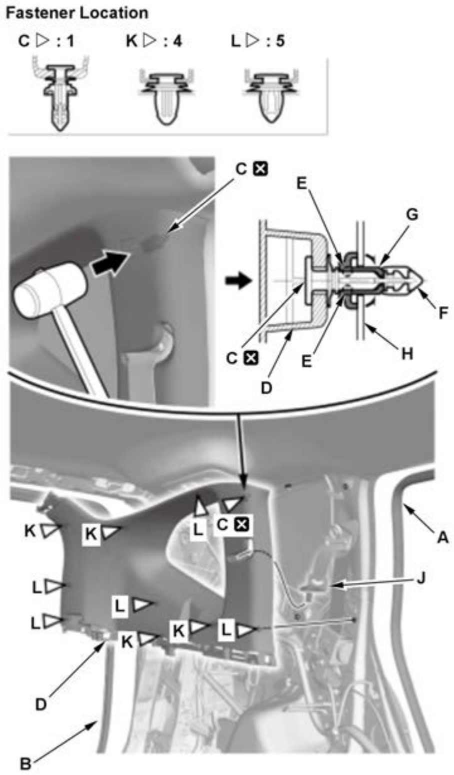
Quarter Pillar Trim

13. Rear Roof End Trim - Remove



Fastener Locations
▷ : 4

14. Rear Seat Belt Lower Anchor Bolt - Remove
15. Rear Side Trim Panel - Remove
16. Quarter Pillar Trim - Remove



1. Remove the rear door opening seal (A) and the tailgate weatherstrip (B) as needed.

2. Hit the upper clip (C) in the quarter pillar trim (D) with a rubber mallet. Hitting the clip breaks the projections (E) on the pin (F), and pushes it into the grommet (G) on the body (H).

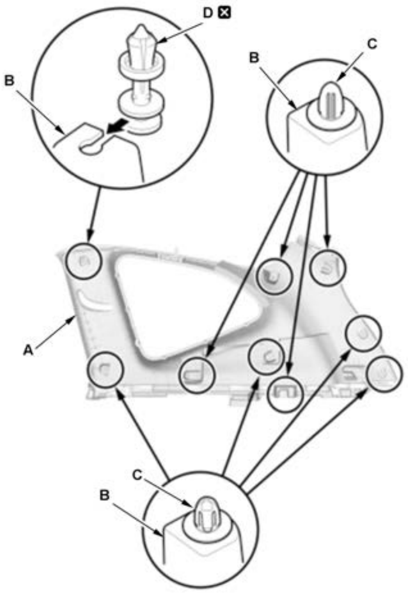
NOTE:

The upper clip must be replaced with a new one when the quarter pillar trim is reinstalled.

3. Pull back the quarter pillar trim.

4. Pass the second row seat belt lower anchor (J) through the hole in the quarter pillar trim.

17. Quarter Pillar Trim - Check



1. If the side curtain airbag has deployed, replace the quarter pillar trim (A) and all clips on the trim with new parts.

2. If the side curtain airbag has not deployed, check the quarter pillar trim and note the following items:

- To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the quarter pillar trim and replace it with a new one if it has any of the following damage:
-
    - -

      Any cracks, deformations, or stress-whitened areas in the quarter pillar trim.
    - -

      Any cracks or stress-whitening in the clip seating surfaces (B).
- If the clips (C) are damaged or stress-whitened, replace them with new ones.
- After checking and adjusting the overlap between the headliner and the quarter pillar trim, replace the upper clip (D) with a new ones.
- Make sure the side curtain airbag is not tucked under the clips or the trim ribs.
- Gently tug on the quarter pillar trim to verify that all clips are securely fastened.

18. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

19. **Headliner/Pillar Trim Overlap - Check**

INTERIOR TRIM REMOVAL AND INSTALLATION - REAR SIDE AREA

Removal and Installation

1. **Rear Trim Panel - Remove**
2. Rear Door Opening Seal - Remove

    1. **Remove the rear door opening seal as needed**.

3. Tailgate Weatherstrip - Remove

    1. **Remove the tailgate weatherstrip as needed** .

4. **Rear Seat - Remove**
5. Rear Side Trim Panel - Remove

	1. Push down on the upper hook (A) on the rear seat release lever cap (B) with a trim tool, then remove the rear seat release lever cap.
	2. Turn the hook (A) up and using a small flat tip screwdriver (B), push in the white release tab (C) while pulling out the trunk hook.

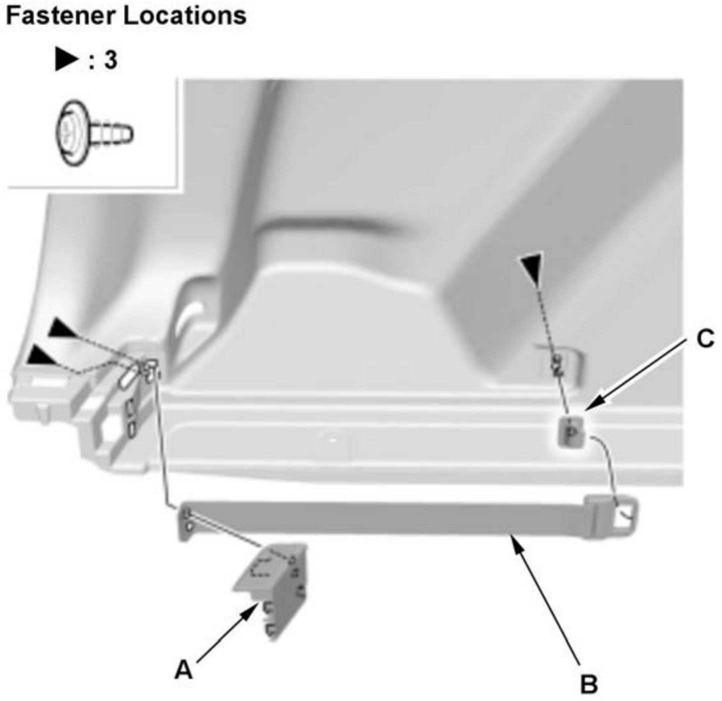
C

3. Remove the clips (A).

4. Disconnect the connector (B).

5. Remove the rear side trim panel (C).



Fastener Locations
▶ : 3
C
A
B

6. If necessary remove the lid (A), band (B) and hook (C).

6. All Removed Parts - Install

	1. Install the parts in the reverse order of removal. **NOTE:** **Align the marks (A) on the rear seat release cable (B) with the clips (C) as shown.**

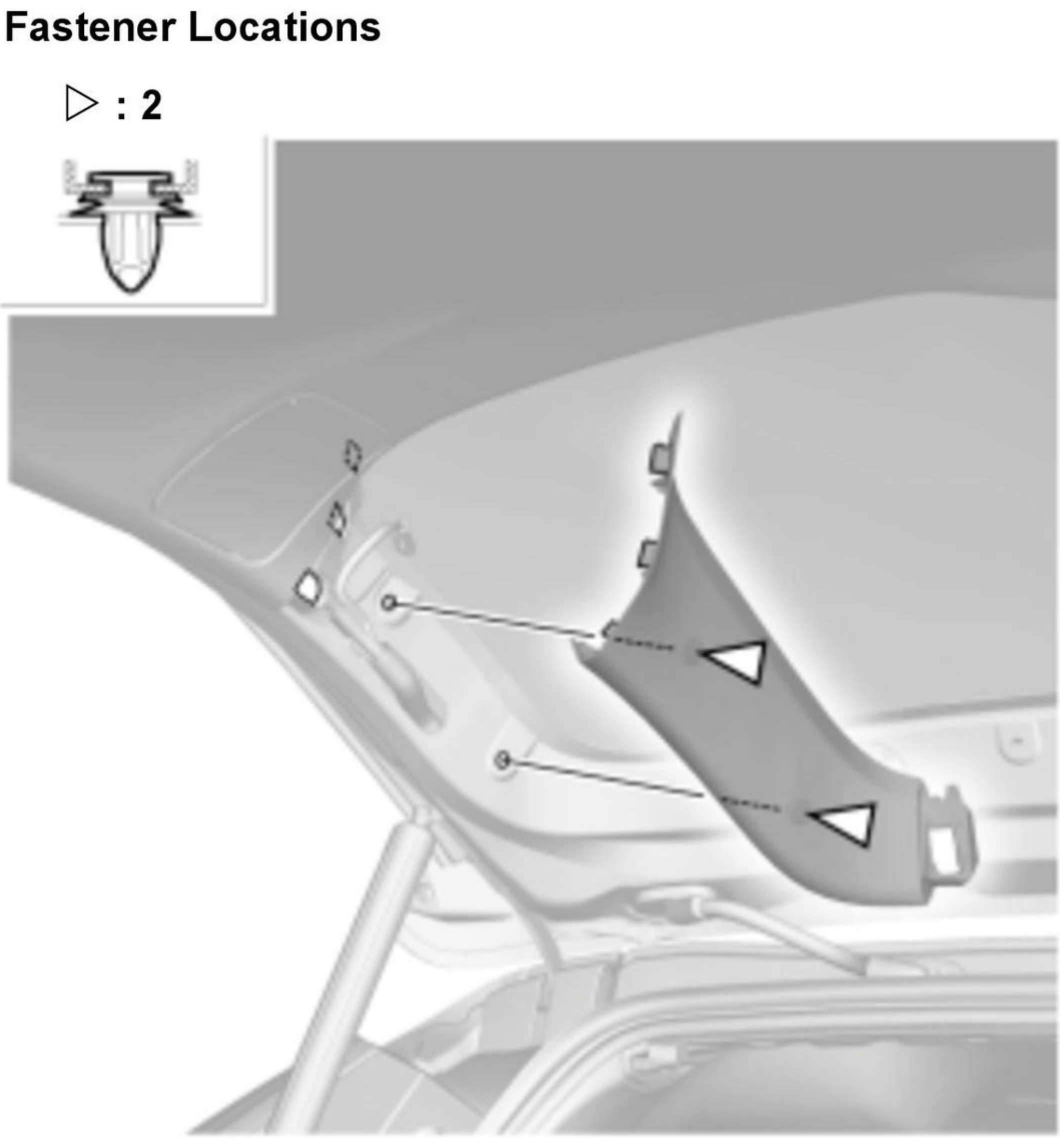
INTERIOR TRIM REMOVAL AND INSTALLATION - TAILGATE AREAS

Removal and Installation

1. Tailgate Upper Trim Panel - Remove

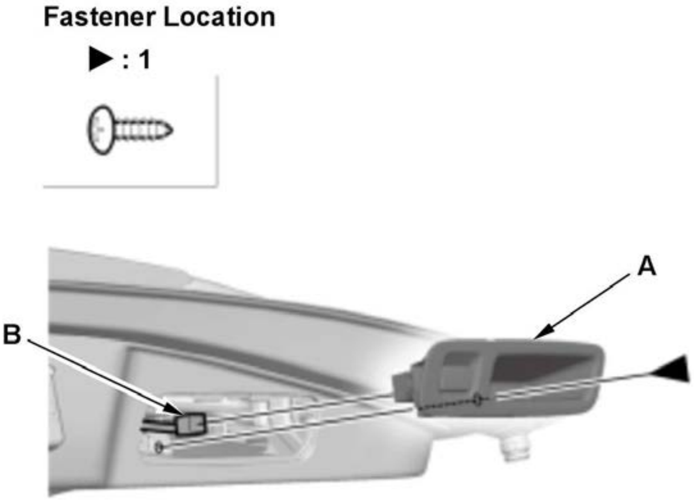
	1. Pry out on the notch (A) in the tailgate upper trim panel (B) with the trim tool.

2. Both Tailgate Side Trim Panels - Remove



Fastener Locations
▷ : 2

3. Tailgate Lower Trim Panel - Remove



Fastener Location
▶ : 1
A
B

1. Remove the tailgate pull pocket (A).

2. For some models: Disconnect the connector (B).

 Fastener Locations B ▷ : 12 C ▷ : 3 B C C C A	3. Remove the tailgate lower trim panel (A).

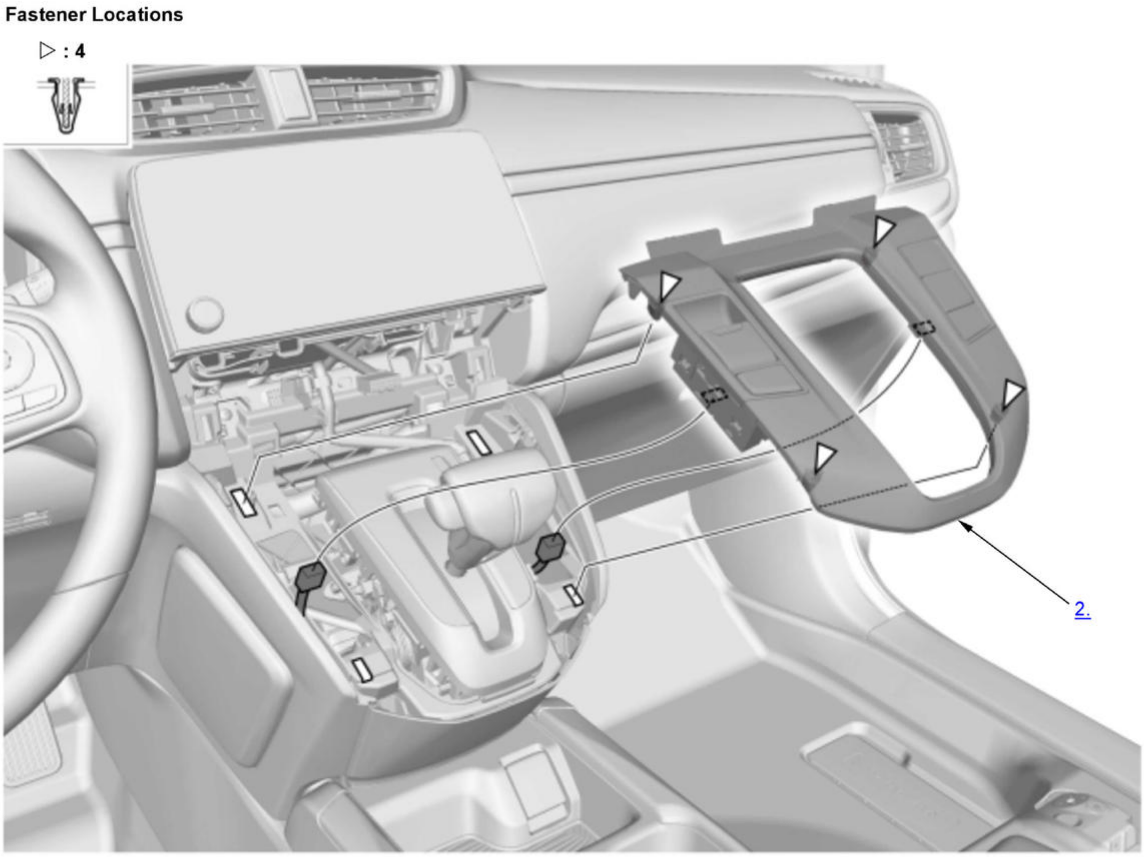
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SHIFT LEVER PANEL REMOVAL AND INSTALLATION

Removal and Installation

1



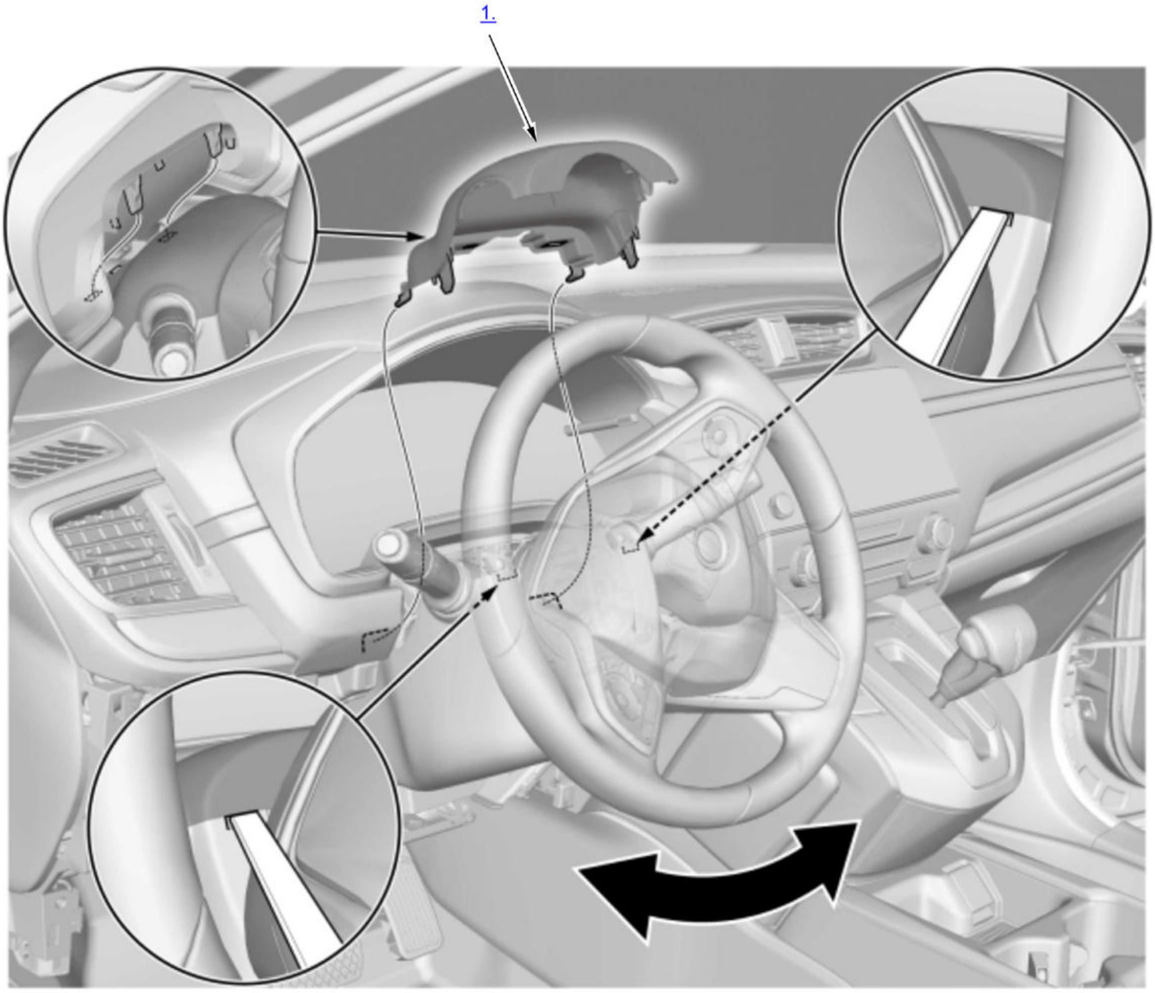
1. Climate Control Panel - Remove
2. Shift Lever Panel - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

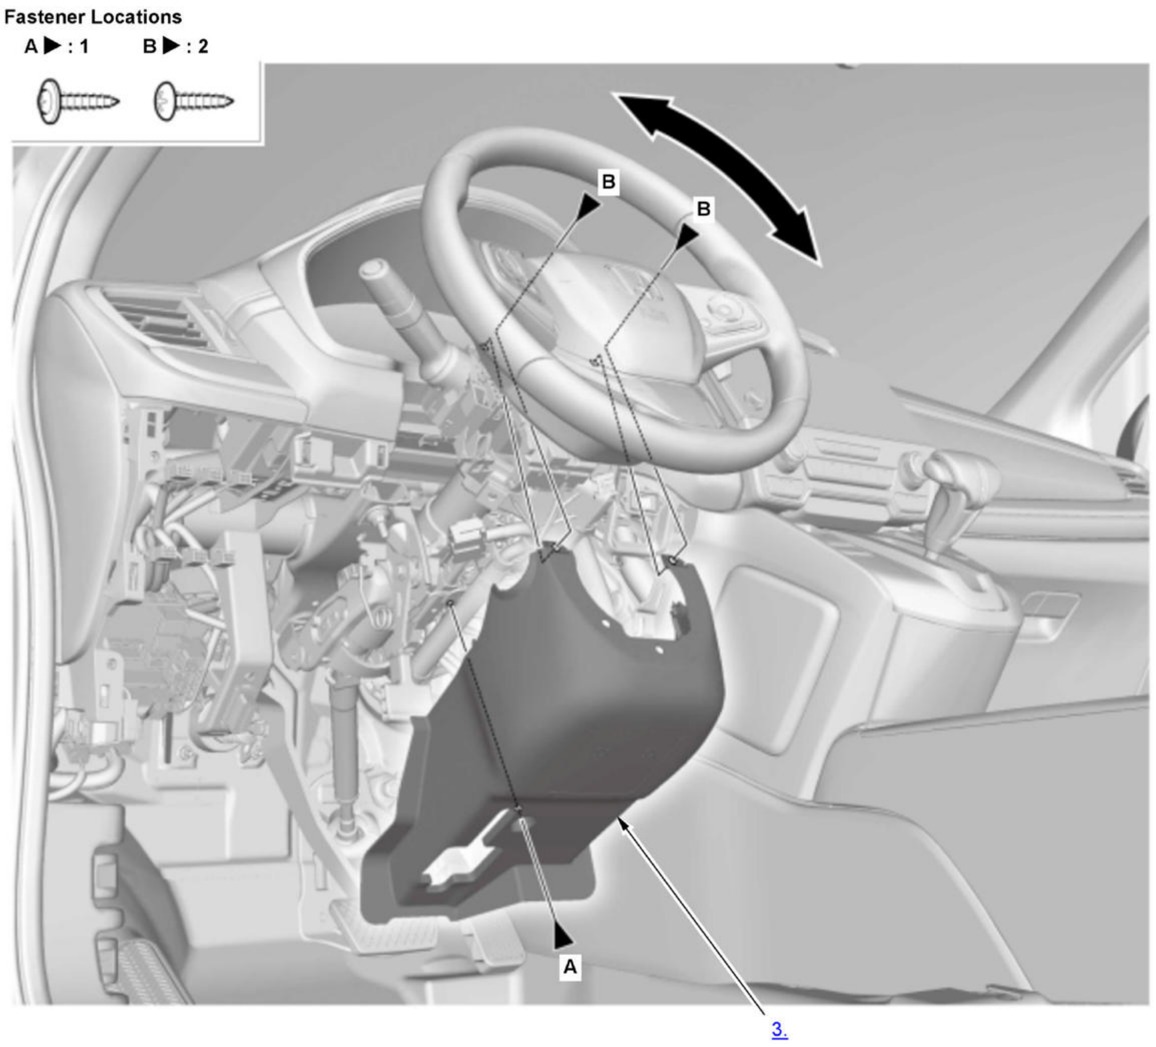
STEERING COLUMN COVER REMOVAL AND INSTALLATION

Removal and Installation

1



1.



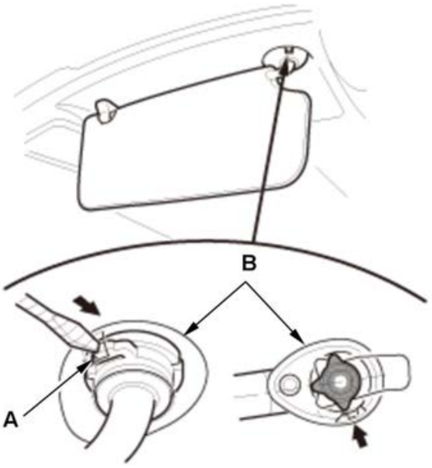
1. Upper Column Cover - Remove
2. **Driver's Dashboard Lower Cover - Remove**
3. Lower Column Cover - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

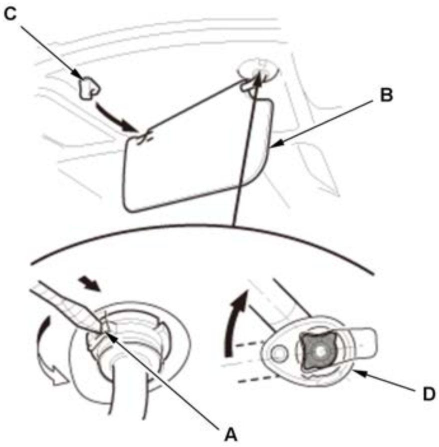
SUNVISOR REMOVAL AND INSTALLATION

Removal and Installation

1. Sunvisor - Remove



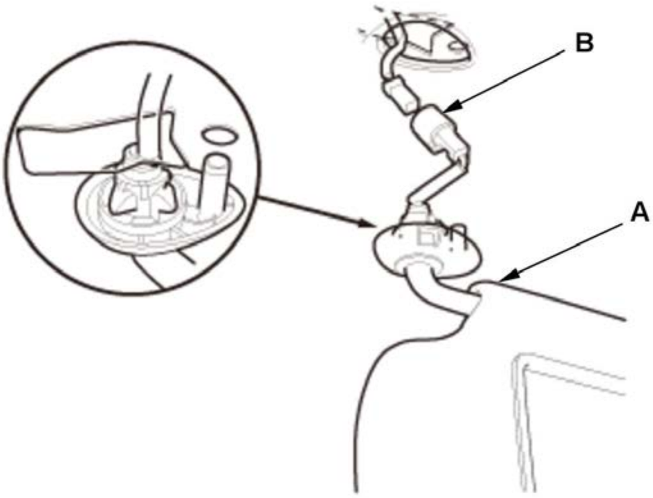
1. Push the hook (A) with a flat-tip screwdriver through the hole in the front side of the bracket cover (B).



2. While pushing in the hook (A) with a flat-tip screwdriver, release the sunvisor (B) from the holder (C), and rotate the sunvisor backward 45 deg..

NOTE:

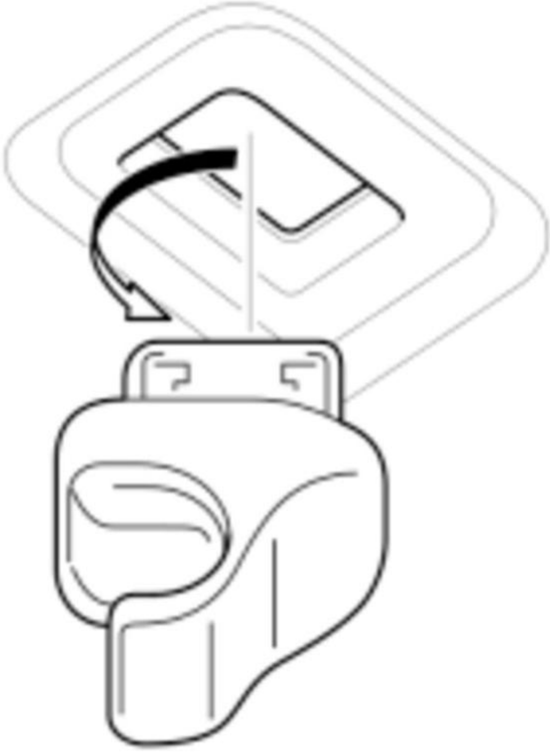
Make sure the hook slides into the bracket cover (D) as you rotate the sunvisor.



3. Remove the sunvisor (A).

4. For some models: Disconnect the connector (B).

2. Sunvisor Holder - Remove



3. Sunvisor - Check

	1. If the side curtain airbag has deployed, replace the sunvisor, along with the other parts listed for side curtain airbag deployment. 2. If the side curtain airbag has not deployed, inspect the sunvisor for damage. A damaged sunvisor may cause the side curtain airbags to deploy improperly, possibly causing injury. Replace the sunvisor if it has any of the following damage: - Any cracks in the sunvisor bracket (A) - Any cracks in the sunvisor bracket cover (B) - Any bends or cracks in the sunvisor shaft (C) - Any cracks in the sunvisor base (D) - Any cracks in the vanity mirror base (E) 3. If the sunvisor holder is damaged or stress-whitened, replace it with new one.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

DTC TROUBLESHOOTING

DTC B1926

DTC B1926 : Backup Control Antenna Open or Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1926 Backup Control Antenna Open or Short	B

DTC (Keyless Access Backup Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -3. While holding the keyless remote against the power switch, do this procedure ten times without pressing the brake pedal: Press the power switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1926 Backup Control Antenna Open or Short	B

   Is DTC B1926 indicated?

   YES

   Replace the power switch .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1280 (KEYLESS ACCESS BACKUP CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Keyless Access Backup Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U128D (KEYLESS ACCESS BACKUP CONTROL UNIT)

DTC U128D : Backup Control Unit Lost Communication with Gauge Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D Backup Control Unit Lost Communication with Gauge Control Module	B

DTC (Keyless Access Backup Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U128D Backup Control Unit Lost Communication with Gauge Control Module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	Body control module connector B (36P)	No. 20	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 21		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.

Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B12C5

DTC B12C5 : Engine Start/Stop Switch (Power Switch) Failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B12C5 Engine Start/Stop Switch (Power Switch) Failure	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Press the power switch at least twenty times, then wait for at least 20 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12C5 Engine Start/Stop Switch (Power Switch) Failure	B

   Is DTC B12C5 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (+B_SMART line, GND line, other)

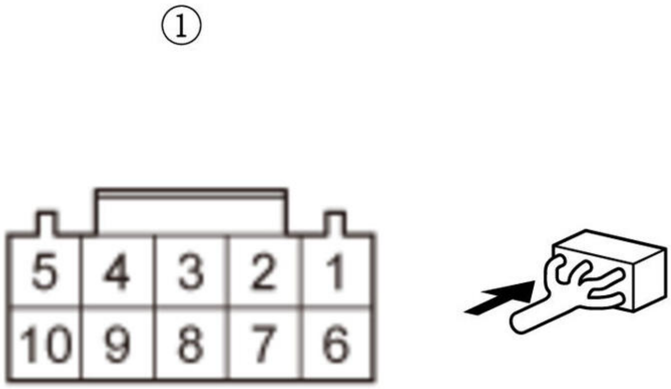
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power switch 10P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected
Test point 1	Power switch 10P connector (female terminals) No. 5: ①
Test point 2	Power switch 10P connector (female terminals) No. 1: ①



Is there battery voltage?

YES

The +B_SMART and GND wires are OK. Go to step 3.

NO

Go to step 6.

3. Shorted wire check (SS1 (+), SS2 (-) lines)

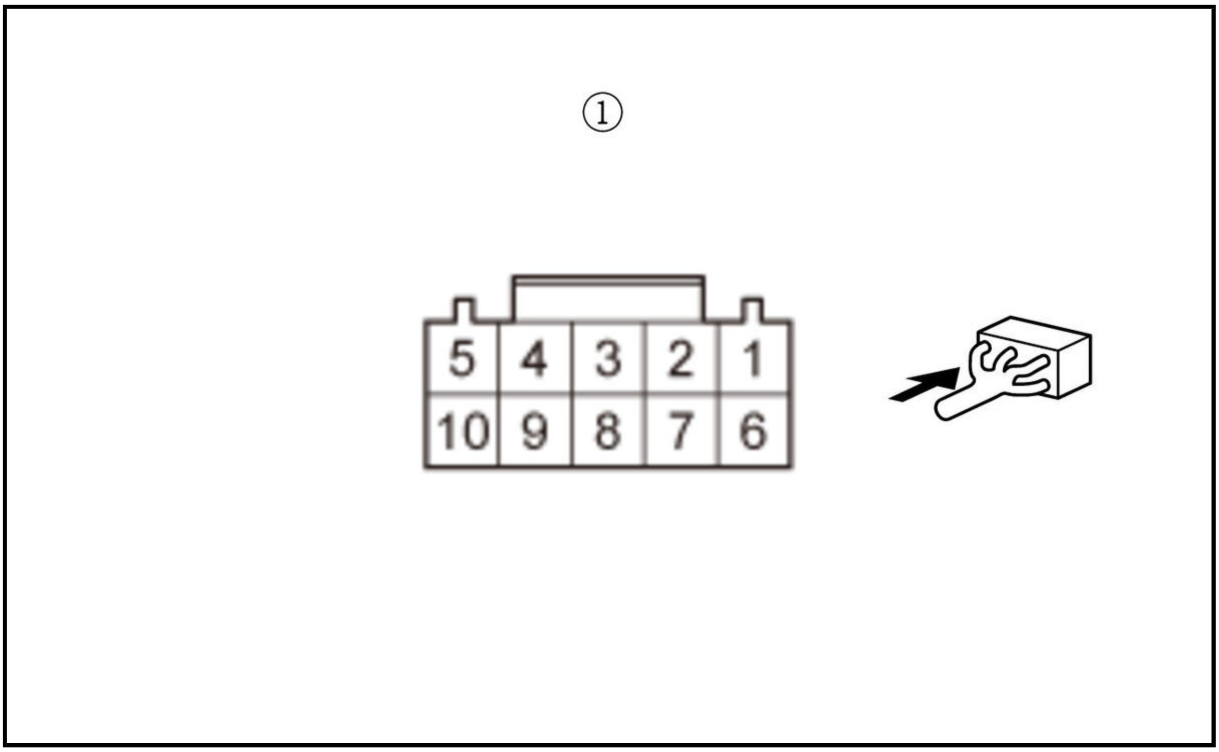
-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Power switch 10P connector (female terminals) No. 6: ①
Test point 2	Body ground

Test point 1	Power switch 10P connector (female terminals) No. 10: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The SS1 (+) and SS2 (-) wires are not shorted. Go to step 4.

NO

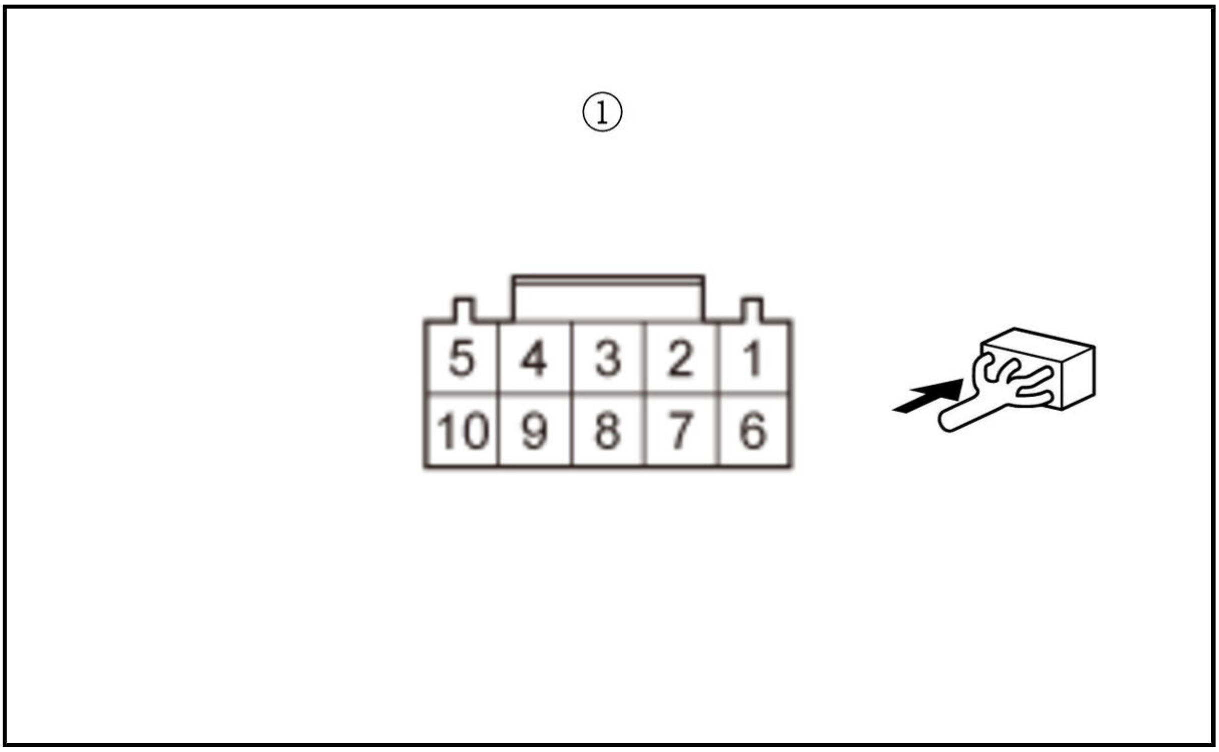
Repair short to ground in the wire.

4. Open wire check (SS1 (+), SS2 (-) lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Power switch 10P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector G (32P) No. 18**

Test point 1	Power switch 10P connector (female terminals) No. 10: ①
Test point 2	**Body control module connector G (32P) No. 9**



Is there 1.0 Ω or less?

YES

The SS1 (+) and SS2 (-) wires are OK. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Power switch check

-1. Do the power switch test .

Is the power switch OK?

YES

Replace the body control module .

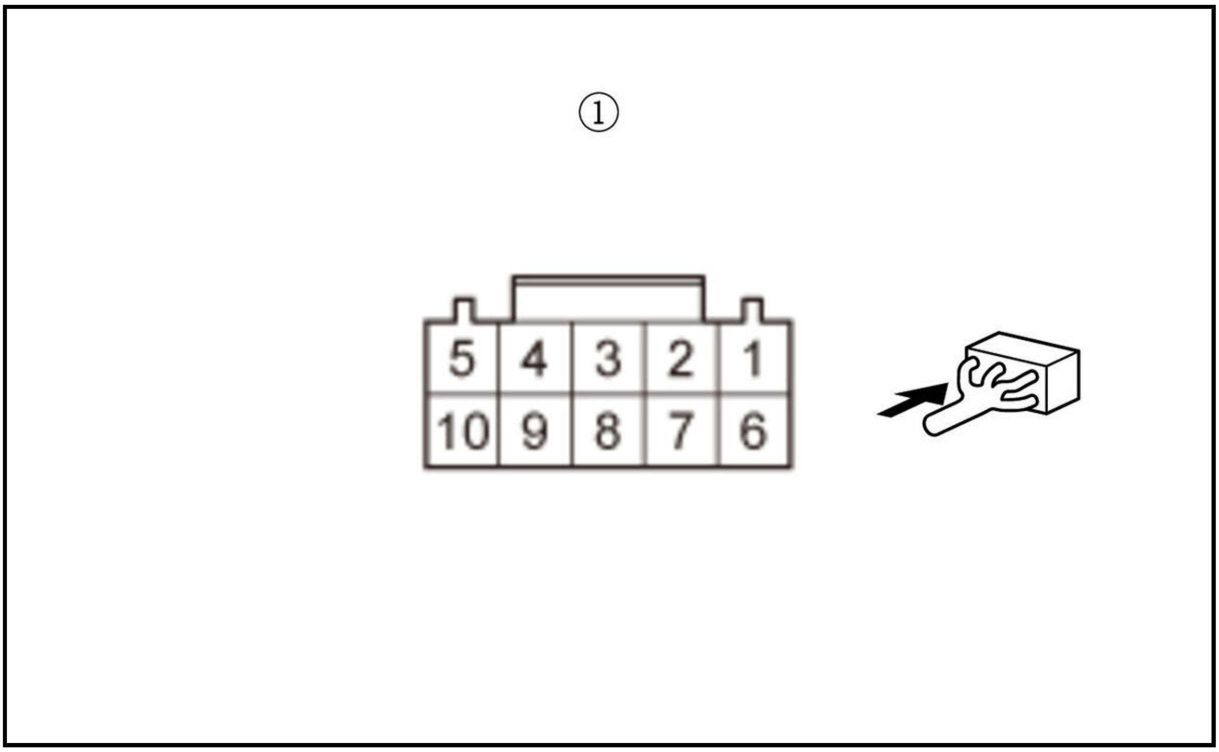
NO

Replace the power switch .

6. Open wire check (+B_SMART line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Power switch 10P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair an open or high resistance in the GND wire.

NO

Repair an open or high resistance in the +B_SMART wire.

DTC B12D0

DTC B12D0 : Power Control Unit IG1A Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D0 Power Control Unit IG1A Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   Do this procedure five times.

   - Turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds.
   - Turn the vehicle to the ACCESSORY mode and wait for at least 10 seconds.
   - Turn the vehicle to the ON mode and wait for at least 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12D0 Power Control Unit IG1A Circuit Error	B

Is DTC B12D0 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12D1

DTC B12D1 : Power Control Unit IG1B Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D1 Power Control Unit IG1B Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

Do this procedure five times.

- Turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds.
- Turn the vehicle to the ACCESSORY mode and wait for at least 10 seconds.
- Turn the vehicle to the ON mode and wait for at least 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12D1 Power Control Unit IG1B Circuit Error	B

Is DTC B12D1 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12D2

DTC B12D2 : Power Control Unit IG2 Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D2 Power Control Unit IG2 Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

Do this procedure five times.

- Turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds.
- Turn the vehicle to the ACCESSORY mode and wait for at least 10 seconds.
- Turn the vehicle to the ON mode and wait for at least 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12D2 Power Control Unit IG2 Circuit Error	B

Is DTC B12D2 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12D3

DTC B12D3 : Power Control Unit IG Latch Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D3 Power Control Unit IG Latch Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Do this procedure five times: Press the power switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12D3 Power Control Unit IG Latch Circuit Error	B

Is DTC B12D3 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time.

DTC B12E5

DTC B12E5 : Incorrect assembly of control unit for electric steering lock equipped vehicle

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B12E5 Incorrect assembly of control unit for electric steering lock equipped vehicle	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Select model on the HDS screen.

-2. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the power switch for at least 2 minutes. This selects the forced ON mode.

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Press the power switch.

-6. Select model on the HDS screen.

-7. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the power switch for at least 2 minutes. This selects the forced ON mode.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B12E5 Incorrect assembly of control unit for electric steering lock equipped vehicle	B

Is DTC B12E5 indicated?

YES

Incorrect assembly of control unit for electric steering lock equipped vehicle. **Replace it with the correct body control module** .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12F3

DTC B12F3 : Power Control Unit Lost Communication with Transmission Control Unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B12F3 Power Control Unit Lost Communication with Transmission Control Unit	B

DTC (Keyless Access Power Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Do this procedure ten times: Turn the vehicle to the OFF(LOCK), ACCESSORY, ON, and OFF(LOCK) mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12F3 Power Control Unit Lost Communication with Transmission Control Unit	B

   Is DTC B12F3 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (+B_BACKUP_FI-ECU line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Park pawl actuator drive unit 26P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Park pawl actuator drive unit 26P connector: disconnected
Test point 1	**Park pawl actuator drive unit 26P connector No. 13**
Test point 2	Body ground

   Is there battery voltage?

YES

The +B_BACKUP_FI-ECU wire is OK. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Open wire check (IG1_SRS2 line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Park pawl actuator drive unit 26P connector: disconnected
Test point 1	**Park pawl actuator drive unit 26P connector No. 15**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1_SRS2 wire is OK. Go to step 4.

NO

Repair an open or high resistance in the wire.

4. Open wire check (GND lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode Park pawl actuator drive unit 26P connector: disconnected
Test point 1	**Park pawl actuator drive unit 26P connector No. 2**
Test point 2	Body ground

Test point 1	**Park pawl actuator drive unit 26P connector No. 3**
Test point 2	Body ground

Test point 1	**Park pawl actuator drive unit 26P connector No. 17**
Test point 2	Body ground

Test point 1	**Park pawl actuator drive unit 26P connector No. 18**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wires are OK. Go to step 5.

NO

Repair an open or high resistance in the ground wire or poor ground (G251).

5. Shorted wire check (IGN_TRX line)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Park pawl actuator drive unit 26P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Park pawl actuator drive unit 26P connector No. 9**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The IGN_TRX wire is not shorted. Go to step 6.

NO

Repair a short to ground in the wire.

6. Open wire check (IGN_TRX line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Park pawl actuator drive unit 26P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 28**
Test point 2	**Park pawl actuator drive unit 26P connector No. 9**

Is there 1.0 Ω or less?

YES

The IGN_TRX wire is OK. Go to step 7.

NO

Repair an open or high resistance in the wire.

7. Keyless access system check:

Reconnect these items:

- Park pawl actuator drive unit 26P connector
- Body control module connector G (32P)

-2. With driver's power window open, turn the vehicle to the OFF (LOCK) mode.

-3. **Do the 12 volt battery terminal disconnection procedure** .

-4. Wait for at least 10 seconds to clear the DTCs.

-5. **Do the 12 volt battery terminal reconnection procedure** .

-6. Turn the vehicle to the ON mode then the OFF (LOCK) mode.

-7. Remove all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (7.9 in) away from the vehicle.

-8. Close all doors, then press the power switch.

-9. The keyless remotes bring to the vehicle inside, during close all doors.

-10.

Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

-11.

Press the power switch, and turn the vehicle to the ON mode.

Does the mode change to ON?

YES

Go to step 8.

NO

Replace the body control module .

8. Problem verification 2

-1. Clear the DTCs with the HDS.

-2. Do this procedure ten times: Turn the vehicle to the OFF(LOCK), ACCESSORY, ON, and OFF(LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12F3 Power Control Unit Lost Communication with Transmission Control Unit	B

Is DTC B12F3 indicated?

YES

Replace the park pawl actuator drive unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0073 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U0073 : F-CAN Communication Bus Line Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U0073 F-CAN Communication Bus Line Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0073 F-CAN Communication Bus Line Error	B

Is DTC U0073 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Intermittent failure, the system is OK at this time.

DTC U0100, U0122 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U0100 : Power Control Unit Lost Communication with PCM

DTC U0122: Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0100 Power Control Unit Lost Communication with PCM	B
U0122 Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0100 Power Control Unit Lost Communication with PCM	B
U0122 Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U0056-00 CAN Gateway F-CAN ch C Bus Off	B
U0065-00 CAN Gateway F-CAN ch D Bus Off	B
U0038-00 CAN Gateway F-CAN ch E Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, U0056-00, U0038-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the body control module detect the CAN gateway Bus channels B?

Bus B is Not Available

Go to step 4.

Bus B is Available

Go to step 5.

4. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

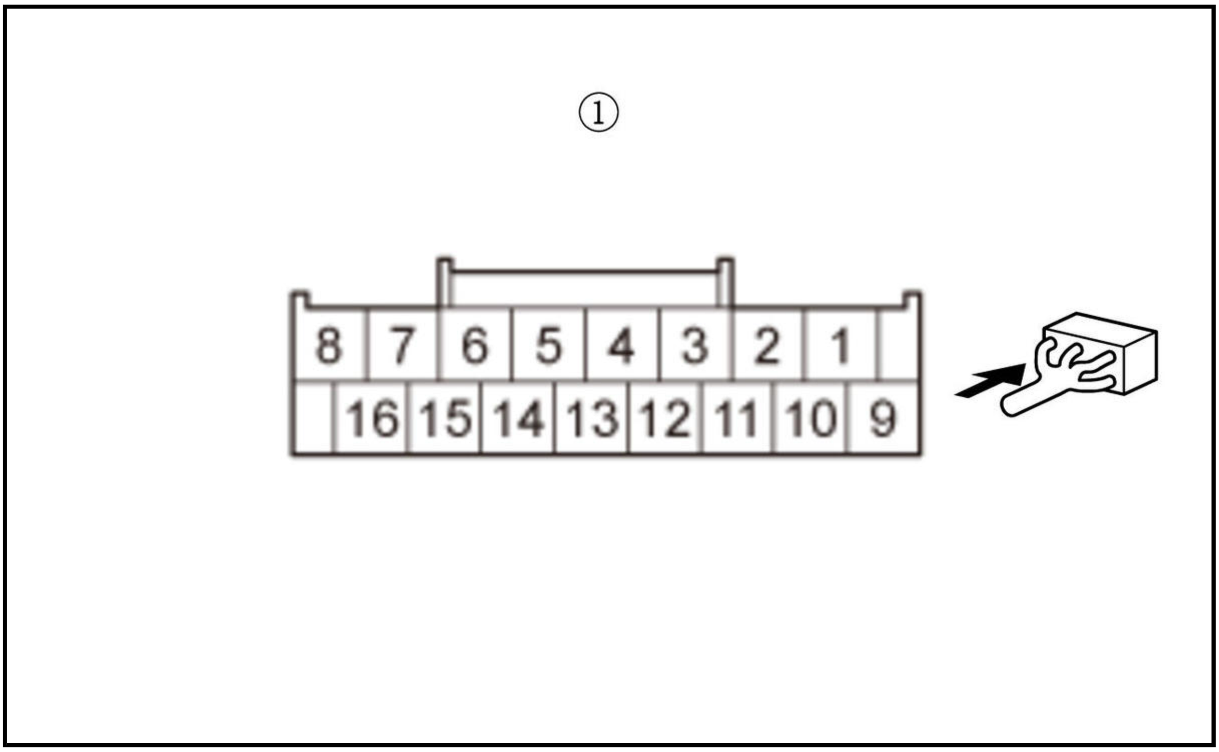
-2. Disconnect the following connectors.

CAN gateway 16P connectorBody control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Body control module connector B (36P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector B (36P) No. 22**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**Body control module connector B (36P) No. 23**



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. **Replace the body control module** .

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100	PCM	A, B, E
U0122	VSA modulator-control unit	B, C

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 6.

U0100: PCM is Not Available for Bus B

Go to step 7.

U0100: PCM is Not Available for Bus E

Go to step 9.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

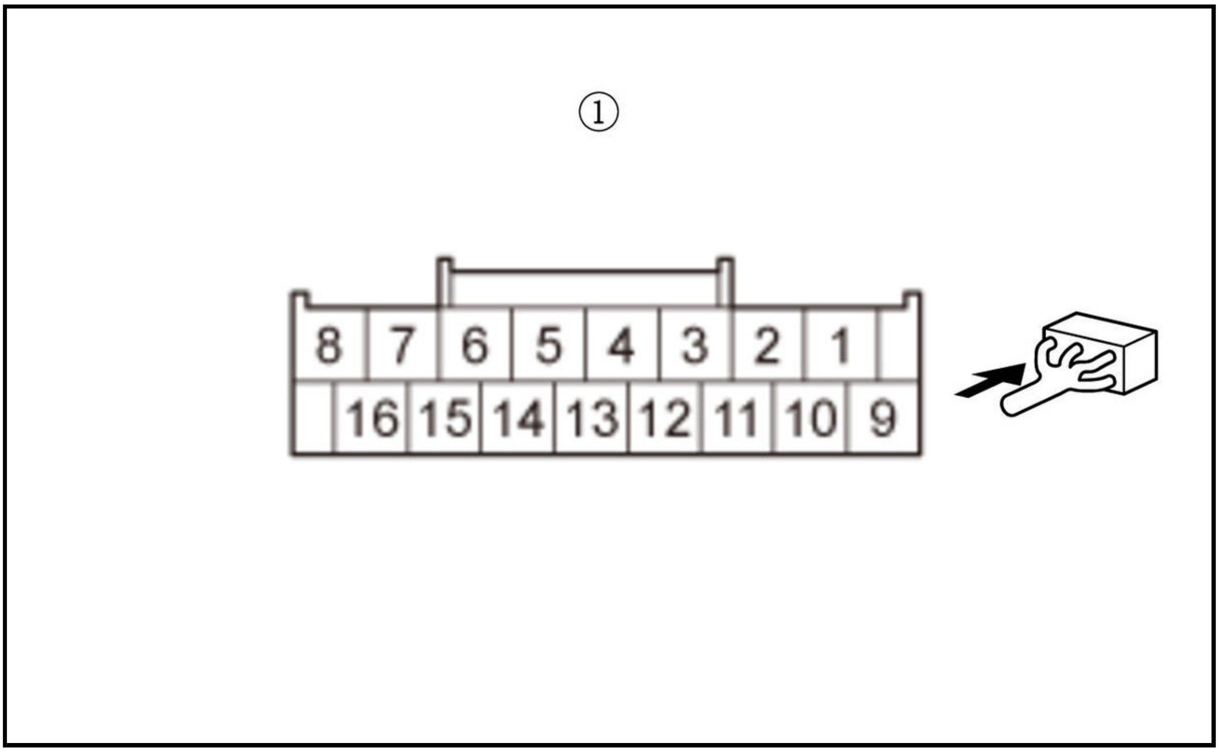
DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 16P connector (female	No. 3	PCM connector A (50P)	No. 37

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
	F-CAN A_L	terminals): ①	No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

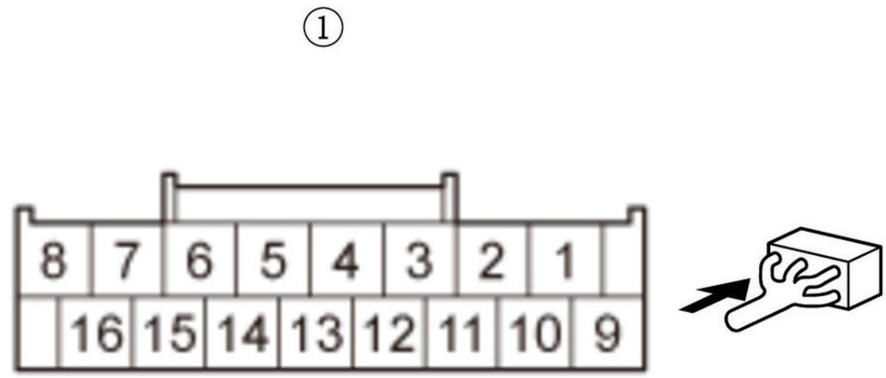
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	PCM connector A (50P)	No. 39
	F-CAN B_L		No. 14		No. 38
U0122	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	VSA modulator-control unit 46P connector	No. 40
	F-CAN B_L		No. 14		No. 28



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM
U0122	VSA modulator-control unit

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN C lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

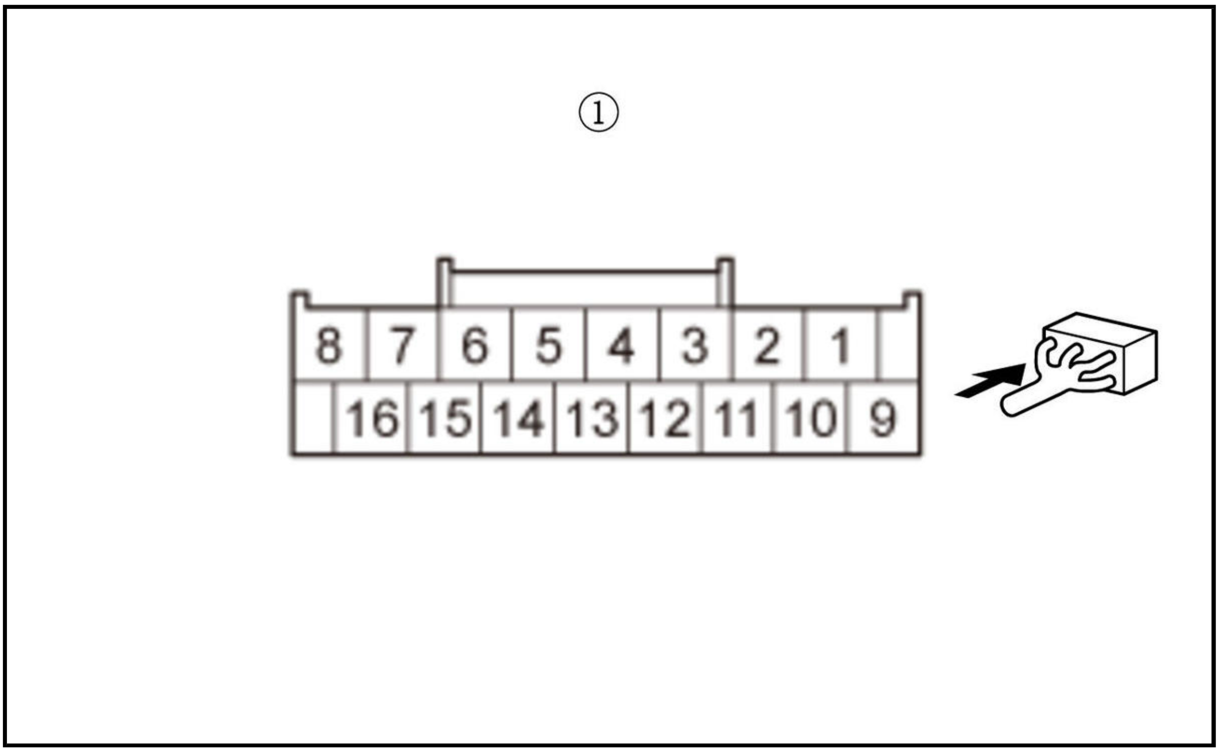
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0122	VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN C_L		No. 13		No. 34



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122	**VSA modulator-control unit**

NO

Repair an open in F-CAN C_H or F-CAN C_L wire.

9. Open wire check (EP-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

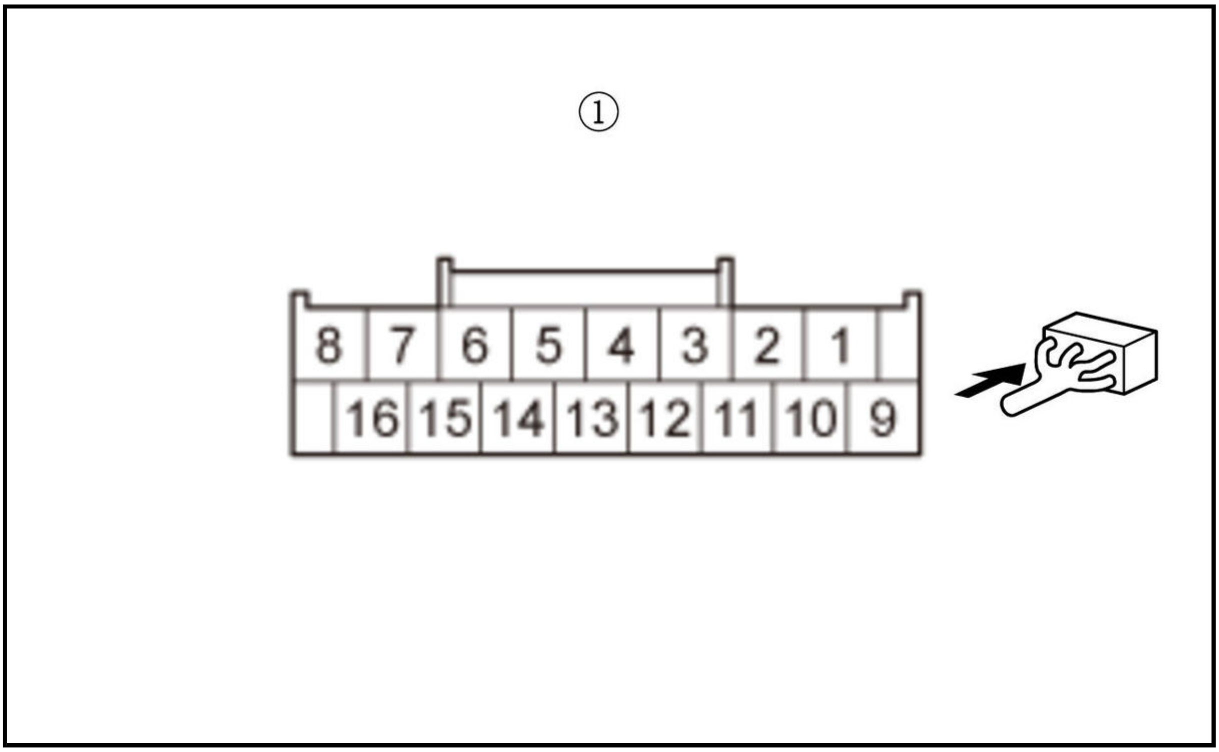
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	PCM connector A (50P)	No. 21
	EP-CAN A_L		No. 8		No. 20



Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM

NO

Repair an open in EP-CAN A_H or EP-CAN A_L wire.

DTC U1280 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U1281 : Power Control Unit Lost Communication with MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1281 Power Control Unit Lost Communication with MICU	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Power Control Unit Lost Communication with MICU	B

Is DTC U1281 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U128D (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U128D : Power Control Unit Lost Communication with Gauge Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D Power Control Unit Lost Communication with Gauge Control Module	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U128D Power Control Unit Lost Communication with Gauge Control Module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	Body control module connector B (36P)	No. 20	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 21		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

TROUBLESHOOTING

DTC B1926

DTC B1926 : Backup Control Antenna Open or Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1926 Backup Control Antenna Open or Short	B

DTC (Keyless Access Backup Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -3. While holding the keyless remote against the engine start/stop switch, do this procedure ten times without pressing the brake pedal: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1926 Backup Control Antenna Open or Short	B

   Is DTC B1926 indicated?

   YES

   Replace the engine start/stop switch .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1280 (KEYLESS ACCESS BACKUP CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Keyless Access Backup Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U128D (KEYLESS ACCESS BACKUP CONTROL UNIT)

DTC U128D : Backup Control Unit Lost Communication with Gauge Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D Backup Control Unit Lost Communication with Gauge Control Module	B

DTC (Keyless Access Backup Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U128D Backup Control Unit Lost Communication with Gauge Control Module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	Body control module connector B (36P)	No. 20	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 21		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B1601

DTC B1601 : Keyless access control unit internal (CPU) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1601 Keyless access control unit internal (CPU) error	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1601 Keyless access control unit internal (CPU) error	B

Is DTC B1601 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time.

DTC B1602

DTC B1602 : Keyless access control unit internal (EEPROM) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1602 Keyless access control unit internal (EEPROM) error	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1602 Keyless access control unit internal (EEPROM) error	B

Is DTC B1602 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time.

DTC B1640

DTC B1640 : RF1 antenna not connected or malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1640 RF1 antenna not connected or malfunction	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Touch the door outer handle touch sensor (LOCK) to lock the door.

-3. Touch the door outer handle touch sensor (UNLOCK) to unlock the door.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1640 RF1 antenna not connected or malfunction	B

Is DTC B1640 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1645

DTC B1645 : Driver's Door LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1645 Driver's Door LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1645 Driver's Door LF Antenna Circuit Short	B

   Is DTC B1645 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT_FR_DR+, EXT_FR_DR- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector F (36P)
Driver's door outer handle 8P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Driver's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 13**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 31**
Test point 2	Body ground

   Is there 1.0 MΩ or more?

   YES

   The EXT_FR_DR+ and EXT_FR_DR- wires are not shorted. Go to step 3.

   NO

   Repair a short to ground in the wire.

3. Shorted wire check (EXT_FR_DR+ line to EXT_FR_DR- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Driver's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 13**
Test point 2	**Body control module connector F (36P) No. 31**

Is there 1.0 MΩ or more?

YES

The EXT_FR_DR+ and EXT_FR_DR- wires are OK. Go to step 4.

NO

Repair a short in EXT_FR_DR+ wire to EXT_FR_DR- wire.

4. Body control module EXT_FR_DR+, EXT_FR_DR- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

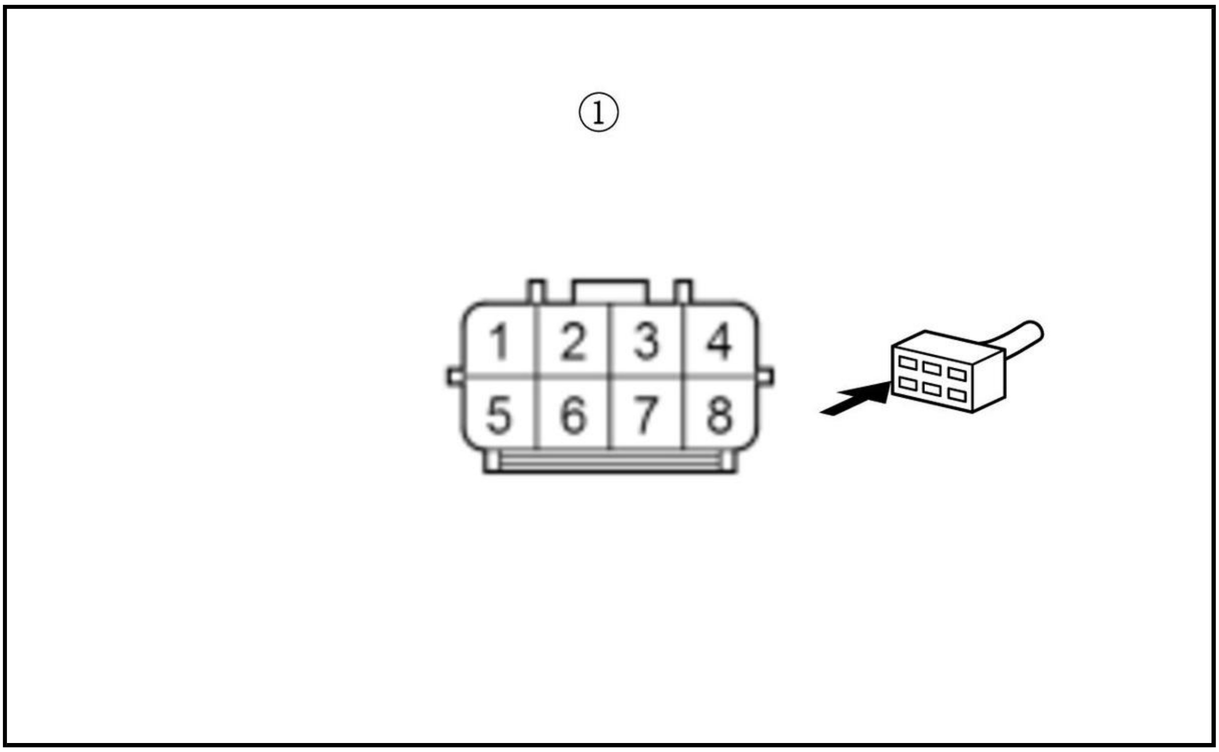
-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Driver's door outer handle 8P connector: disconnected

Test point 1	Driver's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 6: ①



-5. Select DRIVER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; replace the driver's door outer handle .

NO

Replace the body control module .

DTC B1646

DTC B1646 : Driver's Door LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1646 Driver's Door LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1646 Driver's Door LF Antenna Circuit Open	B

Is DTC B1646 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT_FR_DR+, EXT_FR_DR- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door outer handle 8P connector

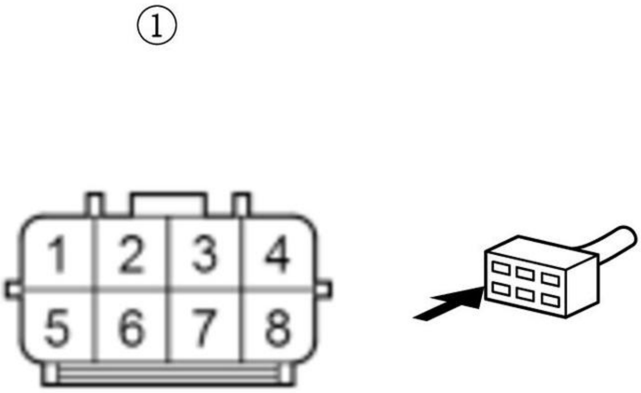
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 6: ①



-6. Select DRIVER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; **replace the driver's door outer handle** .

NO

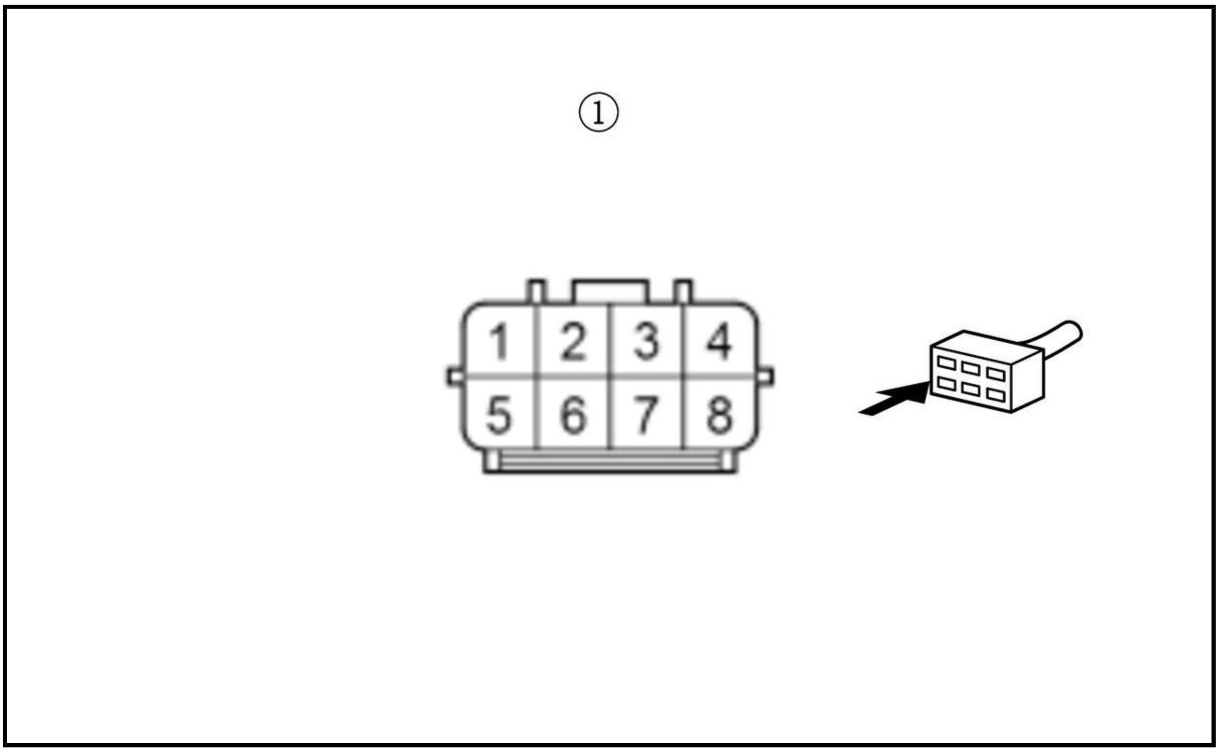
Go to step 3.

3. Open wire check (EXT_FR_DR+, EXT_FR_DR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door outer handle 8P connector (female terminals) No. 2: ①
Terminal B	Driver's door outer handle 8P connector (female terminals) No. 6: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Driver's door outer handle 8P connector: disconnected Driver's door outer handle 8P connector No. 2 and No. 6: jumped
Test point 1	**Body control module connector F (36P) No. 13**
Test point 2	**Body control module connector F (36P) No. 31**

Is there 1.0 Ω or less?

YES

The EXT_FR_DR+ and EXT_FR_DR- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1647

DTC B1647 : Passenger's Door LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1647 Passenger's Door LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1647 Passenger's Door LF Antenna Circuit Short	B

   Is DTC B1647 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT_FR_AS+, EXT_FR_AS- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector F (36P)
Front passenger's door outer handle 8P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected

	Front passenger's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 12**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 30**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The EXT_FR_AS+ and EXT_FR_AS- wires are not shorted. Go to step 3.

NO

Repair a short to ground in the wire.

3. Shorted wire check (EXT_FR_AS+ line to EXT_FR_AS- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front passenger's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 12**
Test point 2	**Body control module connector F (36P) No. 30**

Is there 1.0 MΩ or more?

YES

The EXT_FR_AS+ and EXT_FR_AS- wires are OK. Go to step 4.

NO

Repair a short in EXT_FR_AS+ wire to EXT_FR_AS- wire.

4. Body control module EXT_FR_AS+, EXT_FR_AS- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

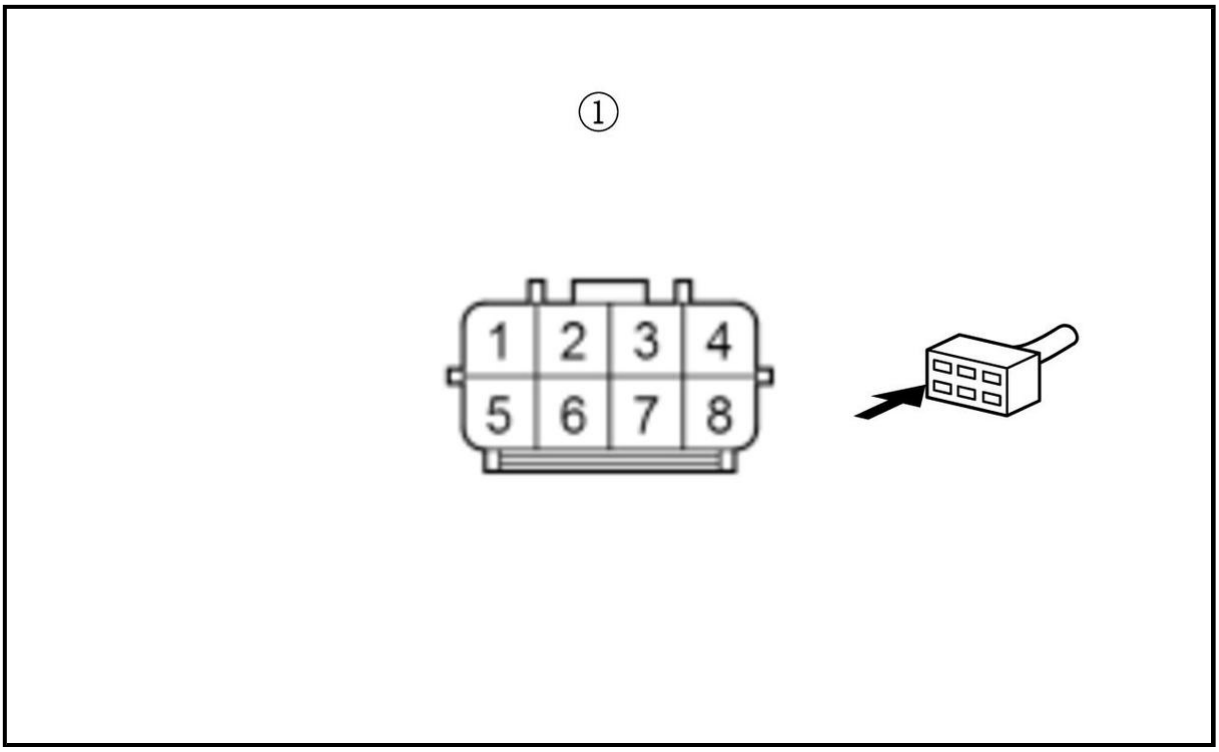
One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front passenger's door outer handle 8P connector: disconnected

Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 2: ①

Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 6: ①



-5. Select FRONT PASSENGER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; **replace the front passenger's door outer handle** .

NO

Replace the body control module .

DTC B1648

DTC B1648 : Passenger's Door LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1648 Passenger's Door LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1648 Passenger's Door LF Antenna Circuit Open	B

Is DTC B1648 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT_FR_AS+, EXT_FR_AS- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door outer handle 8P connector

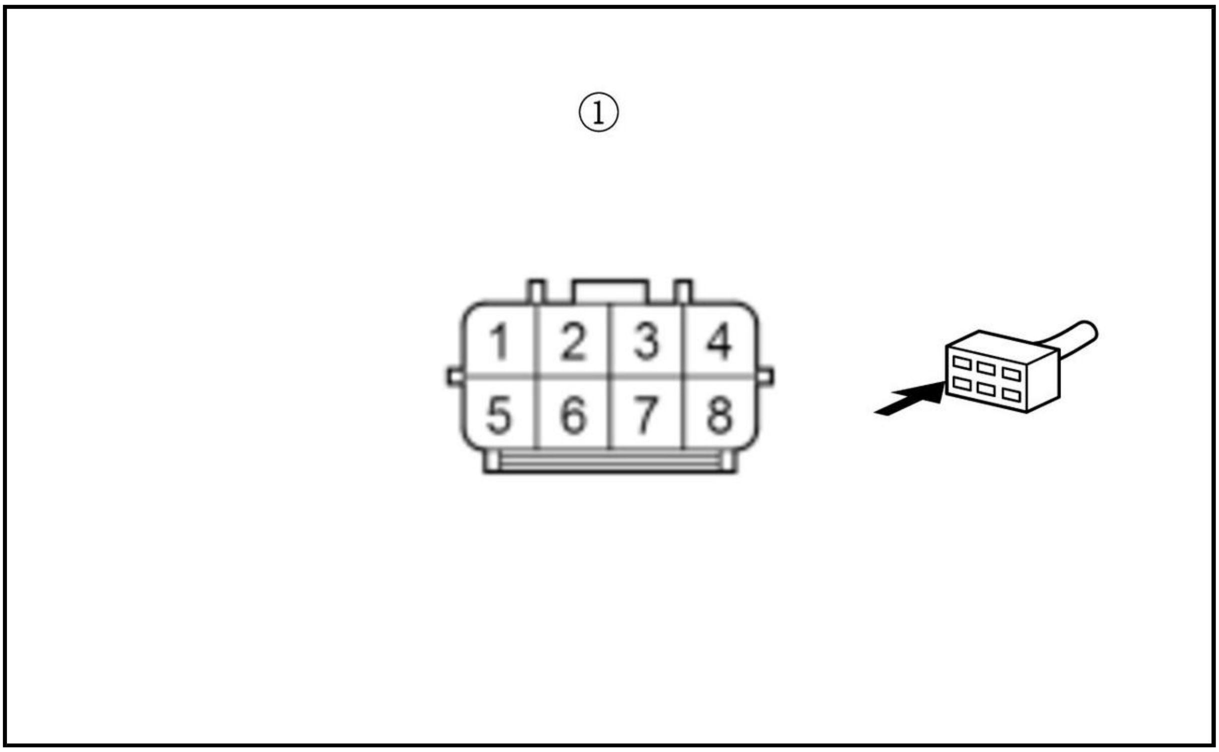
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 6: ①



-6. Select FRONT PASSENGER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; **replace the front passenger's door outer handle** .

NO

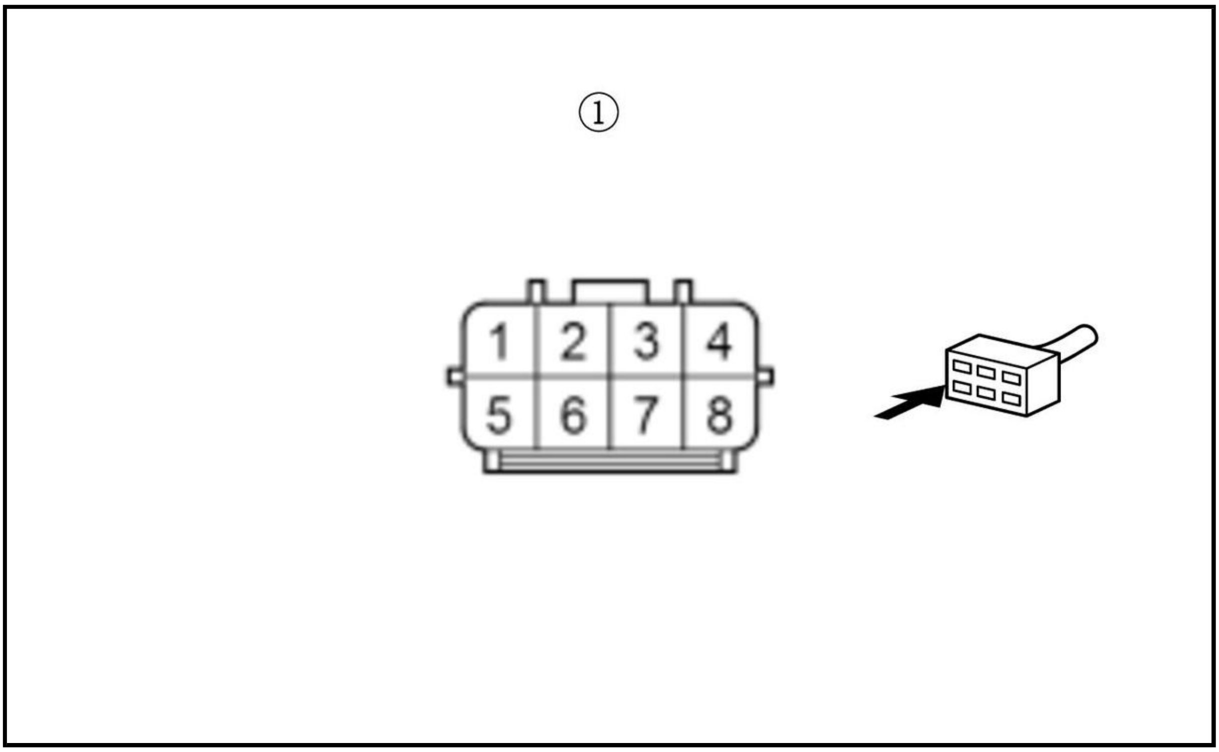
Go to step 3.

3. Open wire check (EXT_FR_AS+, EXT_FR_AS- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's door outer handle 8P connector (female terminals) No. 2: ①
Terminal B	Front passenger's door outer handle 8P connector (female terminals) No. 6: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front passenger's door outer handle 8P connector: disconnected Front passenger's door outer handle 8P connector No. 2 and No. 6: jumped
Test point 1	**Body control module connector F (36P) No. 12**
Test point 2	**Body control module connector F (36P) No. 30**

Is there 1.0 Ω or less?

YES

The EXT_FR_AS+ and EXT_FR_AS- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1657

DTC B1657 : Rear Bumper LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1657 Rear Bumper LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1657 Rear Bumper LF Antenna Circuit Short	B

Is DTC B1657 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT_TR+, EXT_TR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Rear bumper LF antenna 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear bumper LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 14**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 32**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The EXT_TR+ and EXT_TR- wires are not shorted. Go to step 3.

NO

Repair a short to ground in the wire.

3. Shorted wire check (EXT_TR+ line to EXT_TR- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear bumper LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 14**
Test point 2	**Body control module connector F (36P) No. 32**

Is there 1.0 MΩ or more?

YES

The EXT_TR+ and EXT_TR- wires are OK. Go to step 4.

NO

Repair a short in EXT_TR+ wire to EXT_TR- wire.

4. Body control module EXT_TR+, EXT_TR- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

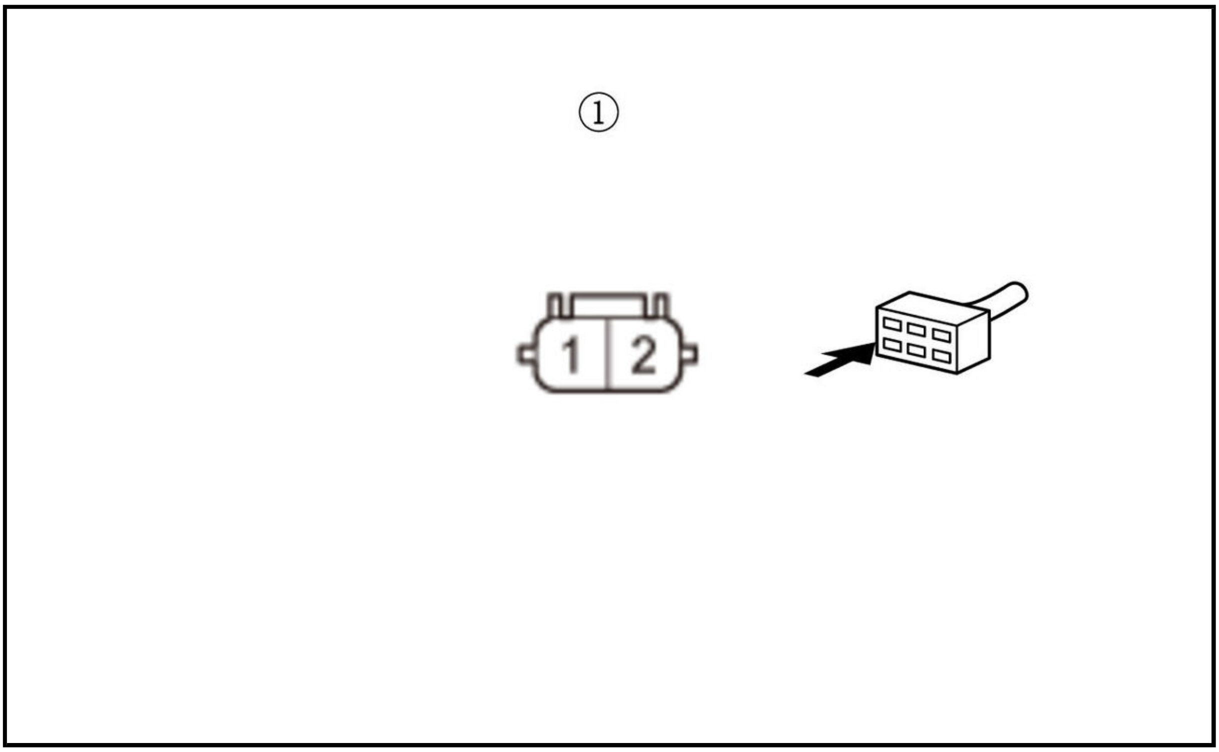
-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear bumper LF antenna 2P connector: disconnected

Test point 1	Rear bumper LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear bumper LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear bumper LF antenna; **replace the rear bumper LF antenna** .

NO

Replace the body control module .

DTC B1658

DTC B1658 : Rear Bumper LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1658 Rear Bumper LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1658 Rear Bumper LF Antenna Circuit Open	B

Is DTC B1658 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT_TR+, EXT_TR- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear bumper LF antenna 2P connector

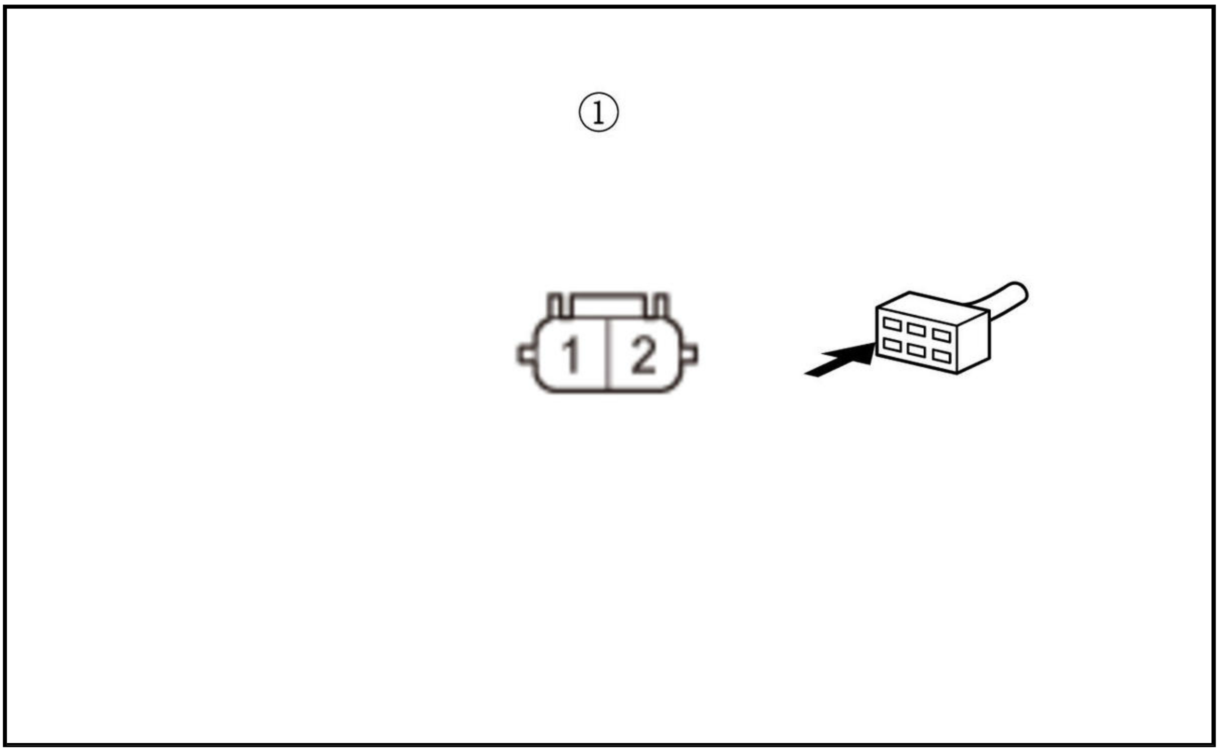
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear bumper LF antenna 2P connector: disconnected
Test point 1	Rear bumper LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear bumper LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear bumper LF antenna; **replace the rear bumper LF antenna** .

NO

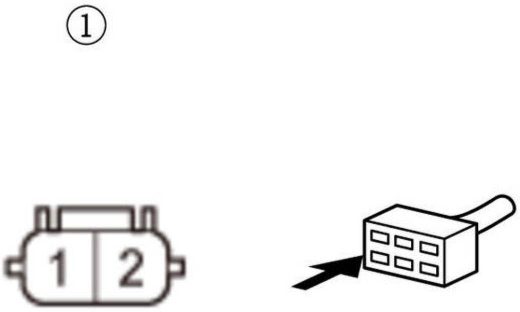
Go to step 3.

3. Open wire check (EXT_TR+, EXT_TR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear bumper LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Rear bumper LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear bumper LF antenna 2P connector: disconnected Rear bumper LF antenna 2P connector No. 1 and No. 2: jumped
Test point 1	**Body control module connector F (36P) No. 14**
Test point 2	**Body control module connector F (36P) No. 32**

Is there 1.0 Ω or less?

YES

The EXT_TR+ and EXT_TR- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1659

DTC B1659 : Front Interior LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1659 Front Interior LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1659 Front Interior LF Antenna Circuit Short	B

   Is DTC B1659 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT_F+, EXT_F- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector F (36P)
Front interior LF antenna 2P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected

	Front interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 16**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 34**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The EXT_F+ and EXT_F- wires are not shorted. Go to step 3.

NO

Repair a short to ground in the wire.

3. Shorted wire check (EXT_F+ line to EXT_F- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 16**
Test point 2	**Body control module connector F (36P) No. 34**

Is there 1.0 MΩ or more?

YES

The EXT_F+ and EXT_F- wires are OK. Go to step 4.

NO

Repair a short in EXT_F+ wire to EXT_F- wire.

4. Body control module EXT_F+, EXT_F- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

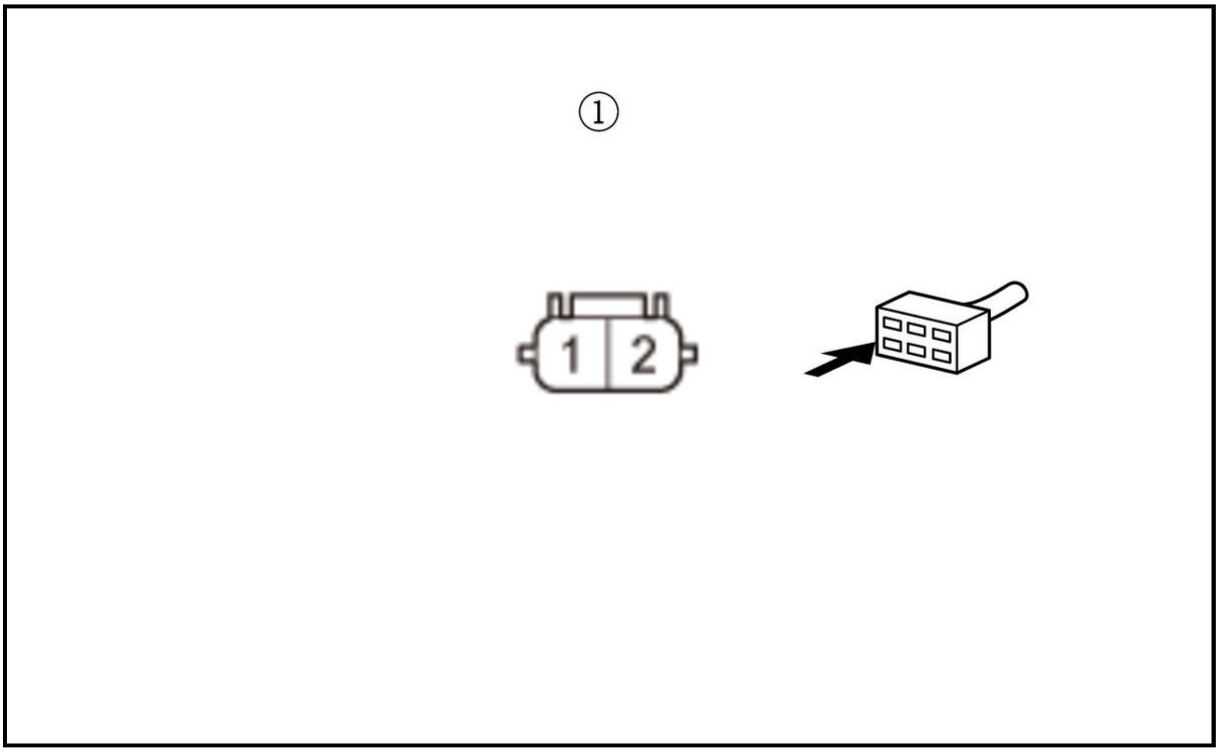
One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front interior LF antenna 2P connector: disconnected

Test point 1	Front interior LF antenna 2P connector (female terminals) No. 2: ①

Test point 2	Front interior LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN FRONT ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty front interior LF antenna; **replace the front interior LF antenna** .

NO

Replace the body control module .

DTC B1660

DTC B1660 : Front Interior LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1660 Front Interior LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	**DTC**
B1660 Front Interior LF Antenna Circuit Open	B

Is DTC B1660 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT_F+, EXT_F- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front interior LF antenna 2P connector

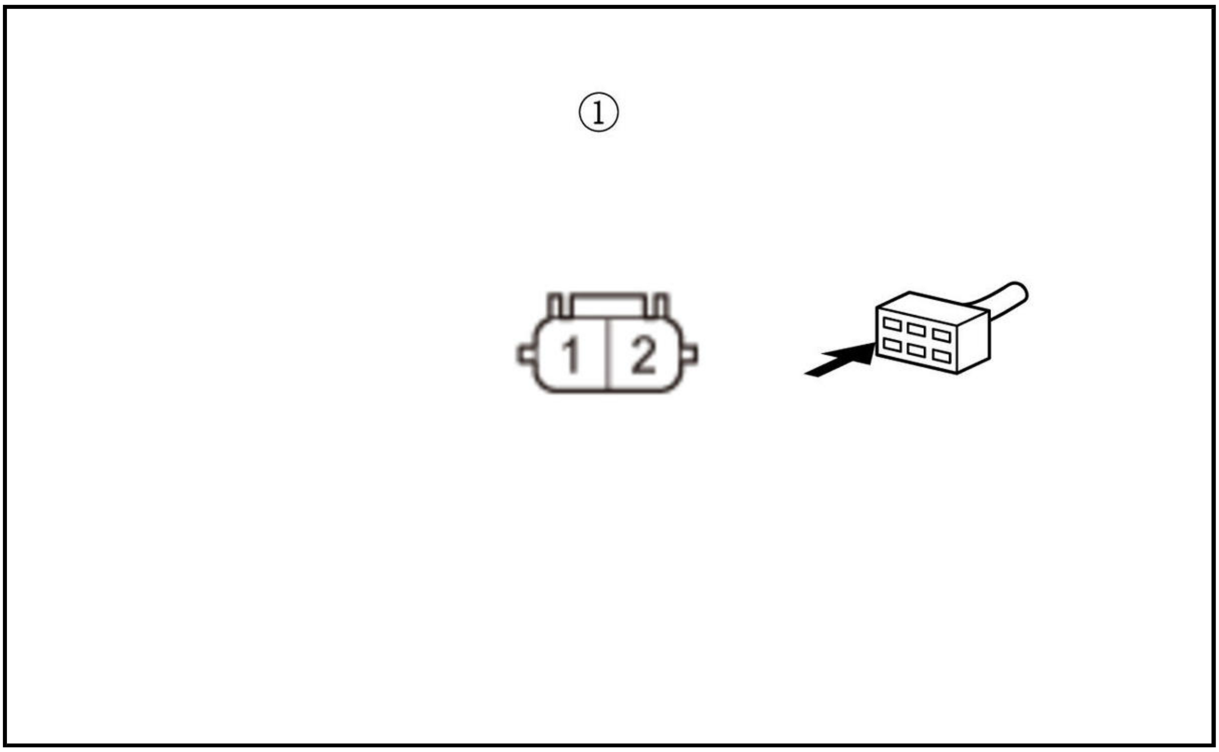
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front interior LF antenna 2P connector: disconnected
Test point 1	Front interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Front interior LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN FRONT ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty front interior LF antenna; **replace the front interior LF antenna** .

NO

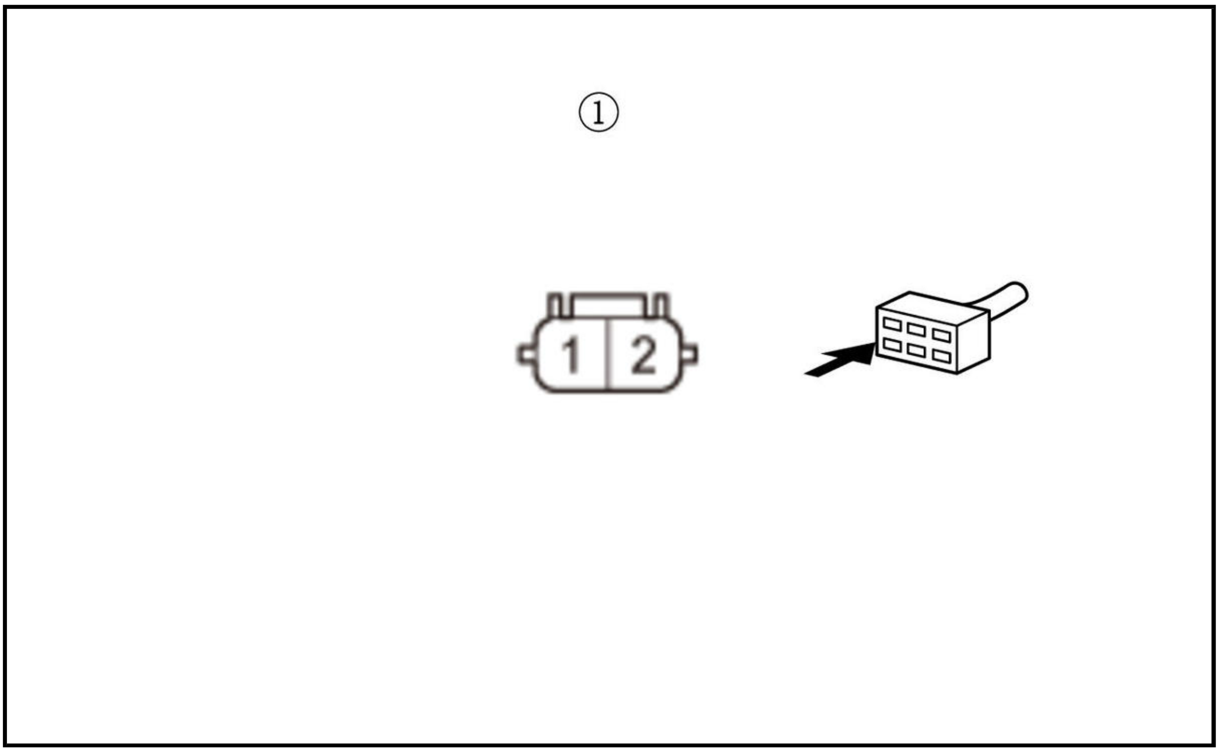
Go to step 3.

3. Open wire check (EXT_F+, EXT_F- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Front interior LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Front interior LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front interior LF antenna 2P connector: disconnected Front interior LF antenna 2P connector No. 1 and No. 2: jumped
Test point 1	**Body control module connector F (36P) No. 16**
Test point 2	**Body control module connector F (36P) No. 34**

Is there 1.0 Ω or less?

YES

The EXT_F+ and EXT_F- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1661, B1667

DTC B1661 : Middle Interior Antenna Circuit Shorted

DTC B1667 : Rear Shelf (Middle Interior) LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1661 Middle Interior Antenna Circuit Shorted	B
B1667 Rear Shelf (Middle Interior) LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   -3. Do the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1661 Middle Interior Antenna Circuit Shorted	B

DTC Description	DTC
B1667 Rear Shelf (Middle Interior) LF Antenna Circuit Short	B

   Is DTC B1661 or B1667 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT_M+, EXT_M- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector F (36P) Middle interior LF antenna 2P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Middle interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 15**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 33**
Test point 2	Body ground

   Is there 1.0 MΩ or more?

   YES

   The EXT_M+ and EXT_M- wires are not shorted. Go to step 3.

   NO

Repair a short to ground in the wire.

3. Shorted wire check (EXT_M+ to EXT_M- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Middle interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 15**
Test point 2	**Body control module connector F (36P) No. 33**

Is there 1.0 MΩ or more?

YES

The EXT_M+ and EXT_M- wires are OK. Go to step 4.

NO

Repair a short in EXT_M+ to EXT_M- wire.

4. Body control module EXT_M+, EXT_M- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

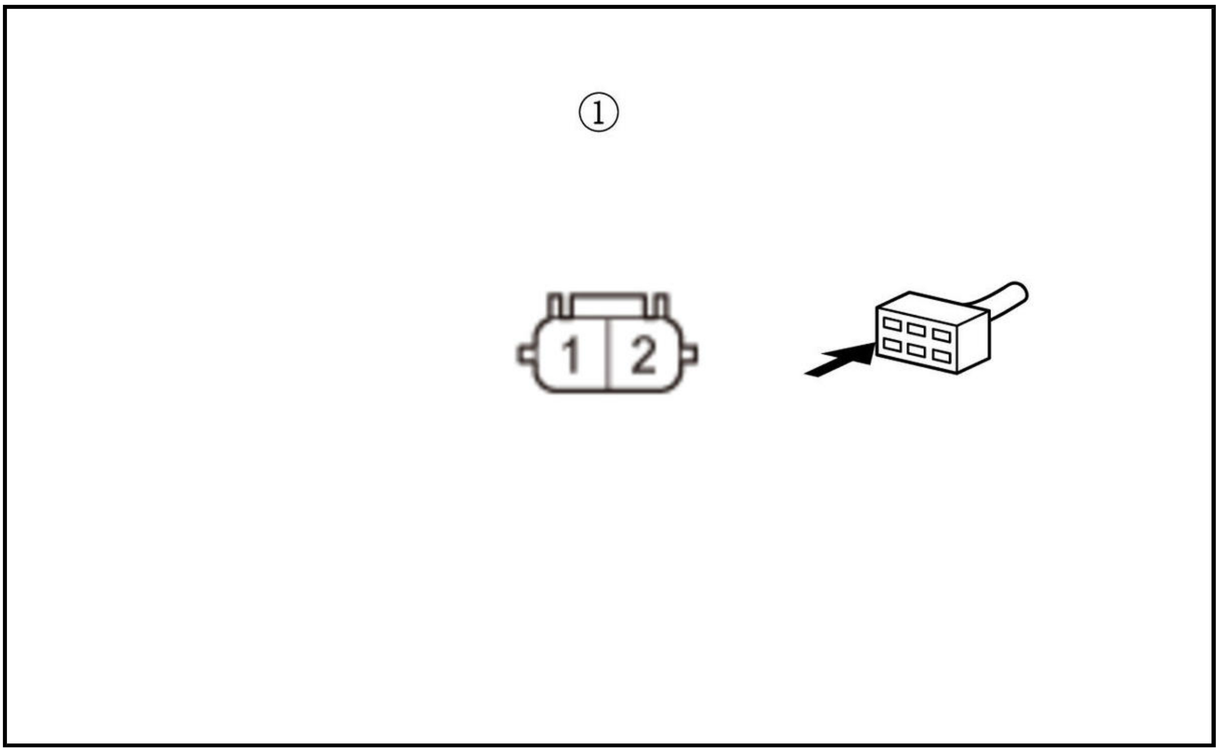
-2. Turn the vehicle to the ON mode.

-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Middle interior LF antenna 2P connector: disconnected
Test point 1	Middle interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Middle interior LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN MIDDLE ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty middle interior LF antenna; **Replace the middle interior LF antenna** .

NO

Replace the body control module .

DTC B1662, B1668

DTC B1662 : Middle Interior Antenna Circuit Opened

DTC B1668 : Rear Shelf (Middle Interior) LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1662 Middle Interior Antenna Circuit Opened	B
B1668 Rear Shelf (Middle Interior) LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1662 Middle Interior Antenna Circuit Opened	B
B1668 Rear Shelf (Middle Interior) LF Antenna Circuit Open	B

Is DTC B1662 or B1668 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT_M+, EXT_M- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Middle interior LF antenna 2P connector

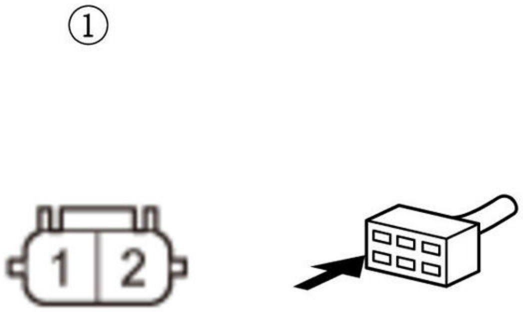
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Middle interior LF antenna 2P connector: disconnected
Test point 1	Middle interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Middle interior LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN MIDDLE ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty middle interior LF antenna; **Replace the middle interior LF antenna** .

NO

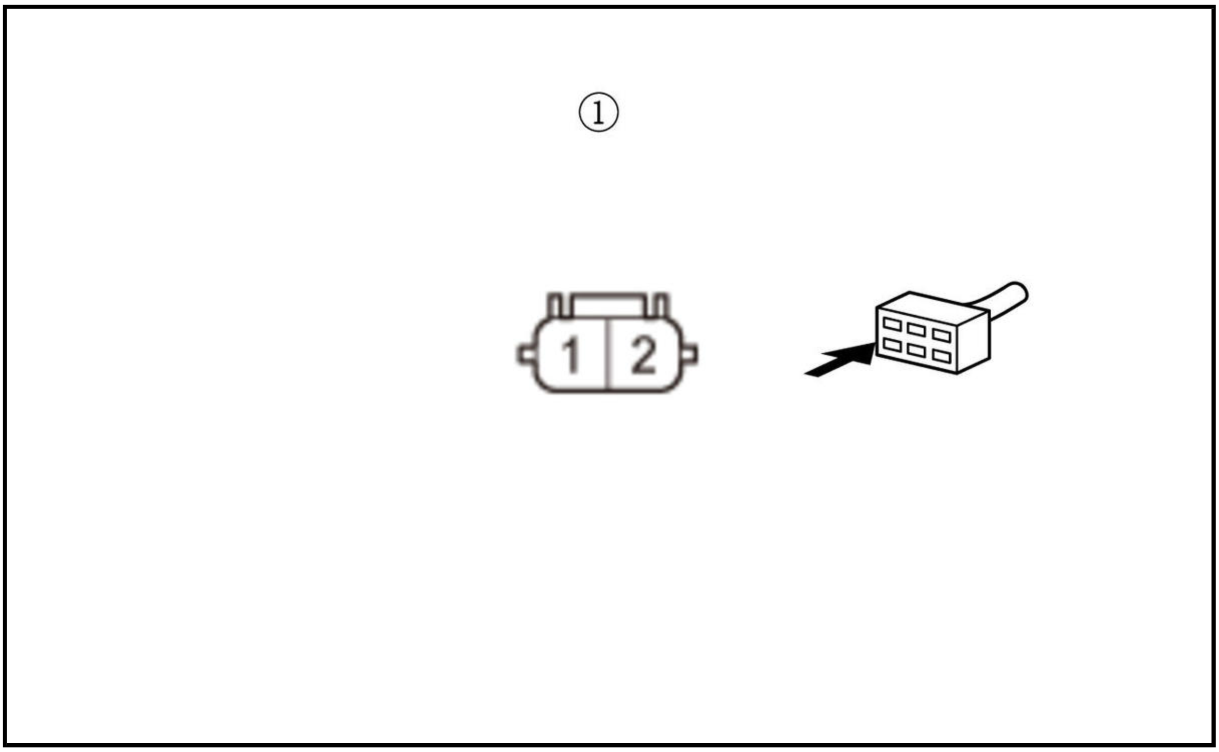
Go to step 3.

3. Open wire check (EXT_M+, EXT_M- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Middle interior LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Middle interior LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Middle interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 15**
Test point 2	**Body control module connector F (36P) No. 33**

Is there 1.0 Ω or less?

YES

The EXT_M+ and EXT_M- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1663

DTC B1663 : Rear Interior LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1663 Rear Interior LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1663 Rear Interior LF Antenna Circuit Short	B

Is DTC B1663 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT_R+, EXT_R- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Rear interior LF antenna 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 17**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 35**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The EXT_R+ and EXT_R- wires are not shorted. Go to step 3.

NO

Repair a short to ground in the wire.

3. Shorted wire check (EXT_R+ line to EXT_R- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 17**
Test point 2	**Body control module connector F (36P) No. 35**

Is there 1.0 MΩ or more?

YES

The EXT_R+ and EXT_R- wires are OK. Go to step 4.

NO

Repair a short in EXT_R+ wire to EXT_R- wire.

4. Body control module EXT_R+, EXT_R- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

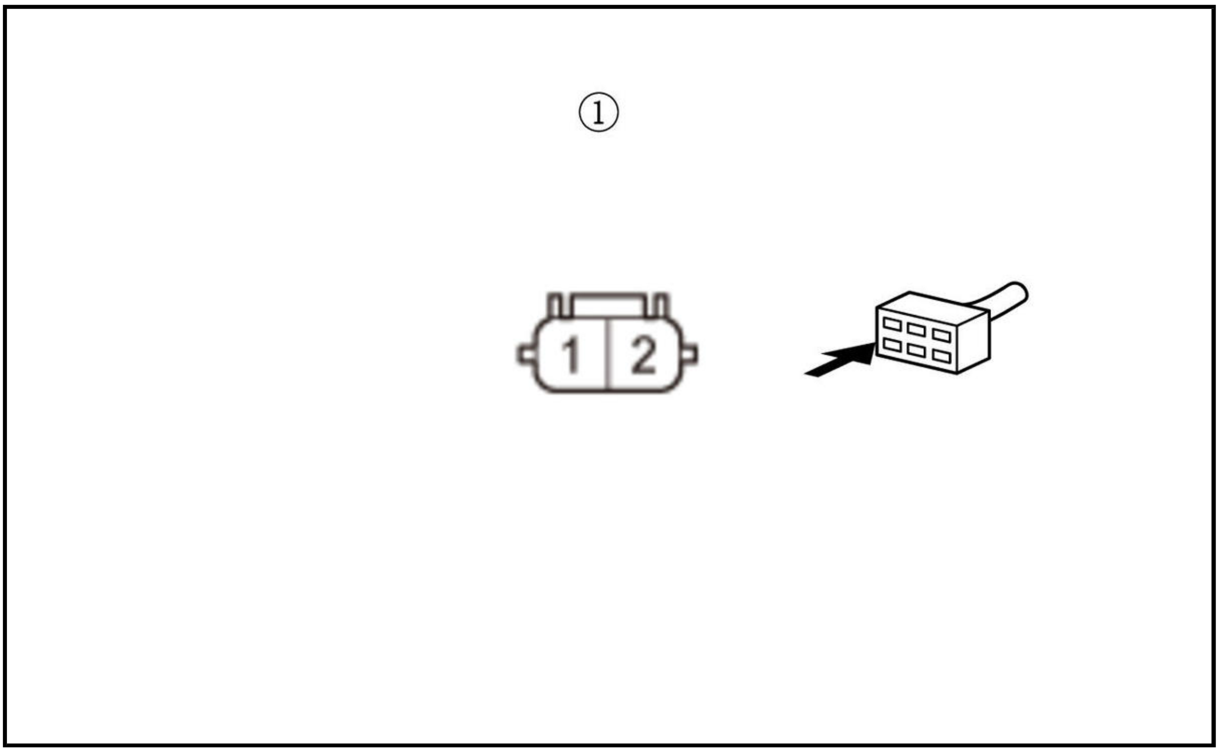
-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear interior LF antenna 2P connector: disconnected

Test point 1	Rear interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear interior LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear interior LF antenna; **replace the rear interior LF antenna** .

NO

Replace the body control module .

DTC B1664

DTC B1664 : Rear Interior LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1664 Rear Interior LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1664 Rear Interior LF Antenna Circuit Open	B

Is DTC B1664 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT_R+, EXT_R- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear interior LF antenna 2P connector

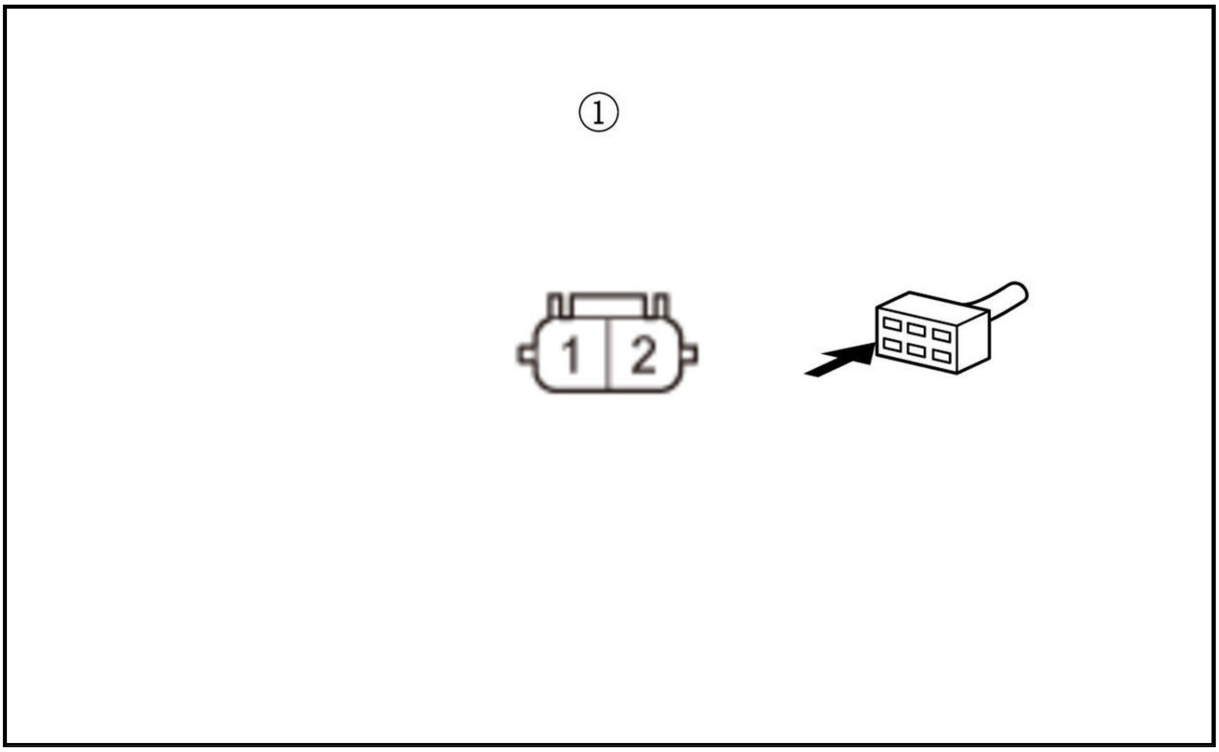
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear interior LF antenna 2P connector: disconnected
Test point 1	Rear interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear interior LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear interior LF antenna; **replace the rear interior LF antenna** .

NO

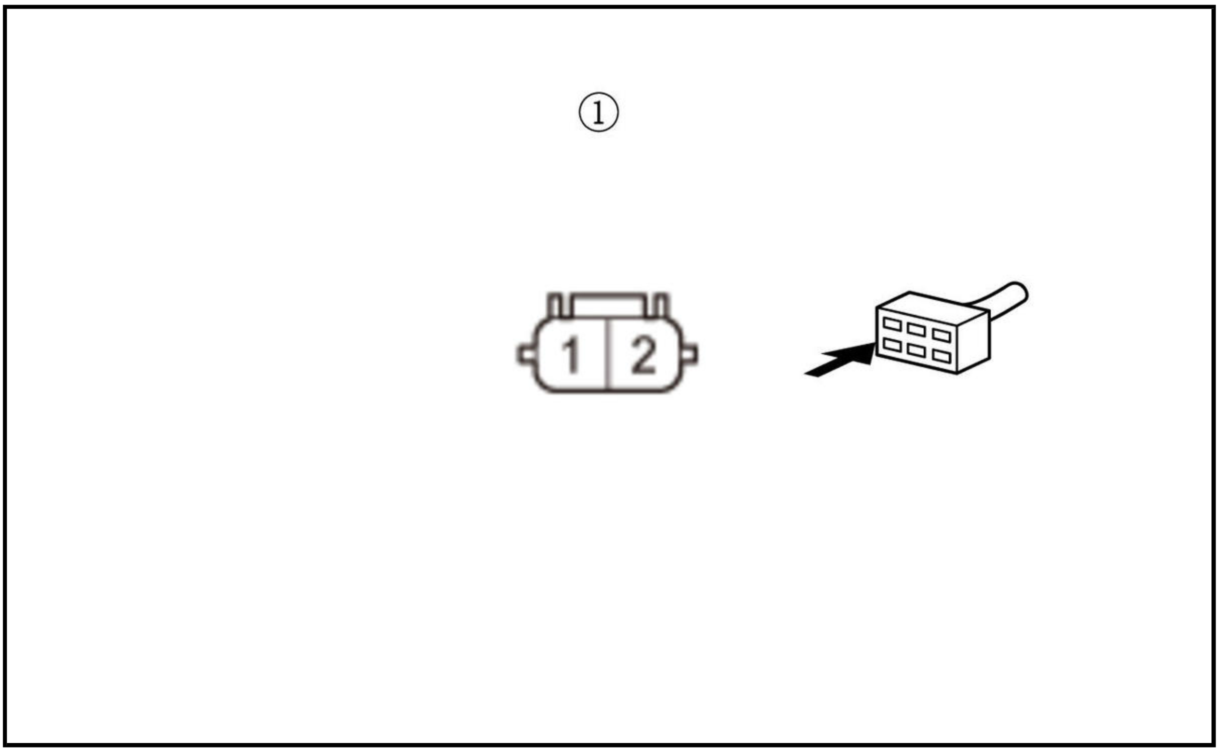
Go to step 3.

3. Open wire check (EXT_R+, EXT_R- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear interior LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Rear interior LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear interior LF antenna 2P connector: disconnected Rear interior LF antenna 2P connector No. 1 and No. 2: jumped
Test point 1	**Body control module connector F (36P) No. 17**
Test point 2	**Body control module connector F (36P) No. 35**

Is there 1.0 Ω or less?

YES

The EXT_R+ and EXT_R- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC U1280 (KEYLESS ACCESS CONTROL UNIT)

DTC U1280 : Keyless access control unit communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Keyless access control unit communication bus line error (BUS-OFF)	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Keyless access control unit communication bus line error (BUS-OFF)	B

   Is DTC U1280 indicated?

   YES

   Go to body control module DTC U1280 troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281 (KEYLESS ACCESS CONTROL UNIT)

DTC U1281 : Keyless Access Control Unit Lost Communication with MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1281 Keyless Access Control Unit Lost Communication with MICU	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Keyless Access Control Unit Lost Communication with MICU	B

Is DTC U1281 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U128D (KEYLESS ACCESS CONTROL UNIT)

DTC U128D : Keyless Access Control Unit Lost Communication with Gauge Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D Keyless Access Control Unit Lost Communication with Gauge Control Module	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U128D Keyless Access Control Unit Lost Communication with Gauge Control Module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	Body control module connector B (36P)	No. 20	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 21		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.

Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B1601

DTC B1601 : Keyless access control unit internal (CPU) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1601 Keyless access control unit internal (CPU) error	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1601 Keyless access control unit internal (CPU) error	B

   Is DTC B1601 indicated?

   YES

   Replace the body control module .

   NO

   Intermittent failure, the system is OK at this time.

DTC B1602

DTC B1602 : Keyless access control unit internal (EEPROM) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1602 Keyless access control unit internal (EEPROM) error	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1602 Keyless access control unit internal (EEPROM) error	B

Is DTC B1602 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time.

DTC B1632

DTC B1632 : MTR CONT Signal Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1632 MTR CONT Signal Error	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Start the engine.

-3. Stop the engine.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1632 MTR CONT Signal Error	B

Is DTC B1632 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Shorted wire check (MTR CONT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

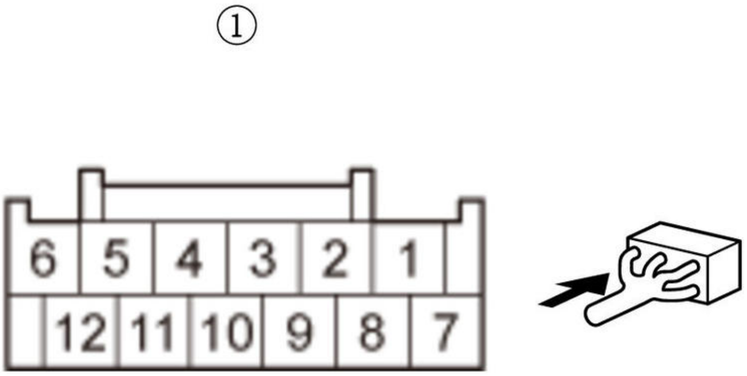
-2. Disconnect the following connectors.

Body control module connector F (36P)
Electric steering lock 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Body control module connector F (36P): disconnected Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power in the wire.

NO

Go to step 3.

3. Electric steering lock MTR CONT line internal short to power check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the following connector.

Electric steering lock 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Body control module connector F (36P): disconnected
Test point 1	**Body control module connector F (36P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the electric steering lock .

NO

Replace the body control module .

DTC B1640

DTC B1640 : RF1 antenna not connected or malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1640 RF1 antenna not connected or malfunction	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Touch the door outer handle touch sensor (LOCK) to lock the door.

-3. Touch the door outer handle touch sensor (UNLOCK) to unlock the door.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1640 RF1 antenna not connected or malfunction	B

Is DTC B1640 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1645

DTC B1645 : Driver's Door LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1645 Driver's Door LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1645 Driver's Door LF Antenna Circuit Short	B

Is DTC B1645 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT FR DR+, EXT FR DR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Driver's door outer handle 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Driver's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 13**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 31**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The EXT FR DR+ and EXT FR DR- wires are not shorted. Go to step 3.

3. Shorted wire check (EXT FR DR+ line to EXT FR DR- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Driver's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 13**
Test point 2	**Body control module connector F (36P) No. 31**

Is there continuity?

YES

Repair a short in EXT FR DR+ wire to EXT FR DR- wire.

NO

The EXT FR DR+ and EXT FR DR- wires are OK. Go to step 4.

4. Body control module EXT FR DR+, EXT FR DR- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

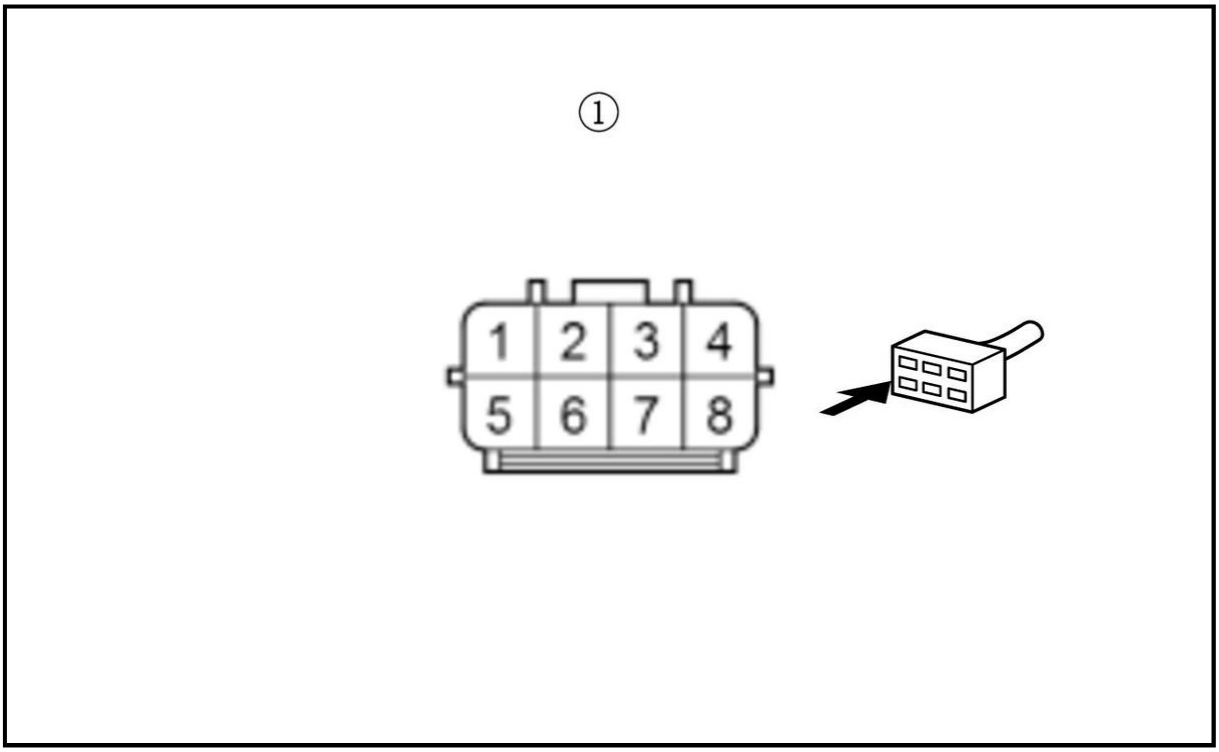
-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Driver's door outer handle 8P connector: disconnected

Test point 1	Driver's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 6: ①



-5. Select DRIVER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; replace the driver's door outer handle .

NO

Replace the body control module .

DTC B1646

DTC B1646 : Driver's Door LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1646 Driver's Door LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1646 Driver's Door LF Antenna Circuit Open	B

   Is DTC B1646 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT FR DR+, EXT FR DR- line output check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Driver's door outer handle 8P connector

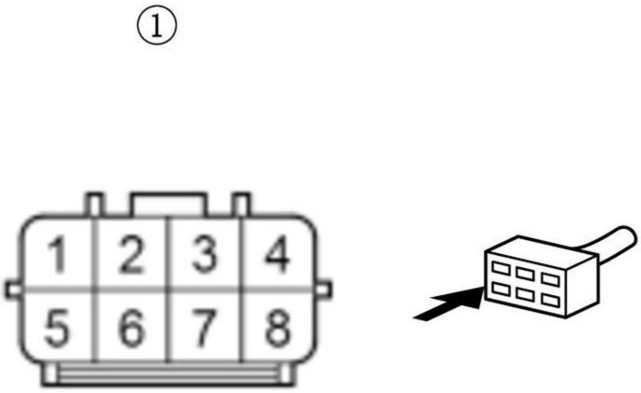
   -3. Turn the vehicle to the ON mode.

   -4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

   One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

   -5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 6: ①



-6. Select DRIVER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; **replace the driver's door outer handle** .

NO

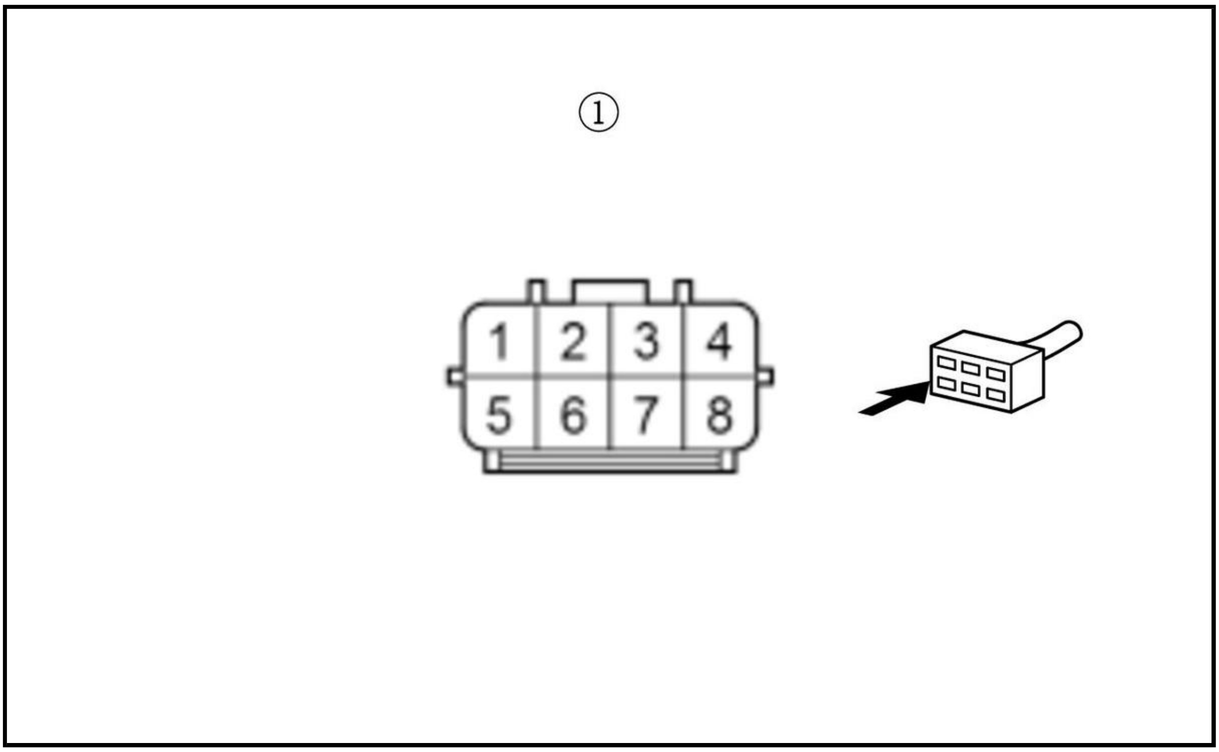
Go to step 3.

3. Open wire check (EXT FR DR+, EXT FR DR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door outer handle 8P connector (female terminals) No. 2: ①
Terminal B	Driver's door outer handle 8P connector (female terminals) No. 6: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Driver's door outer handle 8P connector: disconnected Driver's door outer handle 8P connector No. 2 and No. 6: jumped
Test point 1	**Body control module connector F (36P) No. 13**
Test point 2	**Body control module connector F (36P) No. 31**

Is there continuity?

YES

The EXT FR DR+ and EXT FR DR- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1647

DTC B1647 : Passenger's Door LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1647 Passenger's Door LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1647 Passenger's Door LF Antenna Circuit Short	B

Is DTC B1647 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT FR AS+, EXT FR AS- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Front passenger's door outer handle 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front passenger's door outer handle 8P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 12**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 30**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The EXT FR AS+ and EXT FR AS- wires are not shorted. Go to step 3.

3. Shorted wire check (EXT FR AS+ line to EXT FR AS- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front passenger's door outer handle 8P connector: disconnected

Test point 1	**Body control module connector F (36P) No. 12**
Test point 2	**Body control module connector F (36P) No. 30**

Is there continuity?

YES

Repair a short in EXT FR AS+ wire to EXT FR AS- wire.

NO

The EXT FR AS+ and EXT FR AS- wires are OK. Go to step 4.

4. Body control module EXT FR AS+, EXT FR AS- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

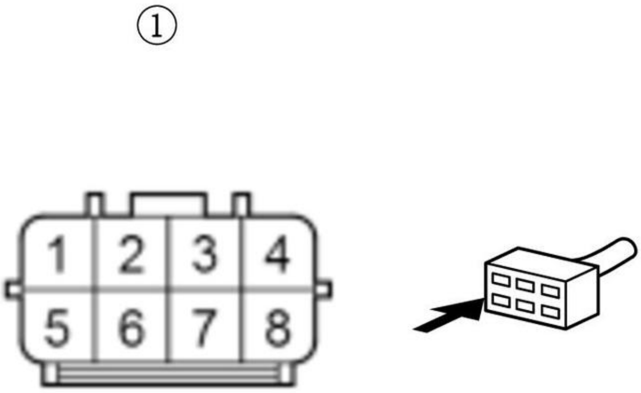
-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front passenger's door outer handle 8P connector: disconnected

Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 6: ①



-5. Select FRONT PASSENGER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; replace the front passenger's door outer handle .

NO

Replace the body control module .

DTC B1648

DTC B1648 : Passenger's Door LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1648 Passenger's Door LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1648 Passenger's Door LF Antenna Circuit Open	B

   Is DTC B1648 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT FR AS+, EXT FR AS- line output check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Front passenger's door outer handle 8P connector

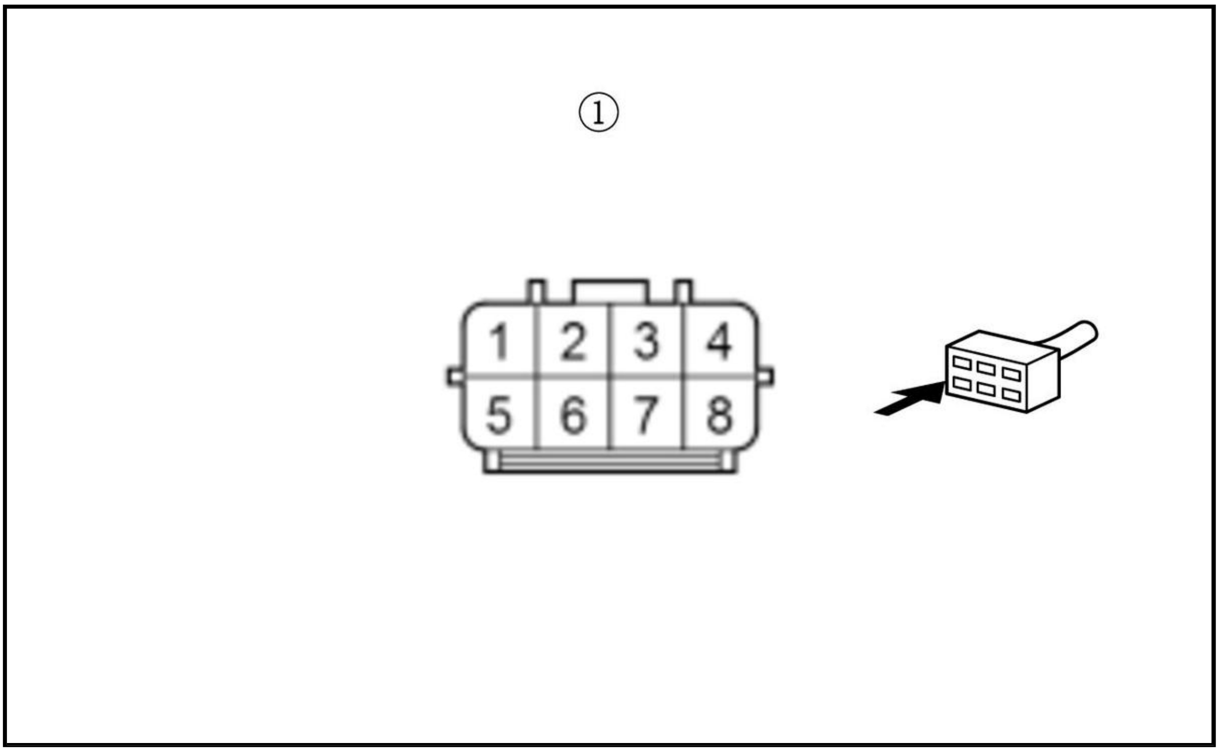
   -3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 2: ①
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 6: ①



-6. Select FRONT PASSENGER (DOOR) ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty LF antenna; **replace the front passenger's door outer handle** .

NO

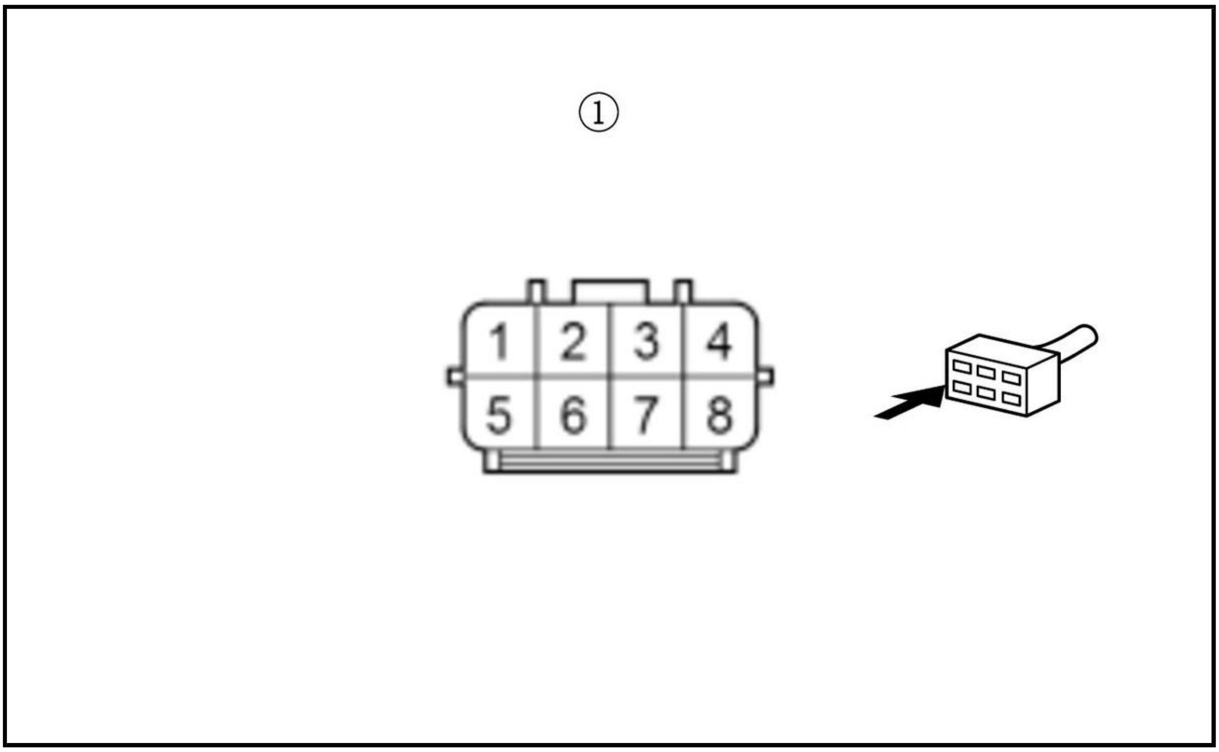
Go to step 3.

3. Open wire check (EXT FR AS+, EXT FR AS- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's door outer handle 8P connector (female terminals) No. 2: ①
Terminal B	Front passenger's door outer handle 8P connector (female terminals) No. 6: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front passenger's door outer handle 8P connector: disconnected Front passenger's door outer handle 8P connector No. 2 and No. 6: jumped
Test point 1	**Body control module connector F (36P) No. 12**
Test point 2	**Body control module connector F (36P) No. 30**

Is there continuity?

YES

The EXT FR AS+ and EXT FR AS- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1657

DTC B1657 : Rear Bumper LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1657 Rear Bumper LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1657 Rear Bumper LF Antenna Circuit Short	B

Is DTC B1657 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT TR+, EXT TR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Rear bumper LF antenna 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear bumper LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 14**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 32**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The EXT TR+ and EXT TR- wires are not shorted. Go to step 3.

3. Shorted wire check (EXT TR+ line to EXT TR- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear bumper LF antenna 2P connector: disconnected

Test point 1	**Body control module connector F (36P) No. 14**
Test point 2	**Body control module connector F (36P) No. 32**

Is there continuity?

YES

Repair a short in EXT TR+ wire to EXT TR- wire.

NO

The EXT TR+ and EXT TR- wires are OK. Go to step 4.

4. Body control module EXT TR+, EXT TR- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

-2. Turn the vehicle to the ON mode.

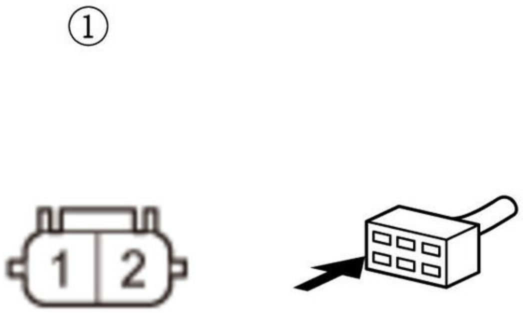
-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear bumper LF antenna 2P connector: disconnected

Test point 1	Rear bumper LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear bumper LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear bumper LF antenna; **replace the rear bumper LF antenna** .

NO

Replace the body control module .

DTC B1658

DTC B1658 : Rear Bumper LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1658 Rear Bumper LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1658 Rear Bumper LF Antenna Circuit Open	B

   Is DTC B1658 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT TR+, EXT TR- line output check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Rear bumper LF antenna 2P connector

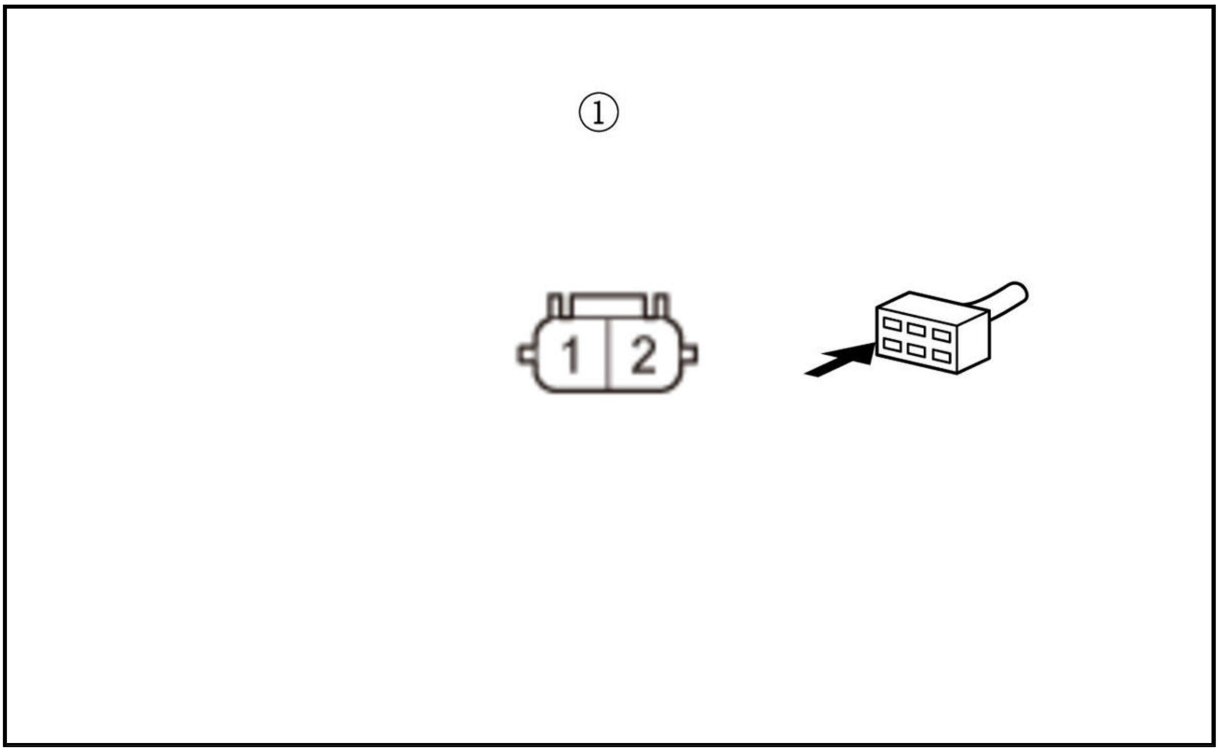
   -3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear bumper LF antenna 2P connector: disconnected
Test point 1	Rear bumper LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear bumper LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear bumper LF antenna; **replace the rear bumper LF antenna** .

NO

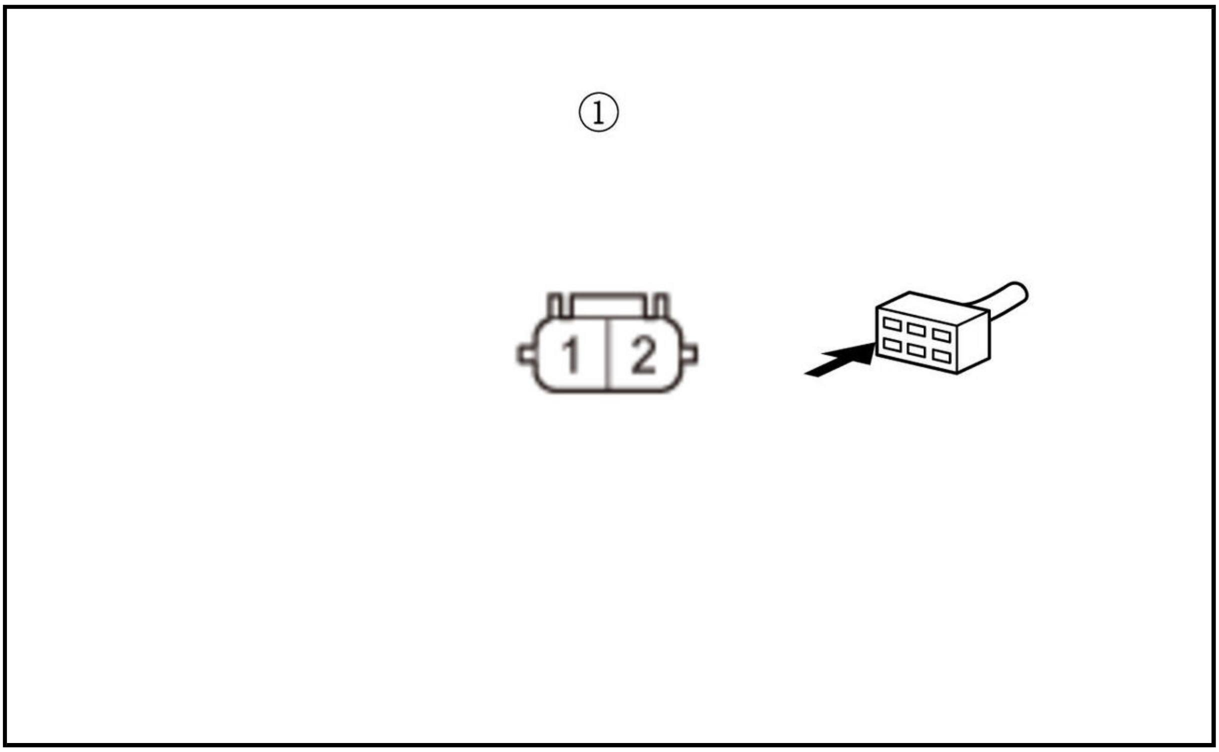
Go to step 3.

3. Open wire check (EXT TR+, EXT TR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear bumper LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Rear bumper LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear bumper LF antenna 2P connector: disconnected Rear bumper LF antenna 2P connector No. 1 and No. 2: jumped
Test point 1	**Body control module connector F (36P) No. 14**
Test point 2	**Body control module connector F (36P) No. 32**

Is there continuity?

YES

The EXT TR+ and EXT TR- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1659

DTC B1659 : Front Interior LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1659 Front Interior LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1659 Front Interior LF Antenna Circuit Short	B

Is DTC B1659 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT F+, EXT F- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Front interior LF antenna 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 16**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 34**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The EXT F+ and EXT F- wires are not shorted. Go to step 3.

3. Shorted wire check (EXT F+ line to EXT F- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front interior LF antenna 2P connector: disconnected

Test point 1	**Body control module connector F (36P) No. 16**
Test point 2	**Body control module connector F (36P) No. 34**

Is there continuity?

YES

Repair a short in EXT F+ wire to EXT F- wire.

NO

The EXT F+ and EXT F- wires are OK. Go to step 4.

4. Body control module EXT F+, EXT F- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

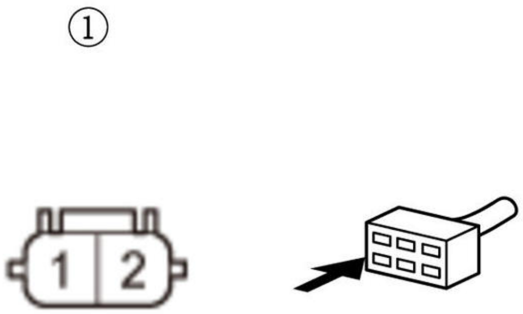
-2. Turn the vehicle to the ON mode.

-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front interior LF antenna 2P connector: disconnected
Test point 1	Front interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Front interior LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN FRONT ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty front interior LF antenna; **replace the front interior LF antenna** .

NO

Replace the body control module .

DTC B1660

DTC B1660 : Front Interior LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1660 Front Interior LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1660 Front Interior LF Antenna Circuit Open	B

Is DTC B1660 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT F+, EXT F- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

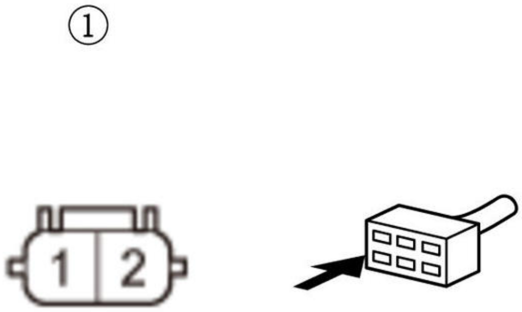
Front interior LF antenna 2P connector

-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front interior LF antenna 2P connector: disconnected
Test point 1	Front interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Front interior LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN FRONT ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty front interior LF antenna; **replace the front interior LF antenna** .

NO

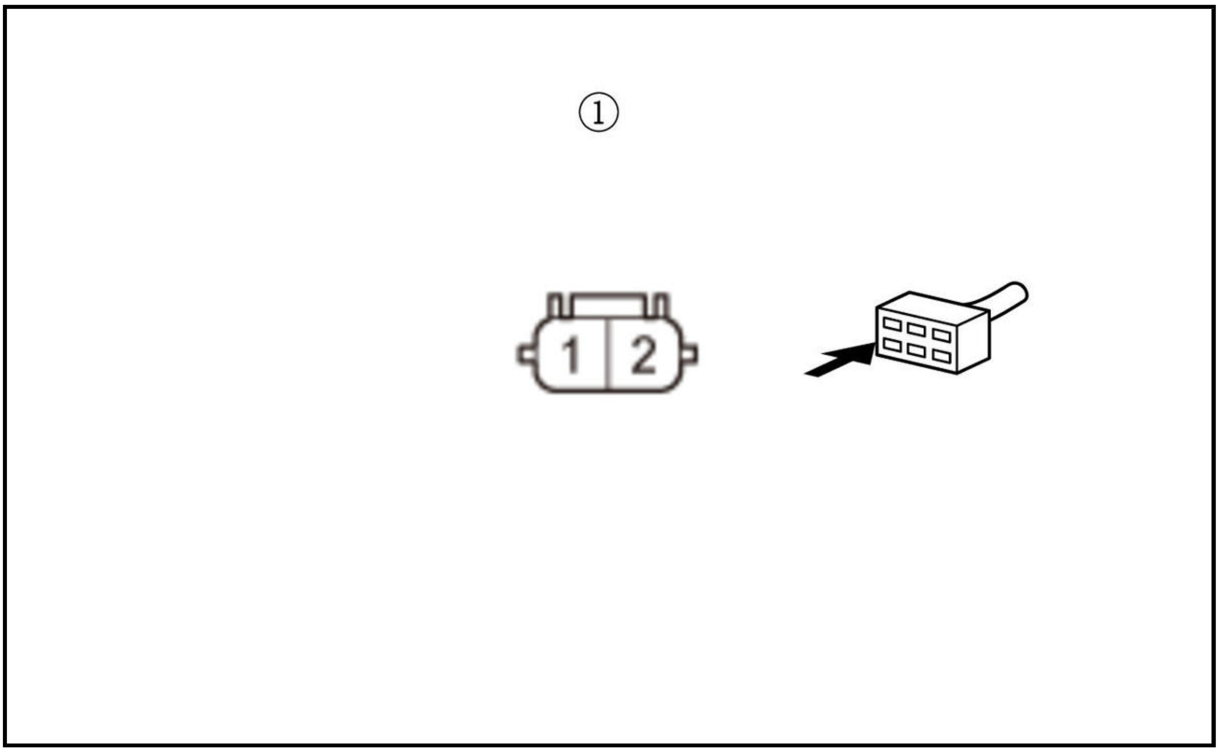
Go to step 3.

3. Open wire check (EXT F+, EXT F- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Front interior LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Front interior LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Front interior LF antenna 2P connector: disconnected Front interior LF antenna 2P connector No. 1 and No. 2: jumped
Test point 1	**Body control module connector F (36P) No. 16**
Test point 2	**Body control module connector F (36P) No. 34**

Is there continuity?

YES

The EXT F+ and EXT F- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1661, B1667

DTC B1661 : Middle Interior Antenna Circuit Shorted

DTC B1667 : Rear Shelf (Middle Interior) LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1661 Middle Interior Antenna Circuit Shorted	B
B1667 Rear Shelf (Middle Interior) LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   -3. Do the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1661 Middle Interior Antenna Circuit Shorted	B
B1667 Rear Shelf (Middle Interior) LF Antenna Circuit Short	B

   Is DTC B1661 or B1667 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT M+, EXT M- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector F (36P)Middle interior LF antenna 2P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Middle interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 15**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 33**
Test point 2	Body ground

   Is there continuity?

   YES

   Repair a short to ground in the wire.

   NO

   The EXT M+ and EXT M- wires are not shorted. Go to step 3.

3. Shorted wire check (EXT M+ to EXT M- line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Middle interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 15**
Test point 2	**Body control module connector F (36P) No. 33**

Is there continuity?

YES

Repair a short in EXT M+ to EXT M- wire.

NO

The EXT M+ and EXT M- wires are OK. Go to step 4.

4. Body control module EXT M+, EXT M- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

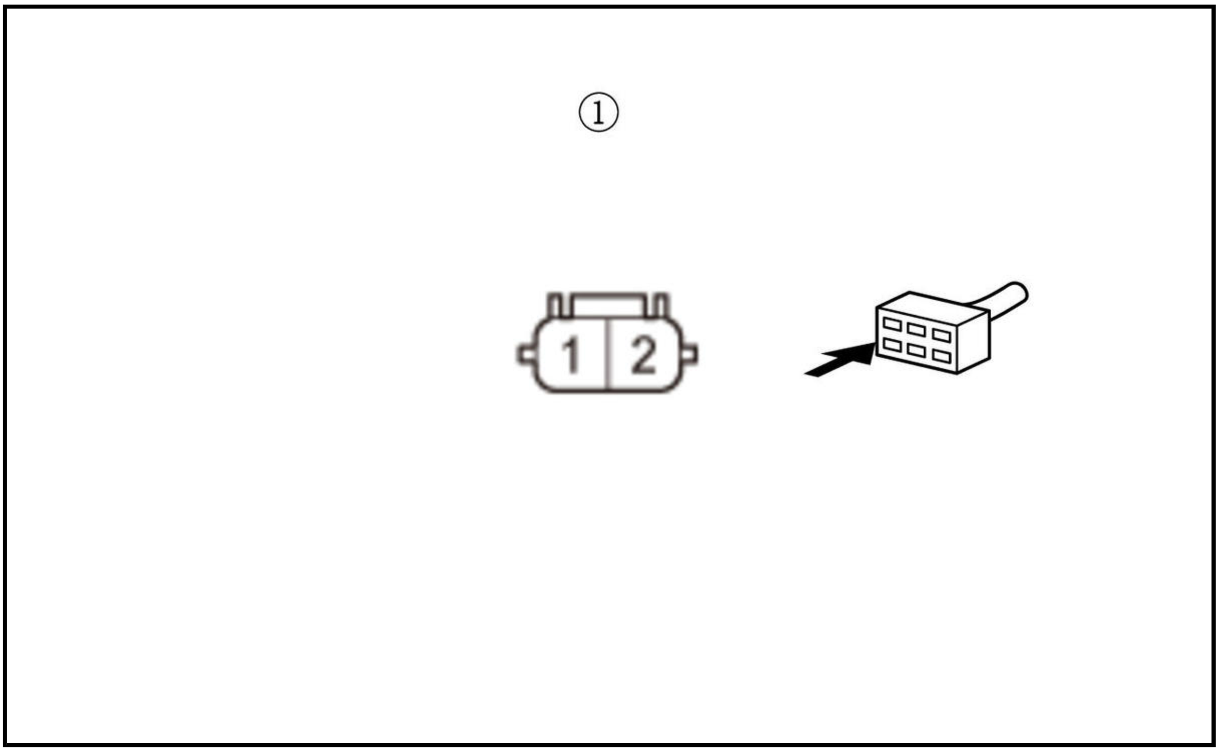
-2. Turn the vehicle to the ON mode.

-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Middle interior LF antenna 2P connector: disconnected
Test point 1	Middle interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Middle interior LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN MIDDLE ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty middle interior LF antenna; **Replace the middle interior LF antenna** .

NO

Replace the body control module .

DTC B1662, B1668

DTC B1662 : Middle Interior Antenna Circuit Opened

DTC B1668 : Rear Shelf (Middle Interior) LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1662 Middle Interior Antenna Circuit Opened	B
B1668 Rear Shelf (Middle Interior) LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   -3. Do the SELF CHECK.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1662 Middle Interior Antenna Circuit Opened	B
B1668 Rear Shelf (Middle Interior) LF Antenna Circuit Open	B

   Is DTC B1662 or B1668 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT M+, EXT M- line output check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Middle interior LF antenna 2P connector

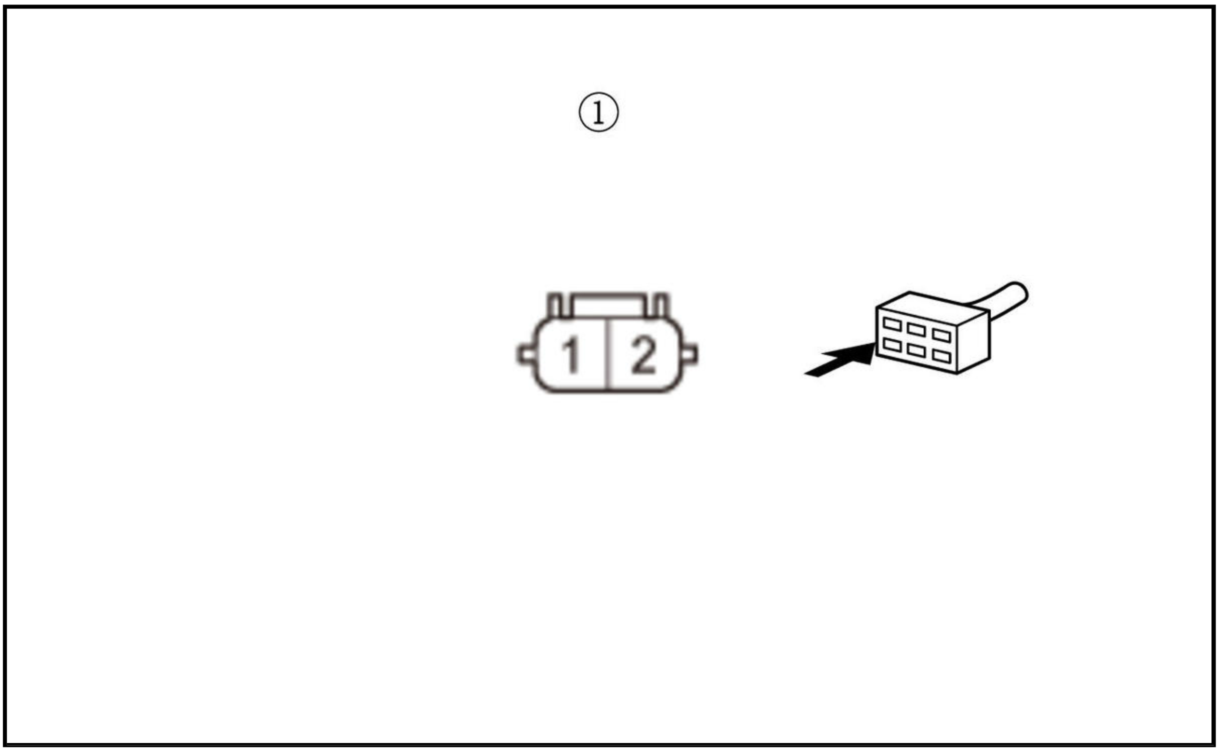
-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Middle interior LF antenna 2P connector: disconnected
Test point 1	Middle interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Middle interior LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN MIDDLE ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty middle interior LF antenna; **Replace the middle interior LF antenna** .

NO

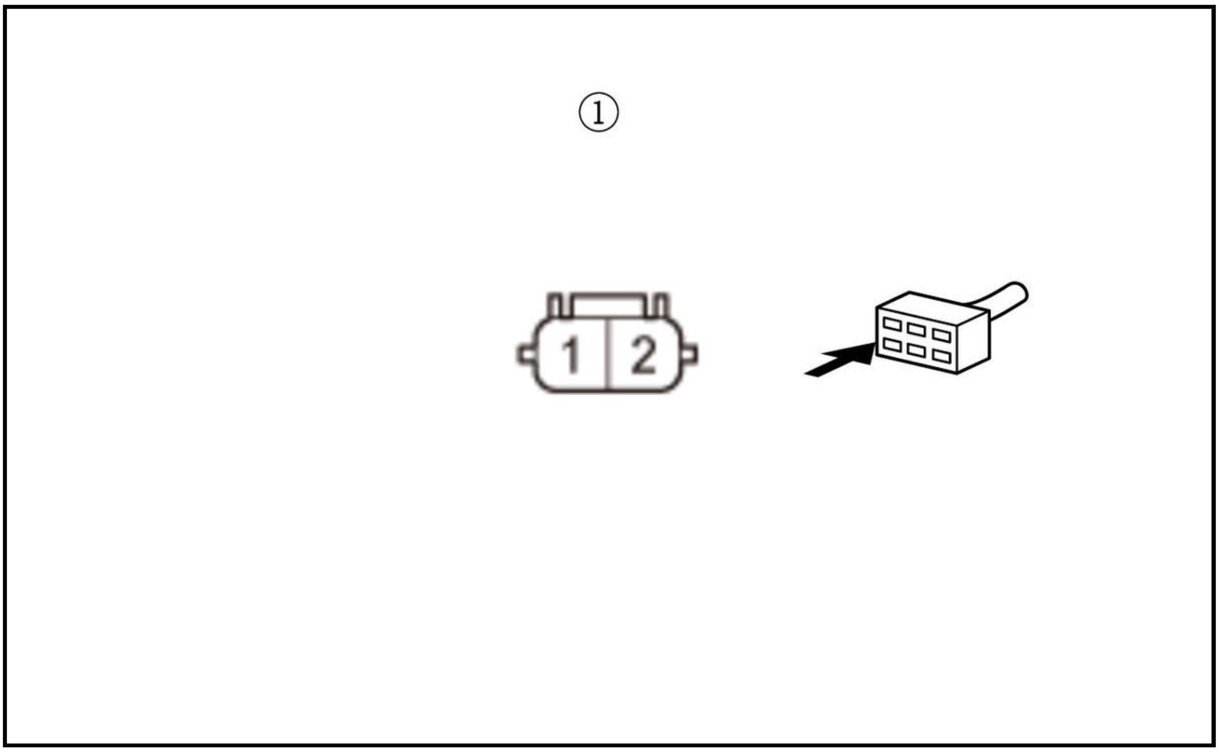
Go to step 3.

3. Open wire check (EXT M+, EXT M- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Middle interior LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Middle interior LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Middle interior LF antenna 2P connector: disconnected
Test point 1	Body control module connector F (36P) No. 15
Test point 2	Body control module connector F (36P) No. 33

Is there continuity?

YES

The EXT M+ and EXT M- wires are OK. Replace the body control module .

NO

Repair an open or high resistance in the wire.

DTC B1663

DTC B1663 : Rear Interior LF Antenna Circuit Short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1663 Rear Interior LF Antenna Circuit Short	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1663 Rear Interior LF Antenna Circuit Short	B

Is DTC B1663 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (EXT R+, EXT R- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector F (36P)
Rear interior LF antenna 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 17**
Test point 2	Body ground

Test point 1	**Body control module connector F (36P) No. 35**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The EXT R+ and EXT R- wires are not shorted. Go to step 3.

3. Shorted wire check (EXT R+ line to EXT R- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear interior LF antenna 2P connector: disconnected
Test point 1	**Body control module connector F (36P) No. 17**

Test point 2	**Body control module connector F (36P) No. 35**

Is there continuity?

YES

Repair a short in EXT R+ wire to EXT R- wire.

NO

The EXT R+ and EXT R- wires are OK. Go to step 4.

4. Body control module EXT R+, EXT R- line output check

-1. Reconnect the following connector.

Body control module connector F (36P)

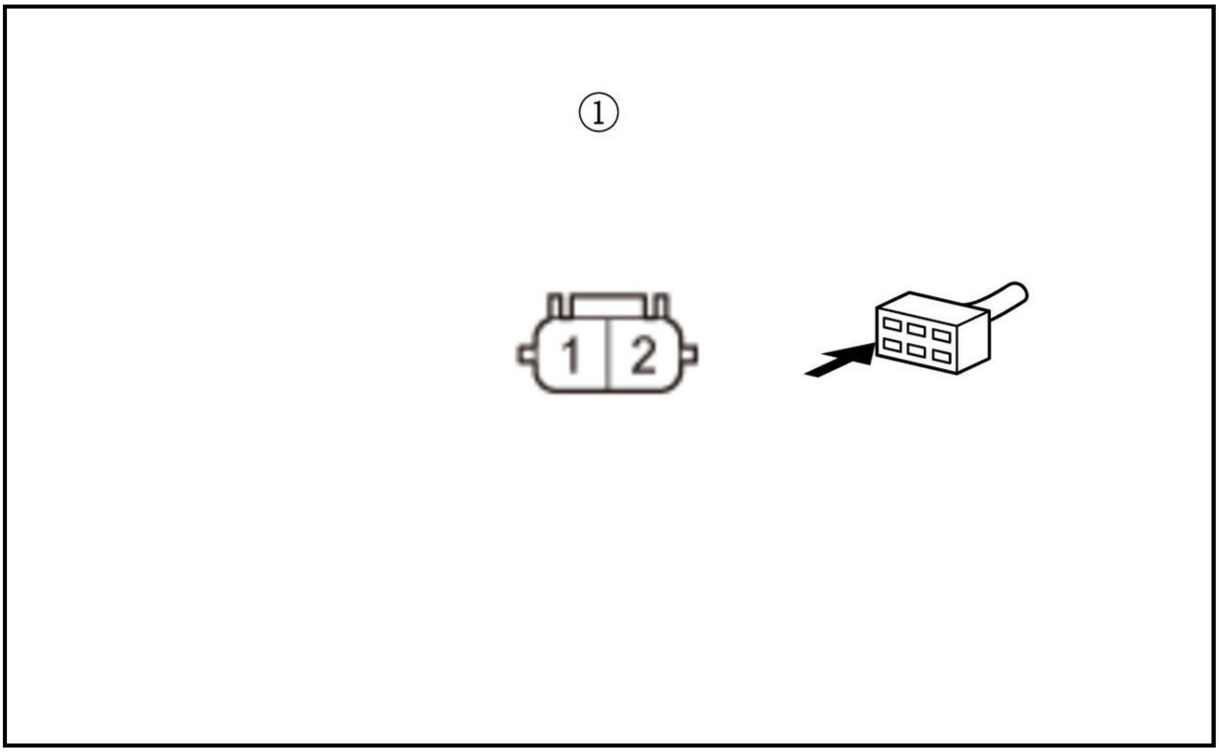
-2. Turn the vehicle to the ON mode.

-3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

One-Push - KEYLESS ACCESS CONTROL UNIT - FUNCTIONAL TESTS

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear interior LF antenna 2P connector: disconnected
Test point 1	Rear interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear interior LF antenna 2P connector (female terminals) No. 1: ①



-5. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear interior LF antenna; replace the rear interior LF antenna .

NO

Replace the body control module .

DTC B1664

DTC B1664 : Rear Interior LF Antenna Circuit Open

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1664 Rear Interior LF Antenna Circuit Open	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Select the KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter the SELF CHECK.

One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

-3. Do the SELF CHECK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1664 Rear Interior LF Antenna Circuit Open	B

Is DTC B1664 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Body control module EXT R+, EXT R- line output check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

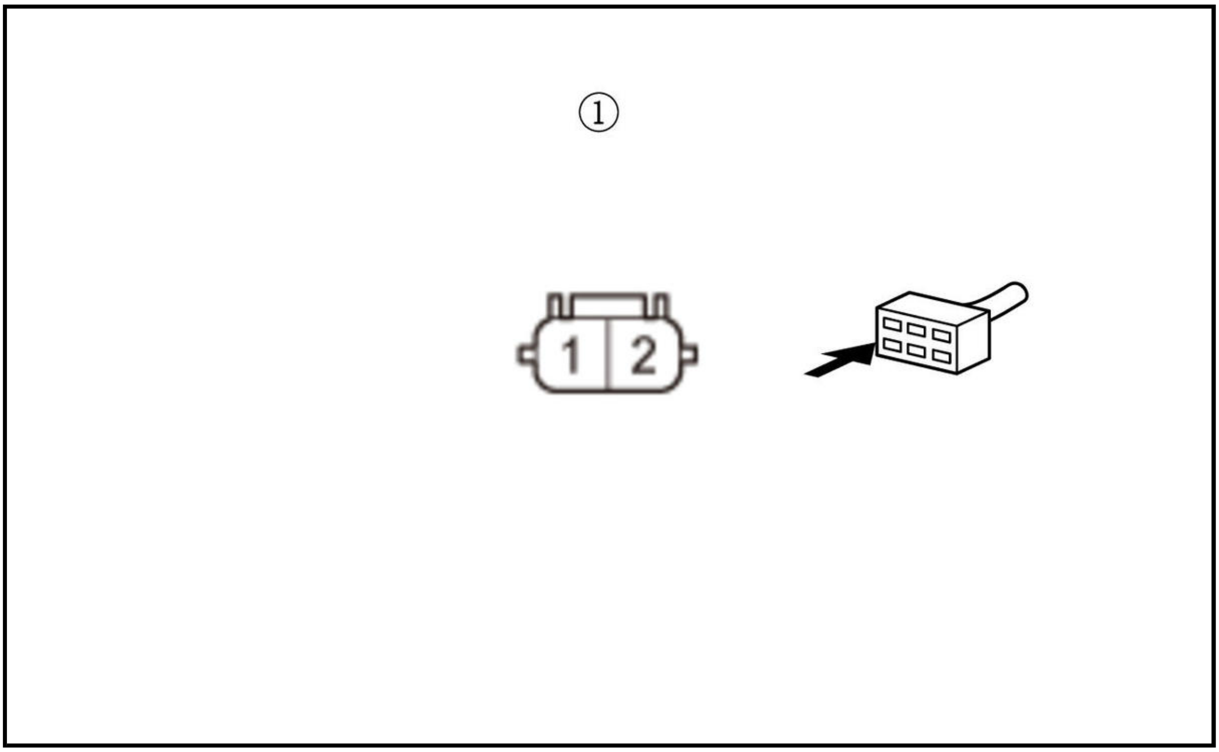
Rear interior LF antenna 2P connector

-3. Turn the vehicle to the ON mode.

-4. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter FUNCTIONAL TESTS.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear interior LF antenna 2P connector: disconnected
Test point 1	Rear interior LF antenna 2P connector (female terminals) No. 2: ①
Test point 2	Rear interior LF antenna 2P connector (female terminals) No. 1: ①



-6. Select CABIN REAR ANTENNA L DC OUTPUT with the HDS.

Is there voltage?

YES

Faulty rear interior LF antenna; **replace the rear interior LF antenna** .

NO

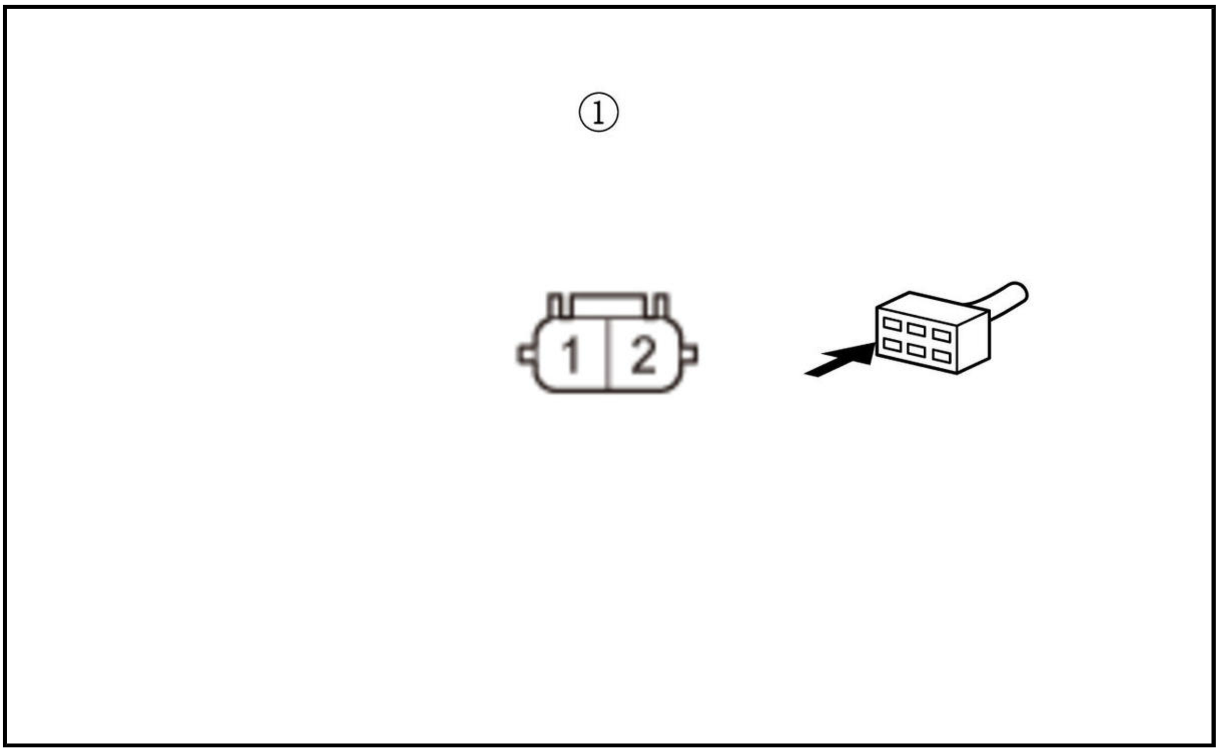
Go to step 3.

3. Open wire check (EXT R+, EXT R- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Rear interior LF antenna 2P connector (female terminals) No. 2: ①
Terminal B	Rear interior LF antenna 2P connector (female terminals) No. 1: ①



-3. Disconnect the following connector.

Body control module connector F (36P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector F (36P): disconnected Rear interior LF antenna 2P connector: disconnected Rear interior LF antenna 2P connector No. 1 and No. 2: jumped
Test point 1	**Body control module connector F (36P) No. 17**
Test point 2	**Body control module connector F (36P) No. 35**

Is there continuity?

YES

The EXT R+ and EXT R- wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC U1280 (KEYLESS ACCESS CONTROL UNIT)

DTC U1280 : Keyless access control unit communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Keyless access control unit communication bus line error (BUS-OFF)	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Keyless access control unit communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281 (KEYLESS ACCESS CONTROL UNIT)

DTC U1281 : Keyless Access Control Unit Lost Communication with MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1281 Keyless Access Control Unit Lost Communication with MICU	B

DTC (Keyless Access Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Keyless Access Control Unit Lost Communication with MICU	B

Is DTC U1281 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U128D (KEYLESS ACCESS CONTROL UNIT)

DTC U128D : Keyless Access Control Unit Lost Communication with Gauge Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D Keyless Access Control Unit Lost Communication with Gauge Control Module	B

DTC (Keyless Access Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U128D Keyless Access Control Unit Lost Communication with Gauge Control Module	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

   -3. Disconnect the transmitting control unit connector(s).

   Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)

   -4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	**Body control module connector B (36P)**	No. 20	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 21		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U128D	**Gauge control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B12C5

DTC B12C5 : Engine Start/Stop Switch Failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B12C5 Engine Start/Stop Switch Failure	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Press the engine start/stop switch at least twenty times, then wait for at least 20 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12C5 Engine Start/Stop Switch Failure	B

   Is DTC B12C5 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (+B SMART line, GND line, other)

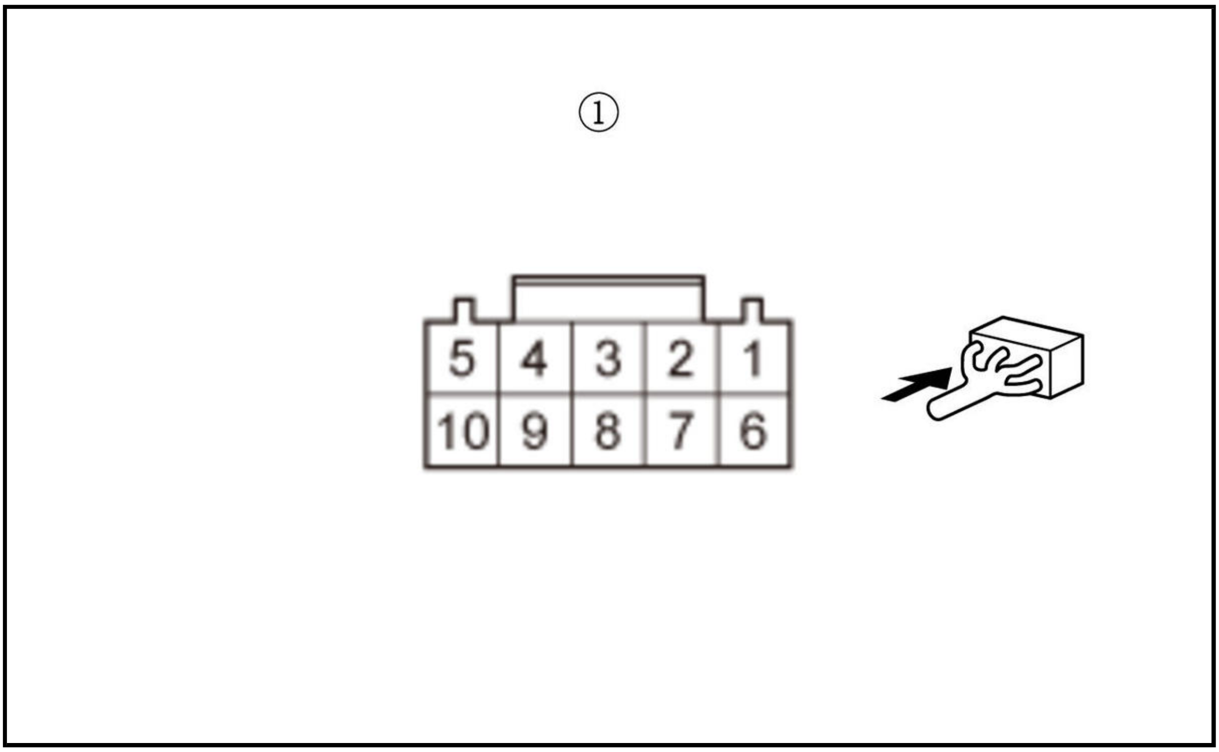
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Engine start/stop switch 10P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Engine start/stop switch 10P connector: disconnected
Test point 1	Engine start/stop switch 10P connector (female terminals) No. 5: ①
Test point 2	Engine start/stop switch 10P connector (female terminals) No. 1: ①



Is there battery voltage?

YES

The +B SMART and GND wires are OK. Go to step 3.

NO

Go to step 6.

3. Shorted wire check (SS1 (+), SS2 (-) lines)

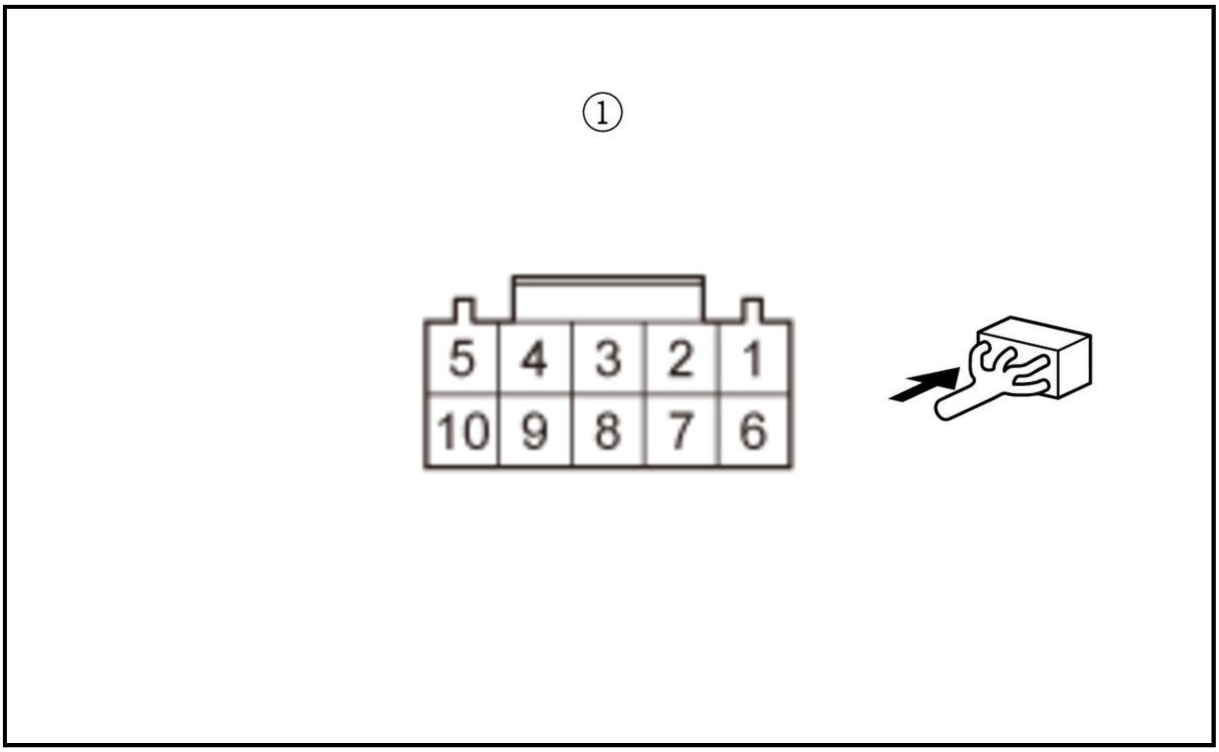
-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Engine start/stop switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Engine start/stop switch 10P connector (female terminals) No. 6: ①
Test point 2	Body ground

Test point 1	Engine start/stop switch 10P connector (female terminals) No. 10: ①
Test point 2	Body ground



Is there continuity?

YES

Repair short to ground in the wire.

NO

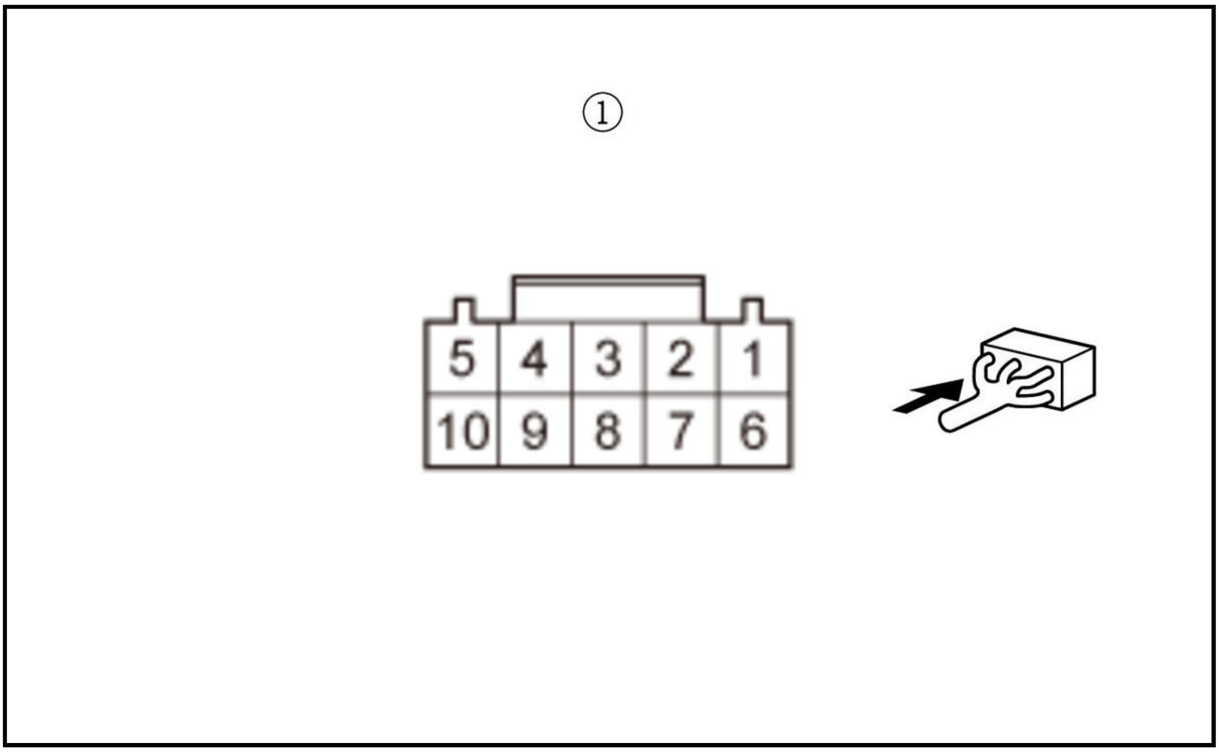
The SS1 (+) and SS2 (-) wires are not shorted. Go to step 4.

4. Open wire check (SS1 (+), SS2 (-) lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Engine start/stop switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Engine start/stop switch 10P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector G (32P) No. 18**

Test point 1	Engine start/stop switch 10P connector (female terminals) No. 10: ①
Test point 2	**Body control module connector G (32P) No. 9**



Is there continuity?

YES

The SS1 (+) and SS2 (-) wires are OK. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Engine start/stop switch check

   -1. **Do the engine start/stop switch test** .

   Is the engine start/stop switch OK?

   YES

   Replace the body control module .

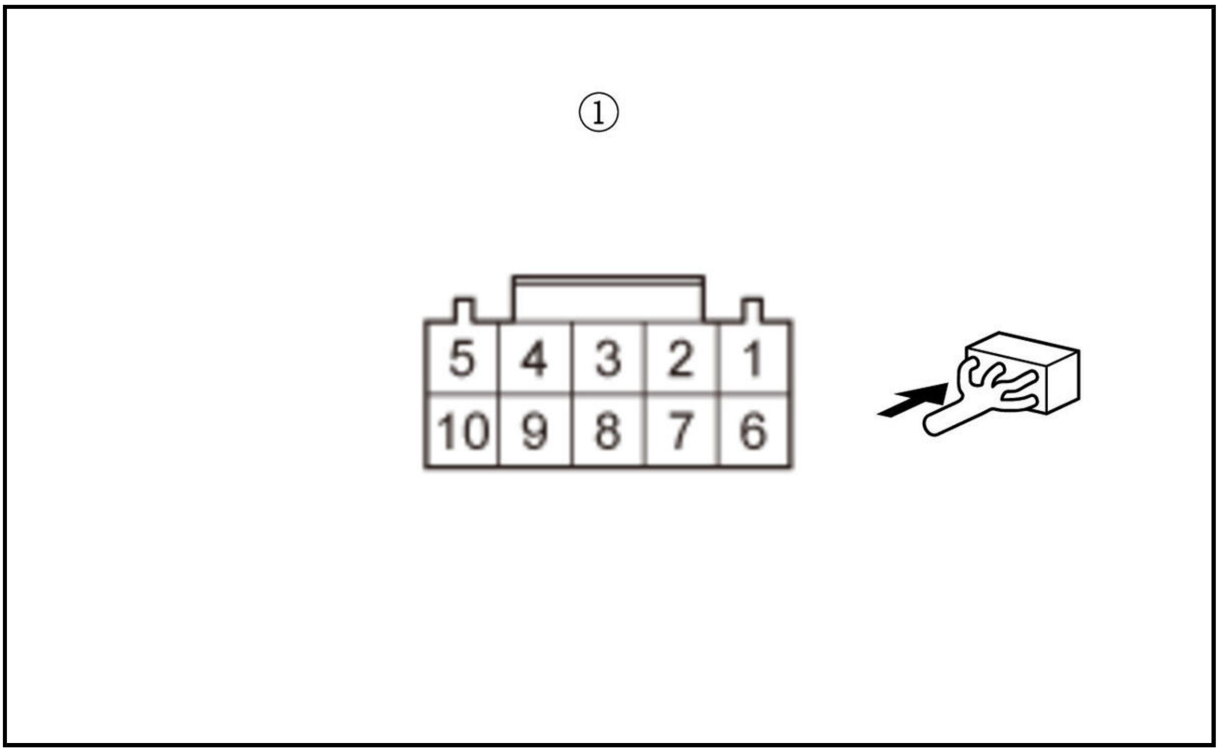
   NO

   Replace the engine start/stop switch .

6. Open wire check (+B SMART line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Engine start/stop switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Engine start/stop switch 10P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair an open or high resistance in the GND wire.

NO

Repair an open or high resistance in the +B SMART wire.

DTC B12C6

DTC B12C6 : Electric Steering Lock Switch C/D Monitor Circuit Failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B12C6 Electric Steering Lock Switch C/D Monitor Circuit Failure	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Press the engine start/stop switch at least ten times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12C6 Electric Steering Lock Switch C/D Monitor Circuit Failure	B

Is DTC B12C6 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. ESL SW line check 1

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Electrical Steering Lock SWITCH C	OFF	B	B	B
Electrical Steering Lock SWITCH D	OFF	B	B	B

Are ELECTRICAL STEERING LOCK SWITCH C and ELECTRICAL STEERING LOCK SWITCH D data list values OFF?

YES

Go to step 9.

NO

Go to step 3.

3. ESL SW line check 2

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Electrical Steering Lock SWITCH C	OFF	B	B	B
Electrical Steering Lock SWITCH D	OFF	B	B	B

Are ELECTRICAL STEERING LOCK SWITCH C data list value OFF?

YES

Go to step 10.

NO

Go to step 4.

4. ESL SW line check 3

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Electrical Steering Lock SWITCH C	OFF	B	B	B
Electrical Steering Lock SWITCH D	OFF	B	B	B

Are ELECTRICAL STEERING LOCK SWITCH D data list value OFF?

YES

Go to step 12.

NO

Go to step 5.

5. Shorted wire check (ESL SW C line) 1

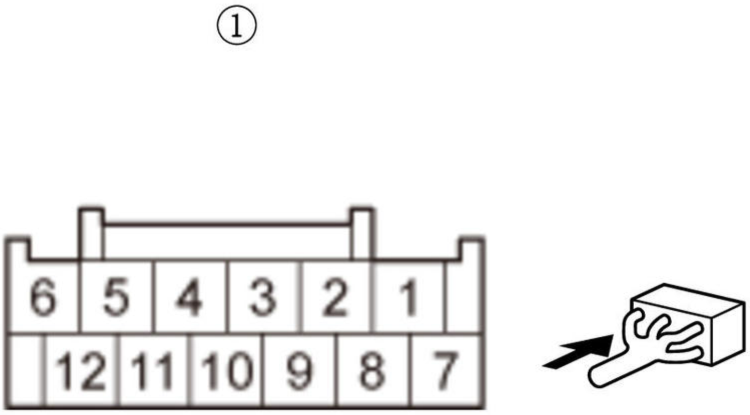
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 6.

NO

Go to step 7.

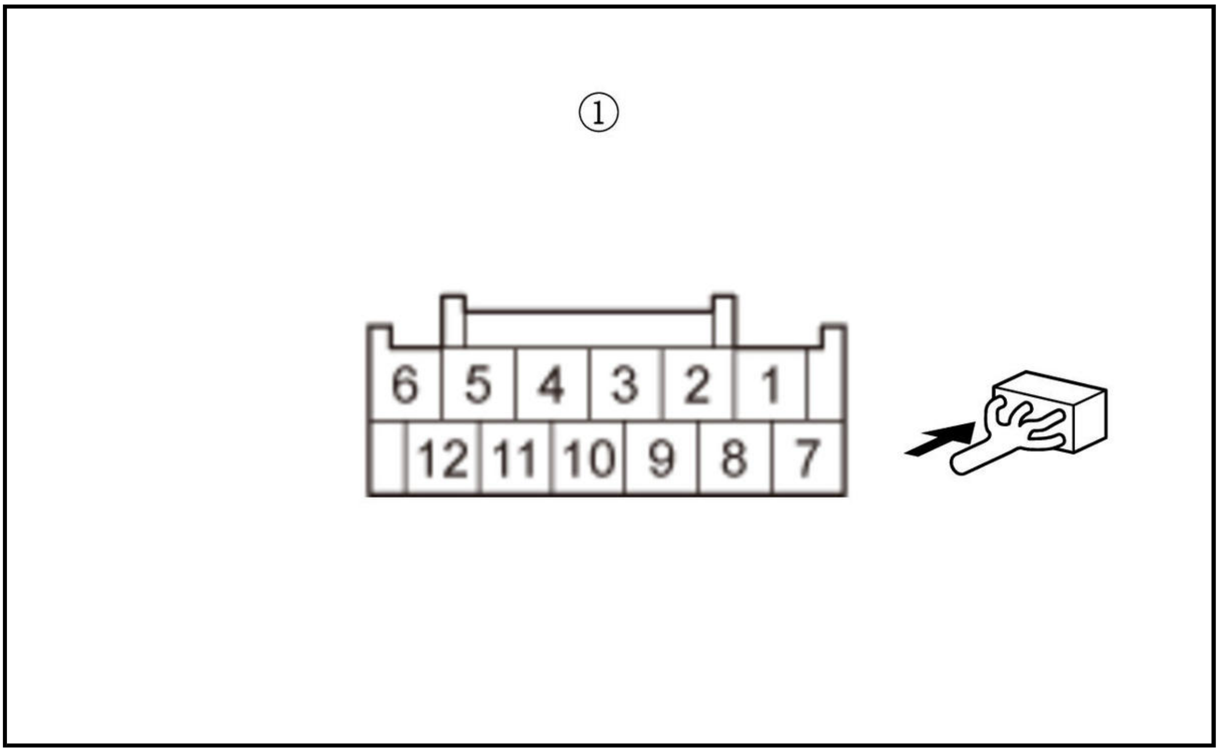
6. Shorted wire check (ESL SW C line) 2

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

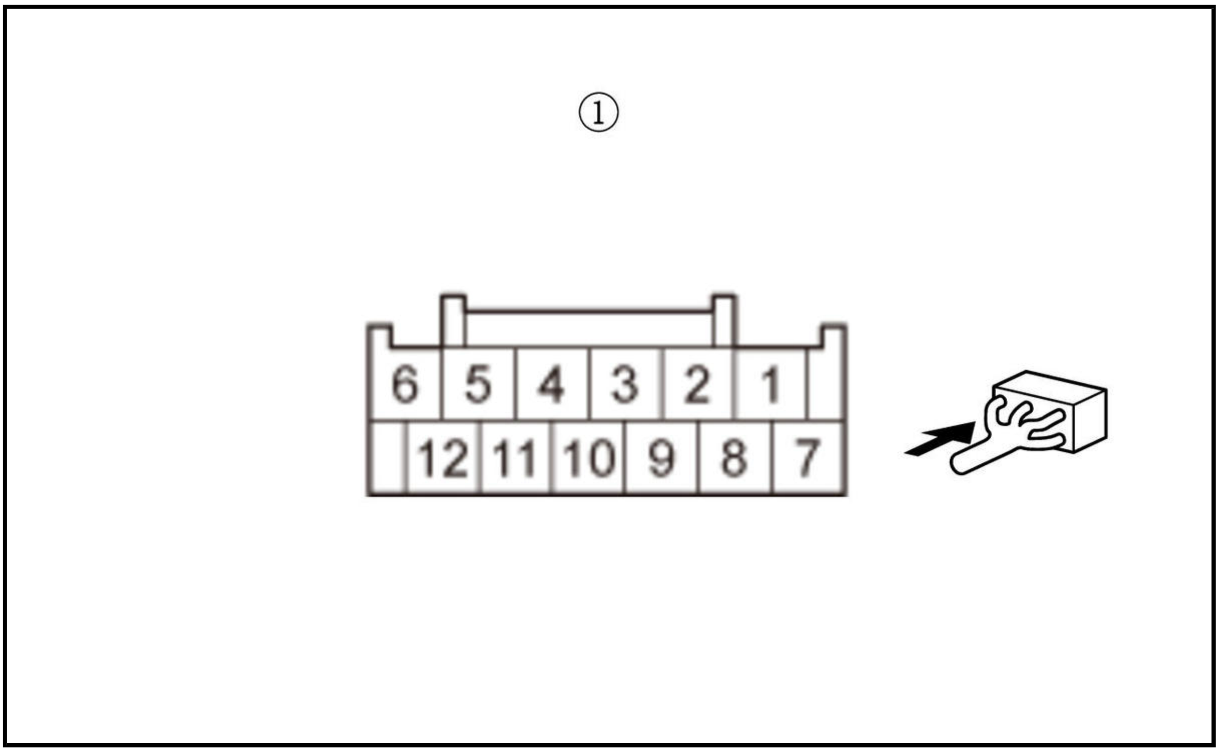
NO

The ESL SW C wire is OK. **Replace the body control module** .

7. Shorted wire check (ESL SW D line) 1

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 10: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 8.

NO

The ESL SW D wire is OK. **Replace the electric steering lock** .

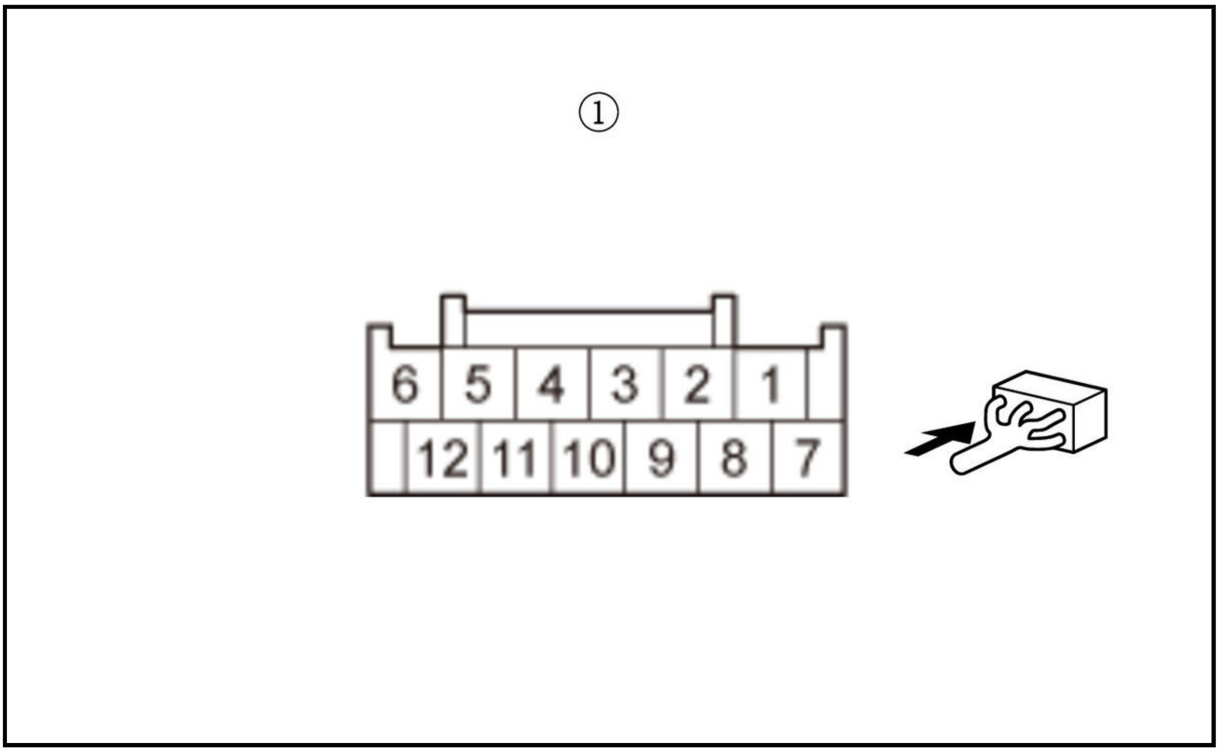
8. Shorted wire check (ESL SW D line) 2

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 10: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

The ESL SW D wire is OK. **Replace the body control module** .

9. Open wire check (GND line)

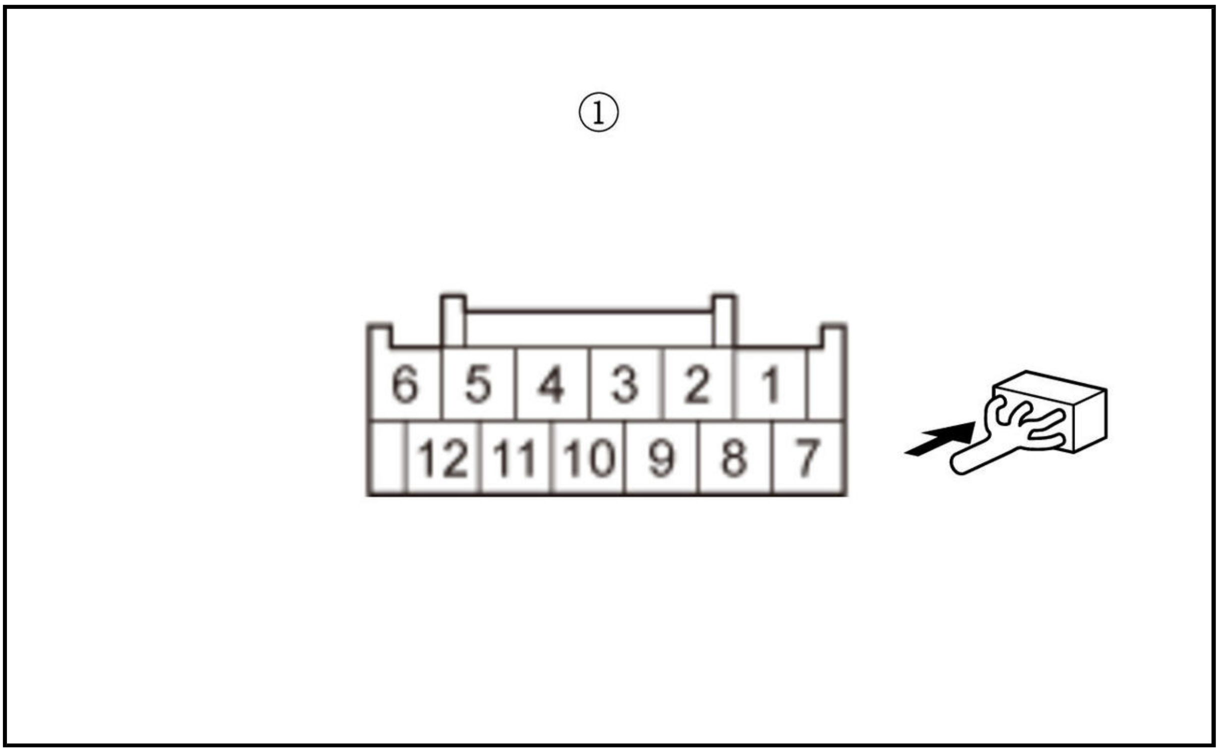
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. **Replace the electric steering lock** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

10. Open wire check (ESL SW C line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

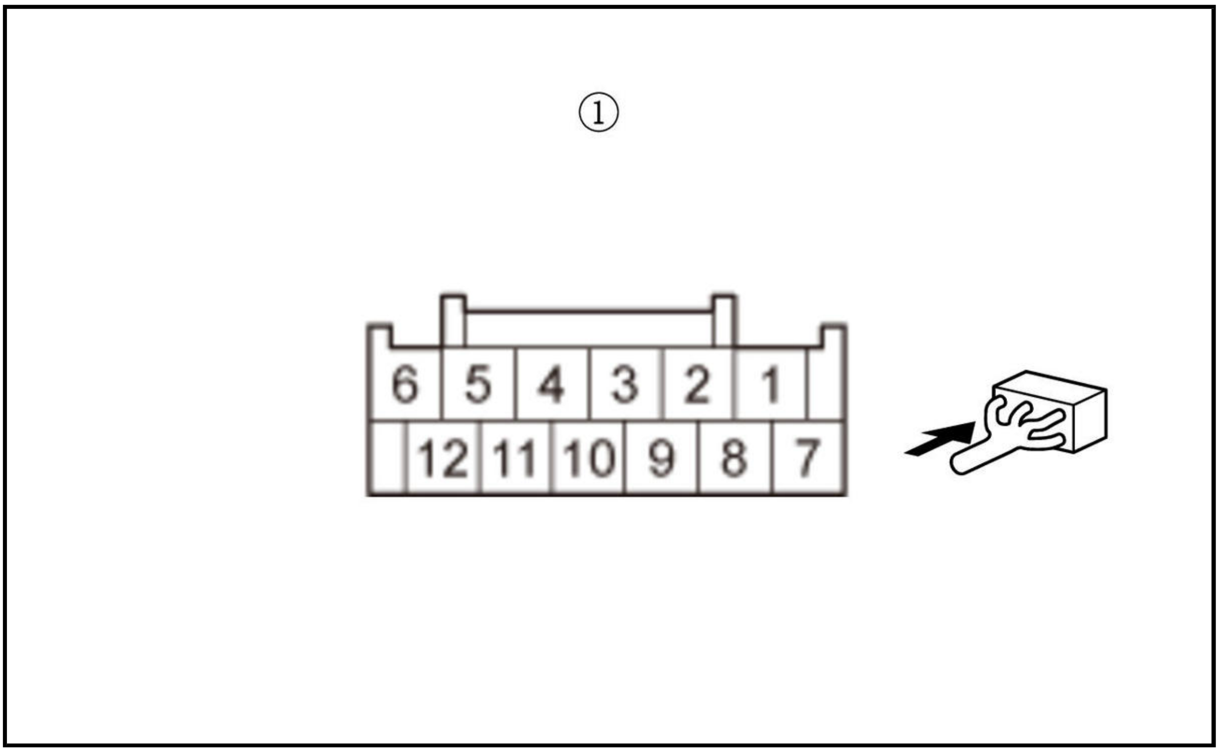
-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ESL SW C wire is OK. **Replace the electric steering lock** .

NO

Go to step 11.

11. Open wire check (ESL SW C line) 2

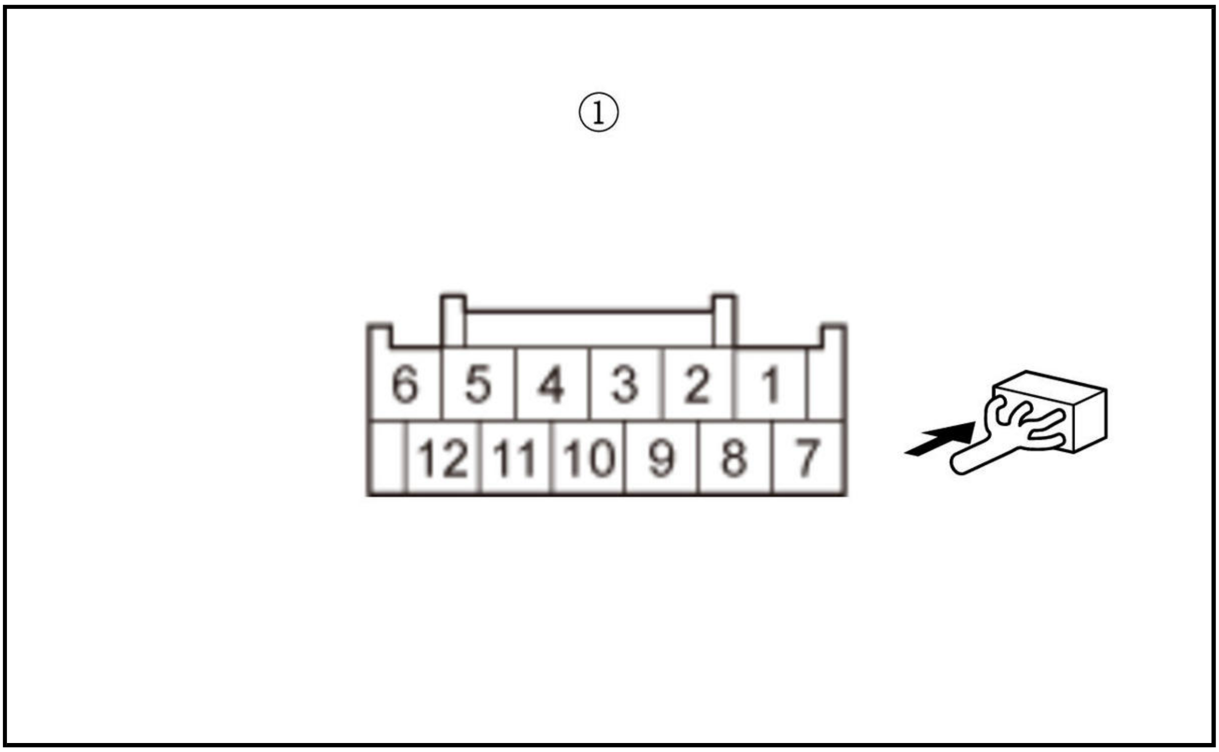
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector G (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 9: ①
Test point 2	**Body control module connector G (32P) No. 4**



Is there continuity?

YES

The ESL SW C wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

12. Open wire check (ESL SW D line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

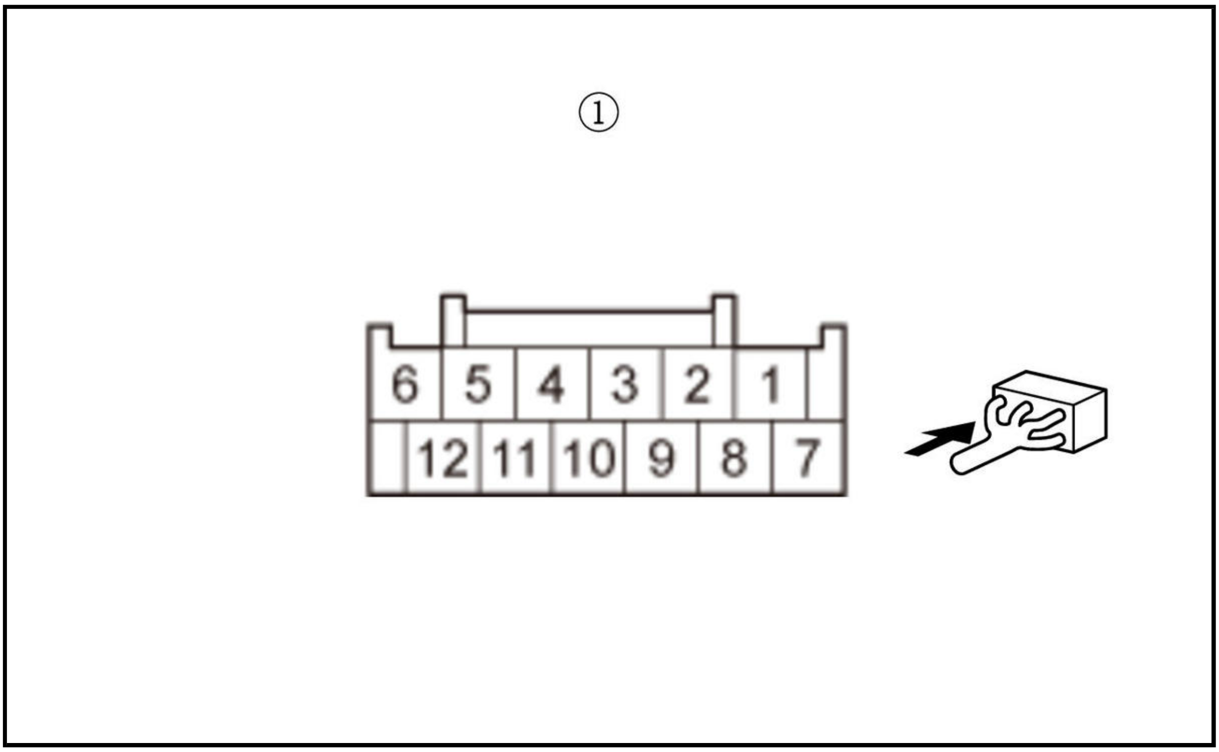
-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 10: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ESL SW D wire is OK. **Replace the electric steering lock** .

NO

Go to step 13.

13. Open wire check (ESL SW D line) 2

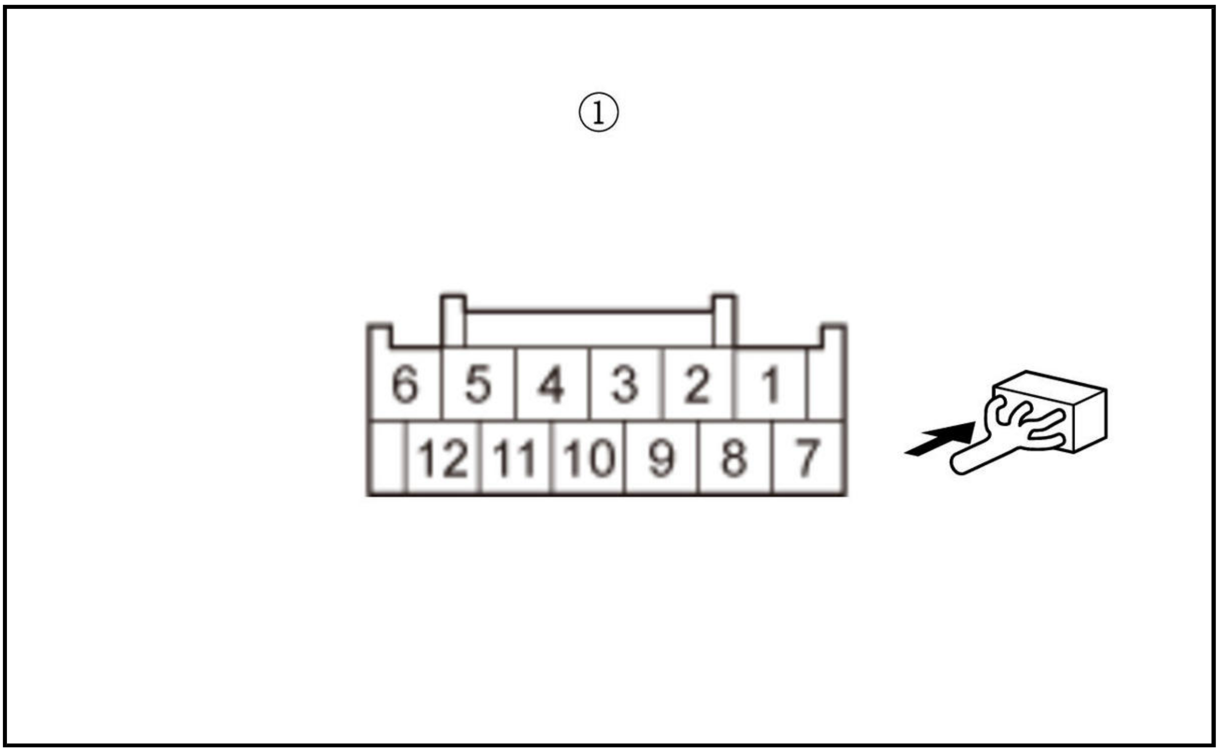
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector G (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 10: ①
Test point 2	**Body control module connector G (32P) No. 5**



Is there continuity?

YES

The ESL SW D wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B12C7

DTC B12C7 : Electric Steering Lock Motor Circuit Failure

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B12C7 Electric Steering Lock Motor Circuit Failure	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12C7 Electric Steering Lock Motor Circuit Failure	B

   Is DTC B12C7 indicated?

   YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (GND line)

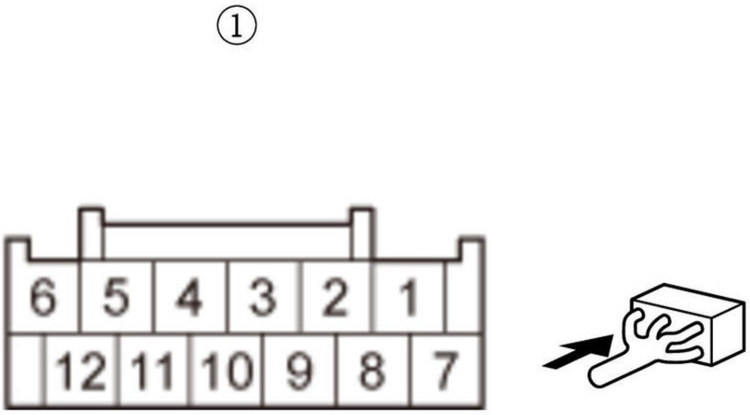
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 3.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

3. Shorted wire check (MTR CUT1(CONT), MTR CUT2(IG1) lines)

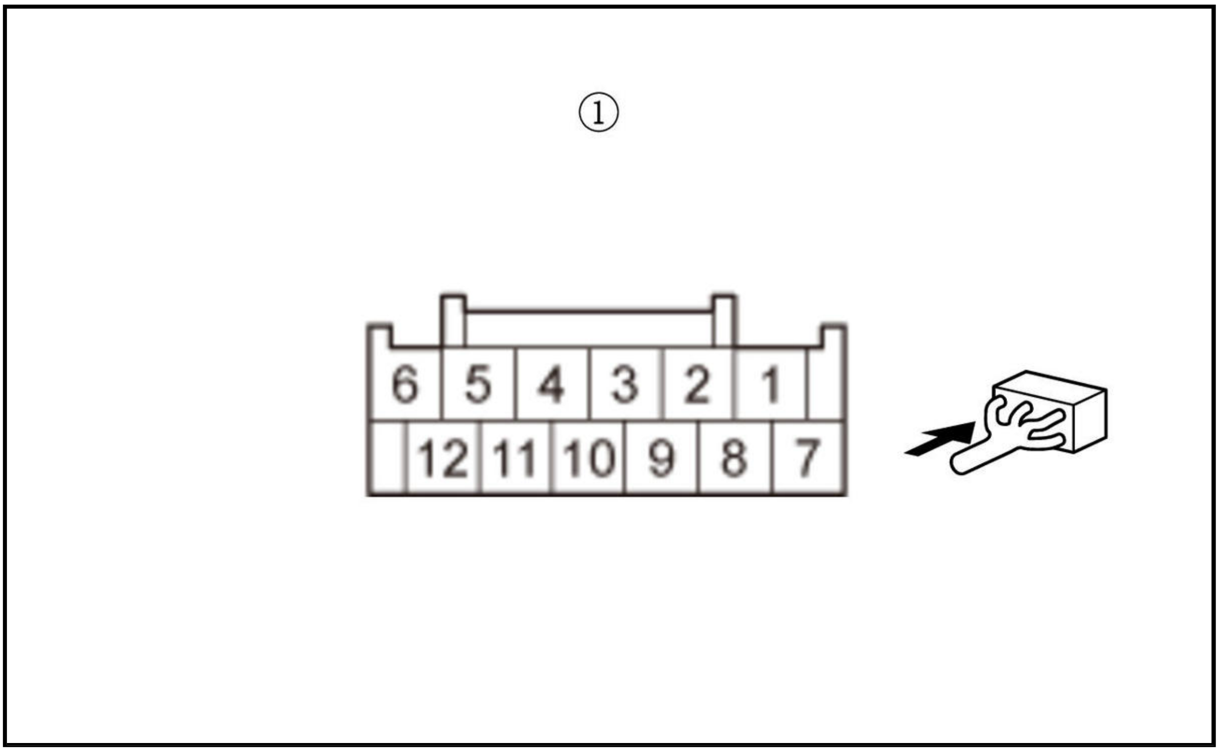
-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 2: ①
Test point 2	Body ground

Test point 1	Electric steering lock 12P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

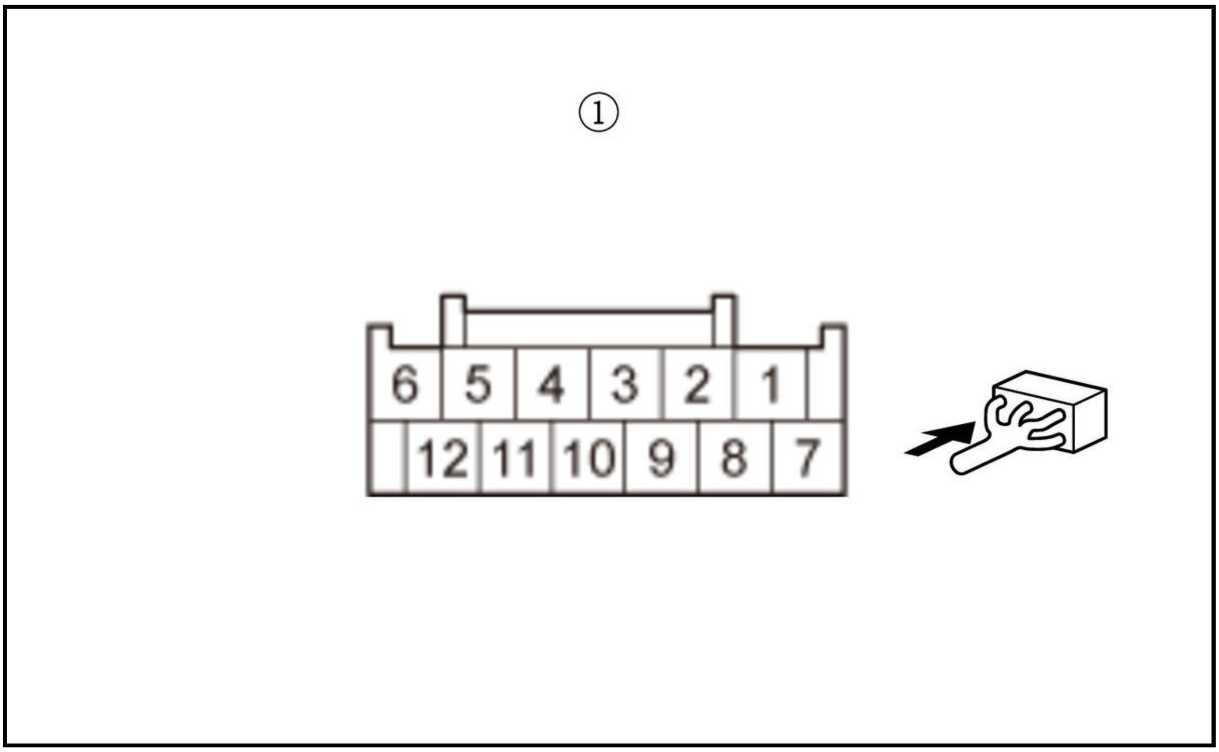
The MTR CUT1(CONT) and MTR CUT2(IG1) wires are not shorted. Go to step 4.

4. Open wire check (MTR CUT1(CONT), MTR CUT2(IG1) lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 6**
Test point 2	Electric steering lock 12P connector (female terminals) No. 2: ①

Test point 1	**Body control module connector G (32P) No. 7**
Test point 2	Electric steering lock 12P connector (female terminals) No. 4: ①



Is there continuity?

YES

The MTR CUT1(CONT) and MTR CUT2(IG1) wires are OK. **Replace the electric steering lock** . If the DTC is still present, **replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B12D0

DTC B12D0 : Power Control Unit IG1A Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D0 Power Control Unit IG1A Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

Do this procedure five times.

- Turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds.
- Turn the vehicle to the ACCESSORY mode and wait for at least 10 seconds.
- Turn the vehicle to the ON mode and wait for at least 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12D0 Power Control Unit IG1A Circuit Error	B

Is DTC B12D0 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12D1

DTC B12D1 : Power Control Unit IG1B Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D1 Power Control Unit IG1B Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

Do this procedure five times.

- Turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds.
- Turn the vehicle to the ACCESSORY mode and wait for at least 10 seconds.
- Turn the vehicle to the ON mode and wait for at least 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12D1 Power Control Unit IG1B Circuit Error	B

Is DTC B12D1 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12D2

DTC B12D2 : Power Control Unit IG2 Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D2 Power Control Unit IG2 Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   Do this procedure five times.

   - Turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds.
   - Turn the vehicle to the ACCESSORY mode and wait for at least 10 seconds.
   - Turn the vehicle to the ON mode and wait for at least 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12D2 Power Control Unit IG2 Circuit Error	B

   Is DTC B12D2 indicated?

   YES

   Replace the body control module .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12D3

DTC B12D3 : Power Control Unit IG Latch Circuit Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12D3 Power Control Unit IG Latch Circuit Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Do this procedure five times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12D3 Power Control Unit IG Latch Circuit Error	B

Is DTC B12D3 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time.

DTC B12E0

DTC B12E0 : Electric Steering Lock Switch Internal Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B12E0 Electric Steering Lock Switch Internal Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12E0 Electric Steering Lock Switch Internal Error	B

Is DTC B12E0 indicated?

YES

Replace the electric steering lock .

NO

Intermittent failure, the system is OK at this time.

DTC B12E1

DTC B12E1 : Electric Steering Lock Motor Internal Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Make sure aftermarket accessories are not installed.

DTC Description	DTC
B12E1 Electric Steering Lock Motor Internal Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12E1 Electric Steering Lock Motor Internal Error	B

Is DTC B12E1 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (+B SMART line)

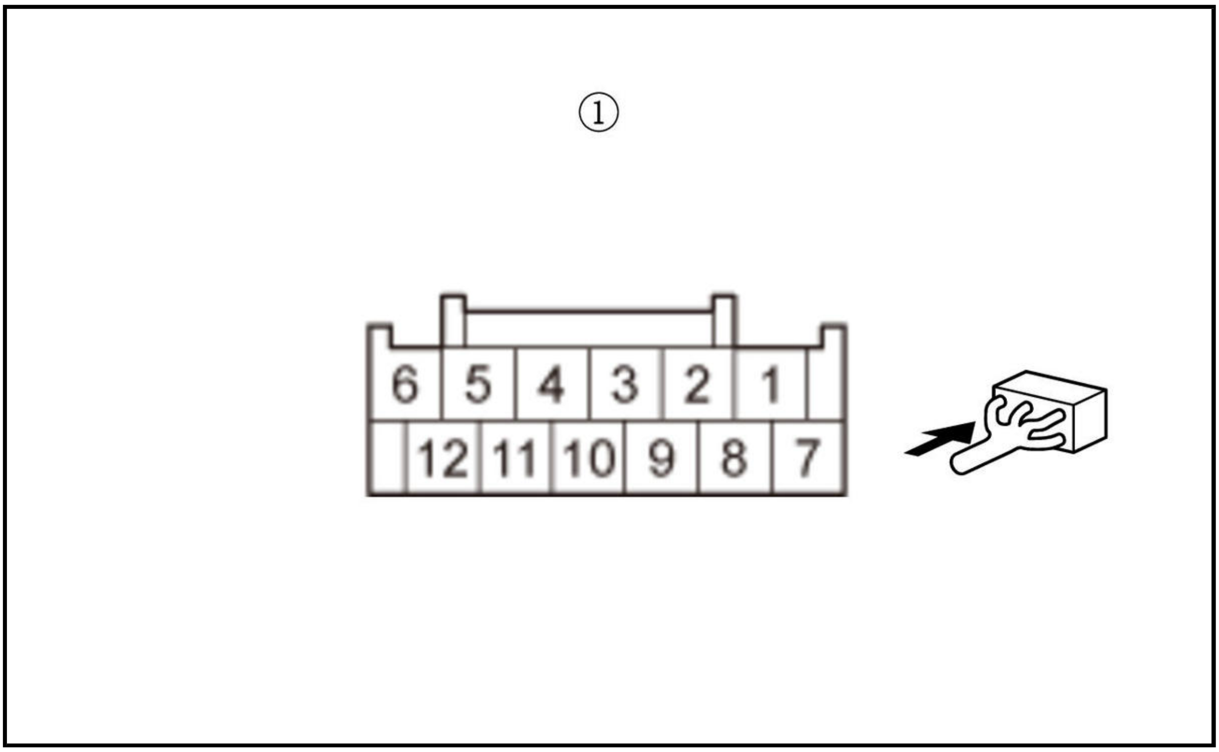
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B SMART wire is OK. Go to step 3.

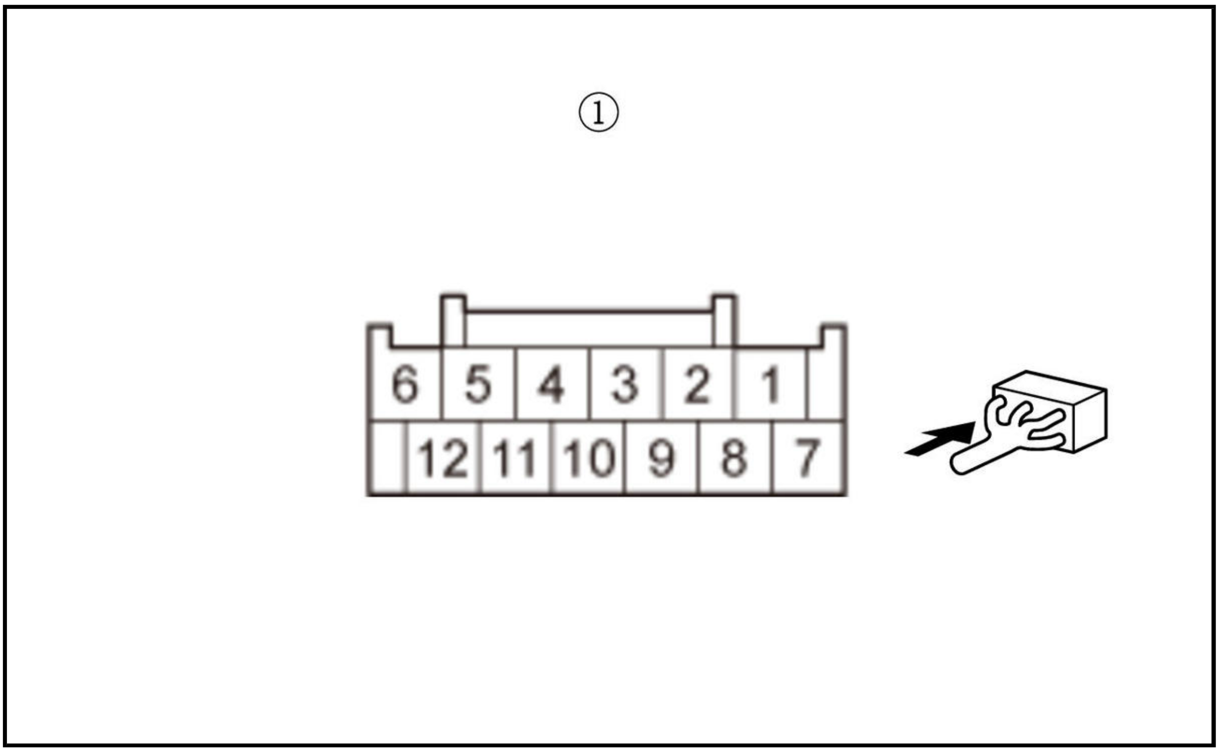
NO

Repair an open or high resistance in the wire.

3. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 4.

NO

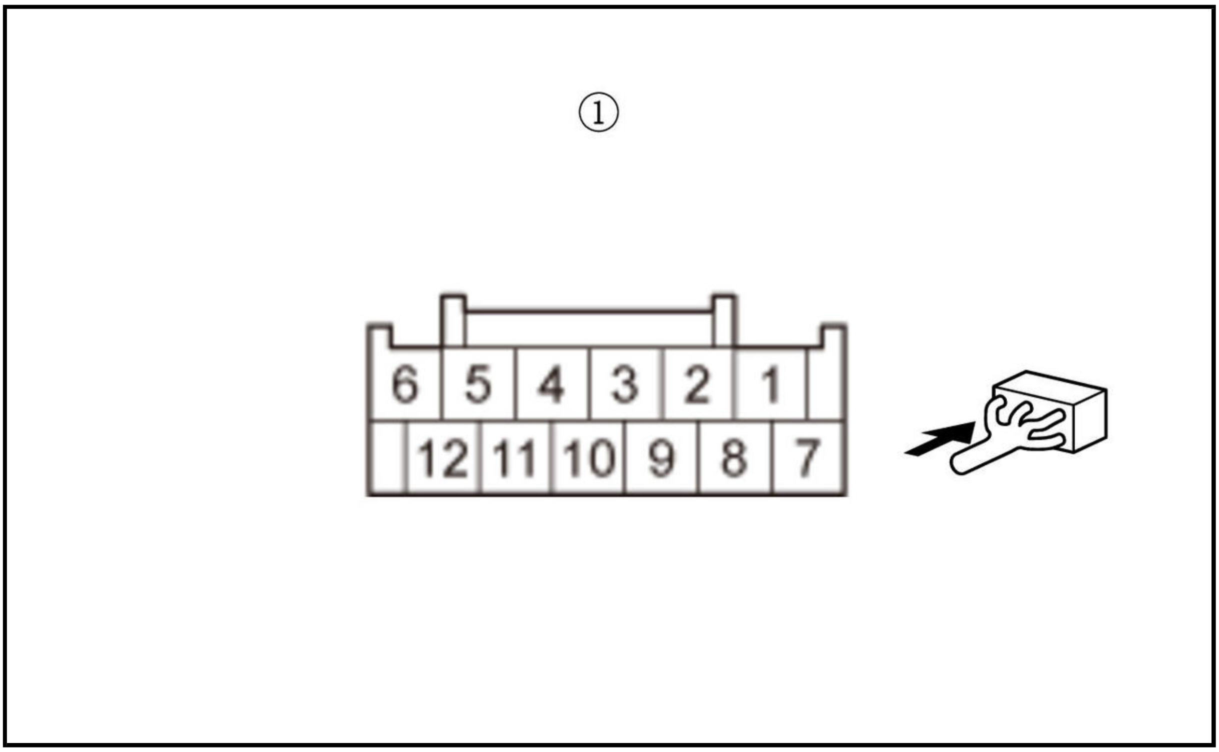
Repair an open or high resistance in the ground wire or poor ground (G401).

4. Open wire check (IG1 FUEL PUMP line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 FUEL PUMP wire is OK. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Open wire check (MTR CONT line)

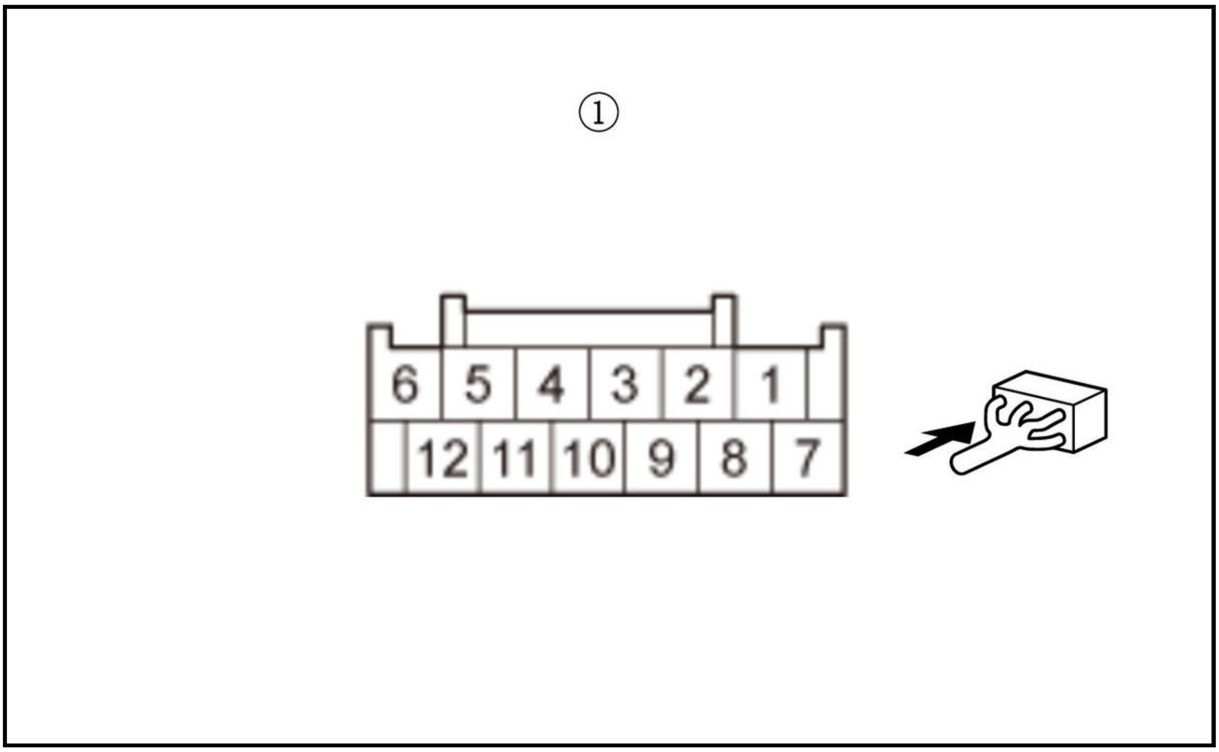
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector F (36P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector F (36P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 1: ①
Test point 2	**Body control module connector F (36P) No. 1**



Is there continuity?

YES

The MTR CONT wire is OK. Go to step 6.

NO

Repair an open or high resistance in the wire.

6. Shorted wire check (MTR CUT1(CONT), MTR CUT2(IG1) lines)

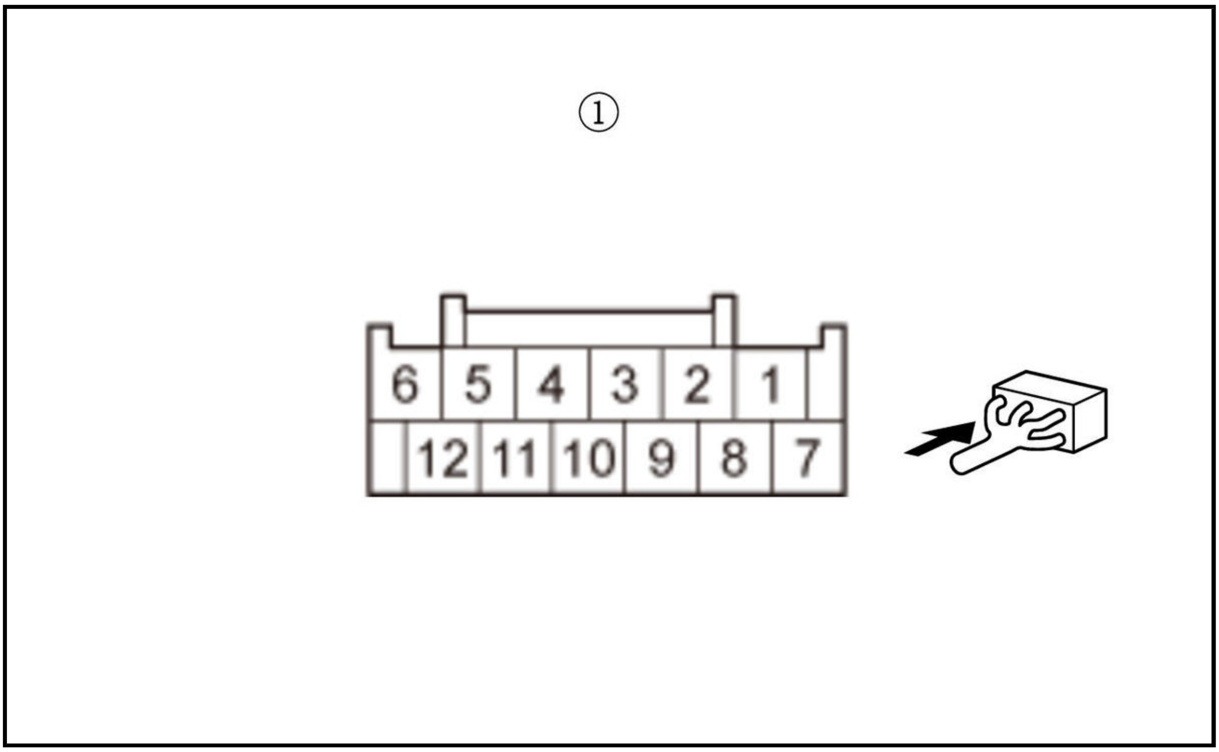
-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector F (36P): disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 2: ①
Test point 2	Body ground

Test point 1	Electric steering lock 12P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

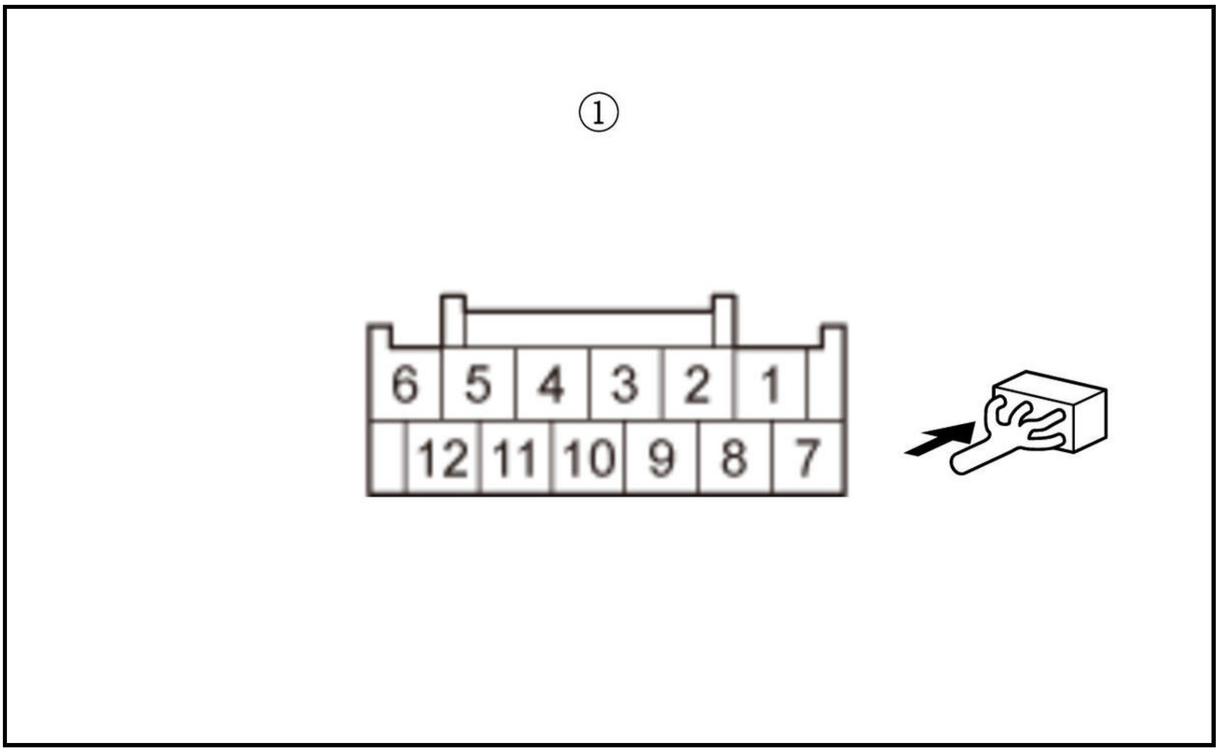
The MTR CUT1(CONT) and MTR CUT2(IG1) wires are not shorted. Go to step 7.

7. Open wire check (MTR CUT1(CONT), MTR CUT2(IG1) lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector F (36P): disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 6**
Test point 2	Electric steering lock 12P connector (female terminals) No. 2: ①

Test point 1	**Body control module connector G (32P) No. 7**
Test point 2	Electric steering lock 12P connector (female terminals) No. 4: ①



Is there continuity?

YES

The MTR CUT1(CONT) and MTR CUT2(IG1) wires are OK. **Replace the electric steering lock** . If the DTC is still present, **replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B12E2

DTC B12E2 : Electric Steering Lock Low Level Failure of MTRCUT1

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B12E2 Electric Steering Lock Low Level Failure of MTRCUT1	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12E2 Electric Steering Lock Low Level Failure of MTRCUT1	B

Is DTC B12E2 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (+B SMART line)

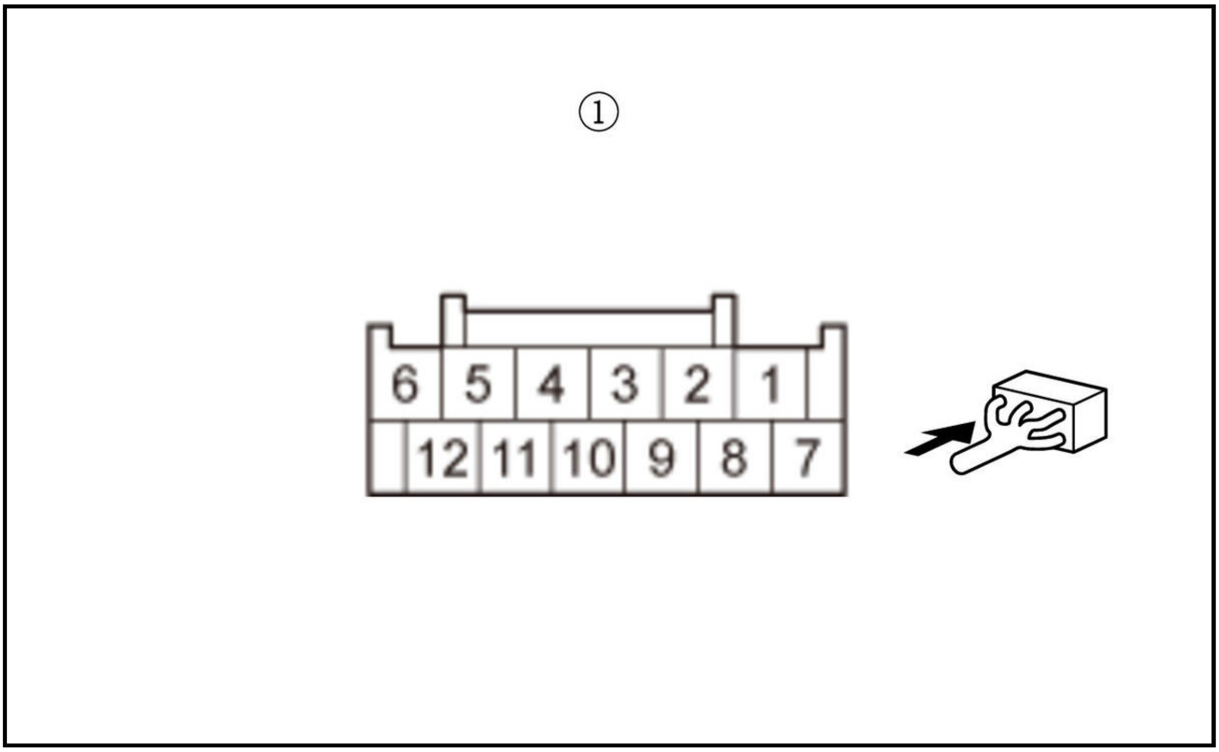
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B SMART wire is OK. Go to step 3.

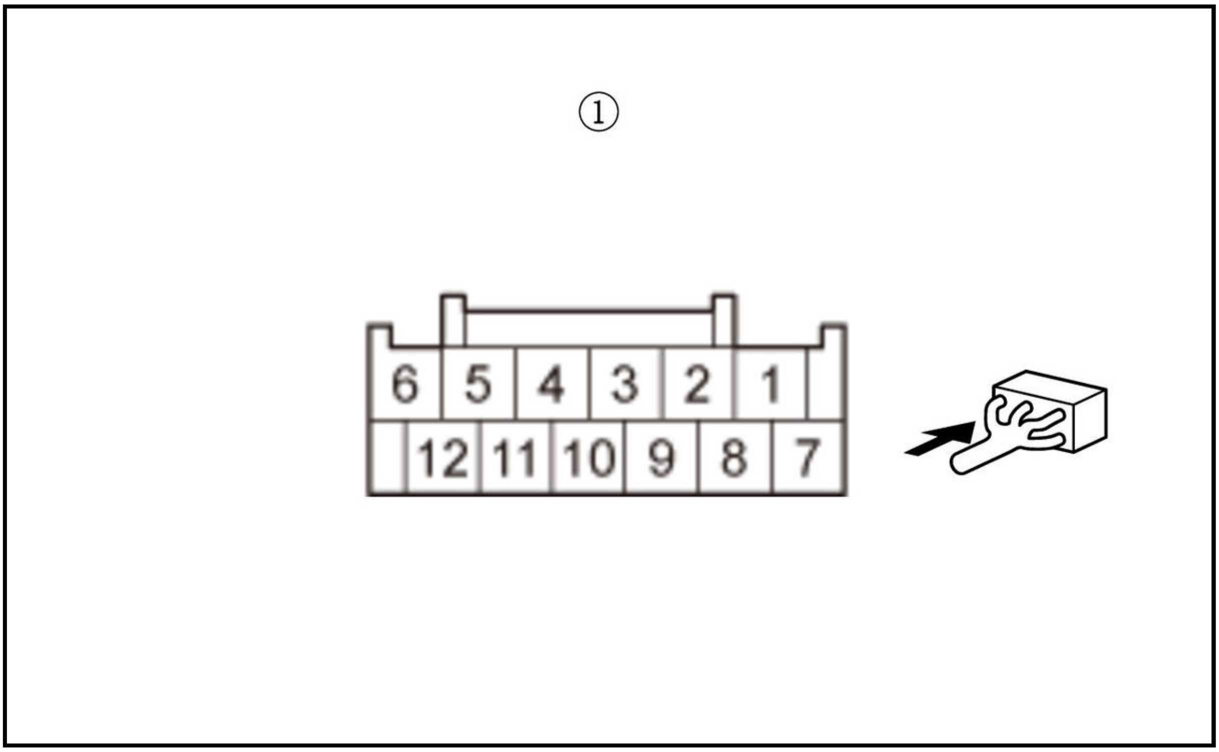
NO

Repair an open or high resistance in the wire.

3. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 4.

NO

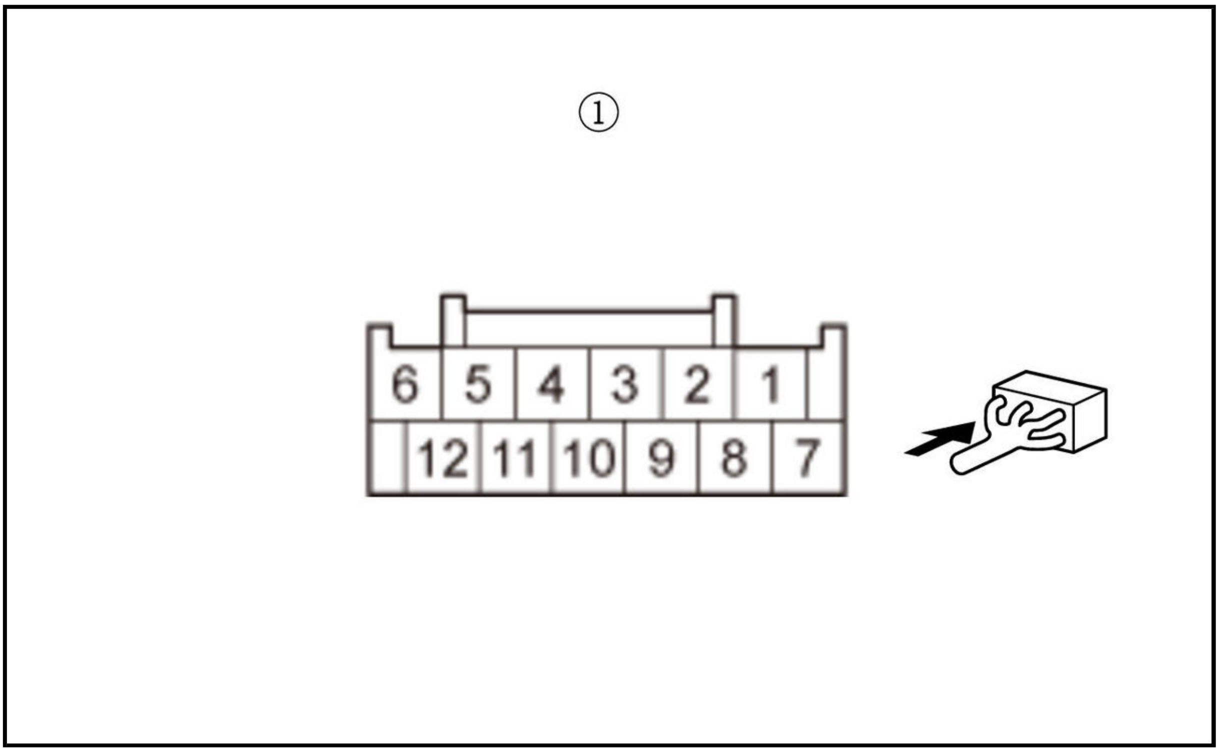
Repair an open or high resistance in the ground wire or poor ground (G401).

4. Open wire check (IG1 FUEL PUMP line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 FUEL PUMP wire is OK. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Open wire check (MTR CONT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

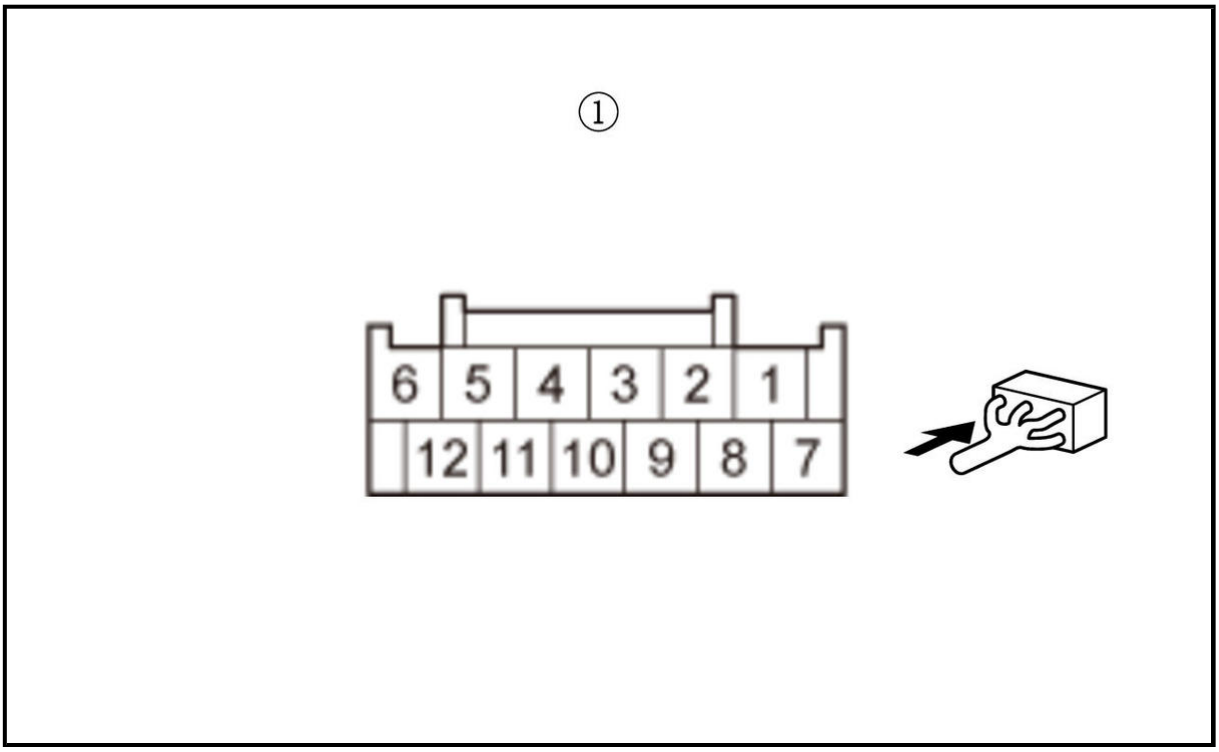
-2. Disconnect the following connector.

Body control module connector F (36P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector F (36P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 1: ①

Test point 2	**Body control module connector F (36P) No. 1**



Is there continuity?

YES

The MTR CONT wire is OK. Go to step 6.

NO

Repair an open or high resistance in the wire.

6. Shorted wire check (MTR CUT1(CONT), MTR CUT2(IG1) lines)

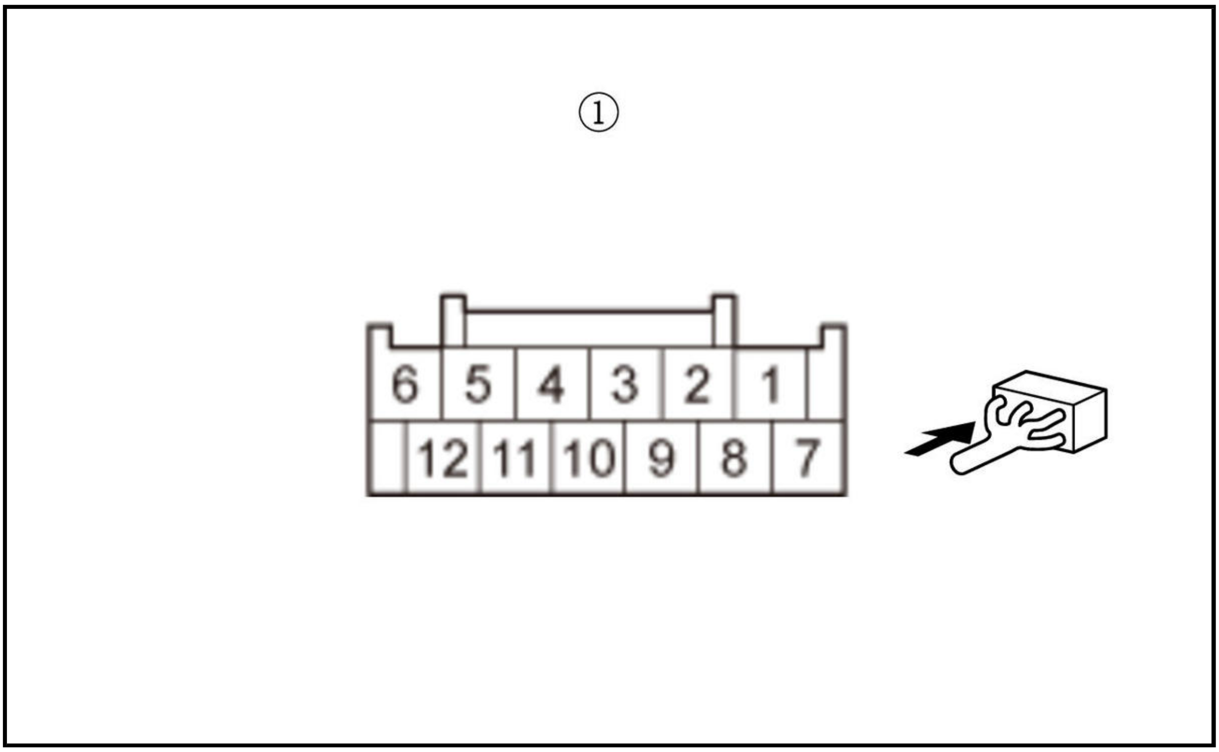
-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector F (36P): disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 2: ①
Test point 2	Body ground

Test point 1	Electric steering lock 12P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

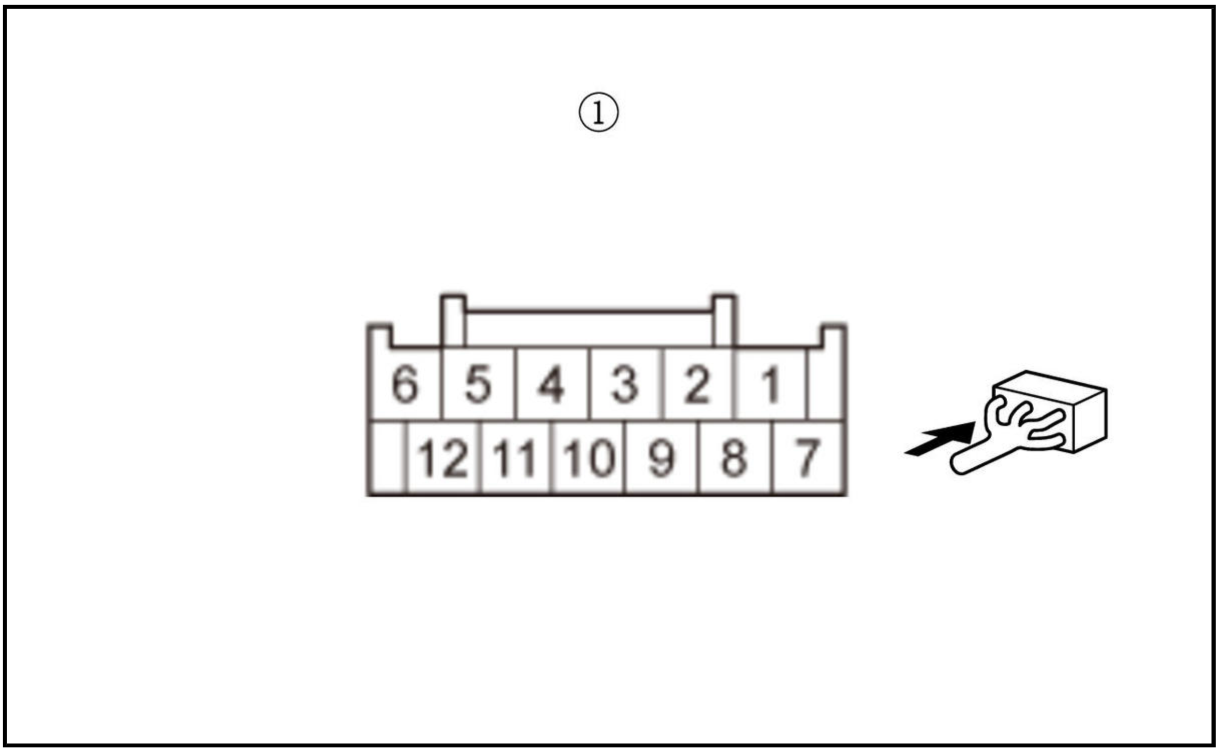
The MTR CUT1(CONT) and MTR CUT2(IG1) wires are not shorted. Go to step 7.

7. Open wire check (MTR CUT1(CONT), MTR CUT2(IG1) lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector F (36P): disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 6**
Test point 2	Electric steering lock 12P connector (female terminals) No. 2: ①

Test point 1	**Body control module connector G (32P) No. 7**
Test point 2	Electric steering lock 12P connector (female terminals) No. 4: ①



Is there continuity?

YES

The MTR CUT1(CONT) and MTR CUT2(IG1) wires are OK. **Replace the electric steering lock** . If the DTC is still present, **replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B12E3

DTC B12E3 : Electric Steering Lock High Level Failure of MTRCUT1

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B12E3 Electric Steering Lock High Level Failure of MTRCUT1	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12E3 Electric Steering Lock High Level Failure of MTRCUT1	B

Is DTC B12E3 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (GND line)

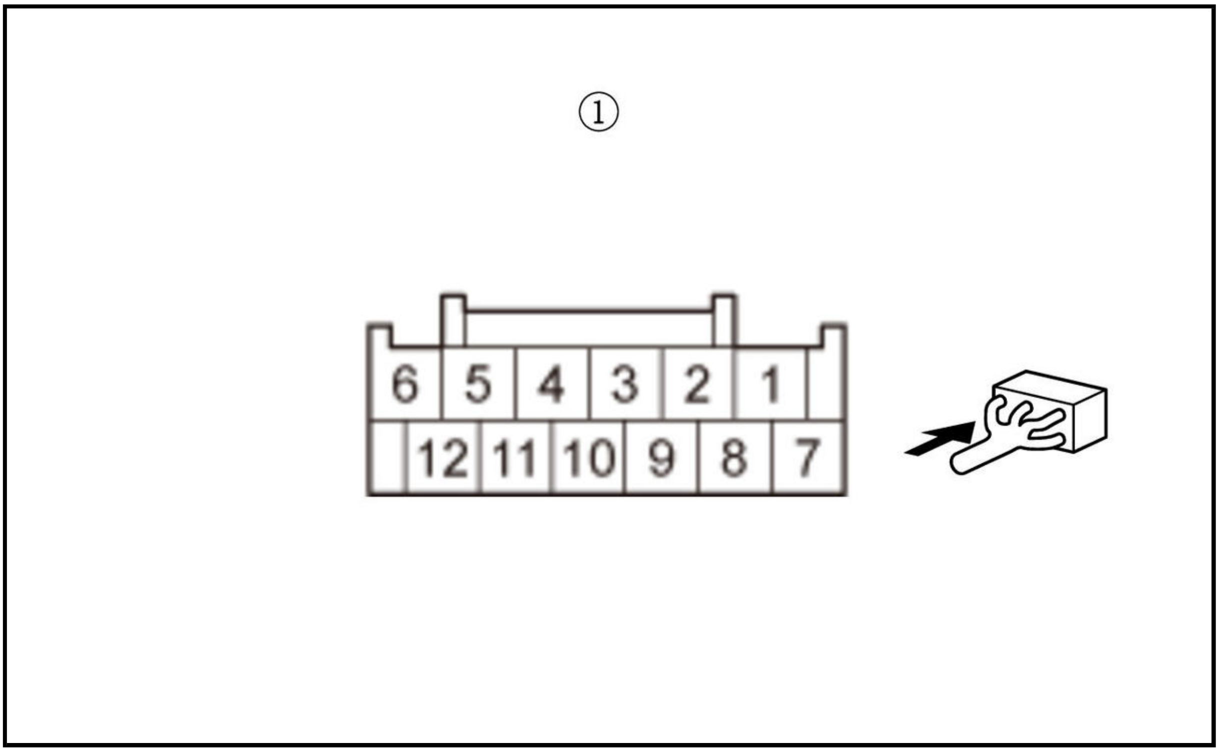
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 3.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

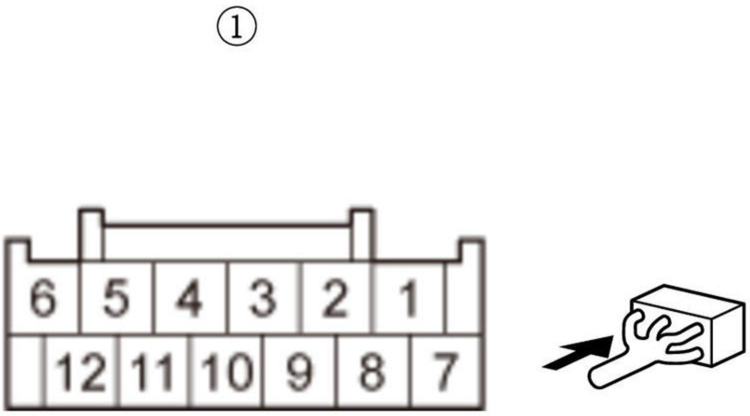
3. Open wire check (MTR CUT1(CONT) line)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 2: ①
Test point 2	**Body control module connector G (32P) No. 6**



Is there continuity?

YES

The MTR CUT1(CONT) wire is OK. **Replace the electric steering lock** . If the DTC is still present, **replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B12E4

DTC B12E4 : Electric Steering Lock High Level Failure of MTRCUT2

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B12E4 Electric Steering Lock High Level Failure of MTRCUT2	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12E4 Electric Steering Lock High Level Failure of MTRCUT2	B

Is DTC B12E4 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (GND line)

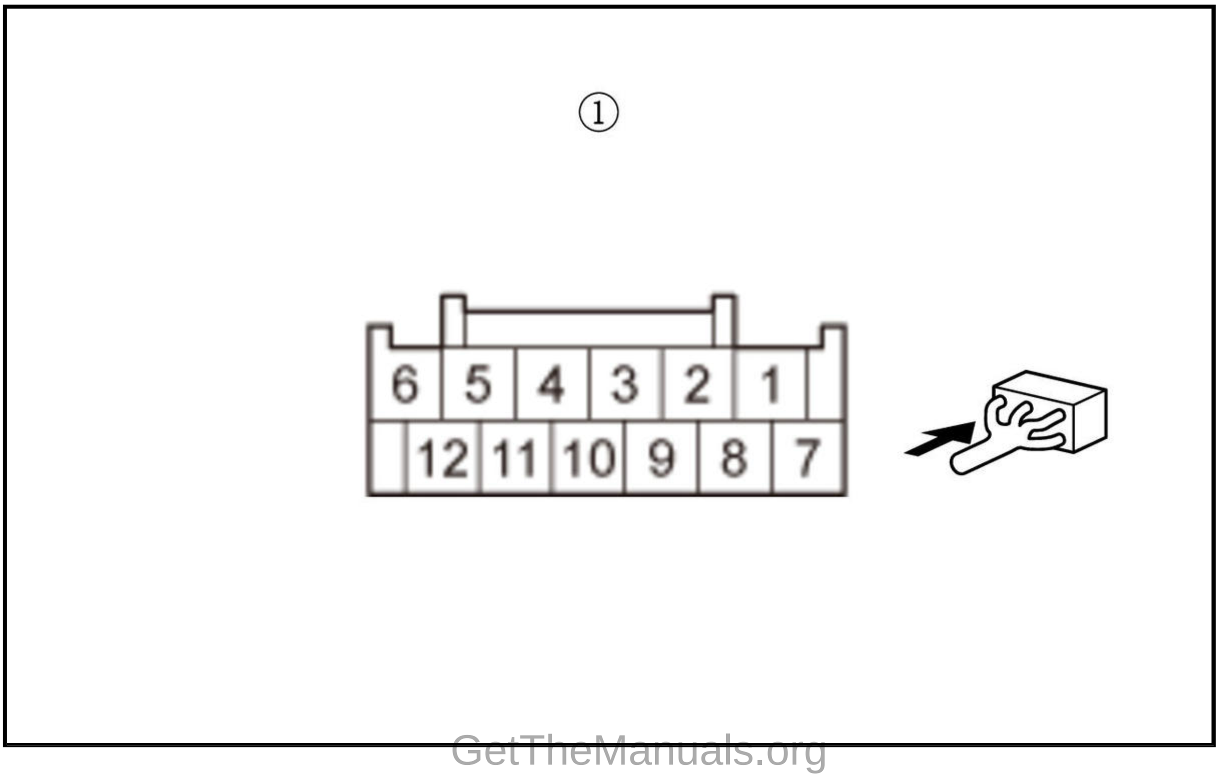
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 3.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

3. Open wire check (MTR CUT2(IG1) line)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 4: ①
Test point 2	**Body control module connector G (32P) No. 7**

Is there continuity?

YES

The MTR CUT2(IG1) wire is OK. **Replace the electric steering lock** . If the DTC is still present, **replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B12E5

DTC B12E5 : Incorrect assembly of control unit for electric steering lock equipped vehicle

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B12E5 Incorrect assembly of control unit for electric steering lock equipped vehicle	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Select model on the HDS screen.

-2. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the engine start/stop switch for at least 2 minutes. This selects the forced ON mode.

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Press the engine start/stop switch.

-6. Select model on the HDS screen.

-7. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the engine start/stop switch for at least 2 minutes. This selects the forced ON mode.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B12E5 Incorrect assembly of control unit for electric steering lock equipped vehicle	B

Is DTC B12E5 indicated?

YES

Incorrect assembly of control unit for electric steering lock equipped vehicle. **Replace it with the correct body control module** .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B12F0

DTC B12F0 : Power Control Unit Lost Communication with Electric Steering Lock

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B12F0 Power Control Unit Lost Communication with Electric Steering Lock	B

DTC (Keyless Access Power Control Unit)

1. Problem verification 1

-1. Clear the DTCs with the HDS.

-2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B12F0 Power Control Unit Lost Communication with Electric Steering Lock	B

Is DTC B12F0 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (+B SMART line)

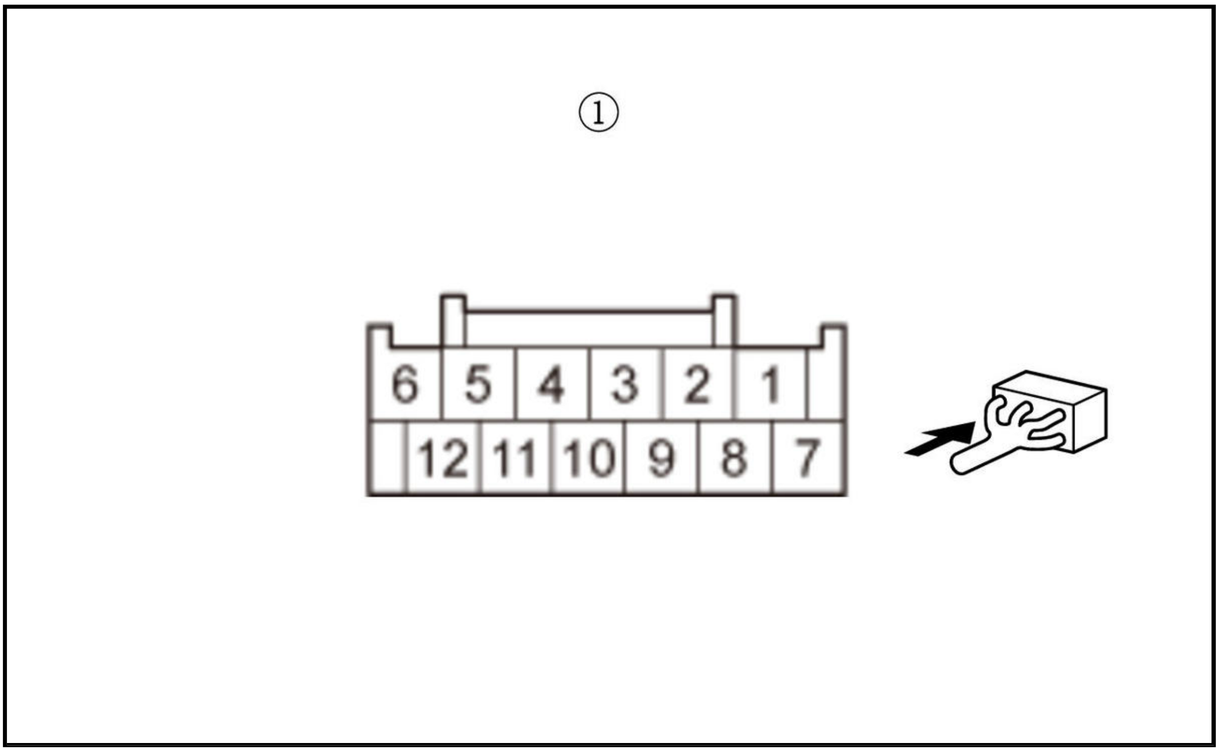
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric steering lock 12P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B SMART wire is OK. Go to step 3.

NO

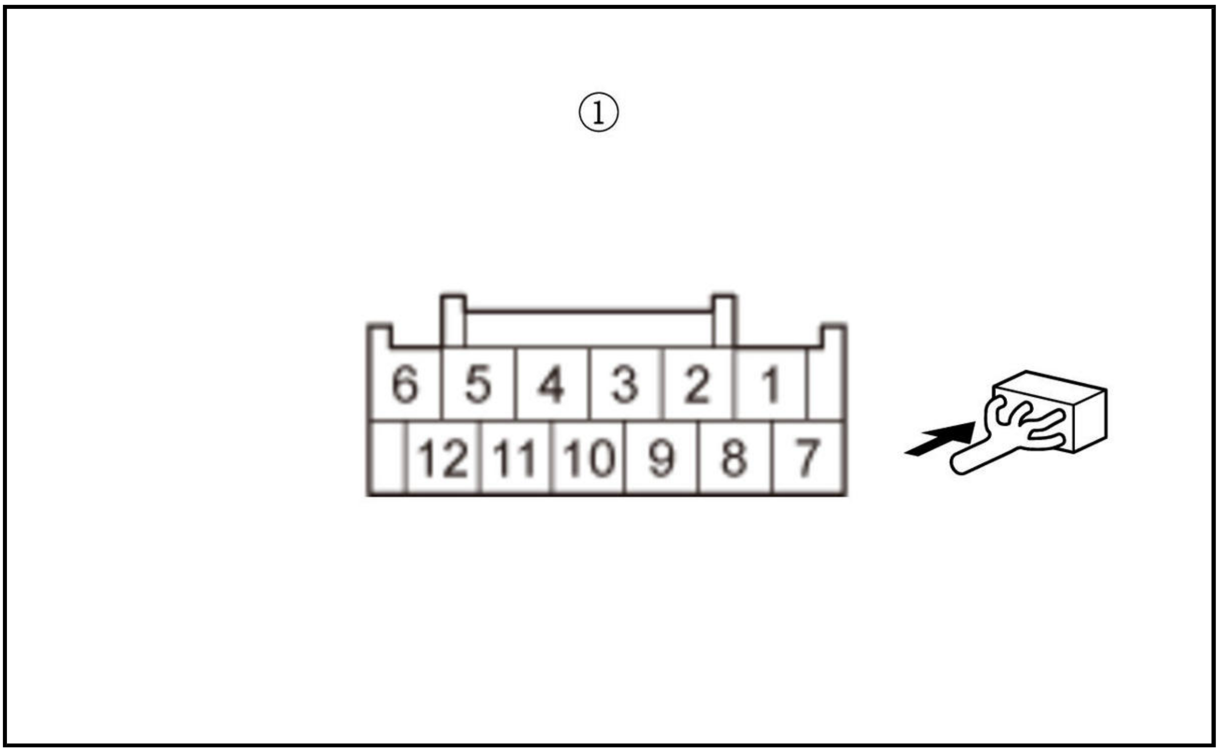
Repair an open or high resistance in the wire.

3. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 7: ①

Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 4.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

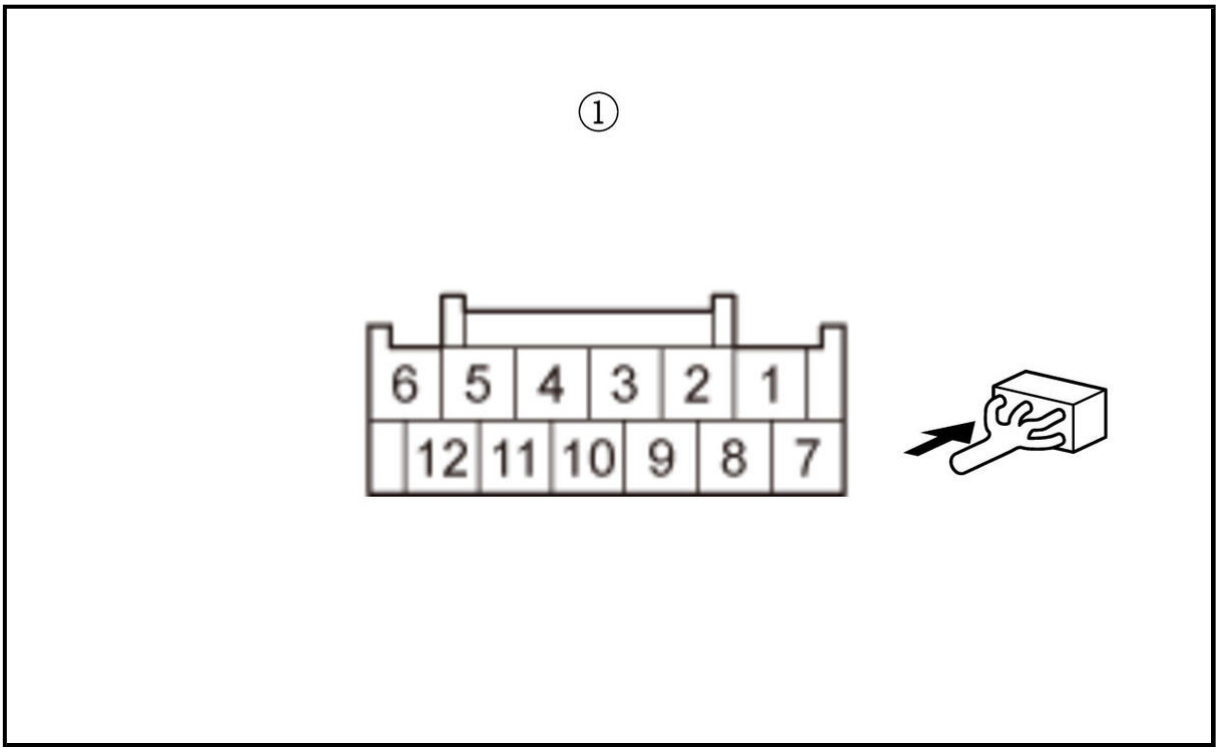
4. Shorted wire check (IGN TRX line)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

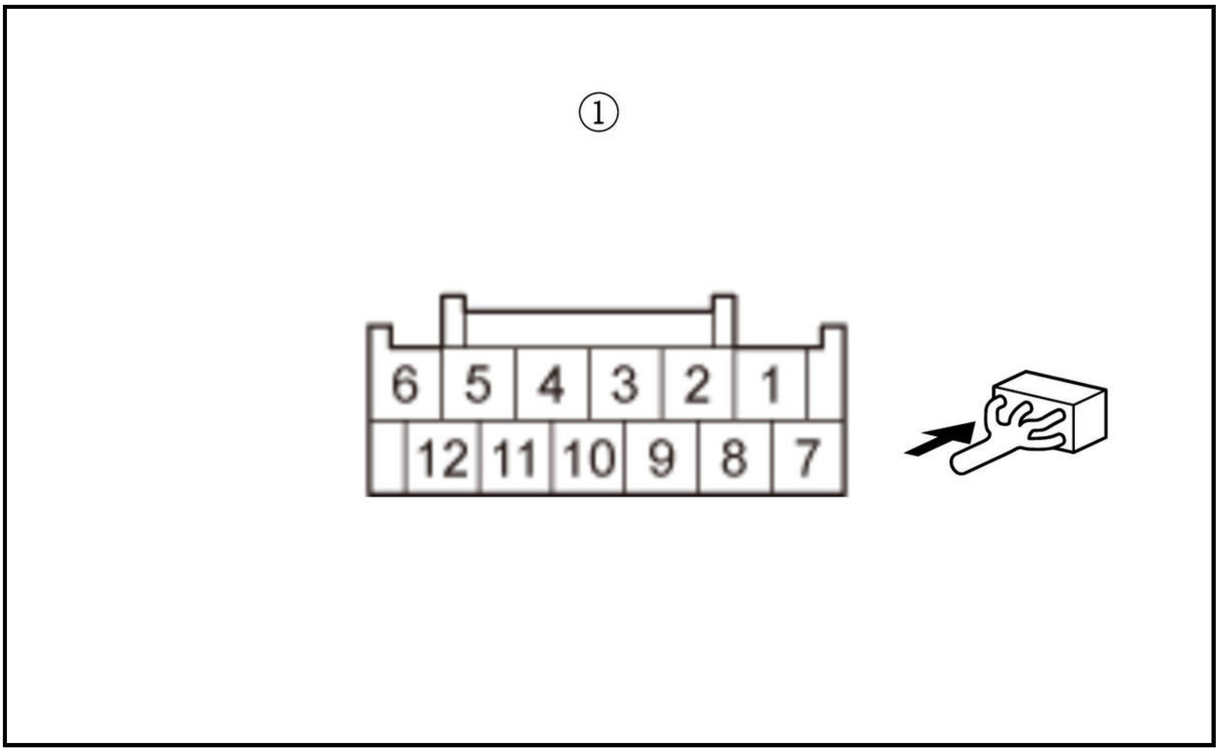
NO

The IGN TRX wire is not shorted. Go to step 5.

5. Open wire check (IGN TRX line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric steering lock 12P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Electric steering lock 12P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector G (32P) No. 28**



Is there continuity?

YES

The IGN TRX wire is OK. Go to step 6.

NO

Repair an open or high resistance in the wire.

6. Keyless access system check:

Reconnect these items:

- Electric steering lock 12P connector
- Body control module connector G (32P)

-2. With driver's power window open, turn the vehicle to the OFF (LOCK) mode.

-3. **Do the 12 volt battery terminal disconnection procedure** .

-4. Wait for at least 10 seconds to clear the DTCs.

-5. **Do the 12 volt battery terminal reconnection procedure** .

-6. Turn the vehicle to the ON mode then the OFF (LOCK) mode.

-7. Remove all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

-8. Close all doors, then press the engine start/stop switch.

-9. The keyless remotes bring to the vehicle inside, during close all doors.

-10.

Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you.

-11.

Press the engine start/stop switch, and turn the vehicle to the ON mode.

Does the mode change to ON?

YES

Go to step 7.

NO

Go to step 8.

7. Problem verification 2

   -1. Clear the DTCs with the HDS.

   -2. Do this procedure ten times: Press the engine start/stop switch to select the OFF (LOCK), ACCESSORY, ON, and OFF (LOCK) mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B12F0 Power Control Unit Lost Communication with Electric Steering Lock	B

   Is DTC B12F0 indicated?

   YES

   Replace the electric steering lock .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

8. Electric steering lock communication status check

   -1. Select COMMUNICATION STATUS in the INSPECTION MENU with the HDS.

   One-Push - KEYLESS ACCESS CONTROL UNIT - STATUS LOG

   Check the value of STATUS with ELECTRICAL STEERING LOCK, STATUS with KEYLESS ACCESS CONTROL UNIT, and STATUS with BACKUP CONTROL UNIT with the HDS.

   One-Push - BACKUP CONTROL UNIT - STATUS LOG

B	HDS Description	Value
Status with ESL	MTR CUT1 (Cont) Status	1
	MTR CUT2 (IG) Status	1
	IG1 Input State of ESL	1
	MTRCONT Status of ESL	1
	ESL Motor Status	1
	Switch D detection for Unlock Status	1
	Switch C detection for Unlock Status	1
	Switch B detection for Unlock Status	1
Status with KEYLESS ACCESS CONTROL UNIT	FOB KEY Authentication Result	1

B	HDS Description	Value
Status with BACKUP CONTROL UNIT	FOB KEY Authentication Result	1

NOTE: The parameters are displayed only when the vehicle cannot be turned to the ON mode.

Are only Status with ELECTRICAL STEERING LOCK 1 values indicated?

YES

Replace the electric steering lock .

NO

Replace the body control module .

DTC U0073 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U0073 : F-CAN Communication Bus Line Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U0073 F-CAN Communication Bus Line Error	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0073 F-CAN Communication Bus Line Error	B

   Is DTC U0073 indicated?

   YES: with CAN gateway

   Go to the troubleshooting for CAN gateway system DTC(s) .

   YES: without CAN gateway

   Go to F-CAN Circuit Troubleshooting .

   NO

   Intermittent failure, the system is OK at this time.

DTC U0100, U0122 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U0100 : Power Control Unit Lost Communication with PCM

DTC U0122: Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0100 Power Control Unit Lost Communication with PCM	B
U0122 Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0100 Power Control Unit Lost Communication with PCM	B
U0122 Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	B

   Are any DTCs indicated?

   YES: with CAN gateway

   Go to step 2.

   YES: without CAN gateway

   Go to step 8.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the body control module detect the CAN gateway Bus channels A?

Bus A is Not Available

Go to step 4.

Bus A is Available

Go to step 5.

4. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type) Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected Body control module connector B (36P): disconnected
Test point 1	CAN gateway 12P connector (female terminals) (12P connector type) No. 3: ① CAN gateway 16P connector (female terminals) (16P connector type) No. 3: ②
Test point 2	**Body control module connector B (36P) No. 22**

Test point 1	CAN gateway 12P connector (female terminals) (12P connector type) No. 9: ① CAN gateway 16P connector (female terminals) (16P connector type) No. 11: ②
Test point 2	**Body control module connector B (36P) No. 23**

Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. **Replace the body control module** .

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100	PCM	A, B
U0122	VSA modulator-control unit	A, B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 6.

U0100: PCM is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus A

Go to step 6.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type)CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

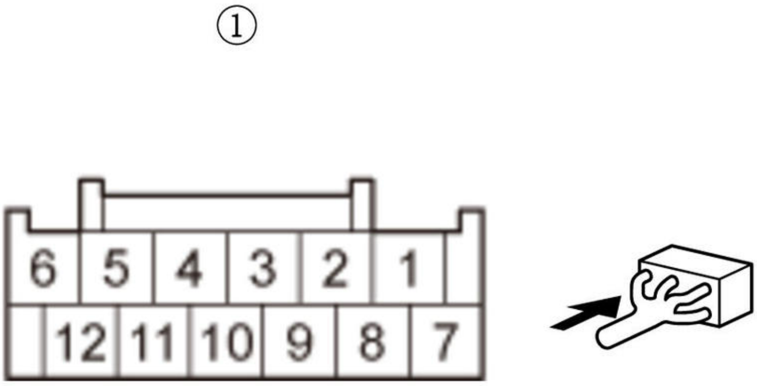
Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

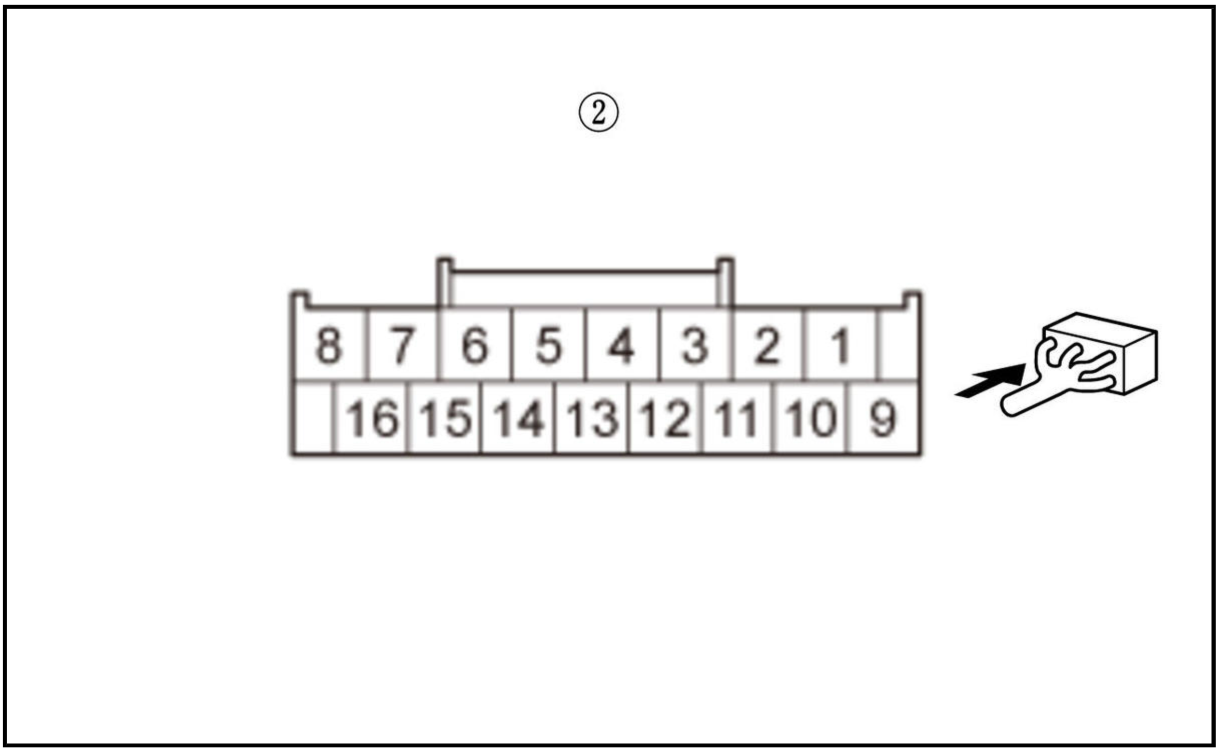
CAN gateway 12P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 9		No. 36
U0122	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 9		No. 28

CAN gateway 16P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 16P connector (female terminals): ②	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0122	F-CAN A_H	CAN gateway 16P connector (female terminals): ②	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 11		No. 28





Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0122	**VSA modulator-control unit**

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type)CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected

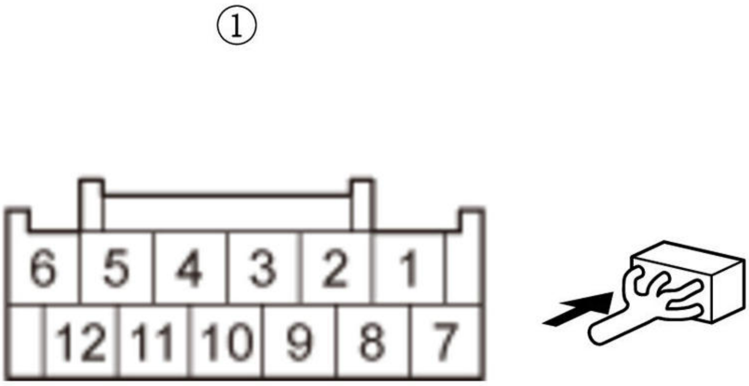
	Transmitting control unit connector(s) for indicated DTCs: disconnected

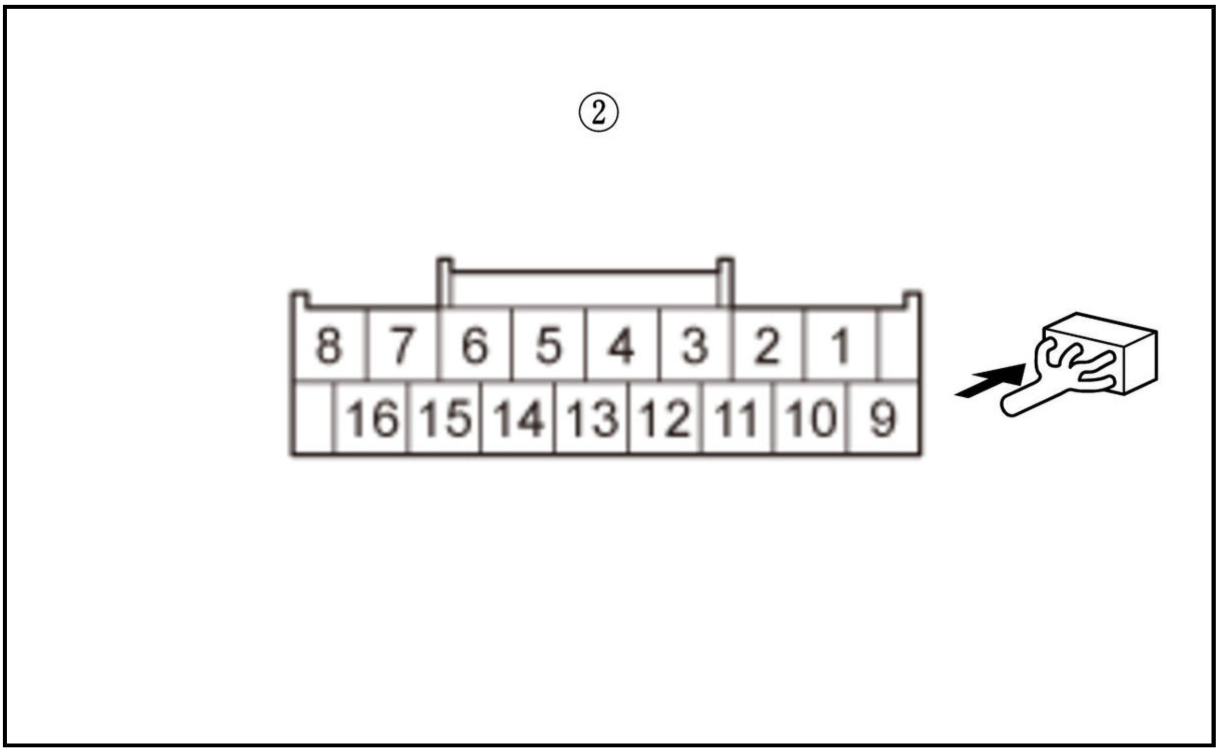
CAN gateway 12P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	PCM connector A (50P)	No. 39
	F-CAN B_L		No. 5		No. 38
U0122	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	VSA modulator-control unit 46P connector	No. 46
	F-CAN B_L		No. 5		No. 34

CAN gateway 16P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN B_H	CAN gateway 16P connector (female terminals): ②	No. 6	PCM connector A (50P)	No. 39
	F-CAN B_L		No. 14		No. 38
U0122	F-CAN B_H	CAN gateway 16P connector (female terminals): ②	No. 6	VSA modulator-control unit 46P connector	No. 46
	F-CAN B_L		No. 14		No. 34





Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK.According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0122	**VSA modulator-control unit**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN_H line, F-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector B (36P)

-3. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-4. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0100	PCM connector A (51P)
U0122	VSA modulator-control unit 46P connector

-5. Measure the resistance between the receiving control unit and the transmitting control unit on the F-CAN_H circuit and the F-CAN_L circuit.

Test condition	Receiving control unit connector(s): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN_H	Body control module connector B (36P)	No. 22	PCM connector A (51P)	No. 2
	F-CAN_L		No. 23		No. 1
U0122	F-CAN_H	Body control module connector B (36P)	No. 22	VSA modulator-control unit 46P connector	No. 40
	F-CAN_L		No. 23		No. 28

Is there 1.0 Ω or less?

YES

The F-CAN_H wire and the F-CAN_L wire are OK. Refer to the DTC shown on the display, replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0100	PCM
U0122	VSA modulator-control unit

NO

Repair an open in the F-CAN_H wire and/or the F-CAN_L wire.

DTC U1280 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281 (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U1281 : Power Control Unit Lost Communication with MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1281 Power Control Unit Lost Communication with MICU	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Power Control Unit Lost Communication with MICU	B

Is DTC U1281 indicated?

YES

Replace the body control module .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U128D (KEYLESS ACCESS POWER CONTROL UNIT)

DTC U128D : Power Control Unit Lost Communication with Gauge Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D Power Control Unit Lost Communication with Gauge Control Module	B

DTC (Keyless Access Power Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U128D Power Control Unit Lost Communication with Gauge Control Module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	**Body control module connector B (36P)**	No. 20	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 21		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U128D	**Gauge control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

REMOVAL & INSTALLATION TEST

LANEWATCH SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

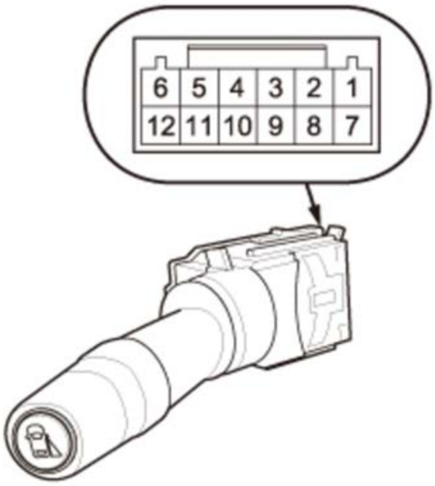
SRS components are located in this area. Review the SRS component locations , and the precautions and procedures before doing repairs or service.

1. Combination Light Switch - Remove
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. LaneWatch Switch - Test



Terminal / Position	3	4
PRESSED	○	○
RELEASED		

1. Check for continuity between the combination light switch 12P connector (male terminals) terminals in each switch position according to the table in illustration.
   - If the continuity is not as specified, replace the combination light switch .

REMOVAL AND INSTALLATION

BSI RADAR UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Rear Bumper - Remove
2. BSI Radar Unit - Remove

 This illustration shows the left side of the vehicle. The right side is symmetrical.	1. Disconnect the BSI radar unit connector (A). 2. Remove the BSI radar unit assembly (B).
 	3. If necessary, remove the BSI radar unit (A) from the bracket (B).

3. All Removed Parts - Install

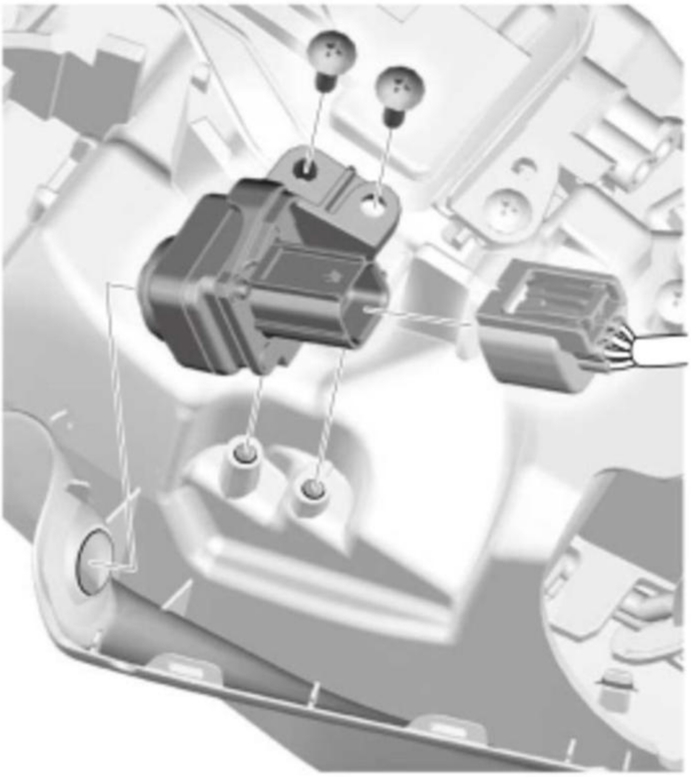
    1. Install the parts in the reverse order of removal.

4. BSI Radar Unit Aiming - Inspect
5. Rear Bumper - Install

LANEWATCH CAMERA REMOVAL AND INSTALLATION

Removal and Installation

1. Passenger's Side Mirror Housing Lower Cover - Remove
2. LaneWatch Camera - Remove



3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **LaneWatch Camera - Aim**

DESCRIPTION AND OPERATION

BLIND SPOT INFORMATION (BSI) SYSTEM DESCRIPTION

The Blind Spot Information (BSI) radar unit emits radar waves from the left and right BSI radar and detects other vehicles in the blind spot. BSI system function uses the BSI radar unit. The BSI alert indicators warn the driver when a vehicle enters the driver's side or the passenger's side blind spot alert zone. If the driver turns on the turn signal while the BSI alert is on, the BSI alert flashes and an audible alarm sounds to warn the driver.

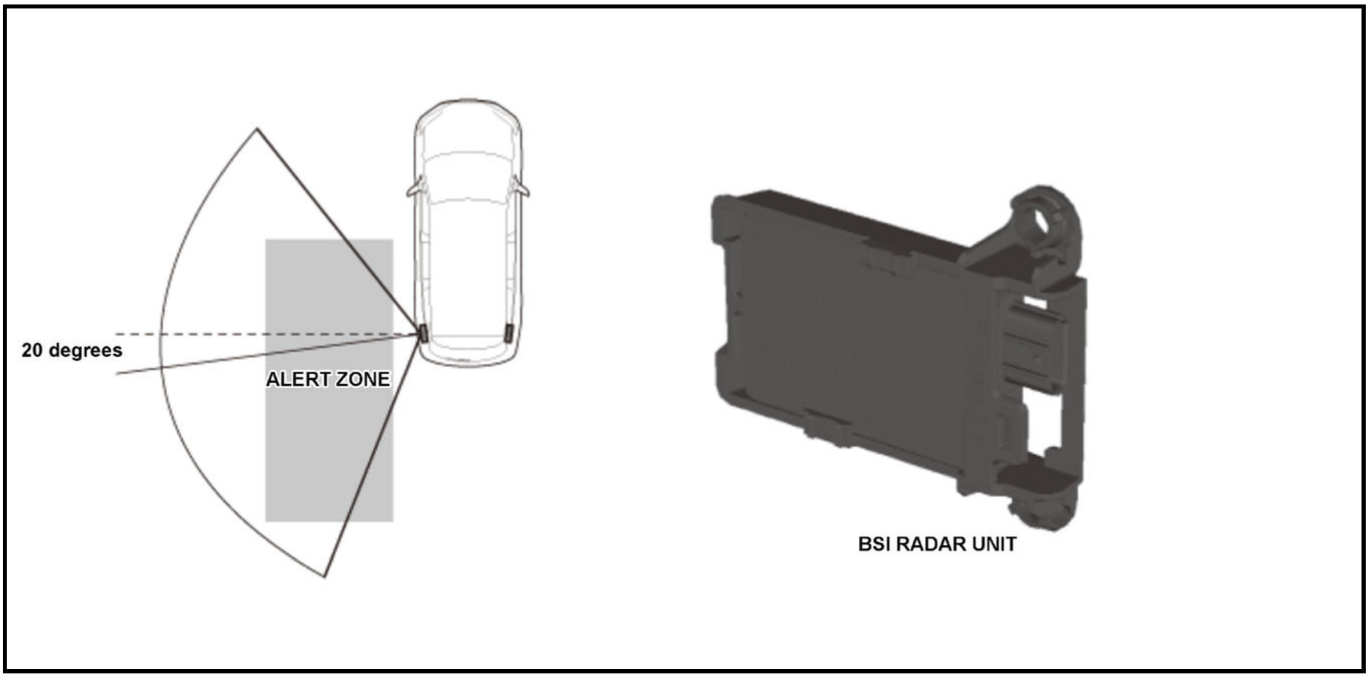
If the BSI radar unit malfunctions, the BSI system stops operating. The vehicle alerts the driver that there is a problem by turning on a warning indicator on the gauge control module.

Radar Zone Definition

The BSI radars are installed on the left and right sides of the rear body panel and covered by the bumper. The mounting positions are symmetrical on the left and the right.

BSI System

The radar wave emission range and the vehicle detection range of the BSI radar unit are shown. They are symmetrical. The alert zone makes up only a part of the radar detection range.



Blind Spot Information (BSI) system

The BSI system alerts the driver by the BSI alert indicator when a vehicle enters the blind spot alert zone. See Warn Conditions for more information.

Warning Conditions

Under normal conditions, the BSI system generally does not alert stationary objects like highway infrastructure, guardrails, posts, walls, foliage, parked cars, etc. The system also doesn't notify when vehicles are traveling in the opposite direction.

B	Vehicle operation speed:	Relative speed: Less than
Pass from rear	20-99 mph (32-160 km/h)	31 mph (50 km/h)

B	Vehicle operation speed:	Relative speed: Less than

Turn signal switch signal

CROSS TRAFFIC MONITOR SYSTEM DESCRIPTION

The Blind Spot Information (BSI) radar unit emits radar waves from the left and right BSI radar and detects other vehicles in the blind spot. Cross Traffic Monitor system function uses the BSI radar unit.

The cross traffic monitor system's alerting arrows are displayed on the rearview camera image of the center display unit when the vehicle is in reverse. When an approaching vehicle enters the cross traffic monitor alert zone, the cross traffic monitor warns the driver with a warning indicator and an audible alarm.

If the BSI radar unit malfunctions, the cross traffic monitor system stops operating. The vehicle alerts the driver that there is a problem by turning on the BSI indicator on the gauge control module, and the cross traffic monitor indicator is shown on the rearview camera image when the vehicle is in reverse gear.

Radar Zone Definition

The BSI radars are installed on the left and right sides of the rear body panel and covered by the bumper. The mounting positions are symmetrical on the left and the right.

Cross Traffic Monitor System

When the BSI radar has a clear view of the environment around it, the cross traffic monitor system will warn to approaching vehicles.

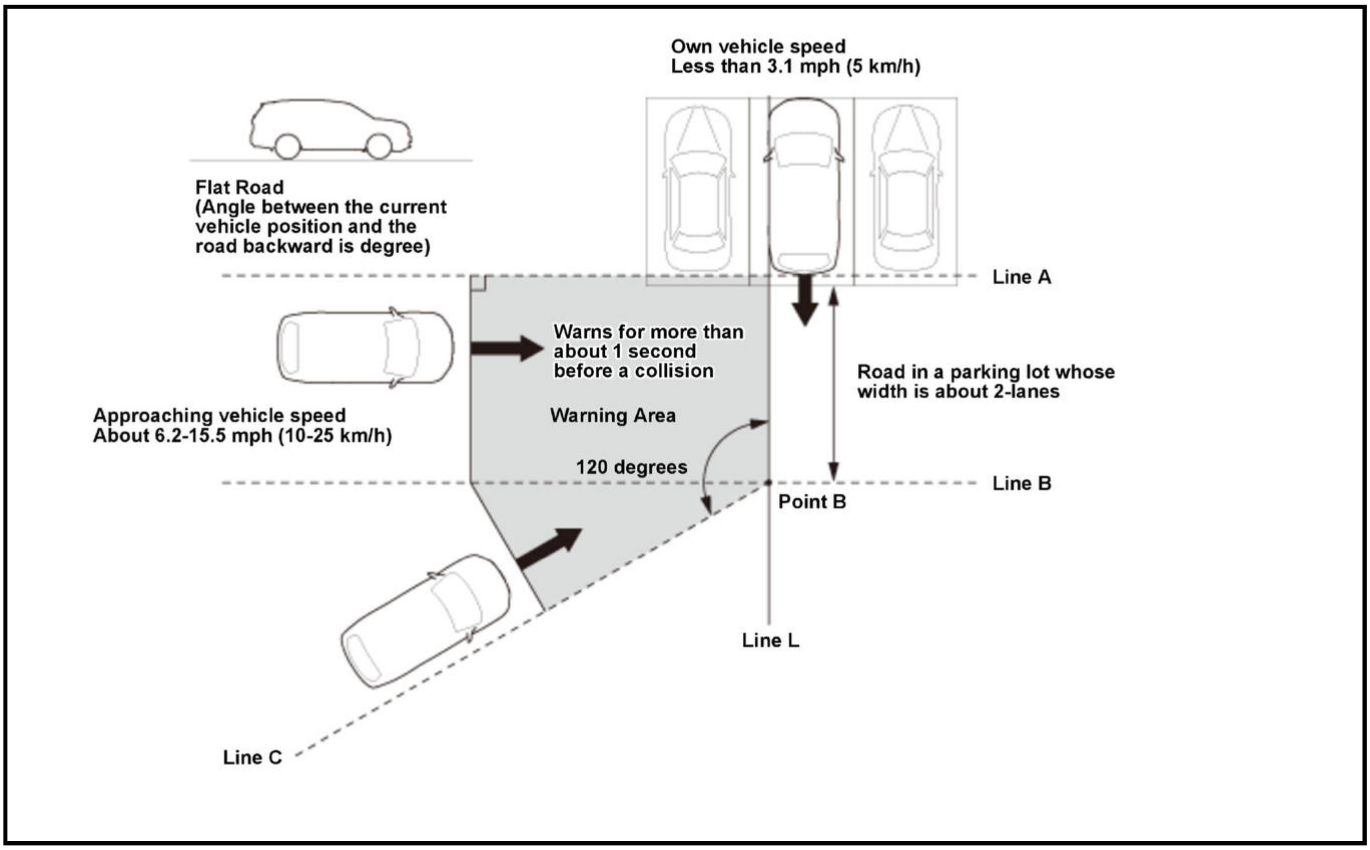
The cross traffic monitor system evaluates the approaching target's speed, time to potential collision and location in the cross traffic monitor system's alert zone to decide if the system should warn or not warn the driver.

Detection Conditions

Parameter	Warn
Your vehicle speed	less than 3 mph (5 km/h)
Time to collision	1.2 to 3.2 seconds
Target closing speed	More than 6 mph (10 km/h), 16 mph (25 km/h) or less
Detection range	Less than 8.3 m (27.2 ft) or based on time to collision (up to 25m (82.0 ft))

The system defines the time to collision, measured in seconds, that it takes for the target vehicle traveling at its current speed to reach the line L when the target vehicle is approaching perpendicular (between line A and B) to the customer's vehicle. If the target vehicle is approaching from a wider angle (between line B and C), the time to collision is measured by how long it takes the target vehicle traveling at its current speed to reach point B.

Detection Range



Own vehicle speed
Less than 3.1 mph (5 km/h)
Flat Road
(Angle between the current vehicle position and the road backward is degree)
Line A
Warns for more than about 1 second before a collision
Road in a parking lot whose width is about 2-lanes
Approaching vehicle speed
About 6.2-15.5 mph (10-25 km/h)
Warning Area
120 degrees
Line B
Point B
Line L
Line C

Cross Traffic Monitor (CTM) system

When driving in reverse, the blind spot information radar unit monitors vehicles approaching from behind your vehicle. When detecting a vehicle approaching from behind, the unit sends the information to the audio-navigation unit via B-CAN line. When receiving the information, the audio-navigation unit gives the warning to the driver by displaying "<<" (a warning arrow) on the rearview camera image. An audible alarm is generated by the meter. The warning indicates left, right or both. The cross traffic monitor system gives a warning depending on the position, speed of the target vehicle in the detection range and the time remaining to the collision.

Restriction Factors	Warning Conditions
Own Vehicle Speed	Less than 3 mph (5 km/h)*
Remaining Time to Collision	Greater than 1.2 to less than 3.2 seconds*
Target Vehicle Speed	Greater than 6 mph (10 km/h) and less than 16 mph (25 km/h)*
Distance to Target Vehicle	Less than 8.3m (27.2 ft) or based on time to collision (up to 25m (82.0 ft))

*: Warnings may be issued out side of these conditions listed above.

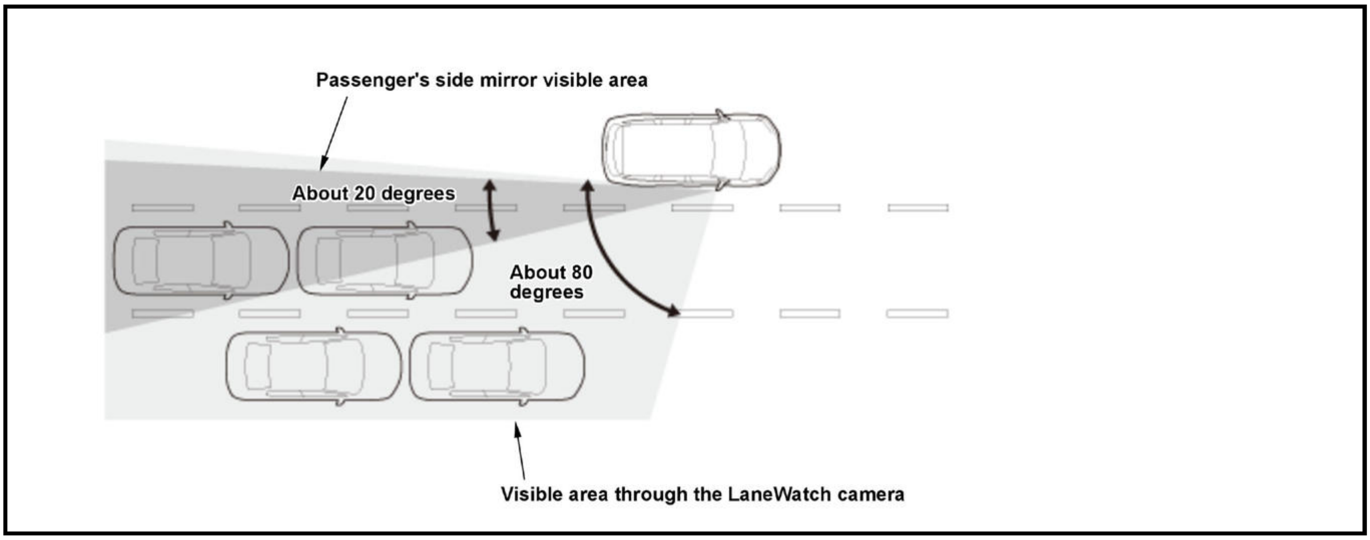
LANEWATCH SYSTEM DESCRIPTION

LaneWatch System

LaneWatch uses a camera and the display to help drivers recognize objects in the passenger's side blind spot. The added visibility improves safety when changing lanes or making right turns.

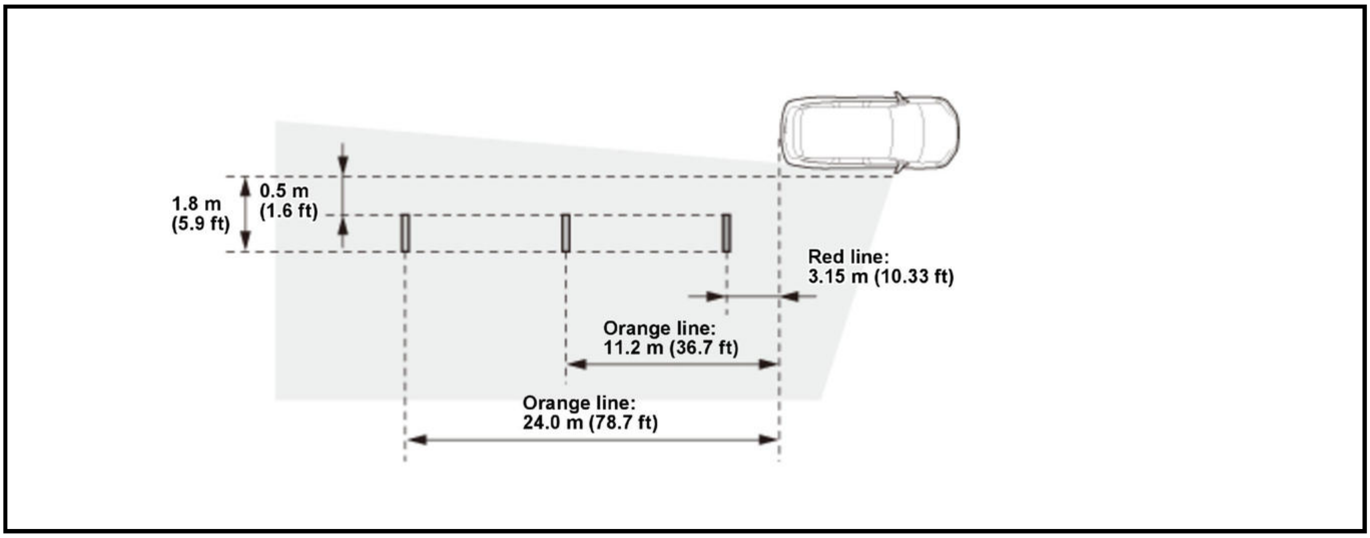
The driver can see other vehicles, bicycles, or pedestrians that are not normally visible in the passenger's side mirror.



Passenger's side mirror visible area
About 20 degrees
About 80 degrees
Visible area through the LaneWatch camera

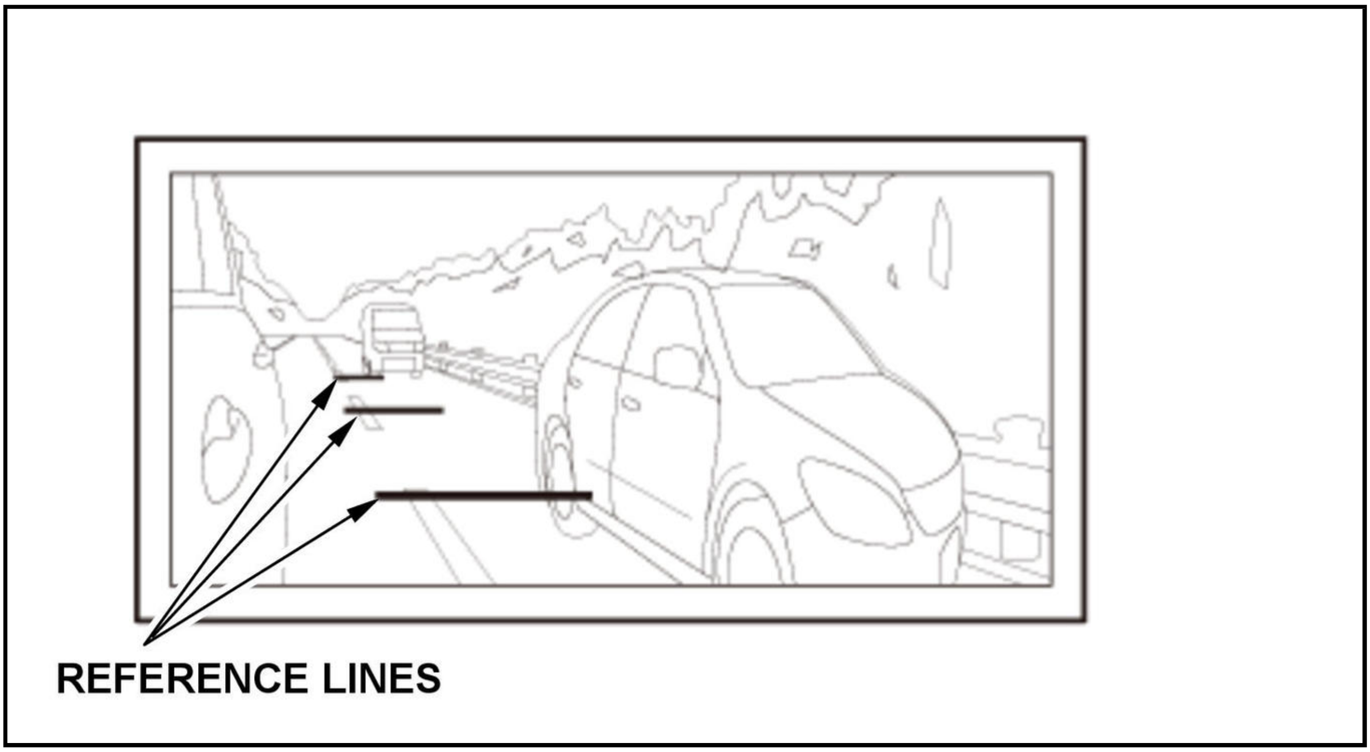
Reference line

The LaneWatch image is provided with three reference lines, each showing the distance from the rear bumper. Three lines that appear on the display can give an idea of how far the vehicles or objects on the display are from your vehicle, respectively. If an object is near line 1 (in red), it indicates that it is close to your vehicle, whereas an object near line 3 is farther away.



1.8 m (5.9 ft)
0.5 m (1.6 ft)
Red line: 3.15 m (10.33 ft)
Orange line: 11.2 m (36.7 ft)
Orange line: 24.0 m (78.7 ft)

Display image (Normal mode)



LaneWatch camera

The LaneWatch camera is built into the passenger's side power mirror which sends the image to the display.

LaneWatch Switch

The LaneWatch switch is built into the combination light switch.

Center Display Unit

The image appears on the center display unit.

Operation

- Whether the display is on or off, pressing the LaneWatch switch will change the display to the LaneWatch screen.
- When the turn signal switch is moved to the right turn position (lane change or continuous flash), the display will change to the LaneWatch camera view.

LANEWATCH SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the LaneWatch system is shown below.

For locations of each component on the vehicle, refer to Component Location Index:

CHECK

BSI RADAR UNIT MOUNTING AREA CHECK

Special Tools Required

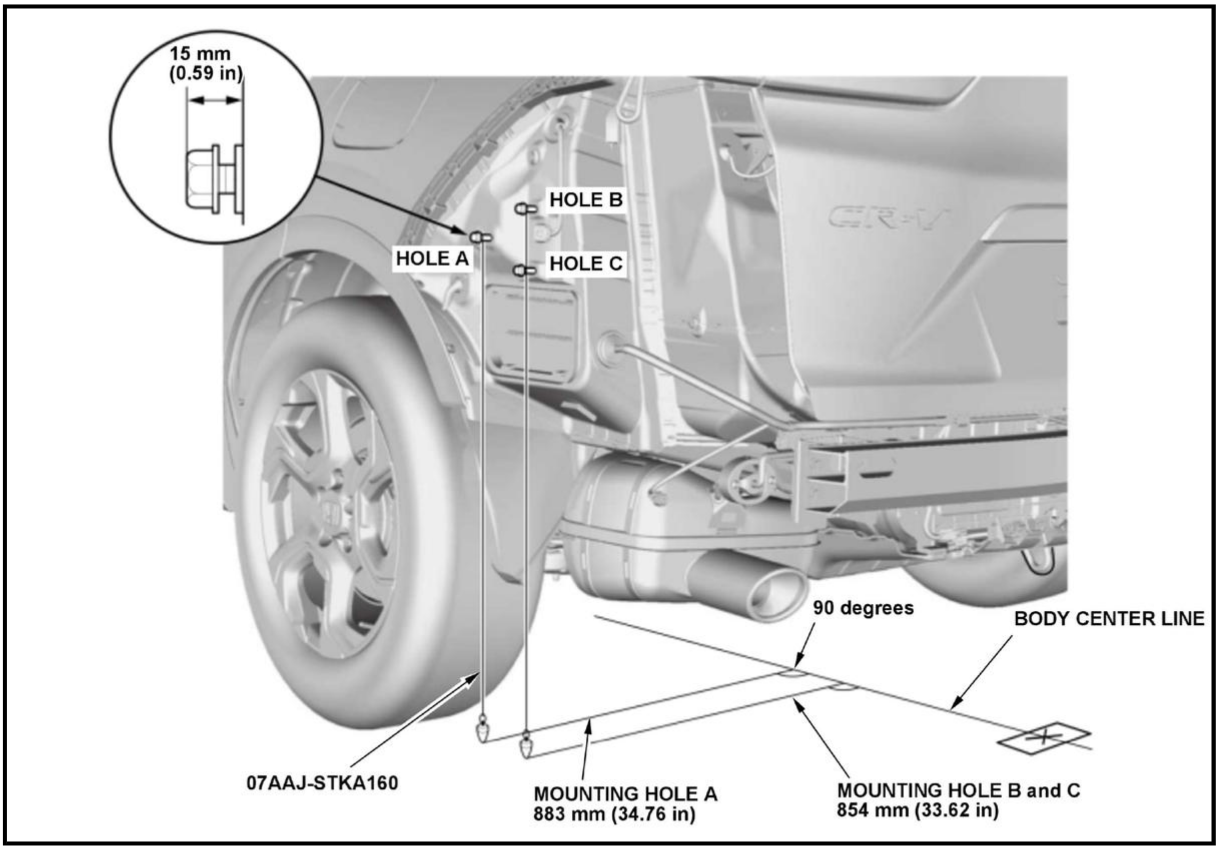
Image	Description/Tool Number
	Target Set 07AAJ-STKA160

Adjustment

1. Center Line - Set
2. BSI Radar Unit - Remove
3. Upper Body Measuring Dimensions - BSI Radar Unit Mounting Positions
    1. Install bolts on each hole of the body panel.

2. Measure the length from the tip of the bolt installed to each hole A, B, and C to the body center line.

NOTE: If the measured lengths between the body center line and hole A to C are different from the standard, take the vehicle to a body repair shop to have the panel adjusted to standard.



15 mm
(0.59 in)
HOLE B
HOLE A
HOLE C
90 degrees
BODY CENTER LINE
07AAJ-STKA160
MOUNTING HOLE A
883 mm (34.76 in)
MOUNTING HOLE B and C
854 mm (33.62 in)

4. BSI Radar Unit - Install
5. Rear Bumper - Install

ADJUSTMENT

LANEWATCH CAMERA AIMING

Special Tools Required

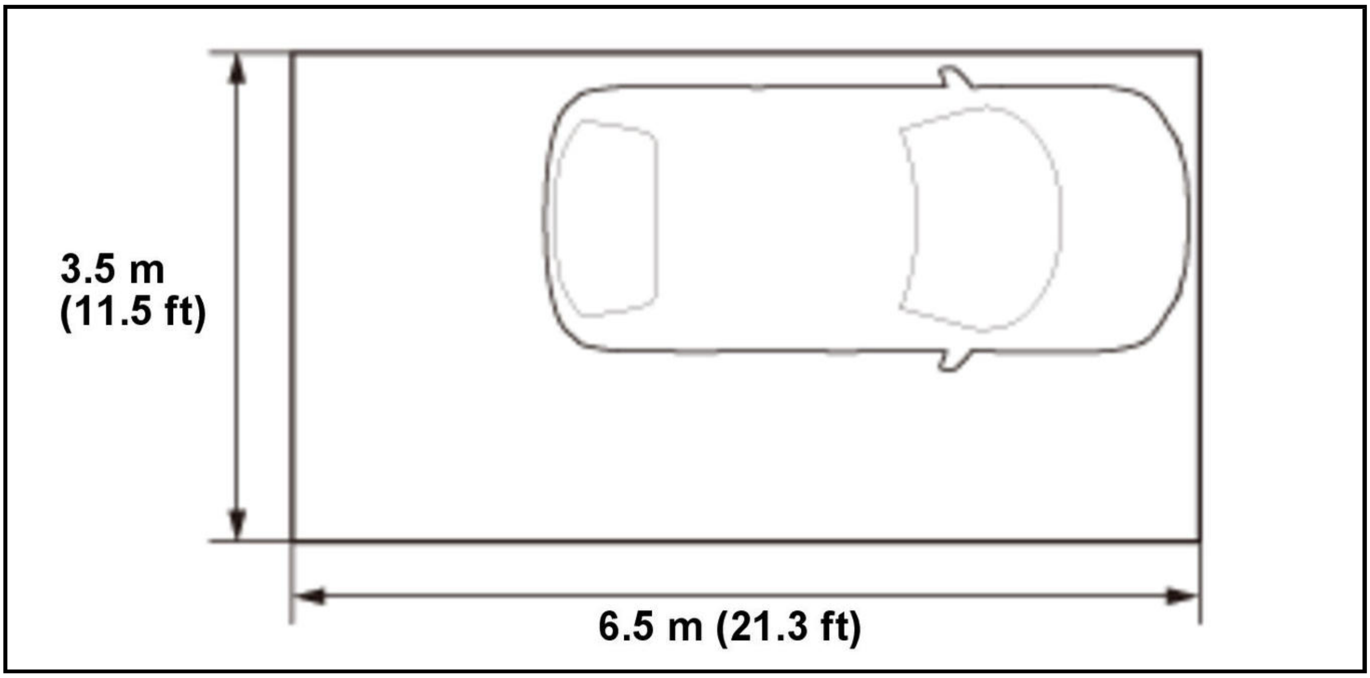
Image	Description/Tool Number
	LaneWatch Aiming Stand Set 070AK-T2AA100

Image	Description/Tool Number
	Aiming Marker 070AK-T2AA110

Adjustment

NOTE:

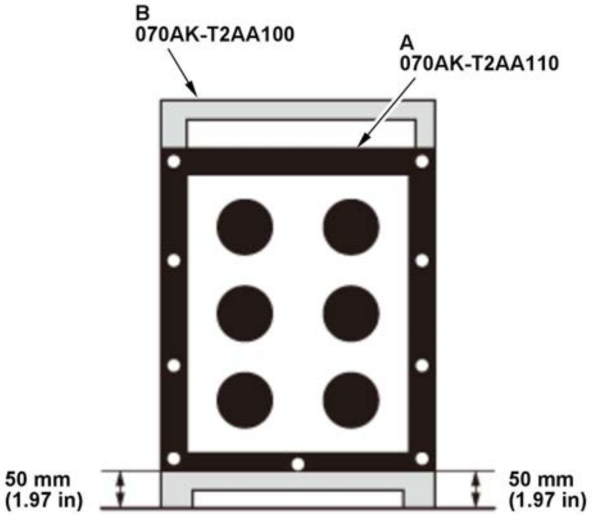
- The LaneWatch camera must be aimed after one or more of the following procedures are done:
-
    - LaneWatch camera removal or replacement
    - Passenger's side power mirror removal or replacement
    - Passenger's side door panel removal or replacement
    - Passenger's side door panel body repair
    - Passenger's side door position adjustment
- Set up the vehicle:
-
    - Install the aiming target on the passenger's side of the vehicle.
    - Do the aiming in a proper place where you can obtain about 4.5 m (14.8 ft) distance between the target pattern and the vehicle (from the center of the front wheel hub).
- Prepare these items:
-
    - Tape measure and ruler
    - Felt-tip pen
    - Tape
    - String
- Park the vehicle on level ground in a wide open area to avoid any reflection from objects that could affect the alignment procedure. Make sure you have at least the following amount of space around the vehicle: 6.5 m (21.3 ft) in length, 3.5 m (11.5 ft) in width.



3.5 m
(11.5 ft)
6.5 m (21.3 ft)

- When marking on the floor surface, use suitable tape to mark the exact locations.

1. **Before Aiming - Set**
2. Aiming Marker - Set

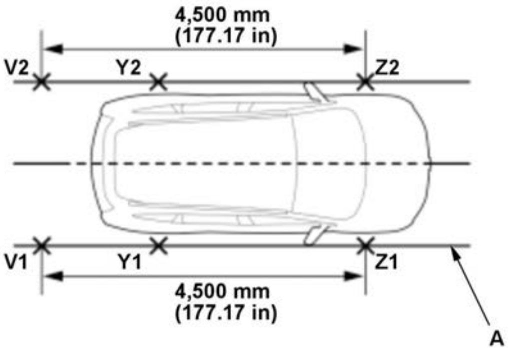


B
070AK-T2AA100
A
070AK-T2AA110
50 mm
(1.97 in)
50 mm
(1.97 in)

NOTE:

- Make sure there are no other objects except the aiming target in this area.
- Check the tire pressures, and adjust them to the specified value if needed.
- Put a person or an object equivalent to the driver's weight in the driver's seat.

1. Set the aiming marker (A) to the LaneWatch aiming stand (B), and adjust the height of the aiming marker.



4,500 mm
(177.17 in)
V2
Y2
Z2
V1
Y1
Z1
4,500 mm
(177.17 in)
A

2. Pull a string (A) between the point Z1 and point Y1, and tape both ends of the string on the floor surface.

NOTE: Repeat this step for the opposite side, and pull a string on the floor surface.

3. Measure and make a new spot V1 on the floor surface at the rear of the vehicle 4, 500 mm (177.17 in) from the point Z1.

NOTE: Repeat this step for the opposite side, and mark a new spot V2 on the floor surface.

	4. Stretch a string (A) between the point V1 and point V2, and tape both ends of the string on the floor surface. Mark a new spot V3 where the string crosses with the center-line (B). 5. On the string, mark a new spot V4 which is 1, 300 mm (51.19 in) from the point V3 to the passenger's side.
	6. Place the left side edge of the aiming marker (A) on the point V4 that you made in the previous step. Align the legs of the marker with the string to make sure the marker is square to the vehicle.

3. LaneWatch Camera - Aim

NOTE:

- When you stop the aiming procedure, turn the vehicle to the OFF (LOCK) mode.
- If the aiming procedure fails, brighten or darken the ambient lighting in case the lighting is affecting the aiming.

1. **Start the LaneWatch camera aiming**

2. Press the LaneWatch switch on the end of the turn signal switch to aim the camera.

3. Wait until the aiming process is complete, and the display returns to the LaneWatch camera image.

INSPECTION

BSI RADAR UNIT AIMING INSPECTION

Special Tools Required

Image	Description/Tool Number
	Stand 07AAJ-TK8A100*
	Rim Frame 07AAJ-TK8A150
	Target Set 07AAJ-STKA160

Image	Description/Tool Number
	Angle Gauge 07AAJ-STKA170
	Stand Set 07AAJ-STKA220*

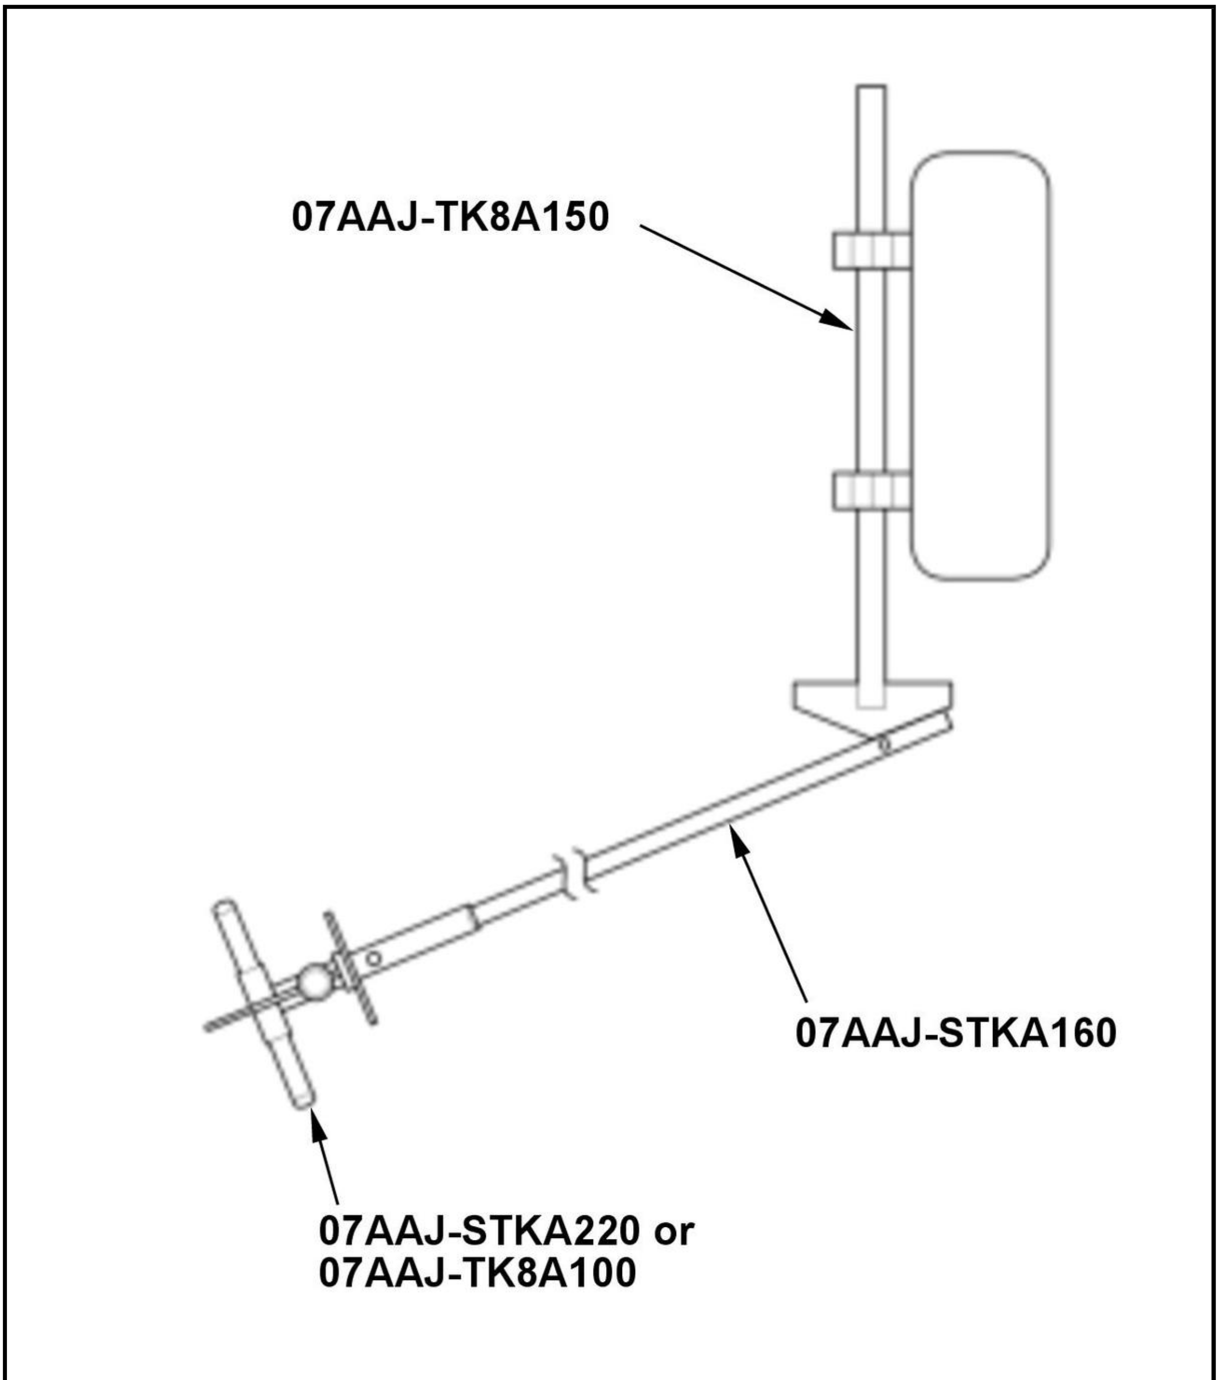
*: Use Stand 07AAJ-TK8A100 or Stand Set 07AAJ-STKA220 for aiming.

Adjustment

NOTE: Inspect the BSI radar unit aiming in these instances:

- After replacing or removing and reinstalling one or both of the BSI radar units.
- After repairing the body panel(s) where the BSI radar unit(s) mount.
- For any of the following DTCs:
-
  - B18B8: **Left Side BSI Radar Unit Azimuth Off Alignment**
  - B1E68: **Right Side BSI Radar Unit Azimuth Off Alignment**
- Park the vehicle on level ground (within 1 degree of slope) with at least 4 m (13 ft) of space on both sides and behind the vehicle. Do not do this procedure with the vehicle on a lift or with the tires on steel plates or rollers.
- Keep the front wheels in the straight ahead position.
- When marking on the floor, use suitable tape to mark the exact locations.

1. **Rear Bumper - Remove**
2. BSI Radar Unit Aiming - Inspect



This illustration shows the left side of the vehicle.
The right side is symmetrical.

Prepare the items shown:

- Felt-tip pen
- Tape

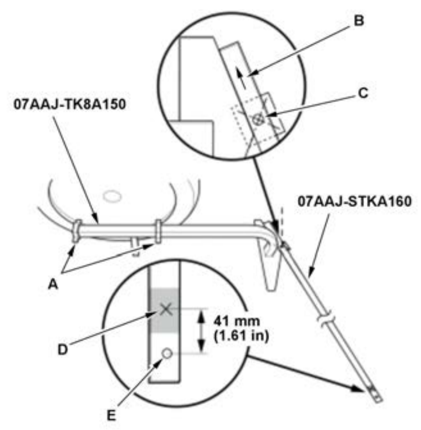
Before Inspection:

- Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.
- Clean the surface of the BSI radar unit.
- Make sure the vehicle does not have aftermarket suspension.
- Make sure that all of the tires are the correct size and inflated to the proper pressure.
- Make sure the fuel tank is full.
- Remove all cargo from the vehicle except the tool kit and the spare tire.

- Make sure the steering wheel is pointed straight ahead, and do not turn it after setting the vehicle.
- Shift the transmission to P position, and the parking brake applied.
- If the vehicle you are aiming was involved in a collision or if you suspect the alignment is out of specifications, you must perform a wheel alignment prior to aiming the BSI radar.

 A B 07AAJ-STKA160 07AAJ-STKA220 or 07AAJ-TK8A100 This illustration shows the left side of the vehicle. The right side is symmetrical.	1. Set the target on the stand. 2. Set the tip (A) of the target at the same height as the center (B).

 This illustration shows the left side of the vehicle. The right side is symmetrical.	3. Set the angle gauge (A) against the radar unit, and align the cutout of the angle gauge with the center (B) on the radar unit. **NOTE:** The angle gauge can be set at any of the 3 angle settings for this procedure. 4. Hang the plumb bob from the angle gauge, and mark a point (C) on the floor where the tip of the plumb bob touches the floor.



B
C

07AAJ-STKA160
A
41 mm
(1.61 in)
D
E

This illustration shows the left side of the vehicle.
The right side is symmetrical.

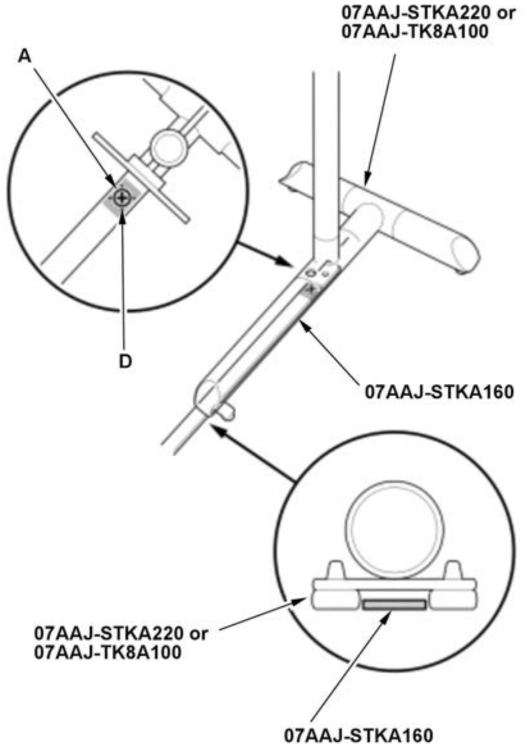
5. Place the rim frame by the rear wheel on the side of the vehicle you are aiming. Adjust the spacers (A) to fit against the wheel rim to make the rim frame parallel with the wheel.

NOTE: Make sure the spacers are touching the wheel rim.

6. Assemble the two sections of the straightedge, then place the hole on the end of the straightedge over the point (C) that you made on the floor in the previous step. Slide the rim frame rearward until the rim frame and the straightedge meet.

NOTE: Set the straightedge according to the arrow (B).

7. Mark a point (D) that is 41 mm (1.61 in) from the hole (E) on the end of the straightedge.



07AAJ-STKA220 or
07AAJ-TK8A100
07AAJ-STKA160

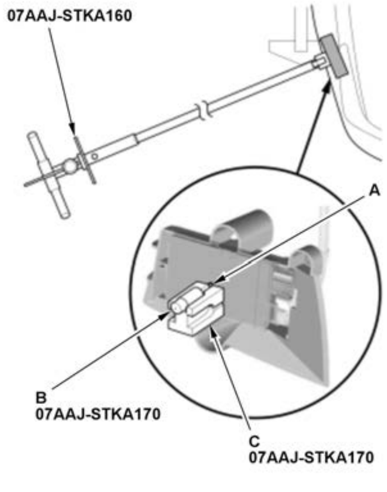
8. Place the target over the other end of the straightedge, and align the hole (A) at the base of the target with the point (D) on the straightedge.



07AAJ-STKA160
A
B
07AAJ-STKA170
C
07AAJ-STKA170

This illustration shows the left side of the vehicle.
The right side is symmetrical.

9. With the angle gauge facing up at the 0 degree setting (indicated on the angle gauge), set the angle gauge against the radar unit. Align the cutout in the angle gauge with the center (A) on the radar unit.

WARNING: Do not aim the laser beam at anyone's eyes.

10. Turn on the laser pointer (B), and set it on the angle gauge (C) so that the beam hits on the target.

 OK A NG 07AAJ-STKA160 07AAJ-STKA220 or 07AAJ-TK8A100	11. Check the point (A) where the laser beam hits the target: - If the laser beam is within the target, the BSI radar unit is aimed properly. - If the laser beam is out of the target range, **check the BSI radar unit mounting area**.

3. **Rear Bumper - Install**

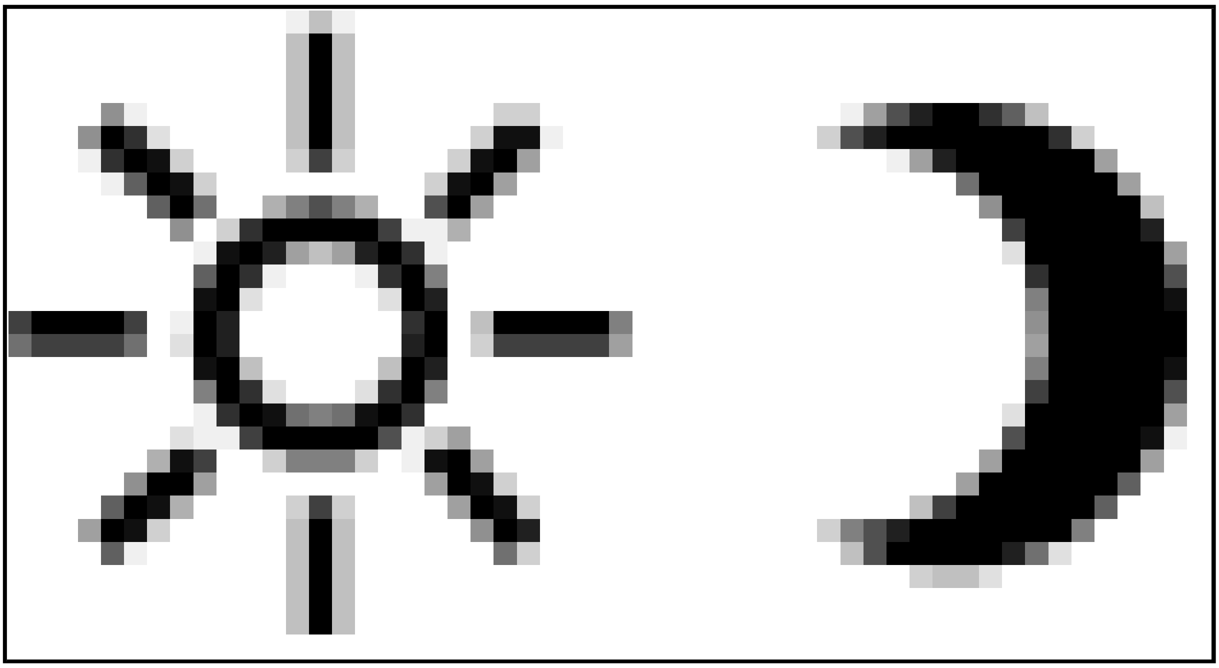
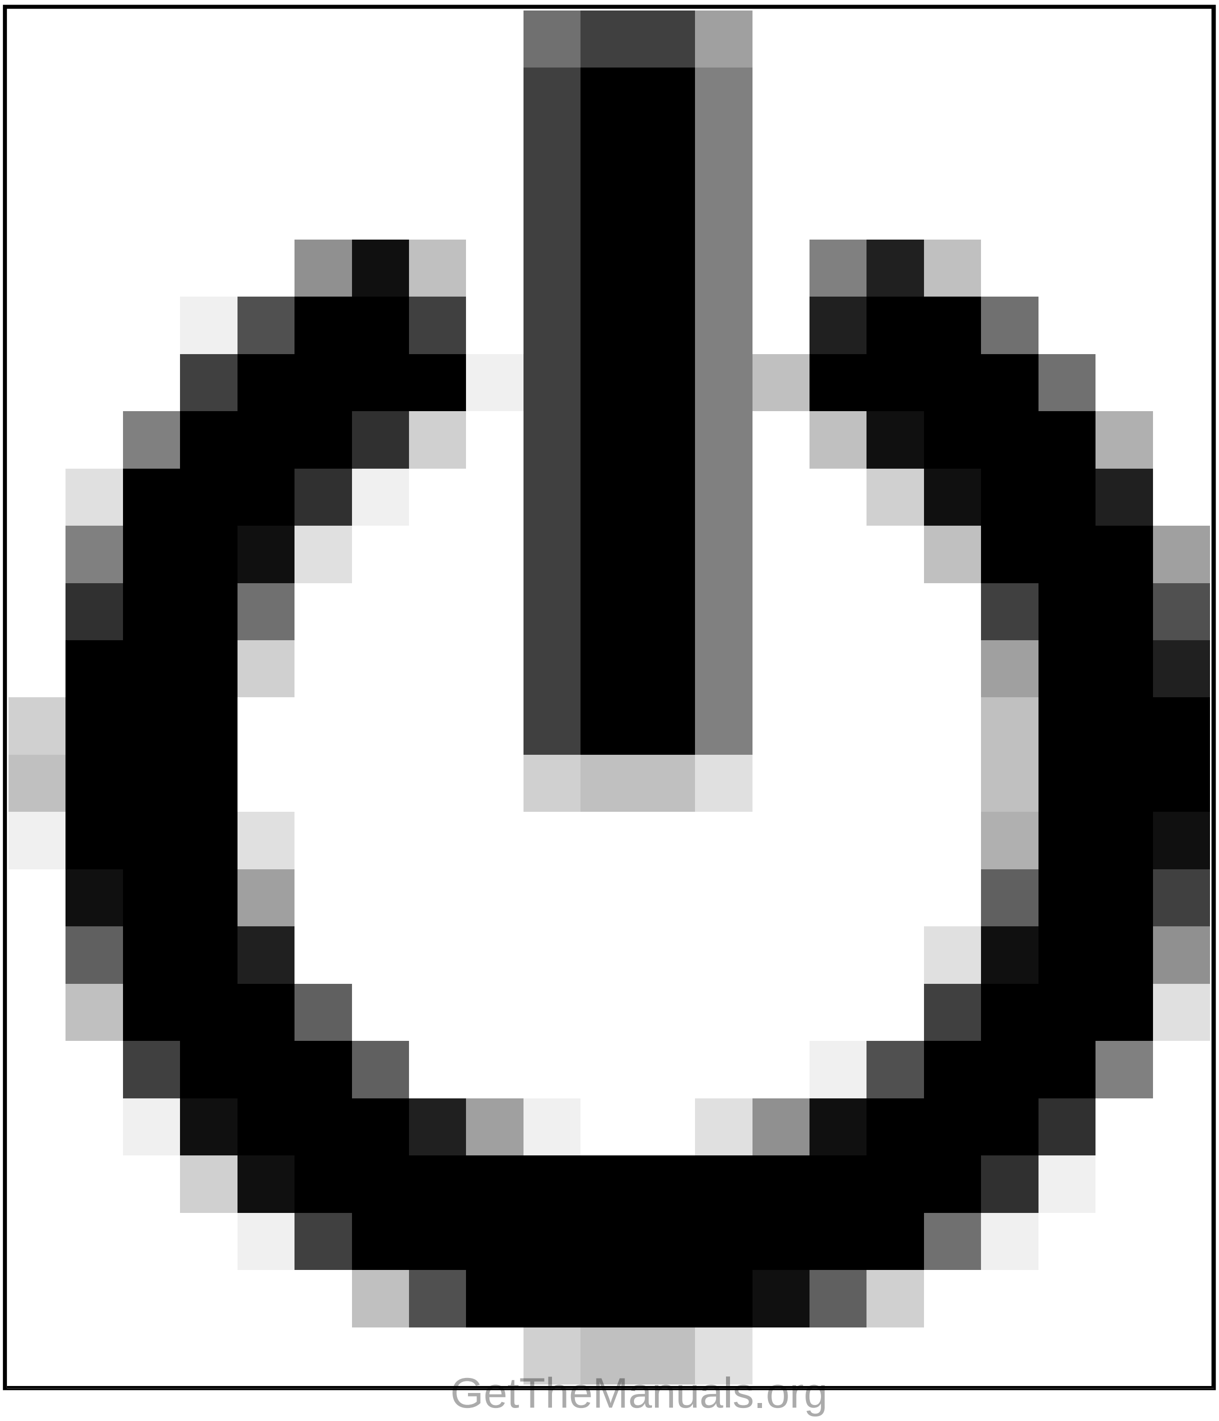
GENERAL INFORMATION

HOW TO START LANEWATCH CAMERA AIMING

Procedure

1. LaneWatch Camera Aiming - Start
    1. Do the LaneWatch camera aiming marker preparation
    2. Turn the vehicle to the ON mode.
    3. Press and hold the PHONE button, the DISPLAY MODE button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed.





NOTE: The buttons needs to be pressed together simultaneously.

SYMPTOM TROUBLESHOOTING

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING

The BSI alert indicator comes on when no other vehicle is in the detectable area (Wrong indication)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Vehicle settings check

   -1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

   Is the BSI system ON?

   YES

   Go to step 3.

   NO

   Cancel the OFF status by operating the BSI customization.

3. Driving condition check:

   Interview the customer about when the symptom occurred to determine if an inspection is needed.

   NOTE: The BSI system cannot work properly in the following driving situations:

   - In rainy, snowy, or foggy weather.
   - When receiving a jamming signal from outside.
   - When followed by other vehicles at a curve in a road.
   - When another vehicle is getting close to yours when turning right or left.
   - When the rear bumper is deformed.
   - When the sensor is out of place.
   - In places where there is a guardrail, pole, or tree.
   - When an area of bumper around the installed sensor is soiled.

   Is an inspection required?

   YES

   Go to step 4.

   NO

   Explain to the customer that the system sometimes cannot detect under certain driving conditions.

4. Rear bumper installation check

   -1. Make sure that the rear bumper is correctly installed, and check the rear bumper for alteration or deformation.

   NOTE: Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.

   Is the rear bumper OK?

   YES

   Go to step 5.

   NO

   If the rear bumper is incorrectly installed, reinstall it correctly. If it is damaged or deformed, replace it. If it is modified, explain to the customer that modifying rear bumper may lead to improper BSI system operation.

5. BSI radar check

   -1. **Remove the rear bumper** .

   -2. Check the inside and outside of the rear bumper for dirt, contaminants, or stickers. Also, check the BSI radar unit surface for dirt or contaminants.

   Is the BSI radar unit OK?

   YES

   Go to step 6.

   NO

   Completely wipe off any dirt or contaminants from the BSI radar unit surface or rear bumper.

6. BSI radar installation check

   -1. Check the body surface where the BSI radar unit is mounted for deformation.

   Is the body surface OK?

   YES

   Replace the appropriate BSI radar unit .

   NO

   Go to the BSI radar unit mounting area check.

The BSI does not come on when other vehicles are in the detectable area (No indication)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Vehicle settings check

   -1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

   Is the BSI system ON?

   YES

   Go to step 3.

   NO

   Cancel the OFF status by operating the BSI customization.

3. Driving condition check:

   Interview the customer about when the symptom occurred to determine if an inspection is needed.

   NOTE: The BSI system cannot work properly in the following driving situations:

   - In rainy, snowy, or foggy weather.
   - When small targets in the detectable area cannot reflect radar; for example, a motor bike.
   - When there is ice, snow, or dirt is stuck to the rear bumper.
   - When driving in a traffic lane divided with road marking ramps.
   - When a vehicle comes over in the lane next to yours from a far lane.
   - When the temperature around the sensor is high.
   - When the rear bumper is deformed.
   - When the sensor is out of place.
   - When an area of bumper around the installed sensor is soiled.

   Is an inspection required?

   YES

   Go to step 4.

   NO

   The system is OK at this time. Check the rear bumper for dirt contamination. If everything looks OK, explain BSI system precautions to the customer.

4. Rear bumper installation check

    -1. Make sure that the rear bumper is correctly installed, and check the rear bumper for alteration or deformation.

    NOTE: Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.

    Is the rear bumper OK?

    YES

    Go to step 5.

    NO

    If the rear bumper is incorrectly installed, reinstall it correctly. If it is damaged or deformed, replace it. If it is modified, explain to the customer that modifying rear bumper may lead to improper BSI system operation.

5. BSI radar check

    -1. **Remove the rear bumper** .

    -2. Check the inside and outside of the rear bumper for dirt, contaminants, or stickers. Also, check the BSI radar unit surface for dirt or contaminants.

    Is the BSI radar unit OK?

    YES

    Go to step 6.

    NO

    Completely wipe off any dirt or contaminants from the BSI radar unit surface or the rear bumper.

6. BSI radar installation check

    -1. Check the body surface where the BSI radar unit is mounted for deformation.

    Is the body surface OK?

    YES

    Replace the appropriate BSI radar unit .

    NO

    Go to the BSI radar unit mounting area check.

The BSI indicator does not go off, or does not come on

1. DTC check

    -1. Turn the vehicle to the ON mode.

    -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode, then the ON mode.

-2. Check the BSI indicator comes on, and then goes off.

Does the BSI indicator come on, then go off?

YES

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

NO

Go to step 3.

3. Vehicle settings check

-1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

Is the BSI system ON?

YES

Go to step 4.

NO

Cancel the OFF status by operating the BSI customization.

4. Gauge control module check

-1. Do the gauge control module self-diagnostic function .

Is the gauge control module OK?

YES

Replace the appropriate BSI radar unit .

NO

Replace the gauge control module .

The HDS does not communicate with the BSI system

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

   DTC (BSI)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC troubleshooting .

   NO

   Go to step 2.

2. 12 volt battery check

   -1. Test the 12 volt battery .

   Is the 12 volt battery OK?

   YES

   Go to step 3.

   NO

   Charge or replace the 12 volt battery .

3. Gauge control module check

   -1. Do the gauge control module self-diagnostic function .

   Does the buzzer sound?

   YES

   Replace the appropriate BSI radar unit .

   NO

   Replace the gauge control module .

The buzzer does not sound

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Vehicle settings check

   -1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

   Is the BSI system ON?

   YES

   Go to step 3.

   NO

   Cancel the OFF status by operating the BSI customization.

3. Gauge control module check

   -1. **Do the gauge control module self-diagnostic function** .

   Does the buzzer sound?

   YES

   Replace the appropriate BSI radar unit .

   NO

   Replace the gauge control module .

LANEWATCH SYMPTOM TROUBLESHOOTING

Does not switch to the LaneWatch screen

1. LaneWatch system check (audio/navigation system diagnostic mode)

   -1. Turn the vehicle to the ON mode.

   Go into the system diagnostic mode, and select the Detail Information and Setting.

   - **Without navigation**

- **With navigation**

-3. Select the Functional Setup icon.

-4. Select the LaneWatch icon.

Is "Connection OK" indicated?

YES

Go to step 2.

NO

Check for hard error codes (audio/navigation DTCs).

- **Without navigation**
- **With navigation**

2. LaneWatch switch check (audio/navigation system diagnostic mode)

-1. Operate the LaneWatch switch.

Is "LaneWatch Switch ON" indicated?

YES

Intermittent failure, the system is OK at this time.

NO

Go to step 3.

3. Open wire check (LWC SW line)

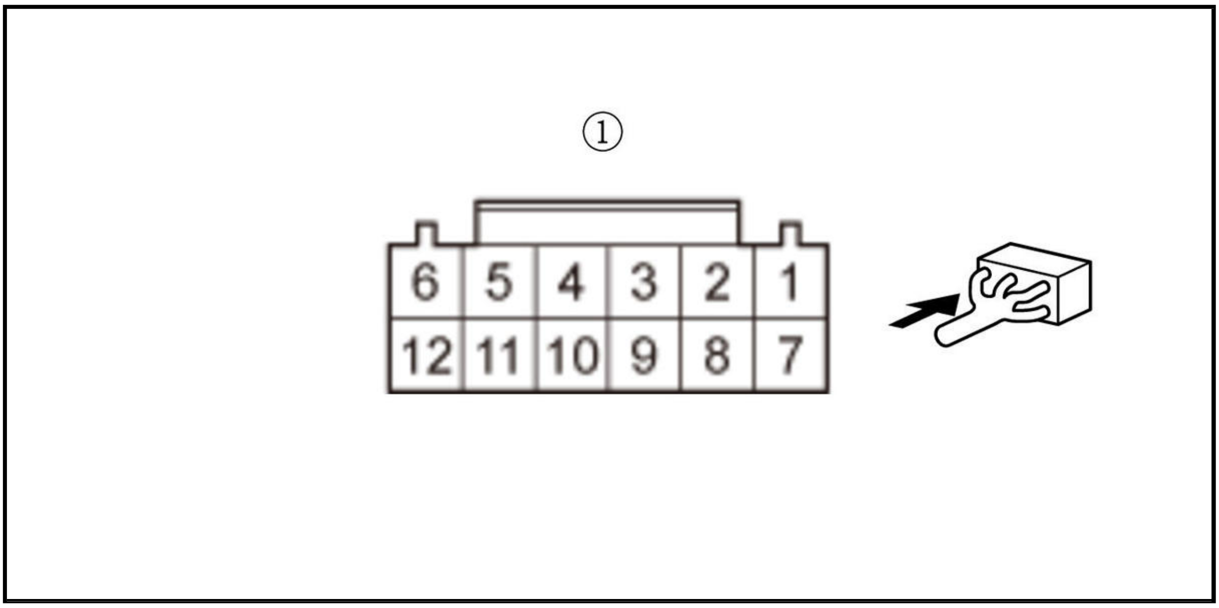
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Combination light switch 12P connector (female terminals) No. 4: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

Go into the system diagnostic mode, and select the Detail Information and Setting.

- **Without navigation**
- **With navigation**

-6. Select the Functional Setup icon.

-7. Select the LaneWatch icon.

Is "LaneWatch Switch ON" indicated?

YES

Go to step 4.

NO

Repair an open in the LWC SW wire between the combination light switch and the audio unit or the audio-navigation unit.

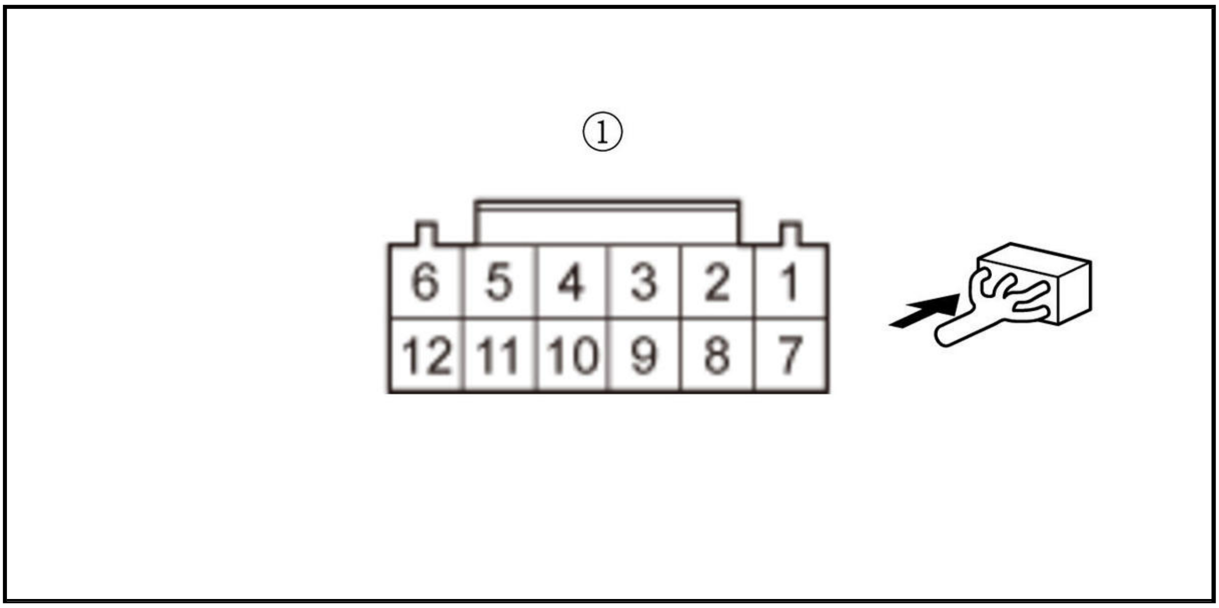
4. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Combination light switch 12P connector (female terminals) No. 3: ①
Terminal B	Combination light switch 12P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

Go into the system diagnostic mode, and select the Detail Information and Setting.

- **Without navigation**
- **With navigation**

-6. Select the Functional Setup icon.

-7. Select the LaneWatch icon.

Is "LaneWatch Switch ON" indicated?

YES

Replace the combination light switch .

NO

Repair an open in the GND wire between the combination light switch and body ground (G401), or repair poor ground (G401).

LaneWatch camera image does not come on (Switches to the black screen)

1. LaneWatch system check (audio/navigation system diagnostic mode)

-1. Turn the vehicle to the ON mode.

Go into the system diagnostic mode, and select the Detail Information and Setting.

- **Without navigation**
- **With navigation**

-3. Select the Functional Setup icon.

-4. Select the LaneWatch icon.

Is "Connection OK" indicated?

YES

Go to step 2.

NO

Check for hard error codes (audio/navigation DTCs).

- **Without navigation**
- **With navigation**

2. Determine possible failure area (LWC CAM VID/LWC V DA AS line, LWC CAM VGND/LWC VGND DA AS line, LaneWatch camera, others)

-1. Start the engine.

-2. Check the B-CAN status.

Is "B-CAN OK" indicated?

YES

Go to step 3.

NO

Go to step 5.

3. Open wire check (LWC CAM VID/LWC V DA AS line)

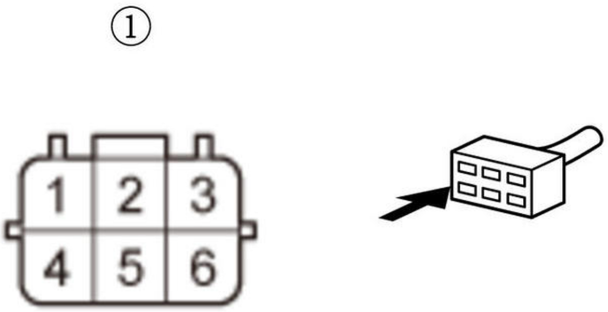
-1. Stop the engine.

-2. Disconnect the following connectors.

LaneWatch camera 6P connector
Audio unit or audio-navigation unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio unit or audio-navigation unit connector B (24P): disconnected
Test point 1	LaneWatch camera 6P connector (female terminals) No. 4: ①
Test point 2	**Audio unit** or **audio-navigation unit** connector B (24P) No. 20



Is there continuity?

YES

Go to step 4.

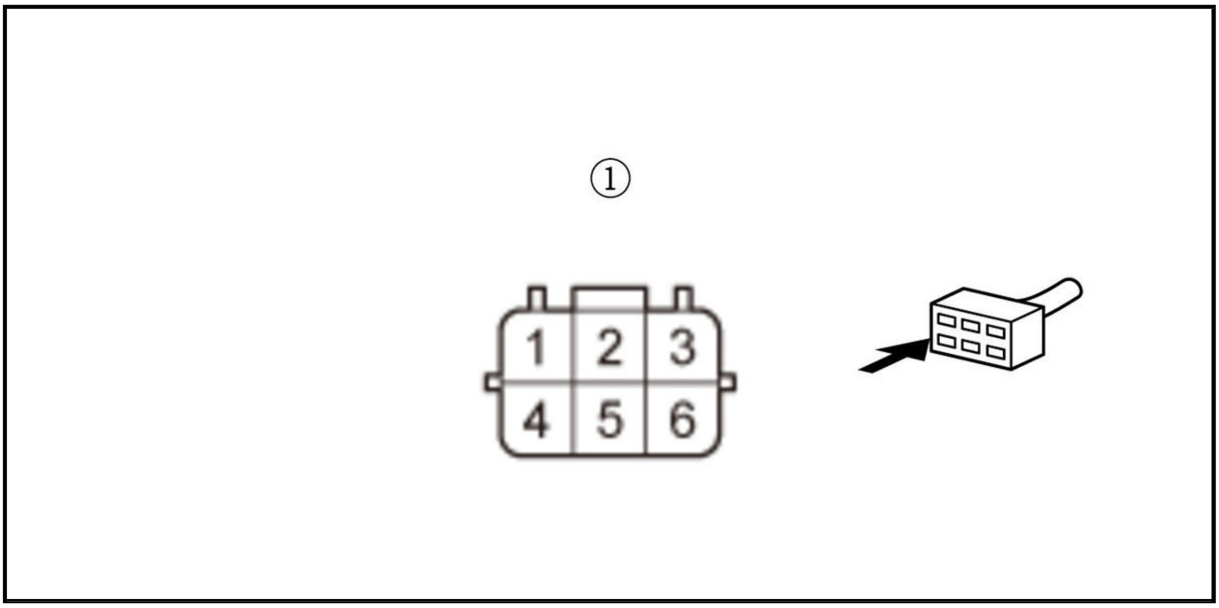
NO

Repair an open in the LWC CAM VID/LWC V DA AS wire between the LaneWatch camera and the audio unit or the audio-navigation unit.

4. Open wire check (LWC CAM VGND/LWC VGND DA AS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio unit or audio-navigation unit connector B (24P): disconnected
Test point 1	LaneWatch camera 6P connector (female terminals) No. 5: ①
Test point 2	**Audio unit** or **audio-navigation unit** connector B (24P) No. 21



Is there continuity?

YES

Replace the LaneWatch camera .

NO

Repair an open in the LWC CAM VGND/LWC VGND DA AS wire between the LaneWatch camera and the audio unit or the audio-navigation unit.

5. Body electrical DTC check

-1. Stop the engine.

-2. Turn the vehicle to the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 6.

6. Open wire check (B-CAN_H, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector B (36P)
Audio unit or audio-navigation unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Body control module connector B (36P): disconnected
B	Audio unit or audio-navigation unit connector A (24P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	**Audio unit** or **audio-navigation unit** connector A (24P) No. 14

Test point 1	**Body control module connector B (36P) No. 21**
Test point 2	**Audio unit** or **audio-navigation unit** connector A (24P) No. 24

Is there continuity?

YES

Check for poor connection or loose terminal at the audio unit or the audio-navigation unit. If the symptom does not go away, replace the **audio unit** or the **audio-navigation unit** .

NO

Repair an open in the B-CAN_H wire or the B-CAN_L wire between the body control module and the audio unit or the audio-navigation unit.

SYMPTOM TROUBLESHOOTING INDEX

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING INDEX (BLIND SPOT INFORMATION (BSI) SYSTEM)

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE LANEWATCH

LaneWatch

The LaneWatch displays the blind spot of the passenger's side through the LaneWatch camera. The image appears on the center display unit.

LaneWatch Camera

The LaneWatch camera is built into the passenger's side power mirror which sends the image to the audio unit or the audio-navigation unit.

LaneWatch Switch

The LaneWatch switch is built into the combination light switch.

Self-Diagnostic Function

The LaneWatch has a self-diagnostic function that you can access through the audio unit or the audio-navigation unit.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

DOES NOT SWITCH TO THE LANEWATCH SCREEN

Diagnostic procedure

- Symptom troubleshooting.

HDS DOES NOT COMMUNICATE WITH THE BSI RADAR UNITS OR THE VEHICLE (BLIND SPOT INFORMATION (BSI) SYSTEM)

Diagnostic procedure

- Troubleshoot the DLC circuit .

Also check for

- Incorrect HDS software.
- Shorted reference voltage.

LANEWATCH CAMERA IMAGE DOES NOT COME ON (SWITCHES TO THE BLACK SCREEN)

Diagnostic procedure

- Symptom troubleshooting.

THE BSI ALERT INDICATOR COMES ON WHEN NO OTHER VEHICLE IS IN THE DETECTABLE AREA (WRONG INDICATION) (BLIND SPOT INFORMATION (BSI) SYSTEM)

Diagnostic procedure

- Symptom troubleshooting.

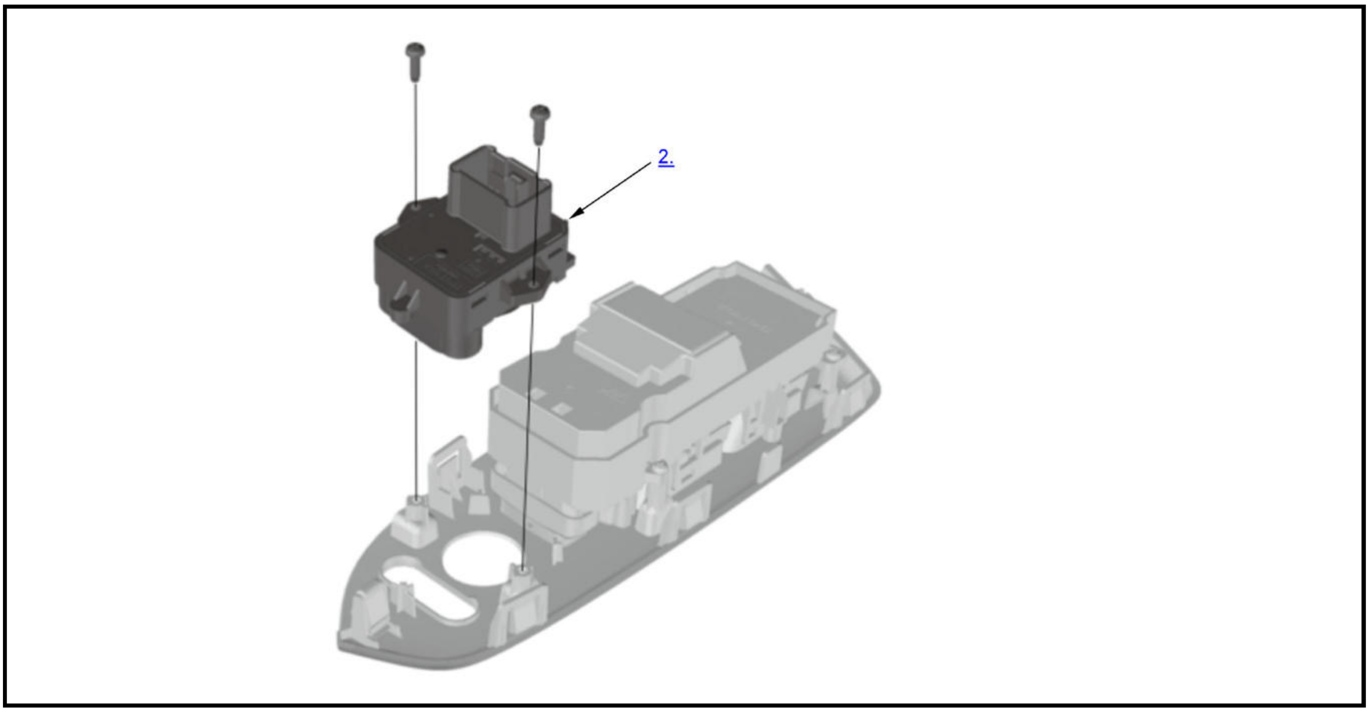
REMOVAL & INSTALLATION TEST

POWER MIRROR SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



1. Front Door Power Window Switch Panel - Remove
2. Power Mirror Switch - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

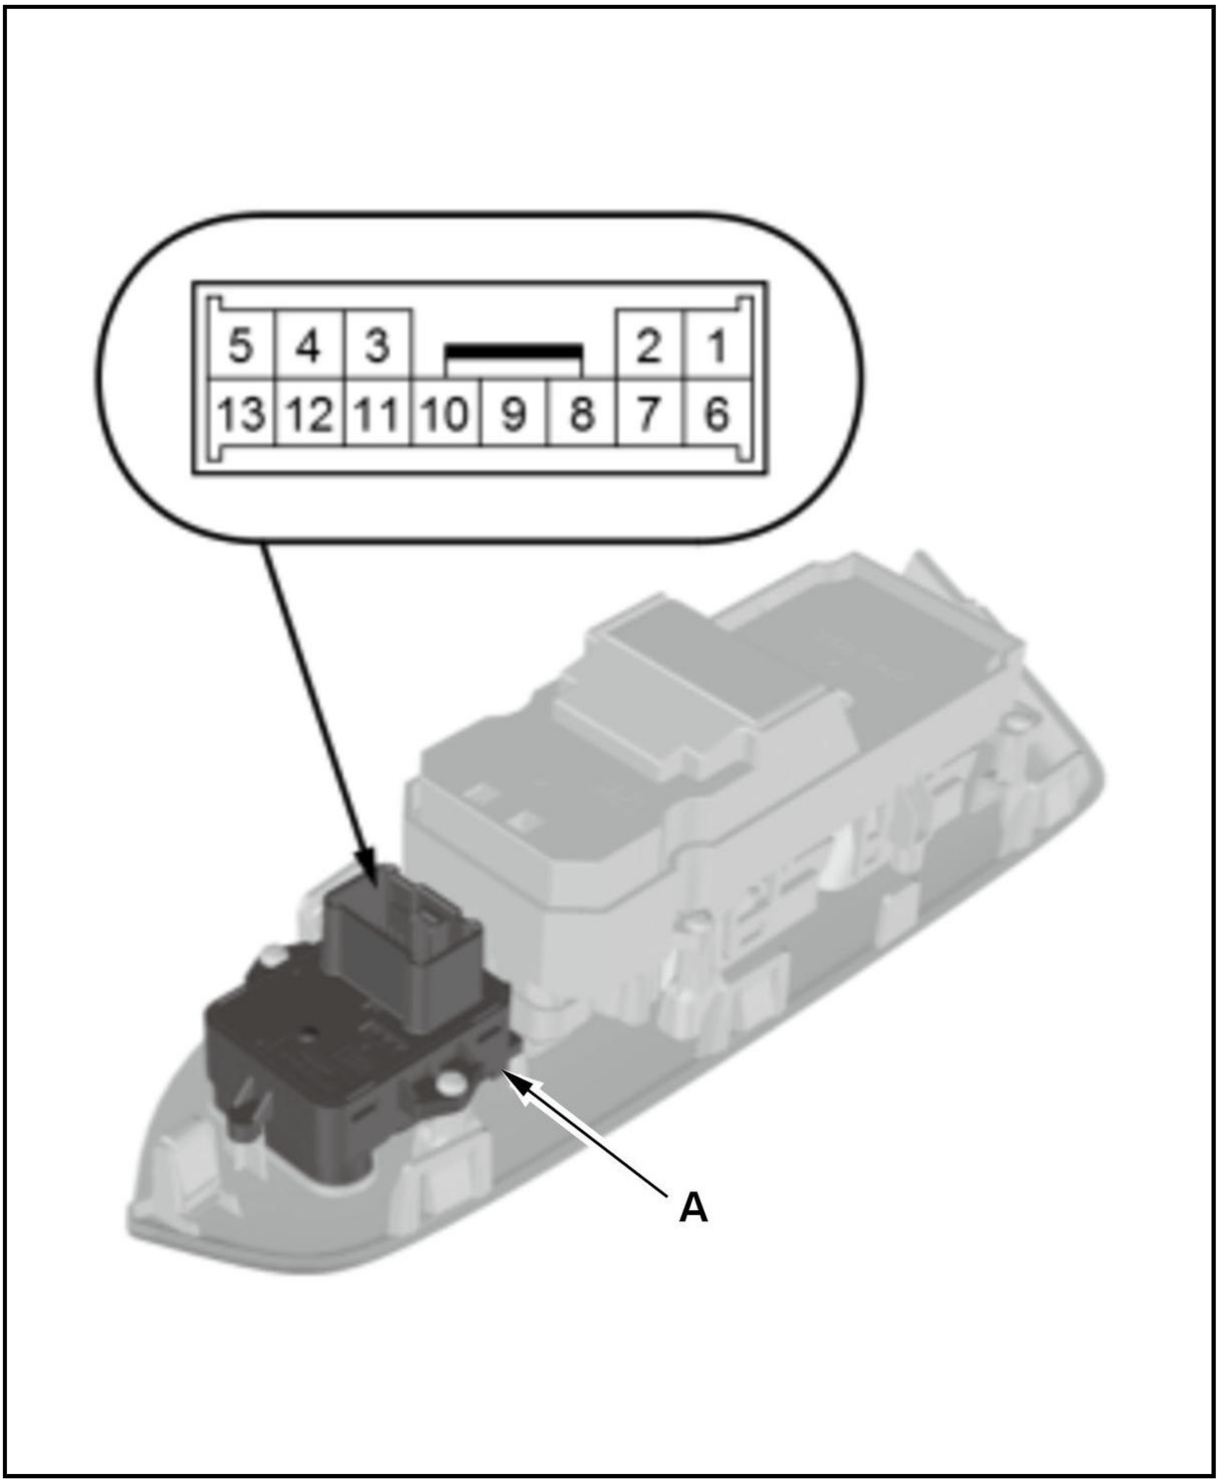
Test

1. Power Mirror Switch - Test

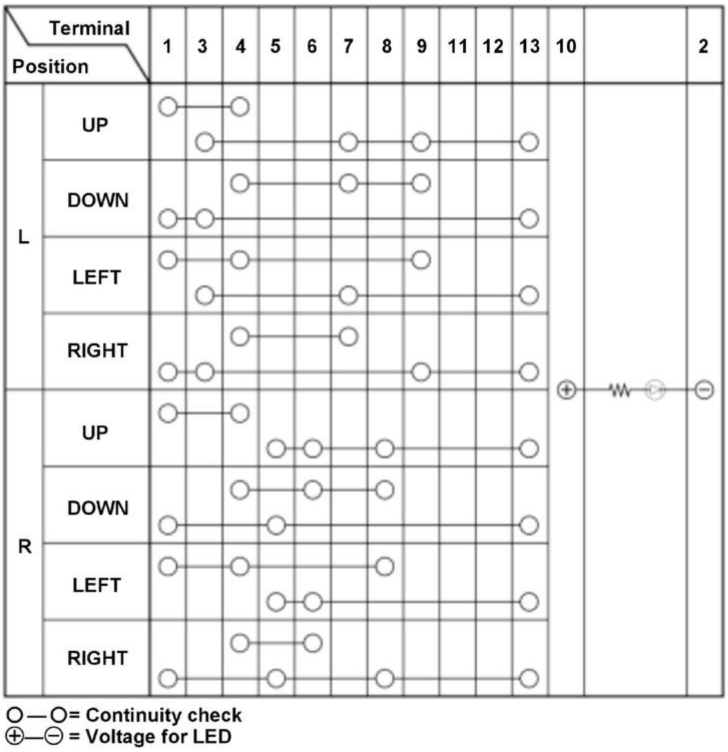
   1. Check the power mirror switch (A) according to the table in illustration.

NOTE:

- **Before testing, make sure not to short the power mirror switch.**
- **When an LED is located between terminals, check if the LED lights by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**



A



Position		1	3	4	5	6	7	8	9	11	12	13	10		2
L	UP	○		○									⊕		⊖
			○				○		○			○

	LEFT	○		○				○							
					○	○						○			
	RIGHT			○		○									
		○			○			○				○			

○—○= Continuity check
⊕—⊖ = Voltage for LED

2. If the result is not as specified, replace the power mirror switch.

REMOVAL AND INSTALLATION

MIRROR HOLDER REMOVAL AND INSTALLATION

Removal and Installation

Mirror Holder Type 1

1. Mirror Holder - Remove

	1. Carefully push on the top edge of the mirror holder (A) by hand. 2. Put a shop towel in the opening between the bottom edge of the mirror holder and the mirror housing (B) to prevent scratches. 3. Insert a flat-tip screwdriver under the mirror holder, and twist the screwdriver to release the hooks (C).

	4. Separate the mirror holder (A) from the actuator (B). 5. For some models: Disconnect the connectors (C).

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal, check the actuator operation

Mirror Holder Type 2

3. Mirror Holder - Remove

	1. Carefully push on the top edge of the mirror holder (A) by hand. 2. Put a shop towel in the opening between the bottom edge of the mirror holder and the mirror housing (B) to prevent scratches. 3. Insert a flat-tip screwdriver under the mirror holder, and twist the screwdriver to release the hooks (C).

	4. Separate the mirror holder (A) from the actuator (B). 5. For some models: Disconnect the connectors (C).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal, check the actuator operation

MIRROR HOUSING COVER REMOVAL AND INSTALLATION

Removal and Installation

Mirror Housing Cover Type 1

1. Mirror Holder - Remove
2. Mirror Housing Upper Cover - Remove

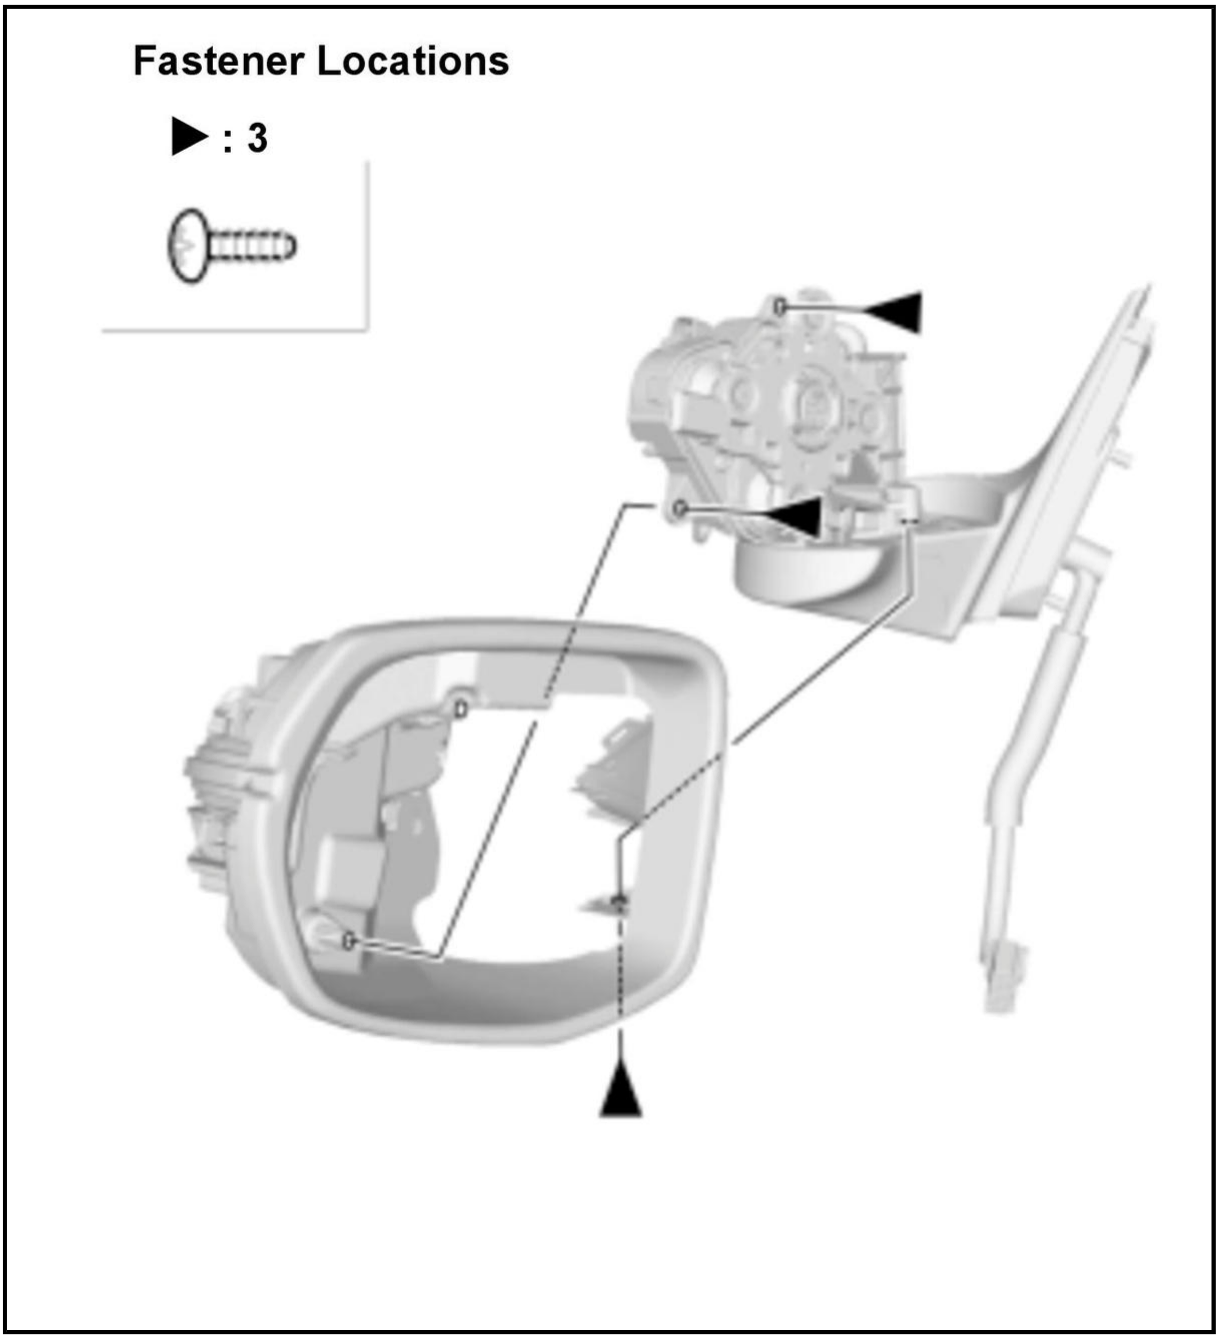
	1. Release the hooks (A), then remove the mirror housing upper cover (B).

3. Mirror Housing Lower Cover - Remove

	1. Remove the mirror housing lower cover (A). 2. Remove these items (For some models): - **Side turn signal light (with mirror turn)** - **LaneWatch camera (with LaneWatch)**

4. **Power Mirror - Remove**

5. Mirror Visor - Remove



6. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

7. LaneWatch Camera - Aim (With LaneWatch)

Mirror Housing Cover Type 2

8. Mirror Holder - Remove
9. Mirror Housing Cover - Remove

	1. Release the hooks (A), then remove the mirror housing upper cover (B).

10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

POWER MIRROR ACTUATOR/RETRACT ACTUATOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

POWER MIRROR REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications

1. Front Door Panel - Remove
2. Mirror Trim - Remove

Fastener Locations  	1. Remove the mirror cover (A). 2. With front tweeter: Disconnect the connector (B).

3. Power Mirror - Remove

<table>
<tr>
<td></td>
<td>1. Disconnect the connector (A).
2. Remove the harness clip (B).
3. While holding the power mirror (C), remove the nuts.</td>
</tr>
</table>

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. LaneWatch Camera - Aim (With LaneWatch)

REARVIEW MIRROR HARNESS COVER BASE REMOVAL AND INSTALLATION

Removal

1. Rearview Mirror (Auto Dimming Type) - Remove
2. Rearview Mirror Harness Cover Base - Remove

<table>
<tr>
<td></td>
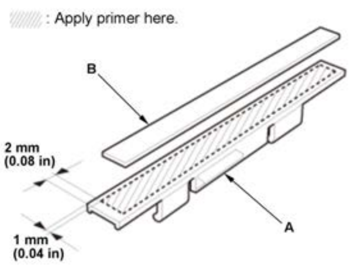
<td>1. Cut through the adhesive tape (A) under the rearview mirror harness cover base (B) using a piano wire, then remove the base.
2. Scrape off all of the original adhesive tape with a putty knife from the windshield. Clean the bonding surface on the inside face of the windshield with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil and grease.</td>
</tr>
</table>

Installation

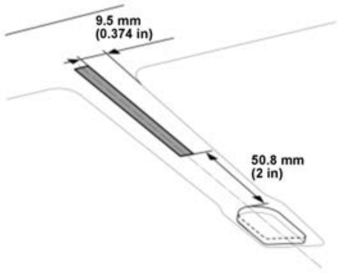
1. Rearview Mirror Harness Cover Base - Install



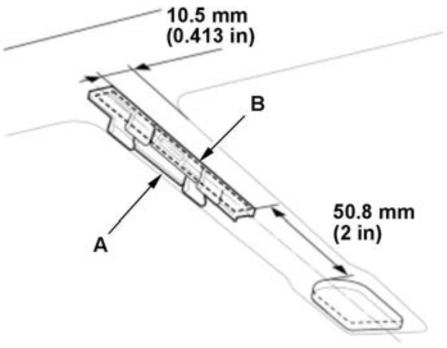
1. If you are reinstalling the original rearview mirror harness cover base (A), scrape off all of the original adhesive tape from the base with a putty knife. Clean the base surface with isopropyl alcohol. Apply primer to the base as shown, and attach the adhesive tape (B) to the base.

Adhesive tape:

Thickness	0.8 mm (0.031 in)
Width	7 mm (0.28 in)



2. Before installing the rearview mirror harness cover base, apply primer to the area where the harness cover base will be installed to the inside face of the windshield. Let the primer dry at least 10 minutes, then attach the rearview mirror harness cover base to the windshield within 12 hours.



3. Install the rearview mirror harness cover base (A) with the adhesive tape (B) to the inside face of the windshield as shown.

2. **Rearview Mirror - Install**

REMOVAL, INSTALLATION & TEST

POWER MIRROR SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

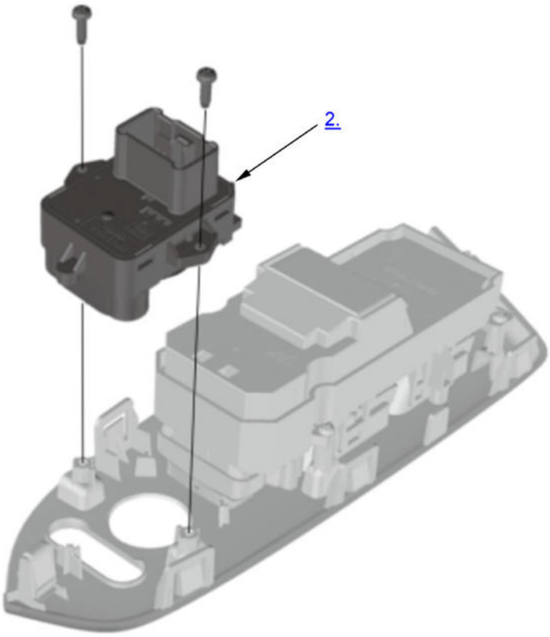

Fig. 6: Power Mirror Switch Components
Courtesy of HONDA, U.S.A., INC.

1. **Front Door Power Window Switch Panel - Remove**
2. Power Mirror Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Power Mirror Switch - Test

   1. Check the power mirror switch (A) according to the table.

   NOTE:

   - When an LED is located between terminals, check if the LED lights by connecting power and ground to the LED.
   - Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

2. If the result is not as specified, replace the power mirror switch.

DESCRIPTION & OPERATION

AUTOMATIC DIMMING MIRRORS SYSTEM DESCRIPTION

Basic Control/Function

Based on each signal, the control unit judges whether the light at the rear of the vehicle is stronger than the light sensed at the front. If the control unit judges that the light sensed by the rear-facing lux level sensor is brighter than the light sensed by the front-facing lux level sensor, it transmits a signal relaying that information to the drive circuit.

When shifting the transmission to the R position/mode while automatic dimming control is in operation, the automatic dimming turns off and the mirror returns to its highest state of reflectivity. When shifting the transmission out of the R position/mode, the automatic dimming control function is reactivated.

Fail-safe Function

In case of a lux level sensor malfunction, the mirror will become clear as a fail-safe action.

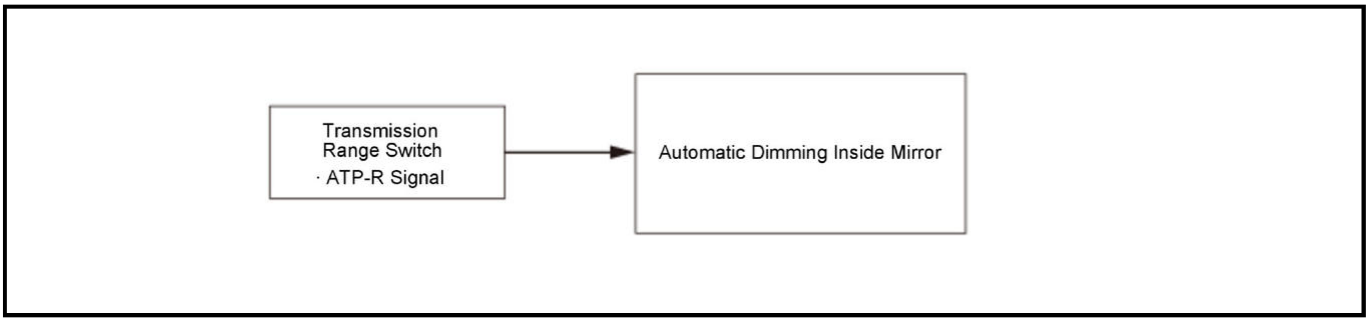
AUTOMATIC DIMMING MIRRORS SYSTEM DESCRIPTION - COMPONENTS

Inside Mirror

The front-facing lux level sensor is attached to the front of the mirror housing. Day or night, it senses the amount of ambient light at the front of the vehicle, and that signal is transmitted to the control unit located inside the mirror housing. The rear-facing lux level sensor is attached to the rear of the mirror housing. It senses the amount of light or glare at the rear of the vehicle, and transmits that signal to the control unit.

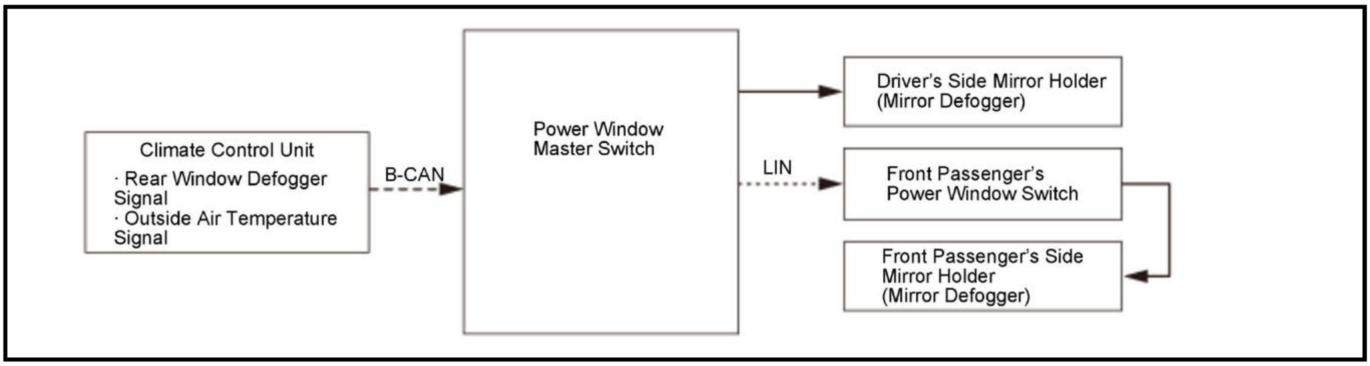
AUTOMATIC DIMMING MIRRORS SYSTEM DESCRIPTION - SYSTEM DIAGRAM

For locations of each component on the vehicle, refer to Component Location Index



POWER MIRRORS SYSTEM DESCRIPTION

Mirror Defogger Function (With Mirror Defogger)



Climate Control Unit
· Rear Window Defogger Signal
· Outside Air Temperature Signal
B-CAN
Power Window Master Switch
LIN
Driver's Side Mirror Holder (Mirror Defogger)
Front Passenger's Power Window Switch
Front Passenger's Side Mirror Holder (Mirror Defogger)

Manual Function

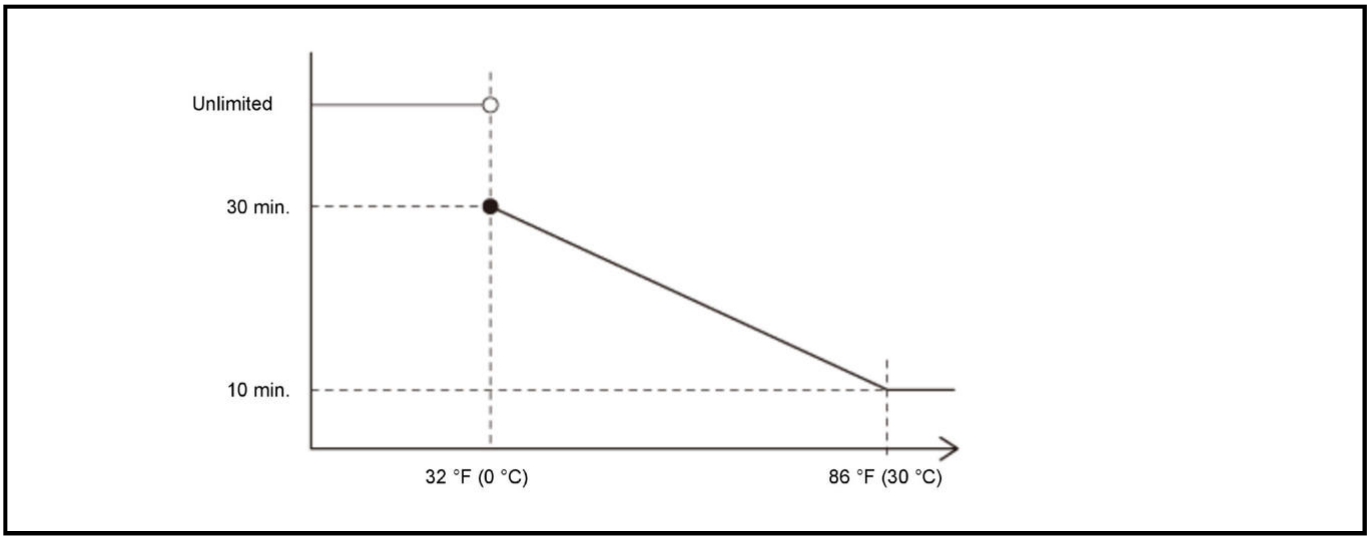
The mirror defogger is controlled by the climate control unit. When the vehicle is turned to the ON mode and the rear window defogger/mirror defogger switch is pressed, the climate control unit sends the defogger ON signal as a B-CAN signal to the power window master switch. The power window master switch operates the driver's side mirror defogger, and sends the defogger ON signal via LIN to the front passenger's power window switch to operate the passenger's side mirror defogger.

Auto Mirror Defogger Function

When the power window master switch receives a signal that the outside air temperature is 41 deg.F (5 deg.C) or below from the outside air temperature sensor, the power window master switch automatically turns on the left and right mirror defoggers within 10 seconds after the vehicle is turned to the ON mode. The mirror defogger output automatically stops in 10 minutes as a result of its timer. If the power window master switch receives a rear window defogger/mirror defogger switch input signal from the climate control unit during mirror defogger output, the power window master switch shuts off the auto operation function immediately.

Defogger Timer Function

The mirror defogger provides the timer control function that is controlled by the climate control unit. The timer control is operated by turning the vehicle to ON mode, then turning on the rear window defogger/mirror defogger switch. The timer operating time varies according to ambient temperature. If the rear window defogger/mirror defogger switch is turned on when the timer is active, it toggles between ON and OFF every time the switch is pressed.



POWER MIRRORS SYSTEM DESCRIPTION - COMPONENTS

Power Mirror

The power mirror has a built-in power mirror actuator, and the power mirror defogger.

Power Window Master Switch

During power mirror control, the power window master switch operates the mirror defogger on the driver's side via B-CAN signal input.

Front Passenger's Power Window Switch

During power mirror control, the front passenger's power window switch receives a signal from the power window master switch via LIN and operates the mirror defogger on the passenger's side.

Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 4.

With the connector still disconnected, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
19*17	BRN*YEL	Vehicle ON mode, connect terminals No. 1 and No. 17, and terminals No. 19 and No. 3 with jumper wires.	Check the right power mirror operation: The right power mirror should move LEFT.	• Faulty right power mirror • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Vehicle ON mode, connect terminals No. 1 and No. 19, and terminals No. 17 and No. 3 with jumper wires.	Check the right power mirror operation: The right power mirror should move RIGHT.	

*1: With mirror defogger

*2: With panoramic glass roof

10	PNK	Vehicle ON mode, power mirror switch in RIGHT mirror position	Measure the voltage to ground: There should be battery voltage when the power mirror switch LEFT or DOWN is pressed.	Faulty power mirror switch An open or high resistance in the wire
11	RED	Vehicle ON mode, power mirror switch in RIGHT mirror position	Measure the voltage to ground: There should be battery voltage when the power mirror switch RIGHT or DOWN is pressed.	Faulty power mirror switch An open or high resistance in the wire
12	GRY	Vehicle ON mode	Measure the voltage to ground: There should be battery voltage when the	Faulty power mirror switch

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
			power mirror switch UP or LEFT is pressed.	- An open or high resistance in the wire
15* 1	PNK	Vehicle ON mode, connect terminals No. 18 and No. 15 with a jumper wire	Check the left power mirror defogger operation: The left power mirror defogger should work (the inside lower edge becomes warm).	- Faulty left power mirror defogger - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire

*1: With mirror defogger

*2: With panoramic glass roof

*3: With moonroof

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
30	PNK	Vehicle ON mode, connect terminals No. 18 and No. 30 with a jumper wire	Check the power mirror switch light operation: The power mirror switch light should come on.	- Faulty LED - Faulty power mirror switch - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire
36	BLU	Disconnect these connectors: - Front passenger's power window switch 37P connector - Panoramic glass roof motor-control unit 14P connector* 2 - Moonroof motor-control unit 14P connector* 3	Check for continuity between terminal No. 36 and front passenger's power window switch 37P connector terminal No. 34: There should be continuity.	An open in the LIN(P/W) wire
			Check for continuity between terminal No. 36 and panoramic glass roof motor-control unit 14P connector terminal No. 12: There should be continuity.	An open in the LINP/W) wire
			Check for continuity between terminal No. 36 and moonroof motor-control unit 14P connector terminal No. 12: There should be continuity.	An open in the LIN(P/W) wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the LIN(P/W) wire

*1: With mirror defogger

*2: With panoramic glass roof

*3: With moonroof

Reconnect the connector, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, **replace the power window master switch** .

NOTE: After replacing the power window master switch, **do the resetting the power window control unit** .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
4	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
18	LT GRN	Vehicle ON mode	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
3	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
29	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire

TEST

AUTOMATIC DIMMING MIRRORS TEST

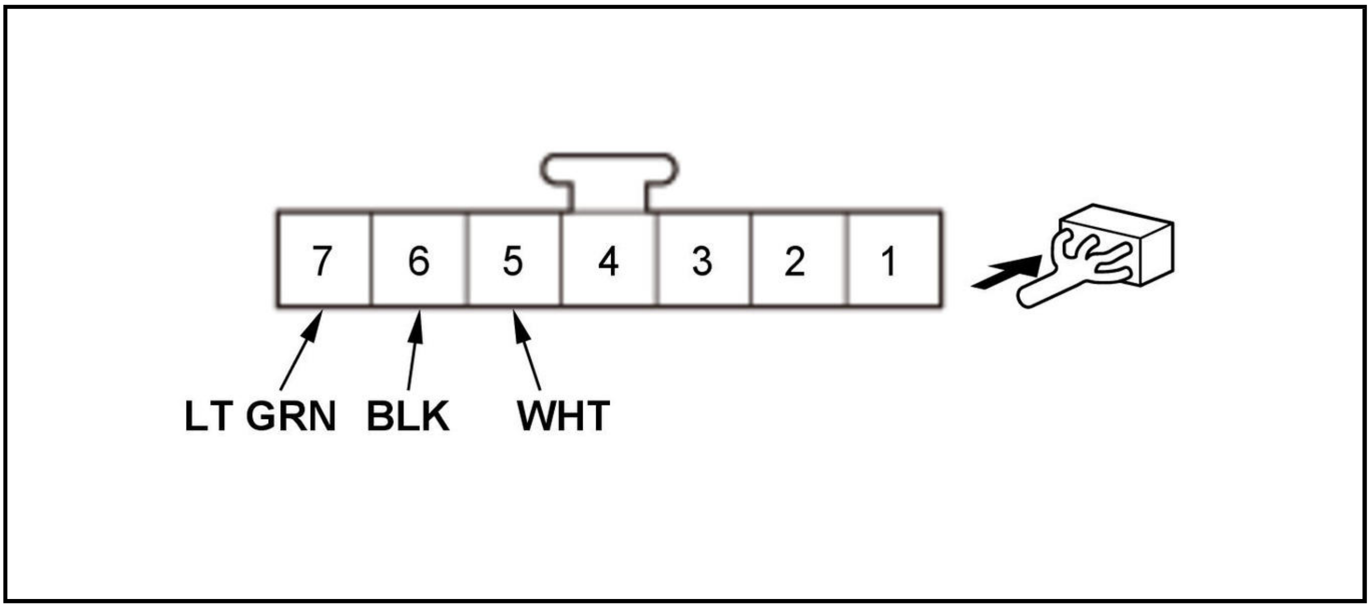
1. Turn the vehicle to the ON mode. Measure the voltage between terminal No. 7 and body ground.

- If there is battery voltage, go to step 3.
- If there is no voltage, check for:
-
    - -

      Blown No. D5 (10 A) fuse in the under-dash fuse/relay box
    - -

      An open or high resistance in the wire

Automatic Dimming Inside Mirror 7P Connector (female terminals)



Measure the voltage between terminal No. 6 and body ground.

- If there is less than 0.2 V, go to step 4.
- If there is voltage more than 0.2 V, check for:
-
    - -

      An open or high resistance in the ground wire
    - -

      Poor ground (G401)

Measure the voltage between terminal No. 5 and body ground with the shift lever in R position/mode.

- If there is battery voltage, **replace the rearview mirror** .
- If there is no voltage, check for:
-
    - -

      An open or high resistance in the wire
    - -

      Faulty under-dash fuse/relay box
    - -

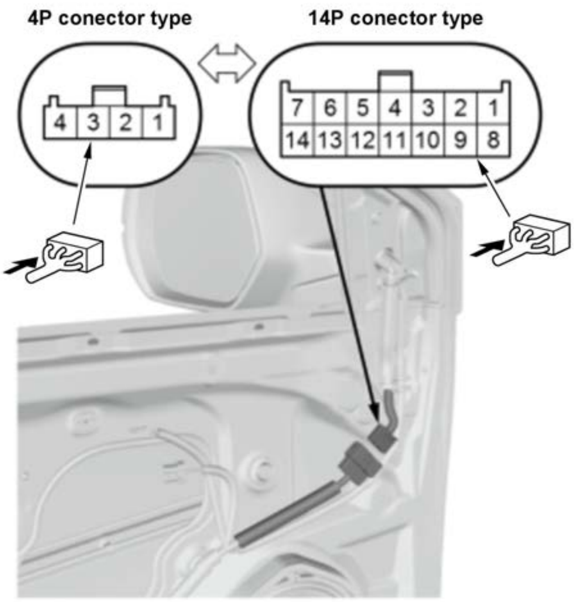
      Faulty reverse relay circuit
    - -

      Faulty transmission range switch

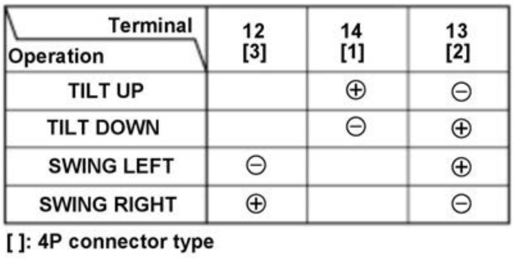
POWER MIRROR ACTUATOR TEST

Test

1. **Front Door Panel - Remove**
2. Power Mirror Actuator - Test



Left and Right Power Mirror Actuator



Terminal / Operation	12 [3]	14 [1]	13 [2]
TILT UP		⊕	⊖
TILT DOWN		⊖	⊕
SWING LEFT	⊖		⊕
SWING RIGHT	⊕		⊖

[ ]: 4P connector type

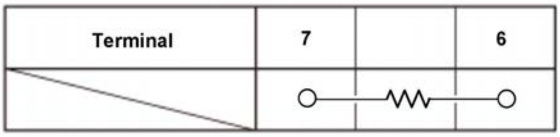
NOTE: Before testing, make sure not to short the power mirror actuator circuit.

1. Check the actuator operation by connecting power and ground according to the table.

2. If the mirror fails to work properly, check for an open or high resistance in the wire between the connector and the mirror holder. If the wire is OK, replace the actuator

.

Defogger



Terminal	7		6
	○	─⋀⋀⋀─	○

3. Check for continuity between the terminals according to the table. There should be continuity.

4. If there is no continuity, check for an open or high resistance in the wire between the connector and the mirror holder. If the wire is OK, replace the mirror holder

.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

DESCRIPTION & OPERATION

AUTOMATIC DIMMING MIRRORS SYSTEM DESCRIPTION

Basic Control/Function

Based on each signal, the control unit judges whether the light at the rear of the vehicle is stronger than the light sensed at the front. If the control unit judges that the light sensed by the rear-facing lux level sensor is brighter than the light sensed by the front-facing lux level sensor, it transmits a signal relaying that information to the drive circuit.

When shifting the transmission to the R position/mode while automatic dimming control is in operation, the automatic dimming turns off and the mirror returns to its highest state of reflectivity. When shifting the transmission out of the R position/mode, the automatic dimming control function is reactivated.

Failsafe Function

In case of a lux level sensor malfunction, the mirror will become clear as a failsafe action.

AUTOMATIC DIMMING MIRRORS SYSTEM DESCRIPTION - COMPONENTS

Inside Mirror

The front-facing lux level sensor is attached to the front of the mirror housing. Day or night, it senses the amount of ambient light at the front of the vehicle, and that signal is transmitted to the control unit located inside the mirror housing. The rear-facing lux level sensor is attached to the rear of the mirror housing. It senses the amount of light or glare at the rear of the vehicle, and transmits that signal to the control unit.

AUTOMATIC DIMMING MIRRORS SYSTEM DESCRIPTION - SYSTEM DIAGRAM

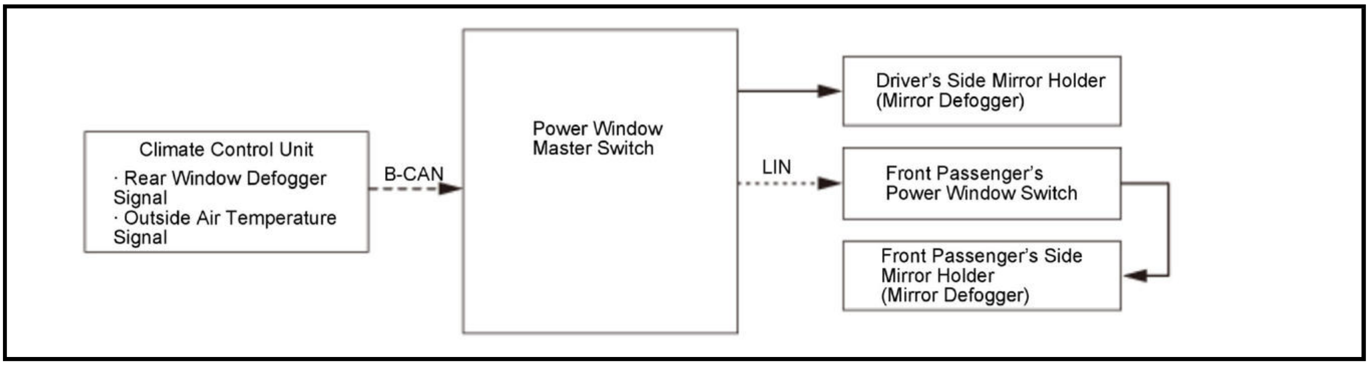
POWER MIRRORS SYSTEM DESCRIPTION

Mirror Defogger Function (With Mirror Defogger)



Climate Control Unit
· Rear Window Defogger Signal
· Outside Air Temperature Signal
B-CAN
Power Window Master Switch
LIN
Driver's Side Mirror Holder (Mirror Defogger)
Front Passenger's Power Window Switch
Front Passenger's Side Mirror Holder (Mirror Defogger)

Manual Function

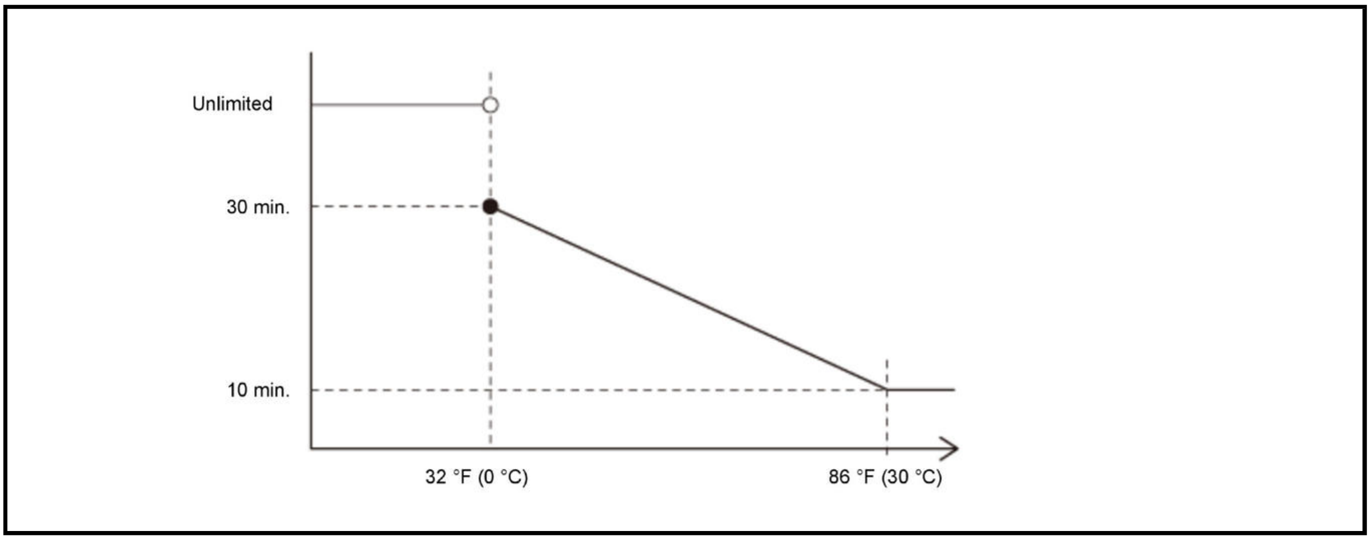
The mirror defogger is controlled by the climate control unit. When the vehicle is turned to the ON mode and the rear window defogger/mirror defogger switch is pressed, the climate control unit sends the defogger ON signal as a B-CAN signal to the power window master switch. The power window master switch operates the driver's side mirror defogger, and sends the defogger ON signal via LIN to the front passenger's power window switch to operate the passenger's side mirror defogger.

Auto Mirror Defogger Function

When the power window master switch receives a signal that the outside air temperature is 41 deg.F (5 deg.C) or below from the outside air temperature sensor, the power window master switch automatically turns on the left and right mirror defoggers within 10 seconds after the vehicle is turned to the ON mode. The mirror defogger output automatically stops in 10 minutes as a result of its timer. If the power window master switch receives a rear window defogger/mirror defogger switch input signal from the climate control unit during mirror defogger output, the power window master switch shuts off the auto operation function immediately.

Defogger Timer Function

The mirror defogger provides the timer control function that is controlled by the climate control unit. The timer control is operated by turning the vehicle to ON mode, then turning on the rear window defogger/mirror defogger switch. The timer operating time varies according to ambient temperature. If the rear window defogger/mirror defogger switch is turned on when the timer is active, it toggles between ON and OFF every time the switch is pressed.



POWER MIRRORS SYSTEM DESCRIPTION - COMPONENTS

Power Mirror

The power mirror has a built-in power mirror actuator, and the power mirror defogger.

Power Window Master Switch

During power mirror control, the power window master switch operates the mirror defogger on the driver's side via B-CAN signal input.

Front Passenger's Power Window Switch

During power mirror control, the front passenger's power window switch receives a signal from the power window master switch via LIN and operates the mirror defogger on the passenger's side.

REMOVAL & INSTALLATION TEST

MOONROOF SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: The moonroof switch is built into the interior light switch.

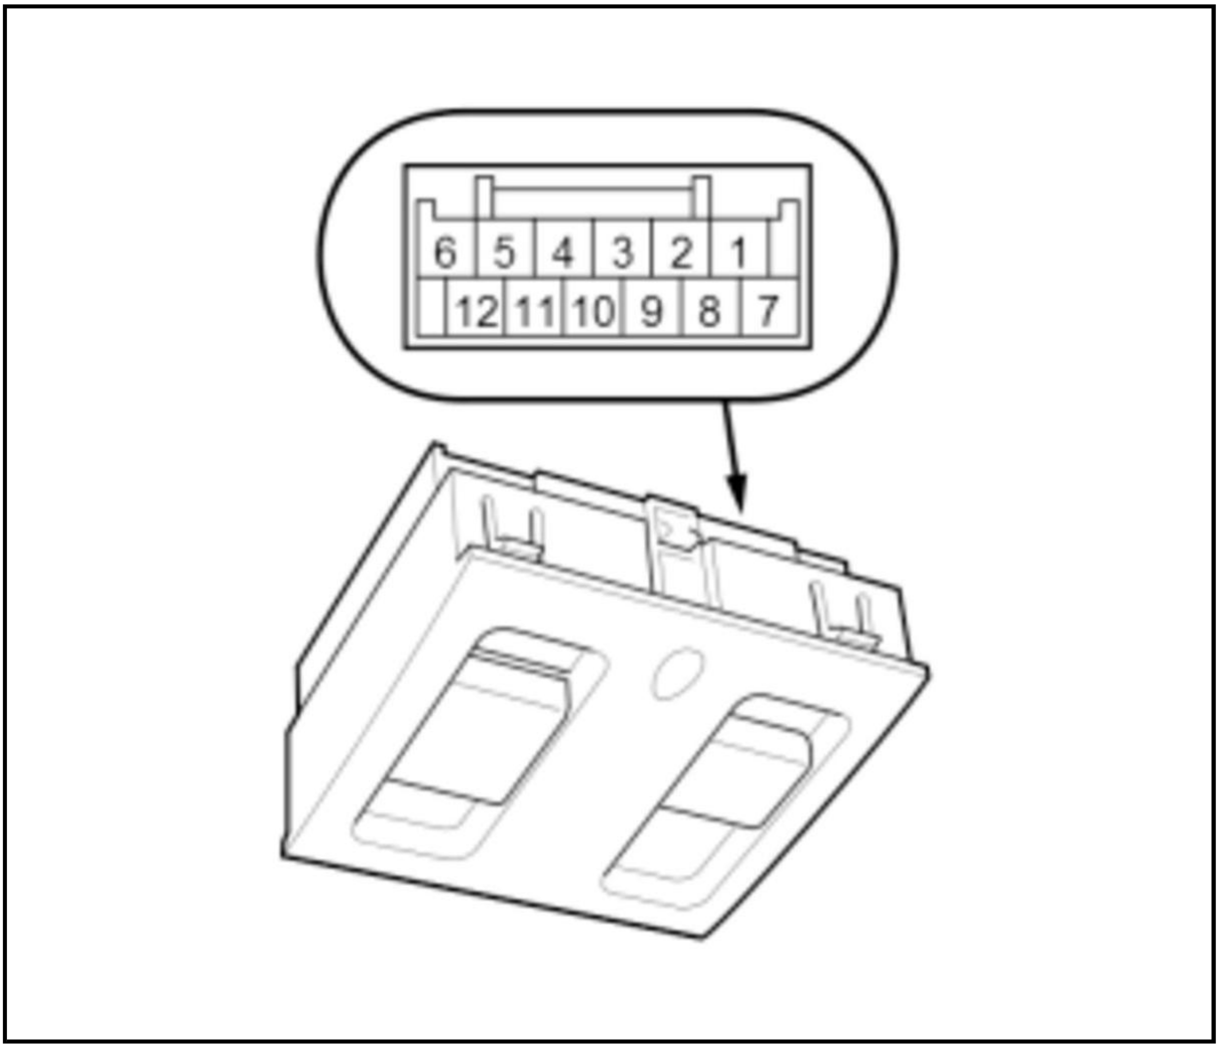
1. Front Individual Map Light - Remove
2. Moonroof Switch - Remove
3. All Removed Parts - Install

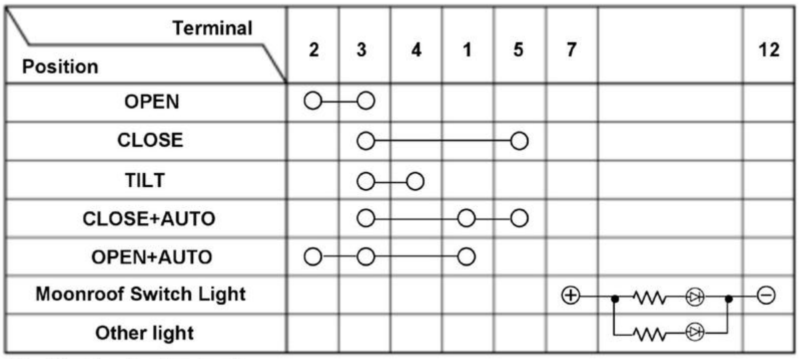
1. Install the parts in the reverse order of removal.

Test

1. Moonroof Switch - Test

1. Check for continuity between the terminals in each switch position according to the table.





Position \ Terminal	2	3	4	1	5	7		12
OPEN	○	○						
CLOSE		○			○			
TILT		○	○					
CLOSE+AUTO		○		○	○			
OPEN+AUTO	○	○		○				
Moonroof Switch Light						⊕		⊖
Other light								

○—○ = Continuity check
⊕—⊖ = Voltage for LED

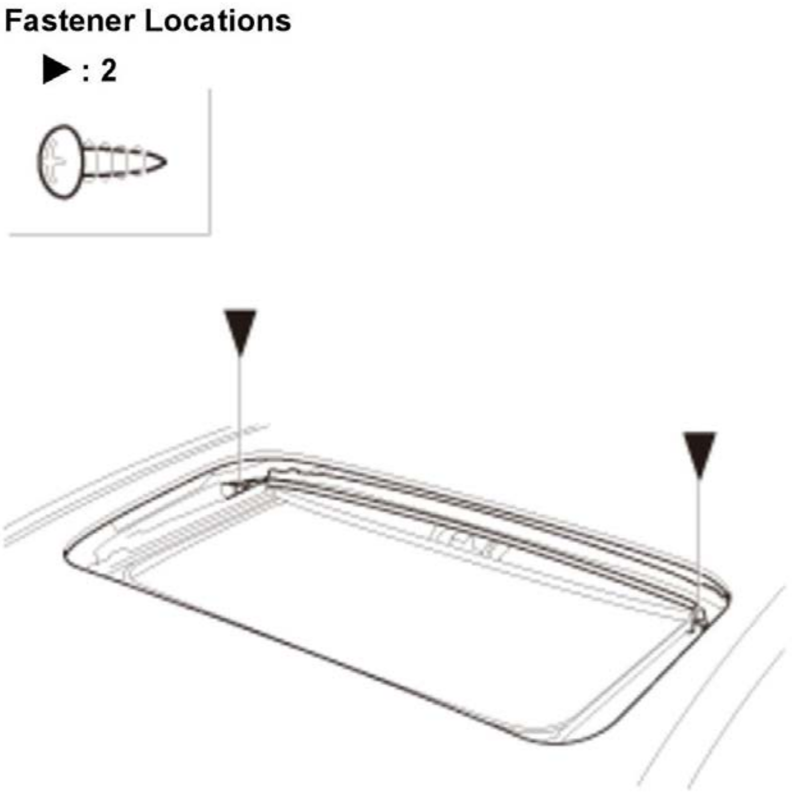
2. If the continuity is not as specified, replace the moonroof switch.

REMOVAL AND INSTALLATION

MOONROOF DRAIN CHANNEL REMOVAL AND INSTALLATION

Removal and Installation

1. Moonroof Glass - Remove
2. Moonroof Drain Channel - Remove



1. Remove the screws.

	2. Remove the drain channel (A).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

MOONROOF DRAIN CHANNEL SLIDER AND CABLE ASSEMBLY REMOVAL AND INSTALLATION

Removal and Installation

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Moonroof Motor-Control Unit - Remove**
2. **Moonroof Drain Channel - Remove**
3. **Moonroof Frame - Remove**
4. Moonroof Drain Channel Slider and Moonroof Cable Assembly - Remove

	1. Slide the drain channel slider and the cable assemblys (A) back from the frame (B), then remove it.

	2. Remove the drain channel slider (A) and the moonroof link (B).

5. All Removed Parts - Install

	1. Install the parts in the reverse order of removal. **NOTE:** • **Apply multipurpose grease to the glass brackets (A) and the guide rail area of the frame (B) indicated by the arrows.** • **Before reinstalling the motor, make sure both link lifters are parallel, and in the tilt up position.**

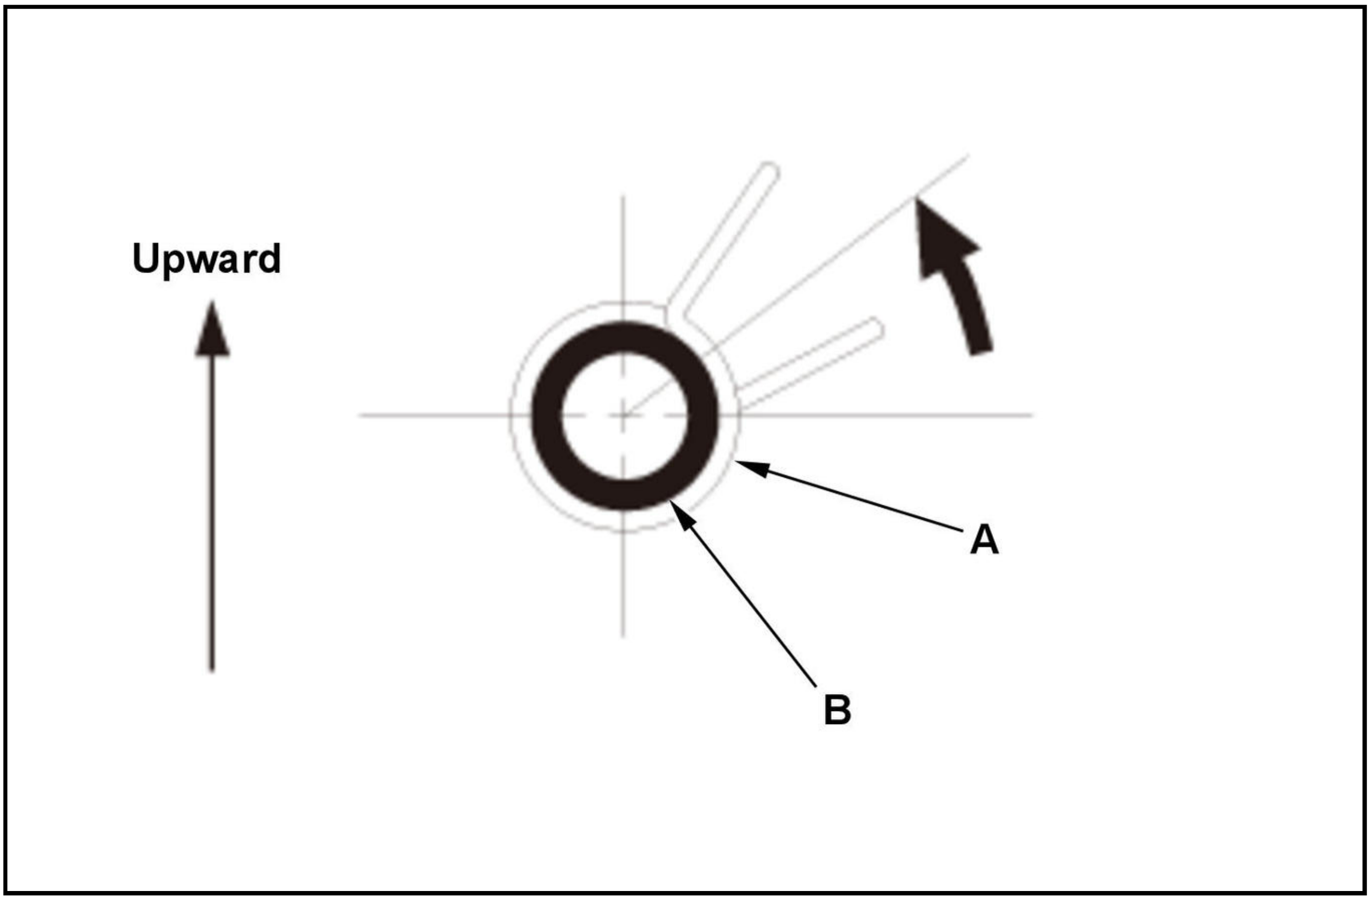
6. Moonroof Glass Position - Adjust
7. Moonroof Motor-Control Unit - Reset
8. Water Leaks - Check

MOONROOF FRAME AND DRAIN TUBE REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- How to read the torque specifications .
- SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
- Before installing the frame, clear the drain tubes and the drain valves using compressed air.
- To install a new drain tube, tie the string left in the body during drain tube removal to the top end of the new drain tube, and pull it up into the roof.
- When connecting the drain tubes, slide them over the frame nozzles at least 10 mm (0.39 in).
- Check the frame seal.
- When installing the frame, first attach the rear hook into the body hole.
- Install the tube clips (A) on the drain tubes (B) as shown.



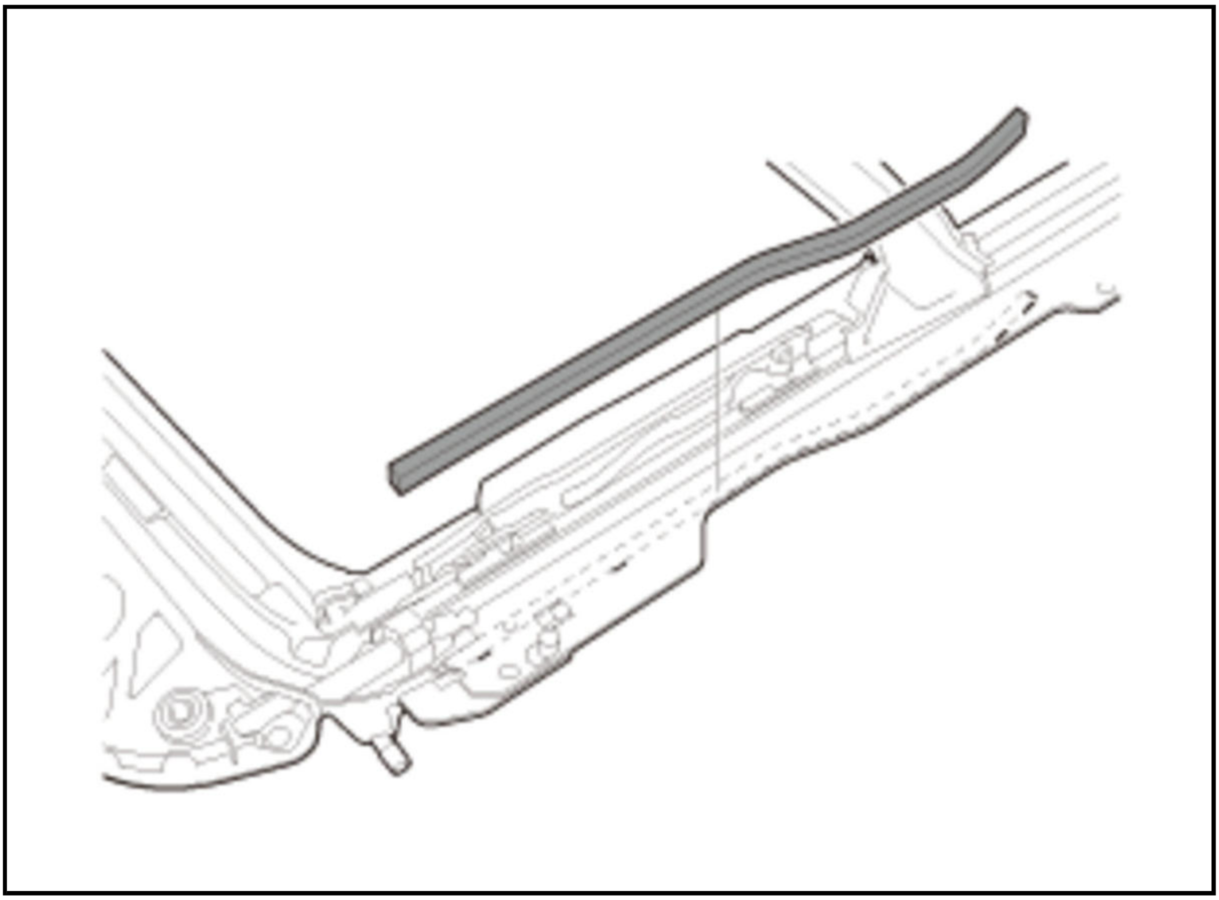
Moonroof Frame

1. Headliner - Remove
2. Moonroof Frame - Remove

	1. Disconnect the front drain tubes (A) and the rear drain tubes (B).

 Fastener Locations ▶ : 10 A 9.4 (0.96, 6.9) Loosen the bolt.	2. Remove the moonroof frame (A).

3. Moonroof Frame Seal - Remove



4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. **Moonroof Glass Position - Adjust**

Front Drain Tube

6. **Headliner - Remove**
7. **Driver's Dashboard Undercover - Remove**
8. **Front Inner Fender - Remove**
9. Moonroof Front Drain Tube - Remove

	1. Pull the front drain valve (A) out of the body hole. 2. Tie a string to the top end of the front drain tube (B), then pull the drain tube down out of the pillar. Leave the string in the pillar to use when reinstalling the drain tube.

10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

11. **Water Leaks - Check**

Rear Drain Tube

12. **Headliner - Remove**
13. **Rear Side Trim Panel - Remove**
14. Moonroof Rear Drain Tube - Remove

	1. Pull the rear drain valve (A) out of the body hole. 2. Tie a string to the top end of the rear drain tube (B), then pull the drain tube down out of the pillar. Leave the string in the pillar to use when reinstalling the drain tube.

15. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

16. **Water Leaks - Check**

MOONROOF GLASS REMOVAL AND INSTALLATION

Removal and Installation

NOTE: **How to read the torque specifications**

1. Moonroof Glass - Remove

 Fastener Locations ▶ : 2 4.2 (0.43, 3.1) Front	1. Remove the bolts. 2. Repeat on the opposite side.

	3. Remove the glass (A) by lifting it up.

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

3. **Moonroof Glass Position - Adjust**

MOONROOF GLASS ROOF SEAL REMOVAL AND INSTALLATION

Removal

1. **Moonroof Glass - Remove**
2. Moonroof Glass Roof Seal - Remove

	1. Place a piece of masking tape (A) on the middle of the front edge of the moonroof glass (B). Make sure that the tape is on the glass only, and is not touching the glass roof seal (C). 2. Place a mark (D) on the masking tape that aligns with the seam (E) of the glass roof seal. 3. Push down on the top of the original glass roof seal with your thumb until a small section separates from the moonroof glass. Once a section has started to separate, grip it and pull outward, working around the moonroof glass until the glass roof seal is completely removed (note the locations of the holes in the glass roof seal).

Installation

1. Moonroof Glass Roof Seal - Install

	1. Align the seam (A) of the new glass roof seal (B) to the mark (C) on the masking tape (D). Make sure the holes are pointed in the same direction as noted in removal procedure. 2. Press the ridge of the new glass roof seal into the groove on the moonroof glass starting at the seam. Work toward one corner; then go back to the middle and work toward the opposite corner. **NOTE:** **Be careful not to stretch the glass roof seal.** 3. Continue pressing along one side, from corner to corner; then press along the opposite side, from corner to corner. 4. At the rear of the moonroof glass, continue pressing from one corner to the middle; then press from the opposite corner to the middle until the glass roof seal is completely installed. 5. Check for proper fit of the new glass roof seal by opening and closing the moonroof.

2. Moonroof Glass - Install

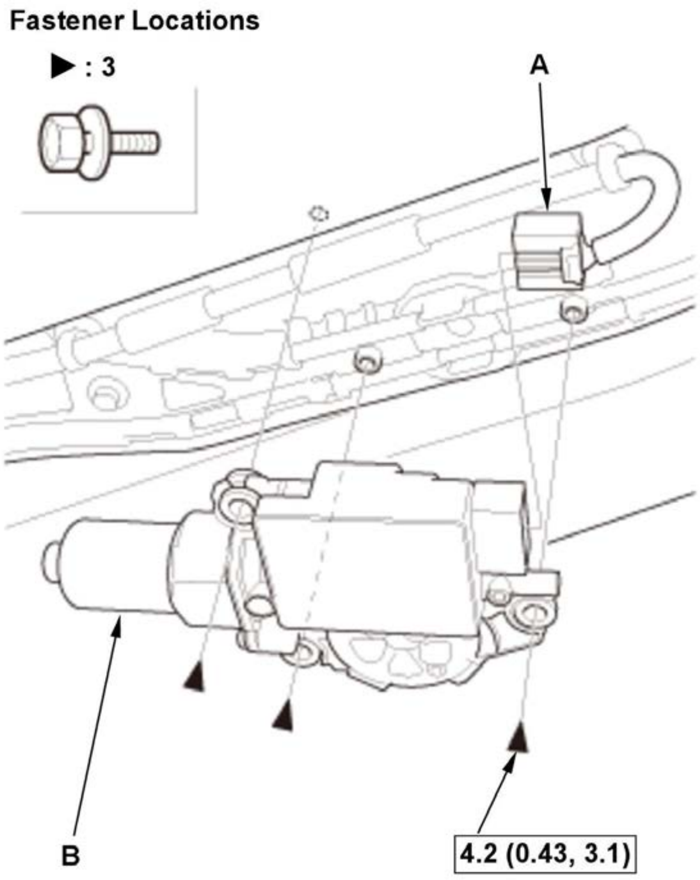
MOONROOF MOTOR-CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications

1. Headliner - Remove
2. Moonroof Motor-Control Unit - Remove

<table>
<tr>
<td>



</td>
<td>
1. Disconnect the connector (A).

2. Remove the moonroof motor-control unit (B).
</td>
</tr>
</table>

3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

4. Moonroof Motor-Control Unit - Reset

MOONROOF SUNSHADE REMOVAL AND INSTALLATION

Removal and Installation

1. Moonroof Frame - Remove
2. Moonroof Sunshade - Remove

	1. Remove the moonroof sunshade rear stoppers (A). 2. Remove the moonroof sunshade (B).

3. Moonroof Sunshade Handle Bracket - Remove

	1. Remove the moonroof sunshade handle bracket (A), then remove the moonroof sunshade handle (B) from the moonroof sunshade (C).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

MOONROOF WIND DEFLECTOR REMOVAL AND INSTALLATION

Removal and Installation

1. Moonroof Wind Deflector - Remove

	1. Open the glass fully. 2. Release both deflector springs (A) and both deflector blades (B). 3. Remove the wind deflector (C).

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

3. **Moonroof Motor-Control Unit - Reset**

PANORAMIC GLASS ROOF CABLE ASSEMBLY REMOVAL AND INSTALLATION

Removal and Installation

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Panoramic Glass Glass Roof Motor - Remove**
2. **Panoramic Glass Drain Channel - Remove**
3. Glass Roof Cable Assembly and Glass Bracket - Remove

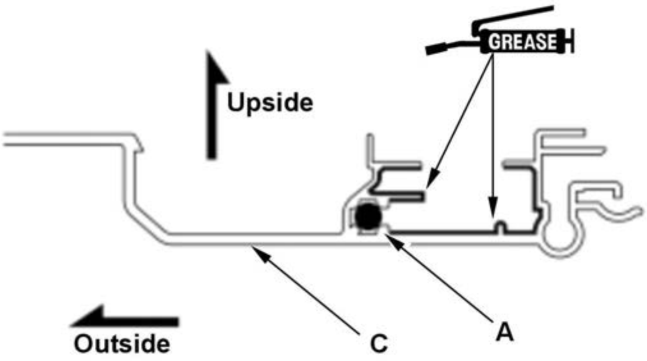
	1. Tilt the glass brackets (A) down by sliding the link lifters (B) back, then slide both glass brackets back with the link lifters.

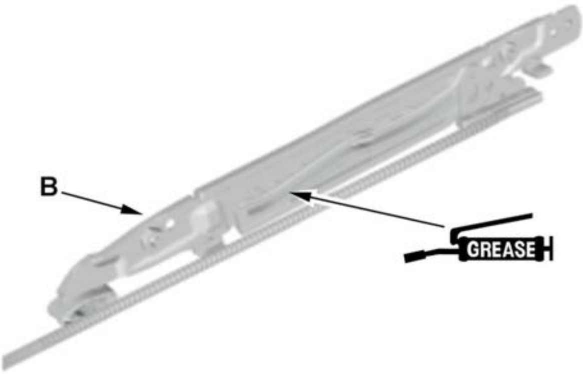
	2. Slide the glass brackets (A) on the glass roof cables (B) towards the rear, and pull it out from the frame (C). 3. Pull out the cable assemblies.

	4. Remove the glass bracket link (A) from the glass bracket (B).

	5. If necessary, remove the set plates (A).

4. All Removed Parts - Install





1. Install the parts in the reverse order of removal.

NOTE:

- **Before install the glass roof cables (A), apply multipurpose grease to the glass brackets (B) and the guide rail areas of the frame (C) indicated by the arrows.**
- **Alignment the bracket links.**
-
  - -

    Insert the glass brackets until it comes to a stop against the frame.
-
  - -

    Make sure the glass roof cables are correctly installed.
-
  - -

    Slide the link lifters (D) forward until it is against the tip of the guide rails (E).
-
  - -

	**Before reinstalling the motor, make sure both link lifters are parallel, and in the tilt up position.**

5. Panoramic Glass Glass Position - Adjust
6. Panoramic Glass Roof Motor-Control Unit - Reset

PANORAMIC GLASS ROOF DRAIN CHANNEL REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- How to read the torque specifications .
- SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Panoramic Glass Front Glass - Remove
2. Panoramic Glass Sunshade - Remove
3. Panoramic Glass Drain Channel - Remove

	1. Remove the front drain channel (A).

	2. If necessary, remove the drain channel seals (A).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. **Panoramic Glass Glass Position - Adjust**

PANORAMIC GLASS ROOF FRAME AND DRAIN TUBE REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- **How to read the torque specifications** .
- SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.
- **Reset the panoramic glass roof motor-control unit** , when the panoramic glass roof was moved manually.

- **Reset the power sunshade motor-control unit** , when the power sunshade was moved manually.

Frame

1. **Headliner - Remove**
2. These Items - Remove

   If necessary, remove these items.

   - **Remove the panoramic front glass**
   - **Remove the panoramic glass wind deflector**
   - **Remove the motor**
3. Panoramic Glass Frame - Remove

	1. Disconnect the front drain tubes (A) and the rear drain tubes (B).

	2. Remove the bolts and lower the frame to release the pins (A). 3. With the help of an assistant, then remove the panoramic glass roof frame (B).

4. All Removed Parts - Install

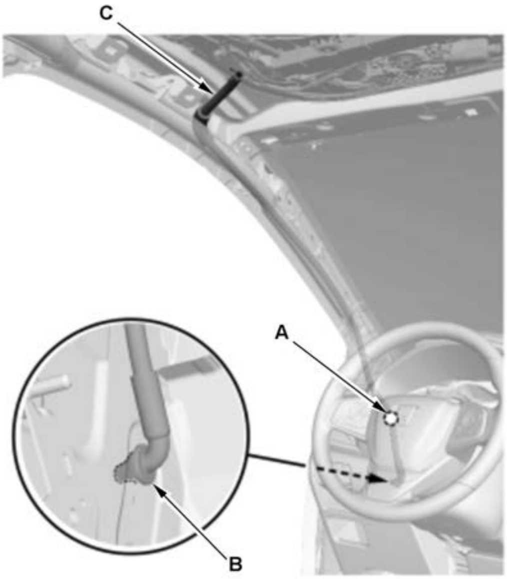
1. Install the parts in the reverse order of removal.

5. **Panoramic Glass Glass Position - Adjust**

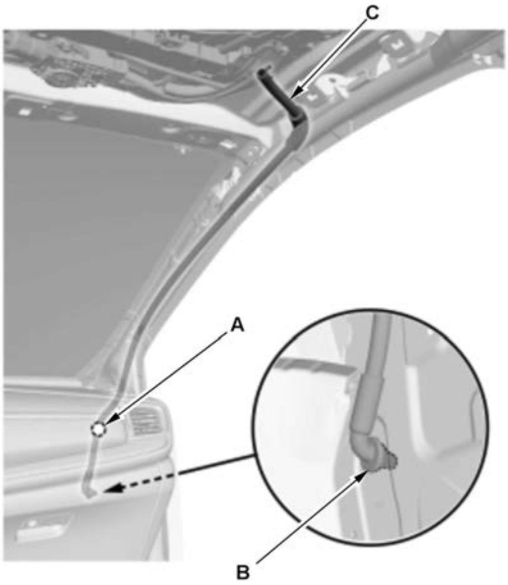
Front Drain Tube

6. **Headliner - Remove**
7. **Driver's Dashboard Undercover - Remove**
8. **Glove Box - Remove**
9. Front Drain Tube - Remove

Driver's Side



Passenger's Side

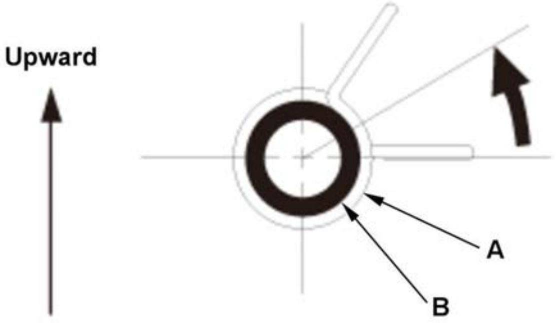


1. Remove the clip (A).

2. Pull the front drain valves (B) out of the body hole.

3. Tie a string to the top end of the front drain tubes (C), then pull the drain tubes down out of the pillars. Leave the string in the pillar to use when reinstalling the drain tubes.

10. All Removed Parts - Install



1. Install the parts in the reverse order of removal.

NOTE:

- **Before installing the drain tubes, clear the drain tubes and the drain valves using compressed air.**

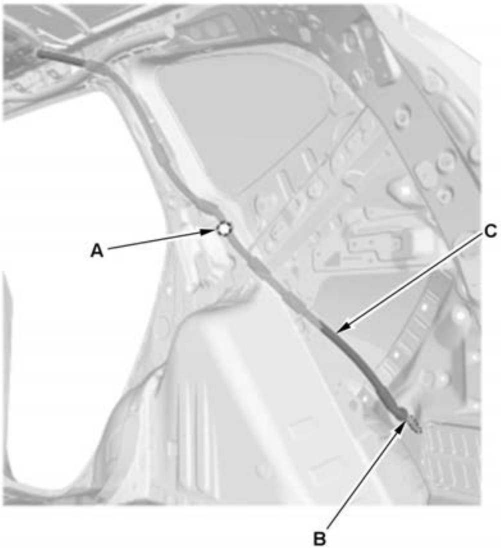
	- **When connecting the drain tubes, slide them over the frame nozzles at least 10 mm (0.39 in).** - **Install the tube clips (A) on the drain tubes (B) as shown.**

Rear Drain Tube

11. **Headliner - Remove**
12. **Subwoofer - Remove**
13. Rear Drain Tube - Remove

 **Left Side** **Right Side**	1. Remove the clip(s) (A). 2. Pull the rear drain valves (B) out of the body hole. 3. Tie a string to the top end of the rear drain tubes (C), then pull the drain tubes down out of the pillars. Leave the string in the pillar to use when reinstalling the drain tubes.



14. All Removed Parts - Install

	1. Install the parts in the reverse order of removal. **NOTE:** - **Before installing the drain tubes, clear the drain tubes and the drain valves using compressed air.** - **When connecting the drain tubes, slide them over the frame nozzles at least 10 mm (0.39 in).** - **Install the tube clips (A) on the drain tubes (B) as shown.**

PANORAMIC GLASS ROOF FRONT GLASS REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications

1. Panoramic Glass Inner Blind Cover - Remove

	1. Close the front glass roof fully. 2. Slide the sunshade all the way back. 3. Remove the inner blind cover (A). 4. Repeat on the opposite side.

2. Panoramic Glass Front Glass - Remove

 Fastener Locations ▶ : 2 4.2 (0.43, 3.1)	1. Remove the bolts. 2. Repeat on the opposite side.

	3. With the help of an assistant, then remove the front glass (A) by lifting it up.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **Panoramic Glass Glass Position - Adjust**

PANORAMIC GLASS ROOF MOTOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- **How to read the torque specifications.**
- SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

Sunshade Motor

1. **Headliner - Remove**
2. Sunshade Motor - Remove

 Fastener Locations ▶ : 3 A 4.2 (0.43, 3.1) B	1. Disconnect the connector (A). 2. Remove the panoramic sunshade motor (B).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **Power Sunshade Motor-Control Unit - Reset**

Glass Roof Motor

5. **Headliner - Remove**
6. Panoramic Glass Glass Roof Motor - Remove

 Fastener Locations ▶ : 3 A B 4.2 (0.43, 3.1)	1. Disconnect the connector (A). 2. Remove the panoramic glass roof motor (B).

7. All Removed Parts - Install

	1. Install the parts in the reverse order of removal. **NOTE:** **Remove the inner blind covers, and check the position of the link lifters (A) of the glass brackets (B) and that the link lifters is positioned within the area (C).**

8. Panoramic Glass Roof Motor-Control Unit - Reset

PANORAMIC GLASS ROOF REAR GLASS REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- **How to read the torque specifications** .
- SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Panoramic Glass Frame - Remove**
2. Panoramic Glass Rear Glass - Remove

	1. Remove the rear glass (A).

	2. If necessary, remove the rear glass bracket (A).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **Panoramic Glass Glass Position - Adjust**

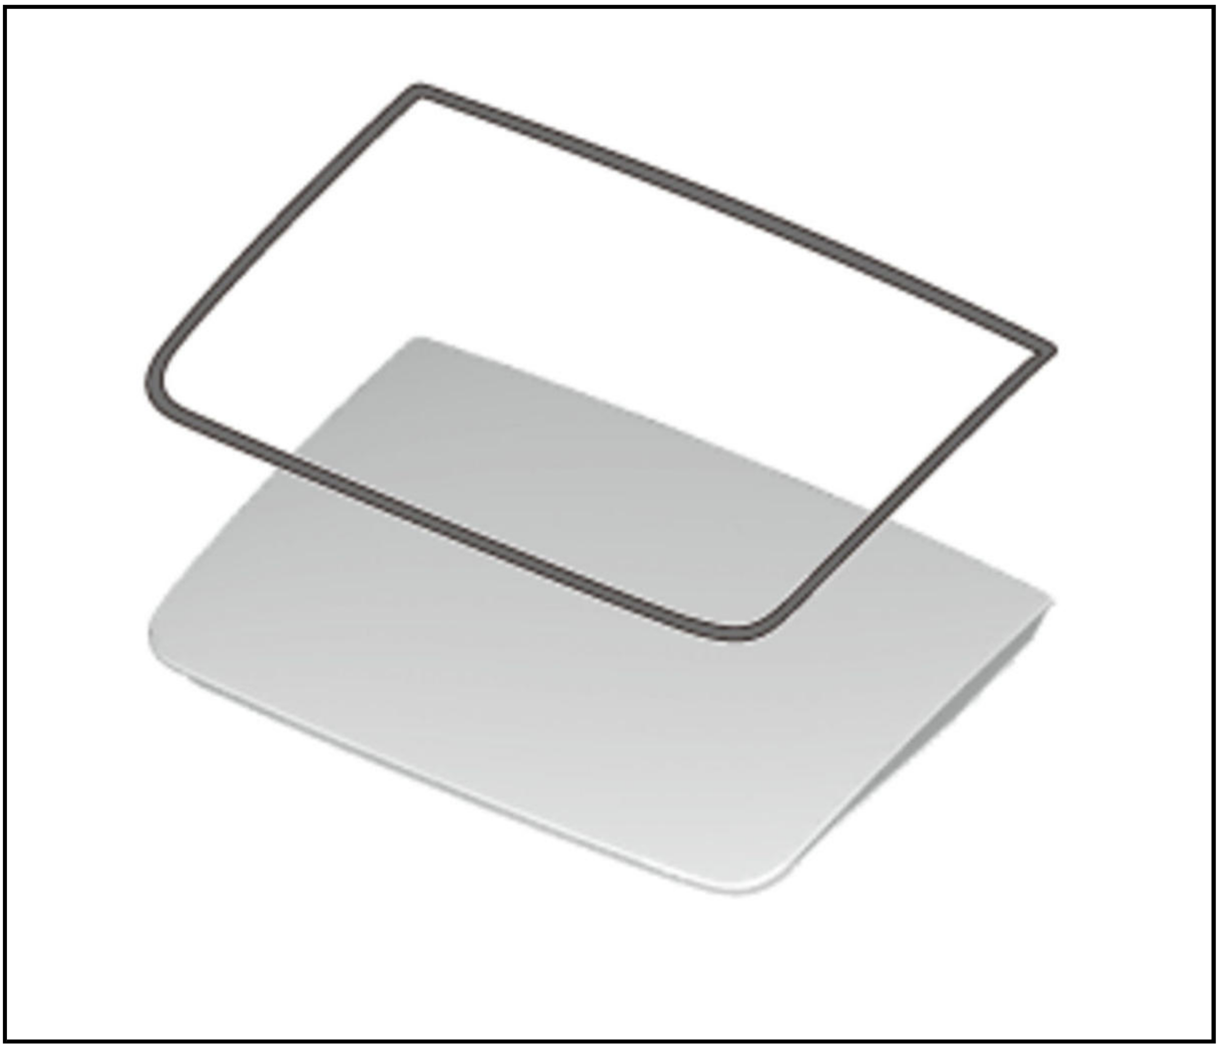
PANORAMIC GLASS ROOF SEAL REMOVAL AND INSTALLATION

Removal

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

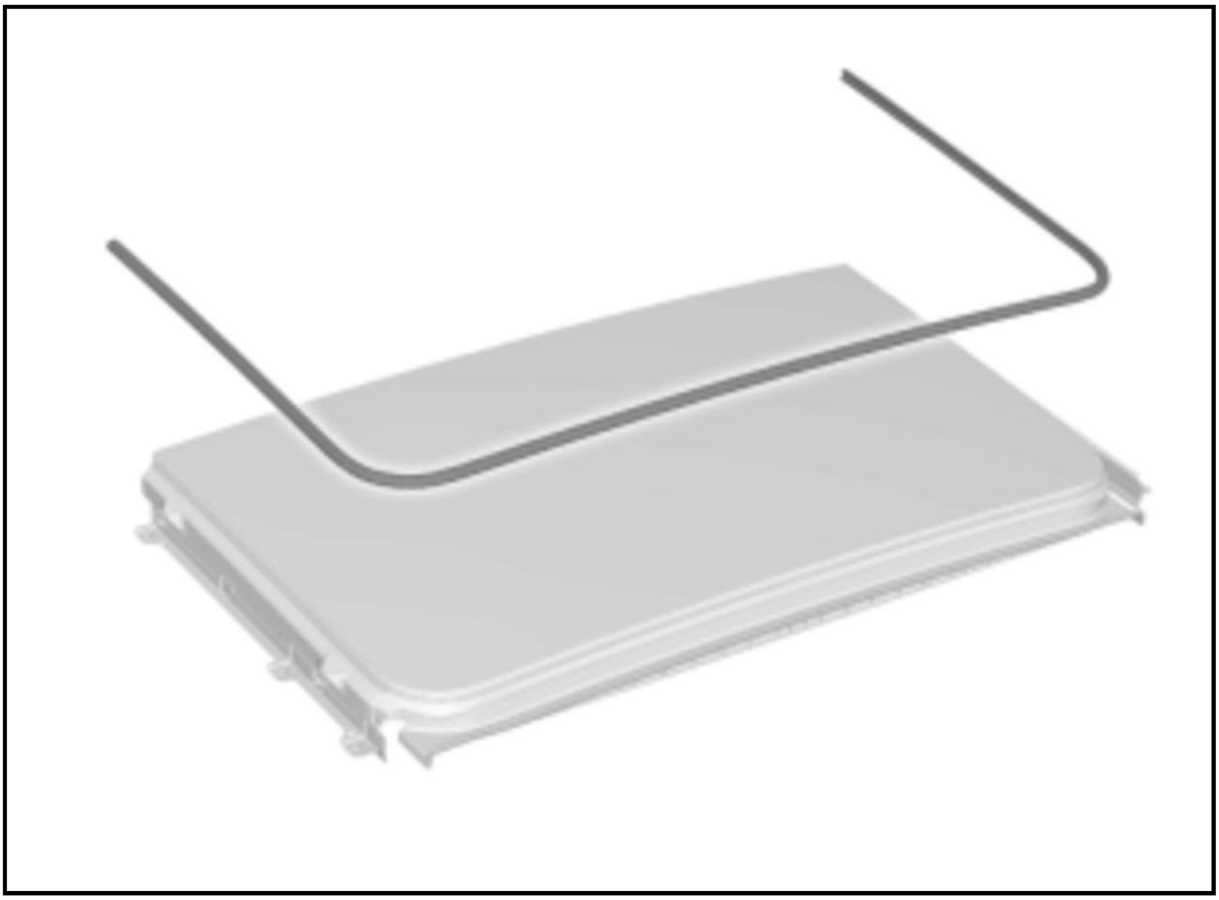
Front

1. **Panoramic Glass Front Glass - Remove**
2. Panoramic Glass Front Glass Roof Seal - Remove



Rear

3. **Panoramic Glass Rear Glass - Remove**
4. Panoramic Glass Rear Glass Roof Seal - Remove



Installation

Front

1. Panoramic Glass Front Glass Roof Seal - Install

	1. Press the two ends of the font glass roof seal (A) rear corners of the front glass (B). 2. Align the midpoint (C) of the font glass roof seal to the center (D) of the front side front glass, and then install it. **NOTE:** **Be careful not to stretch the front glass roof seal.**

	3. Install the font glass roof seal (A) to the front glass (B) as shown. **NOTE:** **After installation, make sure that the glass roof seal is not twisted or have any gaps.**

2. Panoramic Glass Front Glass - Install
3. Panoramic Glass Glass Roof Position - Check

Rear

4. Panoramic Glass Rear Glass Roof Seal - Install

	1. Align the notch (A) of the rear glass roof seal (B) to the projection (C) of the rear glass (D), and then press the rear glass roof seal onto both sides of the front of the rear glass. **NOTE:** - **Be careful not to stretch the rear glass roof seal.** - **Check the rear glass roof seal lines up with the edges of the rear glass as shown.**

	2. Install the rear glass roof seal (A) to the rear glass (B) as shown. **NOTE:** **After installation, make sure that the rear glass roof seal is not twisted or have any gaps.**
	3. Make sure the rear glass roof seal (A) line up with the edges of the rear glass (B) as shown.

5. Panoramic Glass Rear Glass - Install
6. Panoramic Glass Glass Roof Position - Check

PANORAMIC GLASS ROOF SUNSHADE CABLE ASSEMBLY REMOVAL AND INSTALLATION

Removal and Installation

NOTE: SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Panoramic Glass Front Glass - Remove
2. Sunshade Motor - Remove
3. Panoramic Glass Sunshade - Remove
4. Panoramic Glass Cable Assembly - Remove

 	1. Slide the shoe (A) on the sunshade cable towards the rear, and pull it out from the frame (B). 2. Pull out the cable assembly (C).

5. All Removed Parts - Install

  	1. Install the parts in the reverse order of removal. **NOTE:** - **Before install the sunshade cables (A), apply multipurpose grease to the guide rail areas of the frame (B) indicated by the arrow.** - **Make sure the sunshade cables are correctly installed.** - **Slide both shoes (C) to the front of the frame.** - **Before reinstalling the motor, make sure both shoes are parallel.**

6. Panoramic Glass Glass Position - Adjust

7. Power Sunshade Motor-Control Unit - Reset

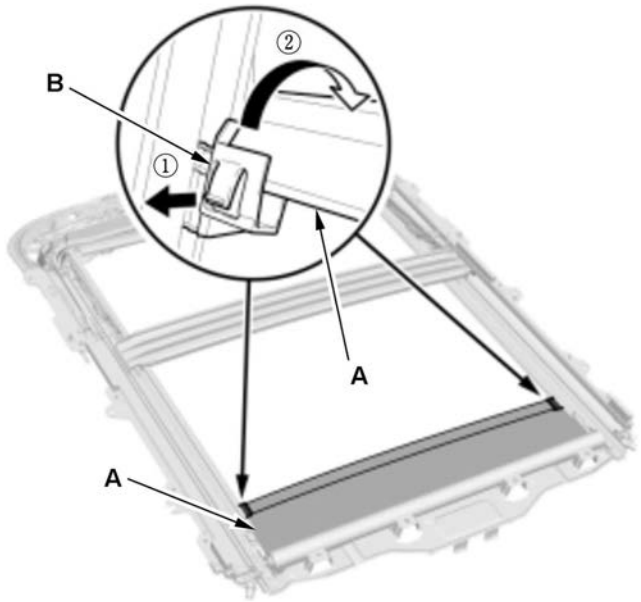
PANORAMIC GLASS ROOF SUNSHADE REMOVAL AND INSTALLATION

Removal and Installation

NOTE: SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Panoramic Glass Rear - Remove
2. Panoramic Glass Sunshade - Remove

	1. Remove the bracket (A). 2. Repeat on the opposite side.

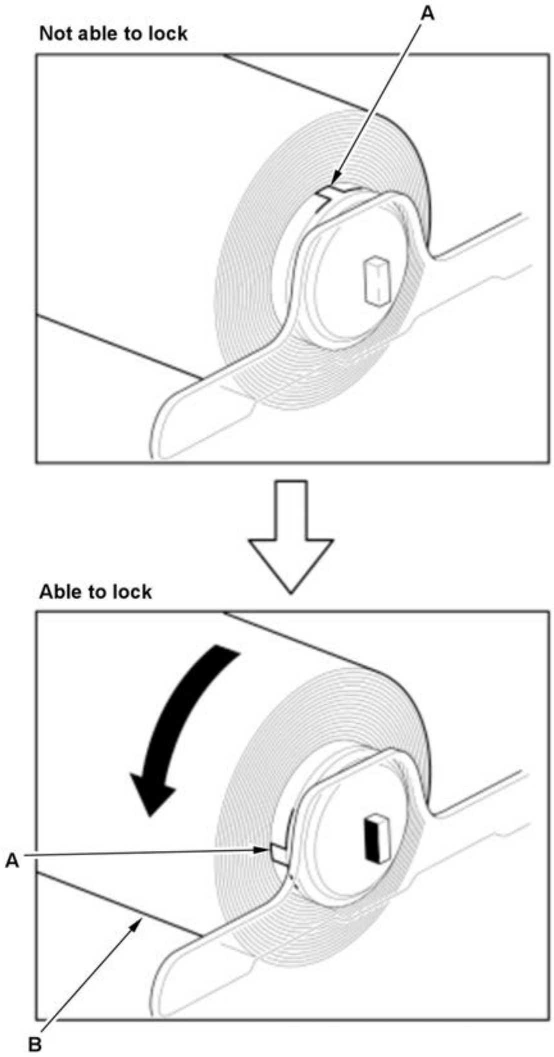


3. Release the sunshade (A) from the sunshade shoes (B) as shown.

NOTE:

Firmly hold the sunshade with both hands; otherwise the wind-up force will be transferred to the sunshade.

4. Close the sunshade slightly.



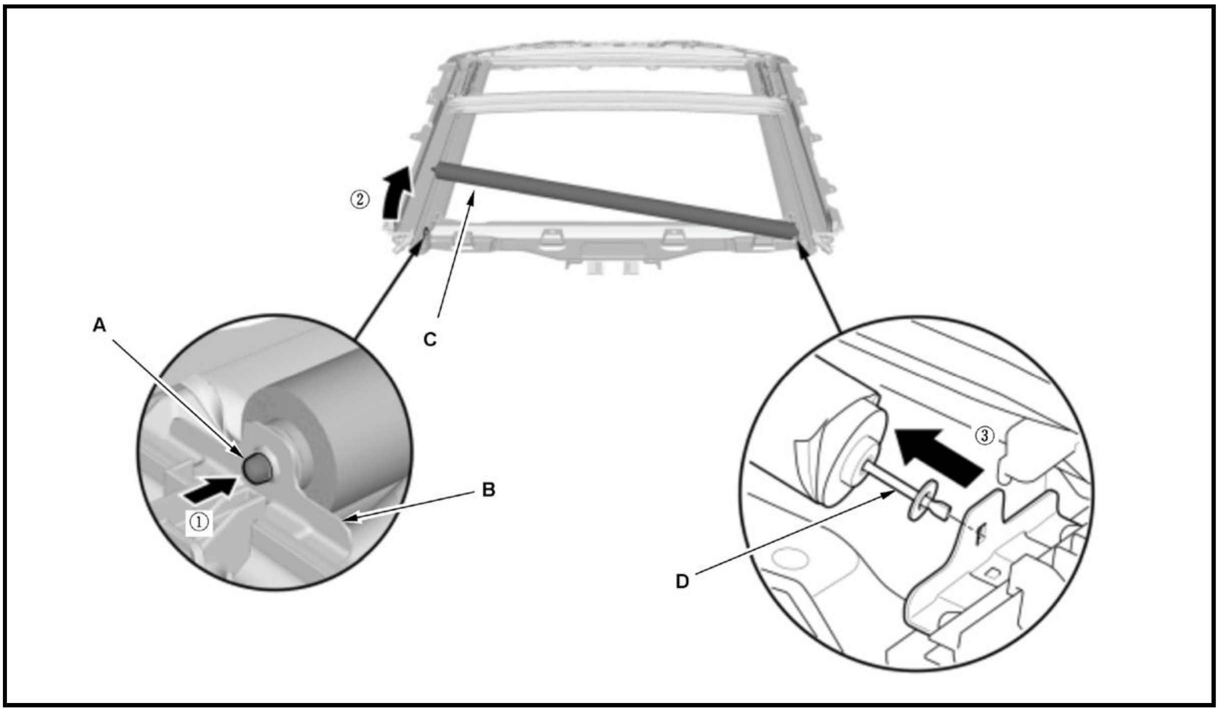
5. Turn marking (A) of the sunshade (B) until it is in the position that can be locked as shown in the lower figure.

NOTE:

- **Do not remove the sunshade from the bracket in this step.**
- **If the sunshade is removed from the sunshade base, the spring is uncoiled, and the sunshade cannot be winded.**

6. Release the end of the sunshade roll shaft (A) from the sunshade base (B), then pull up the sunshade (C) as shown.

NOTE: **Do not remove the other end of the sunshade from the bracket in this step.**

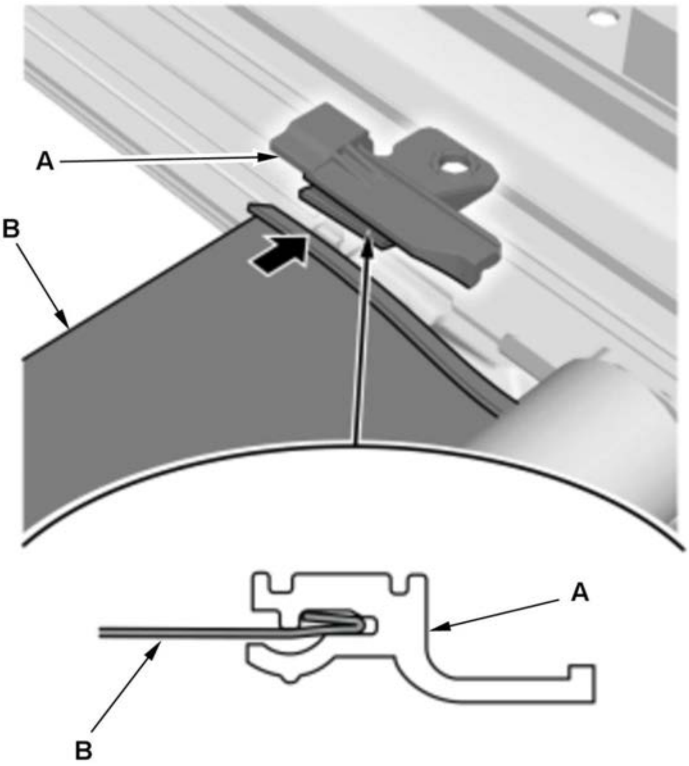


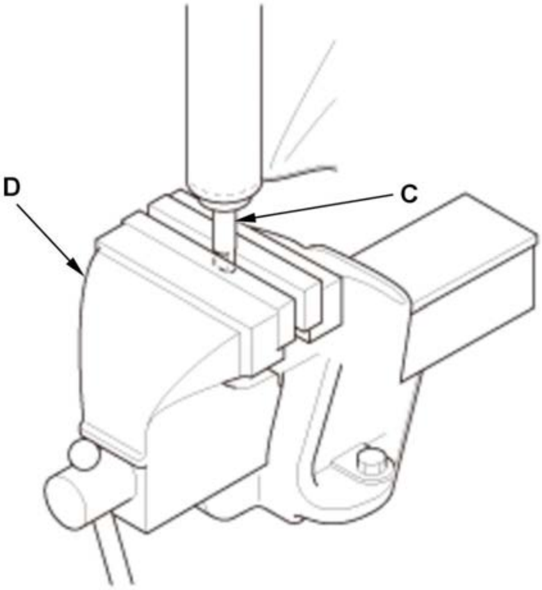
7. With the released end tilted up, slowly pull out the sunshade roll shaft (D), then lock the sunshade.

8. Remove the sunshade.

	9. If necessary, remove the sunshade base (A).

3. All Removed Parts - Install





1. Install the parts in the reverse order of removal.

NOTE:

- **When installing the bracket (A) to the sunshade (B), fold the end of sunshade as shown.**
- **If the spring is uncoiled when removing the sunshade, restore the wind-up mechanism by carrying out the following procedures.**

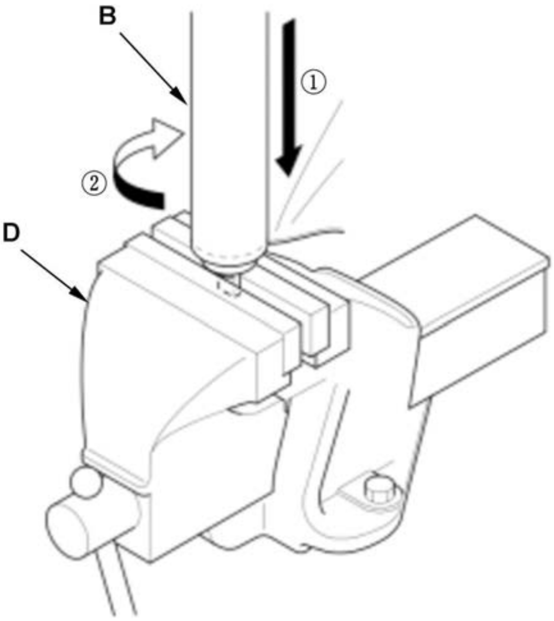
-1. Secure the flat part on the sunshade roll shaft (C) in a vise (D).

-2. While pressing down the sunshade, rotate the sunshade 19 revolutions as shown.

-3. Remove the sunshade from the vise.

NOTE: The wind-up mechanism should be locked up when removing the sunshade from the vise.



PANORAMIC GLASS ROOF WIND DEFLECTOR REMOVAL AND INSTALLATION

Removal and Installation

1. Panoramic Glass Frame - Remove
2. Panoramic Glass Wind Deflector - Remove

	1. Release the hooks (A), and then lift up the wind deflector (B).

	2. Disconnect the deflector springs (A) from the frame (B), and then remove the wind deflector (C).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

REMOVAL AND INSTALLATION

MOONROOF DRAIN CHANNEL REMOVAL AND INSTALLATION

Removal and Installation

1. Moonroof Glass - Remove
2. Moonroof Drain Channel - Remove

	1. Remove the screws.

	2. Remove the drain channel (A).

3. All Removed Parts - Install

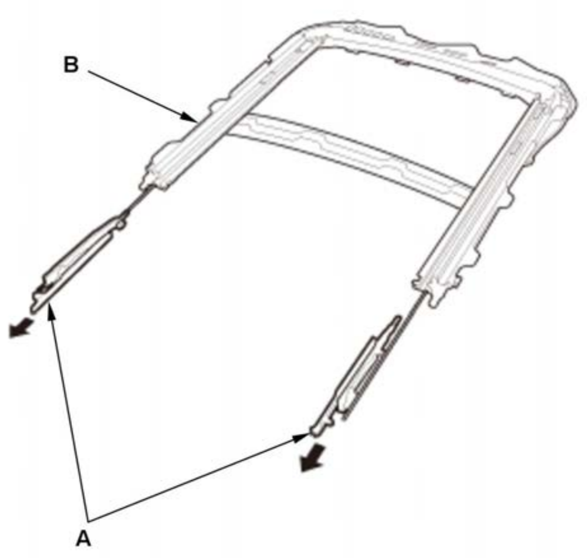
1. Install the parts in the reverse order of removal.

MOONROOF DRAIN CHANNEL SLIDER AND CABLE ASSEMBLY REMOVAL AND INSTALLATION

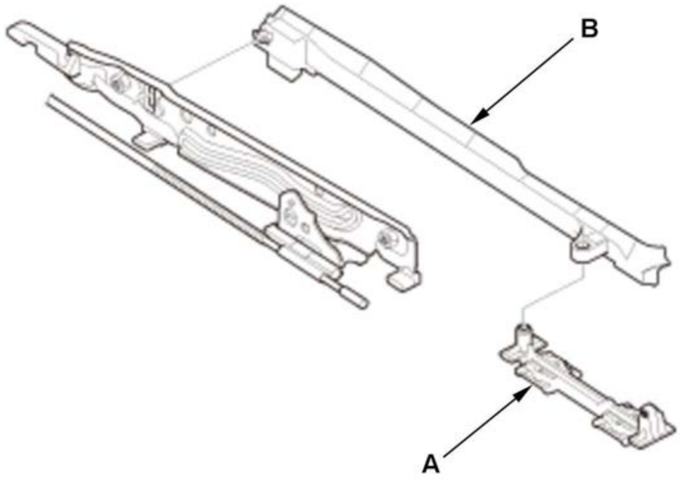
Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Moonroof Motor-Control Unit - Remove**
2. **Moonroof Drain Channel - Remove**
3. **Moonroof Frame - Remove**
4. Moonroof Drain Channel Slider and Moonroof Cable Assembly - Remove

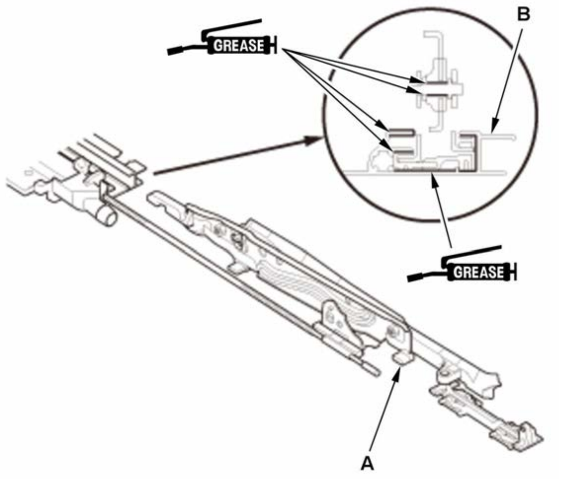


1. Slide the drain channel slider and the cable assemblies (A) back from the frame (B), then remove it.



2. Remove the drain channel slider (A) and the moonroof link (B).

5. All Removed Parts - Install



1. Install the parts in the reverse order of removal.

NOTE:

- Apply multipurpose grease to the glass brackets (A) and the guide rail area of the frame (B) indicated by the arrows.
- Before reinstalling the motor, make sure both link lifters are parallel, and in the tilt up position.

6. **Moonroof Glass Position - Adjust**
7. **Moonroof Motor-Control Unit - Reset**

8. Water Leaks - Check

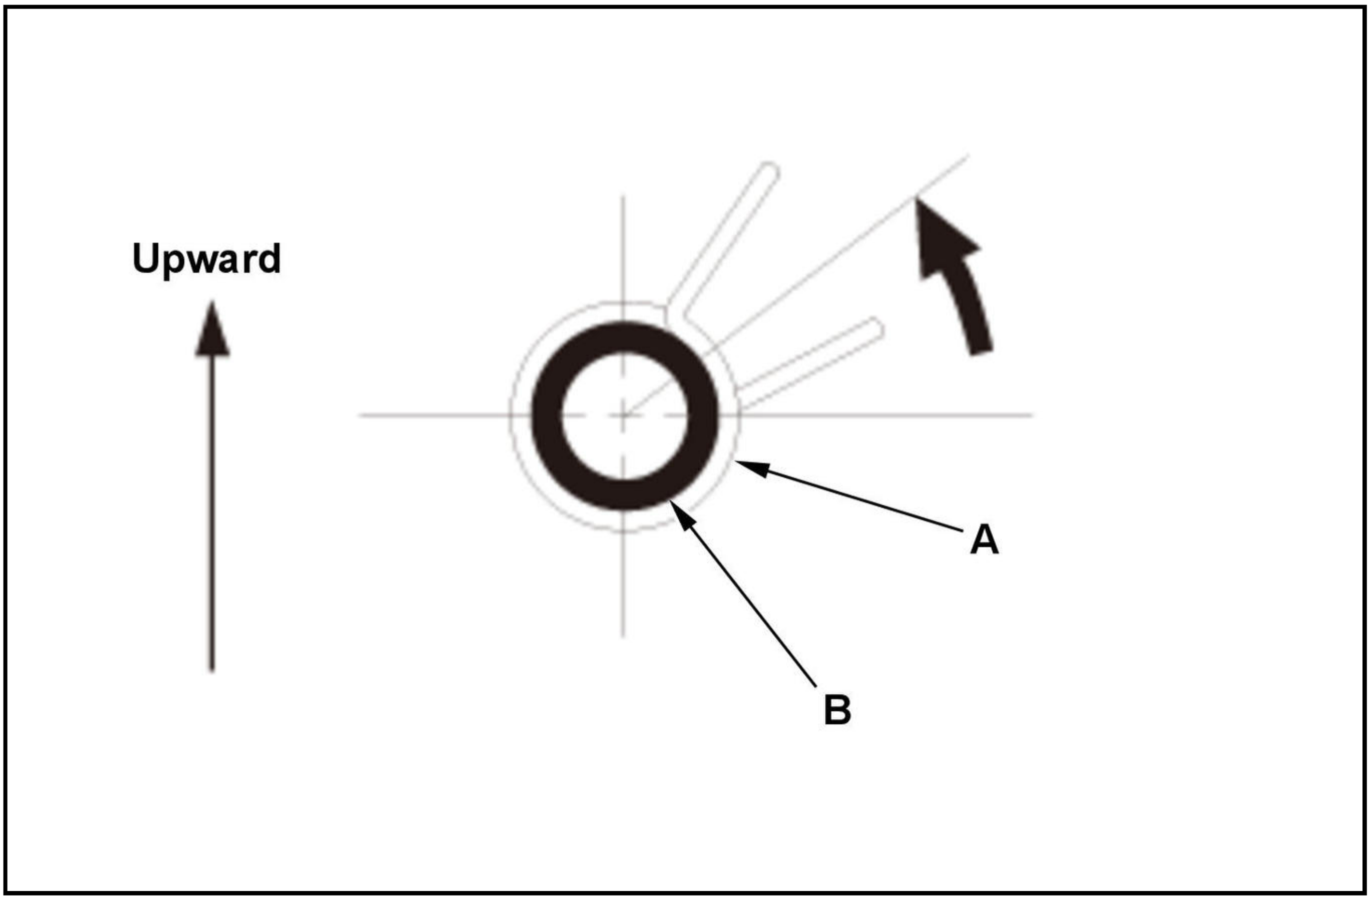
MOONROOF FRAME AND DRAIN TUBE REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- How to read the torque specifications .
- Before installing the frame, clear the drain tubes and the drain valves using compressed air.
- To install a new drain tube, tie the string left in the body during drain tube removal to the top end of the new drain tube, and pull it up into the roof.
- When connecting the drain tubes, slide them over the frame nozzles at least 10 mm (0.39 in).
- Check the frame seal.
- When installing the frame, first attach the rear hook into the body hole.
- Install the tube clips (A) on the drain tubes (B) as shown.



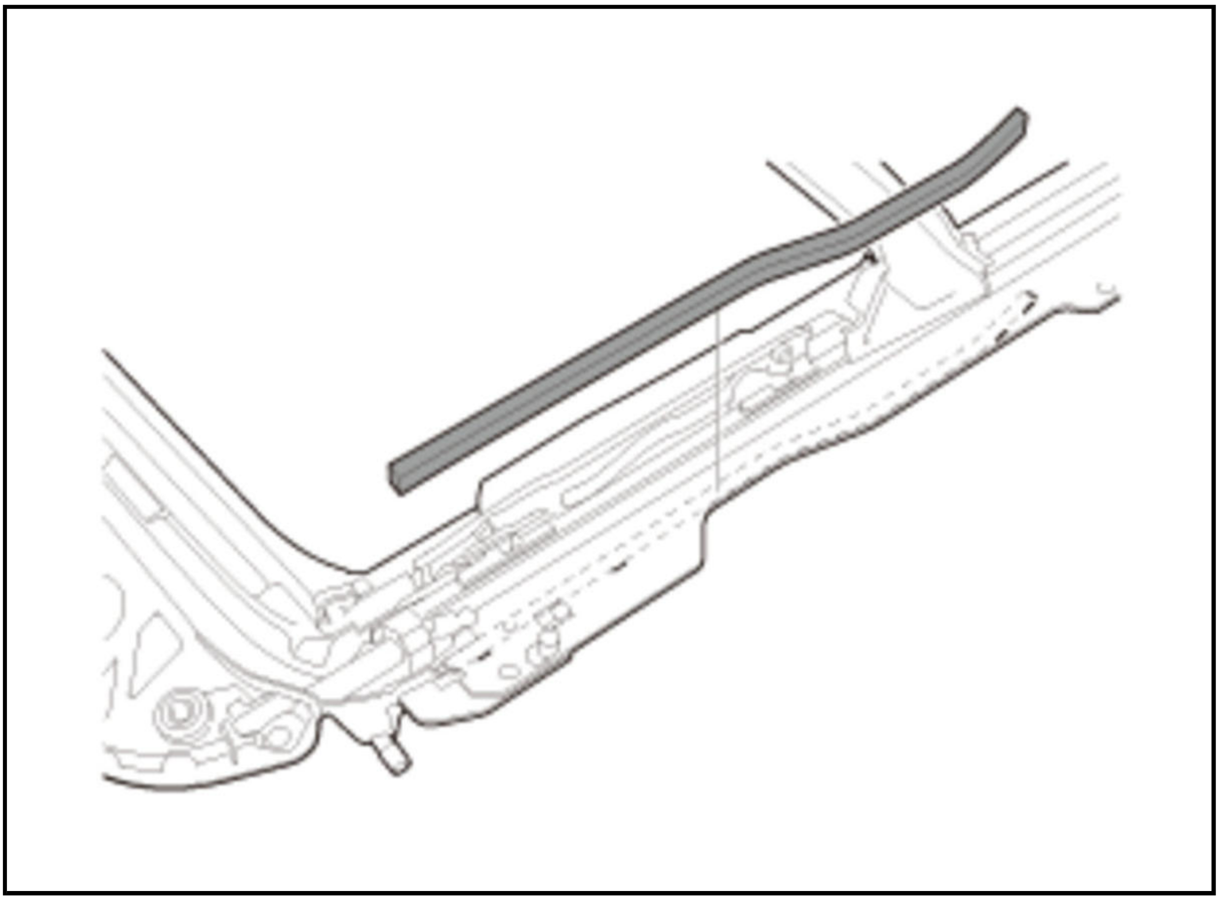
Moonroof Frame

1. Headliner - Remove
2. Moonroof Frame - Remove

	1. Disconnect the front drain tubes (A) and the rear drain tubes (B).

 Fastener Locations ▶ : 10 A 9.4 (0.96, 6.9) Loosen the bolt.	2. Remove the moonroof frame (A).

3. Moonroof Frame Seal - Remove



4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. **Moonroof Glass Position - Adjust**

Front Drain Tube

1. **Headliner - Remove**
2. **Driver's Dashboard Undercover - Remove**
3. **Front Inner Fender - Remove**
4. Moonroof Front Drain Tube - Remove

	1. Pull the front drain valve (A) out of the body hole. 2. Tie a string to the top end of the front drain tube (B), then pull the drain tube down out of the pillar. Leave the string in the pillar to use when reinstalling the drain tube.

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

6. **Water Leaks - Check**

Rear Drain Tube

1. **Headliner - Remove**
2. **Rear Side Trim Panel - Remove**
3. Moonroof Rear Drain Tube - Remove

	1. Pull the rear drain valve (A) out of the body hole. 2. Tie a string to the top end of the rear drain tube (B), then pull the drain tube down out of the pillar. Leave the string in the pillar to use when reinstalling the drain tube.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. **Water Leaks - Check**

MOONROOF GLASS REMOVAL AND INSTALLATION

Removal and Installation

NOTE: **How to read the torque specifications**

1. Moonroof Glass - Remove

 Fastener Locations ▶ : 2 4.2 (0.43, 3.1) Front	1. Remove the bolts. 2. Repeat on the opposite side.
	3. Remove the glass (A) by lifting it up.

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

3. Moonroof Glass Position - Adjust

MOONROOF GLASS ROOF SEAL REMOVAL AND INSTALLATION

Removal

1. Moonroof Glass - Remove
2. Moonroof Glass Roof Seal - Remove

	1. Place a piece of masking tape (A) on the middle of the front edge of the moonroof glass (B). Make sure that the tape is on the glass only, and is not touching the glass roof seal (C). 2. Place a mark (D) on the masking tape that aligns with the seam (E) of the glass roof seal. 3. Push down on the top of the original glass roof seal with your thumb until a small section separates from the moonroof glass. Once a section has started to separate, grip it and pull outward, working around the moonroof glass until the glass roof seal is completely removed (note the locations of the holes in the glass roof seal).

Installation

1. Moonroof Glass Roof Seal - Install

	1. Align the seam (A) of the new glass roof seal (B) to the mark (C) on the masking tape (D). Make sure the holes are pointed in the same direction as noted in removal procedure. 2. Press the ridge of the new glass roof seal into the groove on the moonroof glass starting at the seam. Work toward one corner; then go back to the middle and work toward the opposite corner. **NOTE:** Be careful not to stretch the glass roof seal. 3. Continue pressing along one side, from corner to corner; then press along the opposite side, from corner to corner. 4. At the rear of the moonroof glass, continue pressing from one corner to the middle; then press from the opposite corner to the middle until the glass roof seal is completely installed. 5. Check for proper fit of the new glass roof seal by opening and closing the moonroof.

2. **Moonroof Glass - Install**

MOONROOF MOTOR-CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: **How to read the torque specifications**

1. **Headliner - Remove**
2. Moonroof Motor-Control Unit - Remove

	1. Disconnect the connector (A). 2. Remove the moonroof motor-control unit (B).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **Moonroof Motor-Control Unit - Reset**

MOONROOF SUNSHADE REMOVAL AND INSTALLATION

Removal and Installation

1. **Moonroof Frame - Remove**
2. Moonroof Sunshade - Remove

	1. Remove the moonroof sunshade rear stoppers (A). 2. Remove the moonroof sunshade (B).

3. Moonroof Sunshade Handle Bracket - Remove

	1. Remove the moonroof sunshade handle bracket (A), then remove the moonroof sunshade handle (B) from the moonroof sunshade (C).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

MOONROOF WIND DEFLECTOR REMOVAL AND INSTALLATION

Removal and Installation

1. Moonroof Wind Deflector - Remove

	1. Open the glass fully. 2. Release both deflector springs (A) and both deflector blades (B). 3. Remove the wind deflector (C).

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

3. **Moonroof Motor-Control Unit - Reset**

REMOVAL, INSTALLATION & TEST

MOONROOF SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: The moonroof switch is built into the interior light switch.

1. **Front Individual Map Light - Remove**
2. **Interior Light Switch - Remove**
3. All Removed Parts - Install

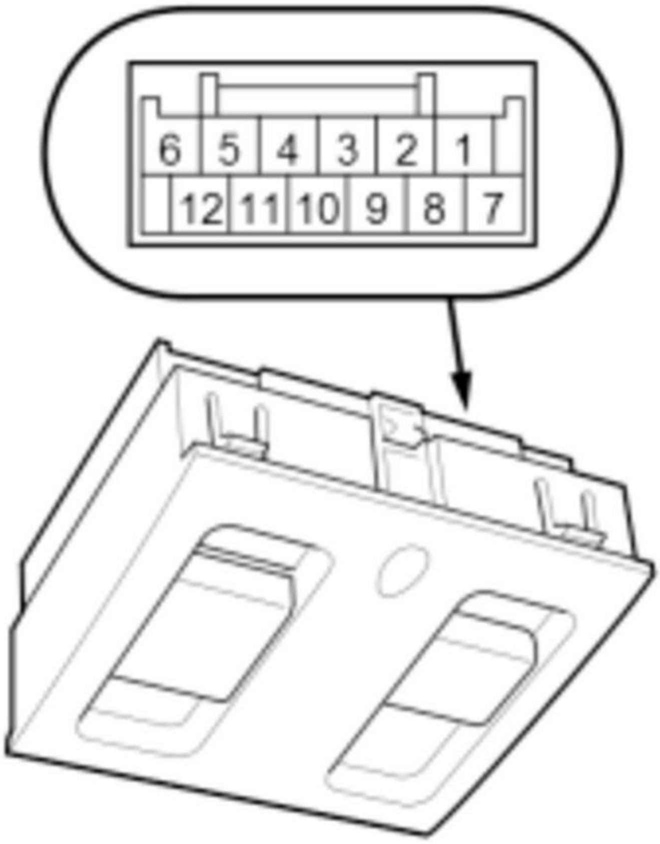
1. Install the parts in the reverse order of removal.

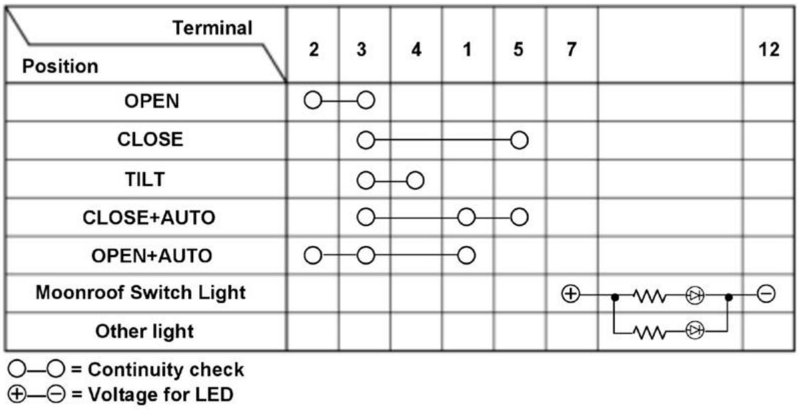
Test

NOTE: The moonroof switch is built into the interior light switch.

1. Moonroof Switch - Test

    1. Check for continuity between the terminals in each switch position according to the table.





Terminal / Position	2	3	4	1	5	7		12
OPEN	○	○						
CLOSE		○			○			
TILT		○	○					
CLOSE+AUTO		○		○	○			
OPEN+AUTO	○	○		○				
Moonroof Switch Light						⊕		⊖
Other light								

○—○ = Continuity check

⊕—⊖ = Voltage for LED

2. If the continuity is not as specified, replace the interior light switch.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

DURING AUTO CLOSE OPERATION, MOONROOF GLASS REVERSES WHEN NO OBJECT IS TRAPPED.

Diagnostic procedure

- Check for dirt and debris in the track.
- Reset the moonroof motor-control unit.

MOONROOF GLASS DOES NOT MOVE AND MOTOR DOES NOT TURN.

Diagnostic procedure

- Check for a run down 12 volt battery .
- Check for a blown fuse.
- Check for a faulty moonroof switch .
- Check for a defective moonroof motor-control unit.

MOONROOF GLASS DOES NOT MOVE SMOOTHLY.

Diagnostic procedure

- Check for a defective moonroof motor-control unit.
- Check the moonroof motor.
- Check the glass position adjustment.
- Check the sliding parts.

MOONROOF GLASS DOES NOT MOVE, BUT MOTOR TURNS.

Diagnostic procedure

- Check for foreign matter stuck between the guide rail and the slider.
- Make sure the cable assembly is attached properly.
- Check for a loose inner cable.
- Check for a defective gear or inner cable.

MOONROOF GLASS DOES NOT STOP AT PROPER FLUSH CLOSED POSITION.

Diagnostic procedure

- Reset the moonroof motor-control unit.
- Check the glass position adjustment.

MOONROOF GLASS MOVES, BUT THERE IS NO AUTO FUNCTION.

Diagnostic procedure

- Reset the moonroof motor-control unit.

MOTOR NOISE FROM MOONROOF

Diagnostic procedure

- Check for a loose motor.
- Check for a worn gear or bearing.
- Check for a deformed cable assembly.
- Check for dirt or debris.

WATER LEAKS FROM MOONROOF

Diagnostic procedure

- Check for a defective or an improperly installed glass weatherstrip or drain channel.
- Check for a gap between the drain channel seal and the roof panel.
- **Check the glass position adjustment**.
- Check for a clogged or detached drain tube.

WIND NOISE FROM MOONROOF

Diagnostic procedure

- Check for excessive clearance between the glass weatherstrip and the roof panel.
- **Check the glass position adjustment**.

DESCRIPTION & OPERATION

MOONROOF SYSTEM DESCRIPTION

Operation (Manual)

The moonroof is activated by pushing the switch to the first detent of the open or close position.

Operation (Auto)

The automatic operation of moonroof is activated by pressing the switch to the second detent of the open or close position. The moonroof will automatically open or close completely even if the switch is released.

Tilt function

Auto tilt up operation

During moonroof auto tilt operation, the moonroof will go to full tilt up position when the moonroof tilt switch is pressed and released.

Auto tilt down operation

The moonroof is moved to the full closing position when the close switch is pressed to second detent position, and then released.

Manual operation (only for tilt down)

In a tilted position, the moonroof is controlled to operate the tilt down when the close switch is pressed to first detent position.

Auto Reverse Function

When the moonroof is closing and the stopping load is greater than the prescribed value, the moonroof will move in reverse direction momentarily then stop. The control unit detects "Pinching" by checking the pulses output from the pulse sensor in the moonroof motor.

Learning Function

The learning function allows the moonroof to open and close with auto operation. If learning is not completed, the auto operation will not function.

Keyless/Key Cylinder Operation

By pressing and holding the UNLOCK button of the remote a second time, the windows and moonroof open. The windows stop moving when the UNLOCK button is released.

With the key inserted in the driver's door key cylinder, turn the key a second time holding it (counterclockwise to close). The windows and moonroof stop moving when the key is released.

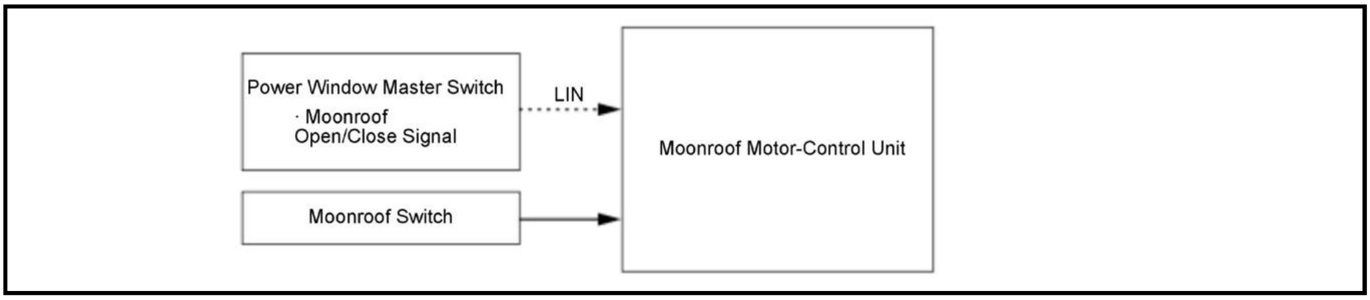
Keyless Operation	OPEN	Possible
	CLOSE	Impossible
Key Cylinder Operation	OPEN	Possible
	CLOSE	Possible

Failsafe Function

When a failure occurs in the inputs of the motor pulses and moonroof switch, the failsafe function stops the control of each function.

MOONROOF SYSTEM DESCRIPTION - SYSTEM DIAGRAM

For locations of each component on the vehicle, refer to Component Location Index



SYMPTOM TROUBLESHOOTING INDEX

MOONROOF ELECTRICAL SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Water leaks from moonroof	• Check for a defective or an improperly installed glass weatherstrip or drain channel. • Check for a gap between the drain channel seal and the roof panel. • Check the glass position adjustment. • Check for a clogged or detached drain tube.	B
Wind noise from moonroof	• Check for excessive clearance between the glass weatherstrip and the roof panel. • Check the glass position adjustment.	B
Motor noise from moonroof	• Check for a loose motor. • Check for a worn gear or bearing. • Check for a deformed cable assembly.	B

Symptom	Diagnostic procedure	Also check for
	• Check for dirt or debris.	
Moonroof glass does not move smoothly.	• Check for a defective moonroof motor-control unit. • Check the moonroof motor. • Check the glass position adjustment. • Check the sliding parts.	B
Moonroof glass does not move, but motor turns.	• Check for foreign matter stuck between the guide rail and the slider. • Make sure the cable assembly is attached properly. • Check for a loose inner cable. • Check for a defective gear or inner cable.	B
Moonroof glass does not move and motor does not turn.	• Check for a run down 12 volt battery . • Check for a blown fuse. • Check for a faulty moonroof switch . • Check for a defective moonroof motor-control unit.	B
Moonroof glass does not stop at proper flush closed position.	• Reset the moonroof motor-control unit. • Check the glass position adjustment.	B
During auto close operation, moonroof glass reverses when no object is trapped.	• Check for dirt and debris in the track. • Reset the moonroof motor-control unit.	B
Moonroof glass moves, but there is no AUTO function.	Reset the moonroof motor-control unit.	B

LEARNING RESET CLEAR

RESETTING THE MOONROOF MOTOR-CONTROL UNIT

Procedure

1. Moonroof Control Unit - Reset

   Resetting the moonroof is required when any of the following have occurred:

   - The moonroof stops during AUTO/MANUAL operation.
   - The moonroof does not work during auto operation.
   - The moonroof was moved manually while the 12 volt battery was dead or disconnected.
   - The moonroof motor was removed or replaced with a new one.
   - Any of components related to the moonroof were replaced or removed and installed.
   -
     - -

       Wind deflector
   -

  - -

    Moonroof glass

-
  - -

    Moonroof seal

-
  - -

    Moonroof glass bracket

-

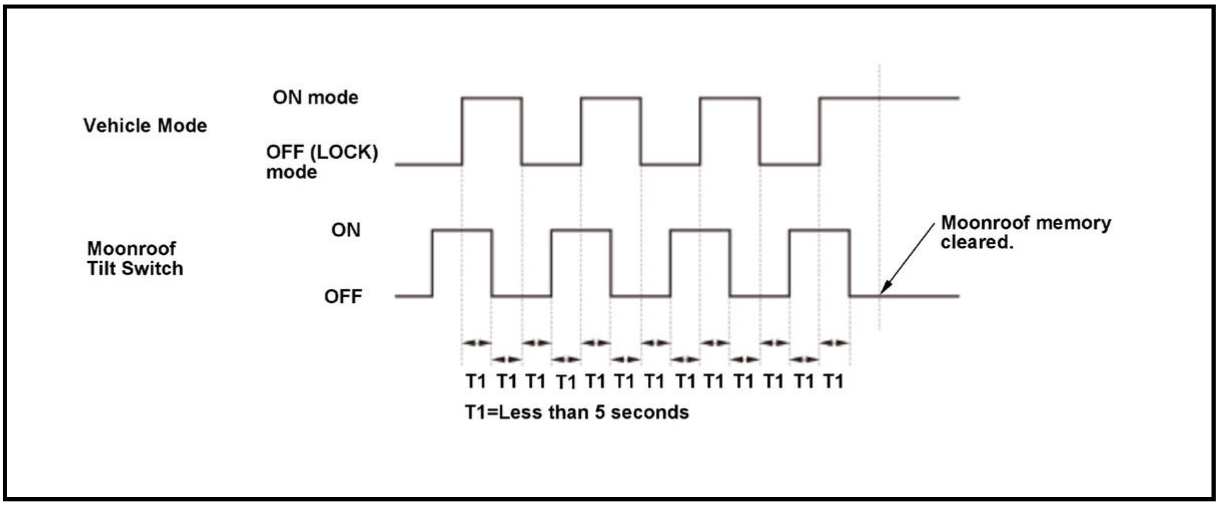
-
  - -

    Moonroof cables, etc.

To reset the moonroof control unit, do these steps:

1. Close the driver's door, and leave it closed until the procedure is complete.

2. Turn the vehicle to the OFF (LOCK) mode.



Vehicle Mode
ON mode
OFF (LOCK) mode
Moonroof Tilt Switch
ON
OFF
Moonroof memory cleared.
T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1
T1=Less than 5 seconds

3. Press and hold the tilt switch, and turn the vehicle to the ON mode.

4. Release the tilt switch, and turn the vehicle to the OFF (LOCK) mode.

5. Repeat steps 3 and 4 three more times.

6. Check if the AUTO OPEN and AUTO CLOSE function still work. If they still work, the AUTO functions have not been cleared, go back to step 1. If the AUTO functions have been cleared, go to step 7.

7. Press and hold the moonroof close switch until the moonroof is fully open in the tilt position.

8. Confirm that the moonroof control unit is reset by using the moonroof AUTO OPEN and AUTO CLOSE function.

DESCRIPTION AND OPERATION

MOONROOF SYSTEM DESCRIPTION

Operation (Manual)

The moonroof is activated by pushing the switch to the first detent of the open or close position.

Operation (Auto)

The automatic operation of moonroof is activated by pressing the switch to the second detent of the open or close position. The moonroof will automatically open or close completely even if the switch is released.

Tilt function

Auto tilt up operation

During moonroof auto tilt operation, the moonroof will go to full tilt up position when the moonroof tilt switch is pressed and released.

Auto tilt down operation

The moonroof is moved to the full closing position when the close switch is pressed to second detent position, and then released.

Manual operation (only for tilt down)

In a tilted position, the moonroof is controlled to operate the tilt down when the close switch is pressed to first detent position.

Auto Reverse Function

When the moonroof is closing and the stopping load is greater than the prescribed value, the moonroof will move in reverse direction momentarily then stop. The control unit detects "Pinching" by checking the pulses output from the pulse sensor in the moonroof motor.

Learning Function

The learning function allows the moonroof to open and close with auto operation. If learning is not completed, the auto operation will not function.

Keyless/Key Cylinder Operation

By pressing and holding the UNLOCK button of the keyless transmitter or the remote a second time, the windows and moonroof open. The windows stop moving when the UNLOCK button is released.

With the key inserted in the driver's door key cylinder, turn the key a second time holding it (counterclockwise to close). The windows and moonroof stop moving when the key is released.

Keyless Operation	OPEN	Possible
	CLOSE	Possible
Key Cylinder Operation	OPEN	Impossible
	CLOSE	Possible

PANORAMIC GLASS ROOF SYSTEM DESCRIPTION

Basic Control/Function

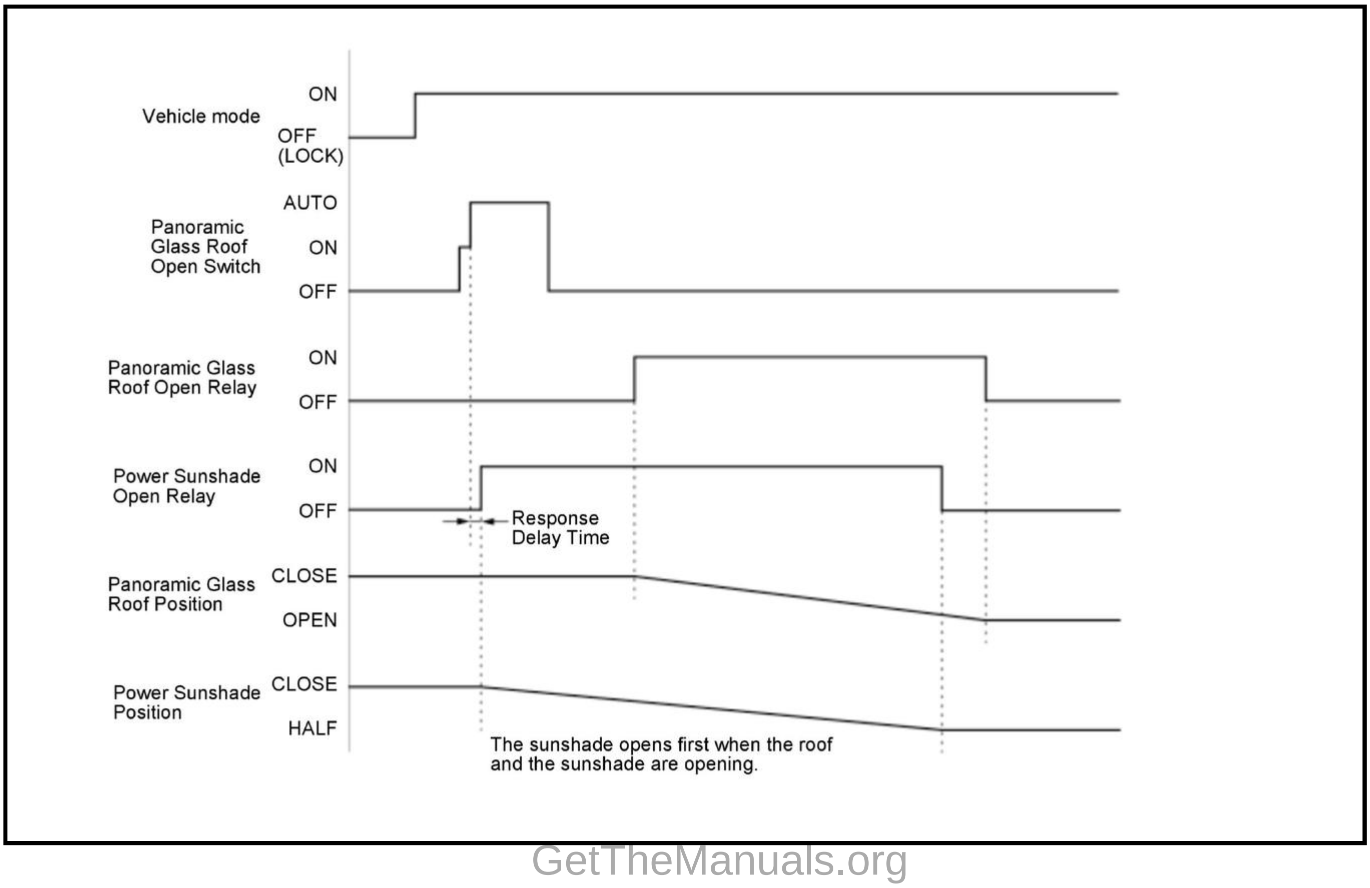
The panoramic glass roof opens when the panoramic glass roof open switch is turned to on. During this process, the sunshade also opens keeping a given distance to the panoramic glass roof if the sunshade is closed.The panoramic glass roof closes when the panoramic glass roof close switch is turned to on.

The power sunshade opens when the power sunshade open switch is turned to on.The power sunshade closes when the power sunshade close switch is turned to on. If the panoramic glass roof is opened, the power sunshade stops closing just short of the panoramic glass roof position. If the power sunshade close switch is turned to on again, the power sunshade closes again along with the panoramic glass roof keeping a given distance to each other.

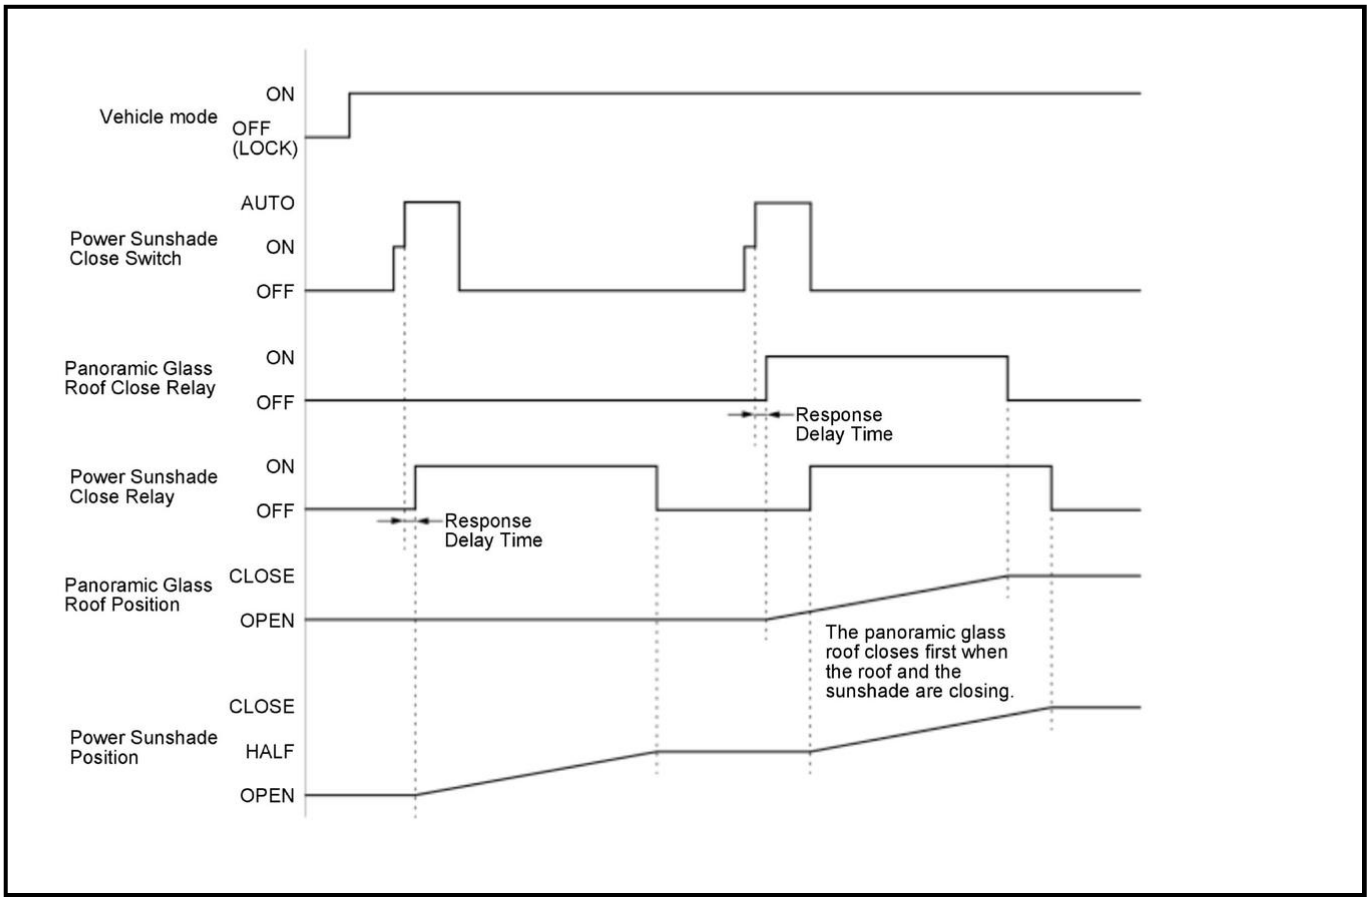
Each switch has the first detent position (to do the manual roof or sunshade operation) and the second detent position (to do the automatic roof or sunshade operation). In the manual operation, the roof or the sunshade opens/closes only while the switch in first detent. In the automatic operation, the roof or the sunshade opens/closes fully once it is set to the second detent.

NOTE: However, the only available option for the tilt up is the automatic operation.

AUTO OPEN Function



AUTO CLOSE Function



ACTIVATION TERM	CANCELLATION TERM
• Vehicle is turned to the ON mode or the vehicle OFF timer signal is on. • AUTO switch is turned on after pressing open or close switch. • The voltage over the switch exceeds the minimum working voltage.	• Vehicle is turned to the OFF (LOCK) mode and the vehicle OFF timer signal is off. • When the panoramic glass roof switch is pressed again. • When the power sunshade switch is pressed again. • Pinching is detected. • Fully opening or fully closing is detected. • Fail safe function is operated.

Tilt Function

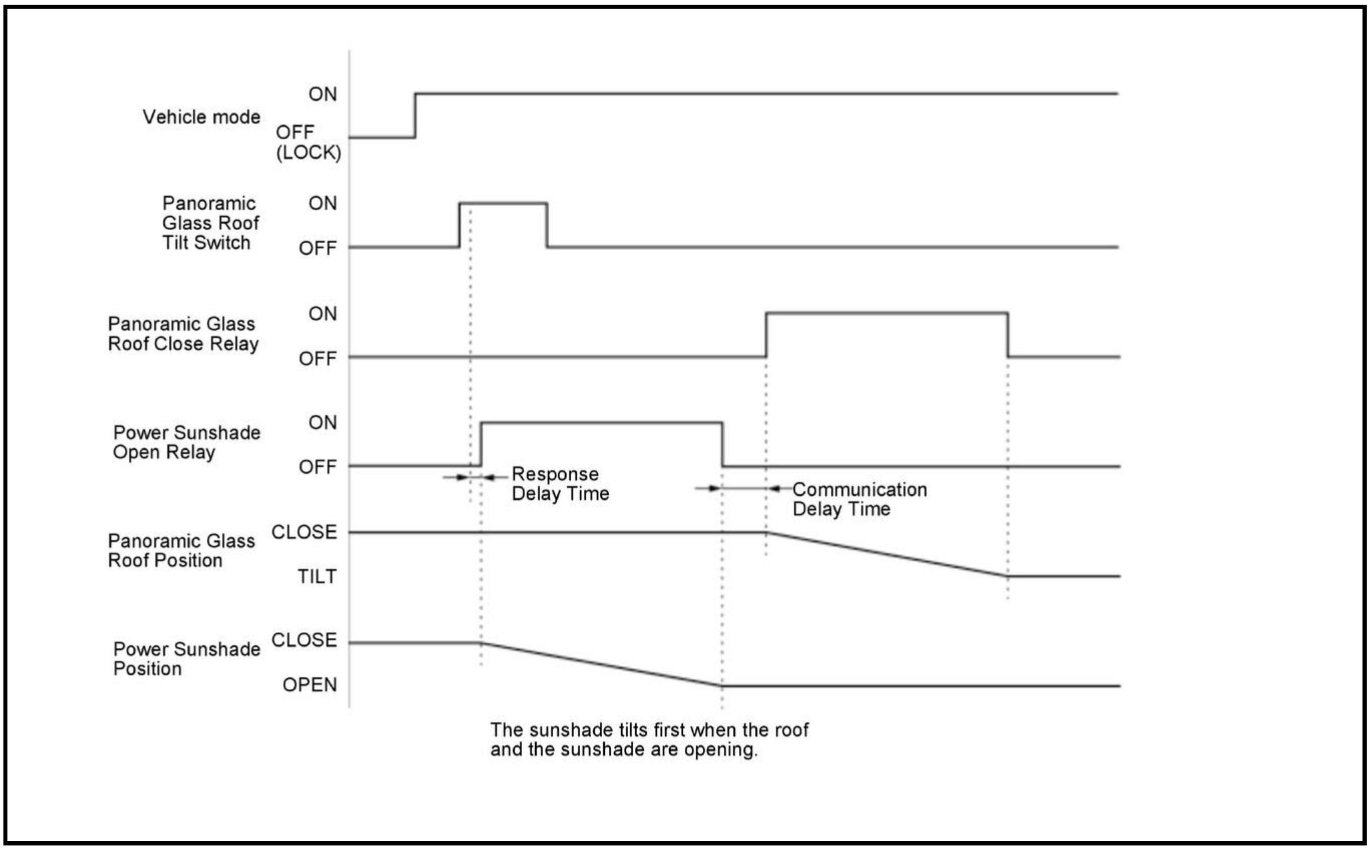
- Auto tilt up operation

The panoramic glass roof tilts up when the panoramic glass roof tilt switch is turned to on. In this process, first, the sunshade opens to a certain extent, and then the panoramic glass roof tilts up if the sunshade is closed. Once the panoramic glass roof tilt switch is turned to on, the panoramic glass roof tilts up automatically without having to keep pressing the switch.

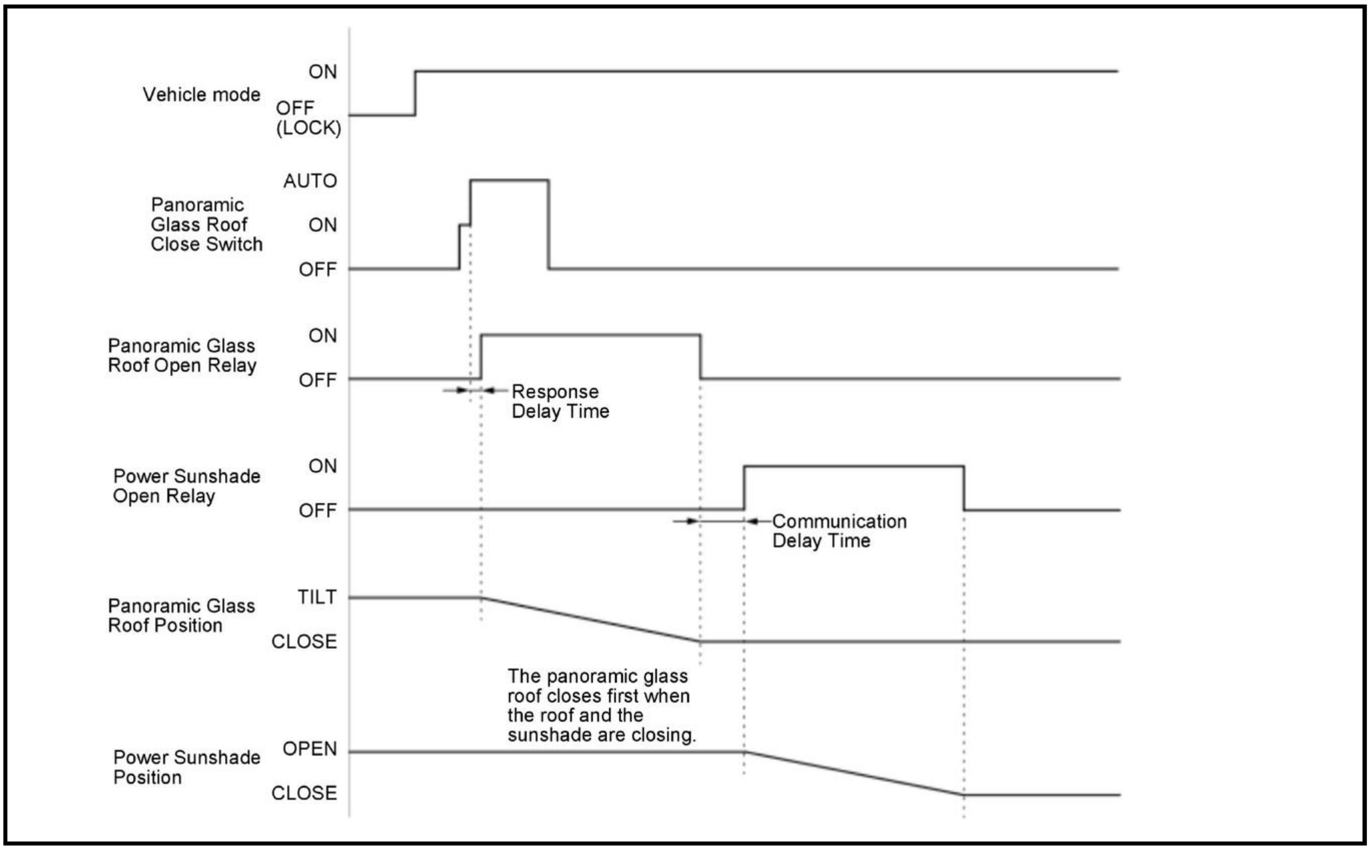
- Auto tilt down operation

The panoramic glass roof tilts down when the panoramic glass roof close switch is turned to on while the panoramic glass roof is tilted-upward. In this process, first, the panoramic glass roof tilts down, and then the sunshade closes. The switch has the first detent position (to do the manual roof or sunshade operation) and the second detent position (to do the automatic roof or sunshade operation). In the manual operation, the roof or the sunshade opens/closes only while the switch in first detent. In the automatic operation, the roof or the sunshade opens/closes fully once it is set to the second detent.

TILT UP Function



TILT DOWN Function



ACTIVATION TERM	CANCELLATION TERM
• Vehicle is turned to the ON mode or the vehicle OFF timer signal is on. • Tilt switch is turned on.	• Vehicle is turned to the OFF (Lock) mode and the vehicle OFF timer signal is off. • Open, close or tilt switch is turned on again.

ACTIVATION TERM	CANCELLATION TERM
• The voltage over the switch exceeds the minimum working voltage.	• Pinching is detected. • Fully tilt opening or fully closing is detected. • Fail safe function is operated.

Pinching Detect Function

When the panoramic glass roof is closing and the stopping load is greater than a prescribed threshold, the sunroof will reverse direction momentarily then stop. The control unit detects "Pinching" by checking the pulses output from the pulse sensor in the panoramic glass roof motor.

Learning Function

The panoramic glass roof and the power sunshade have learning functions. If the learning is not completed, the automatic operation from the open, close or tilt operation can not be done.

Failsafe Function

Only manual operations are available, when the controls of each function are disabled by the fail safe function while in the power supply failure or the control unit failure.

INPUT TEST

MOONROOF MOTOR-CONTROL UNIT INPUT TEST

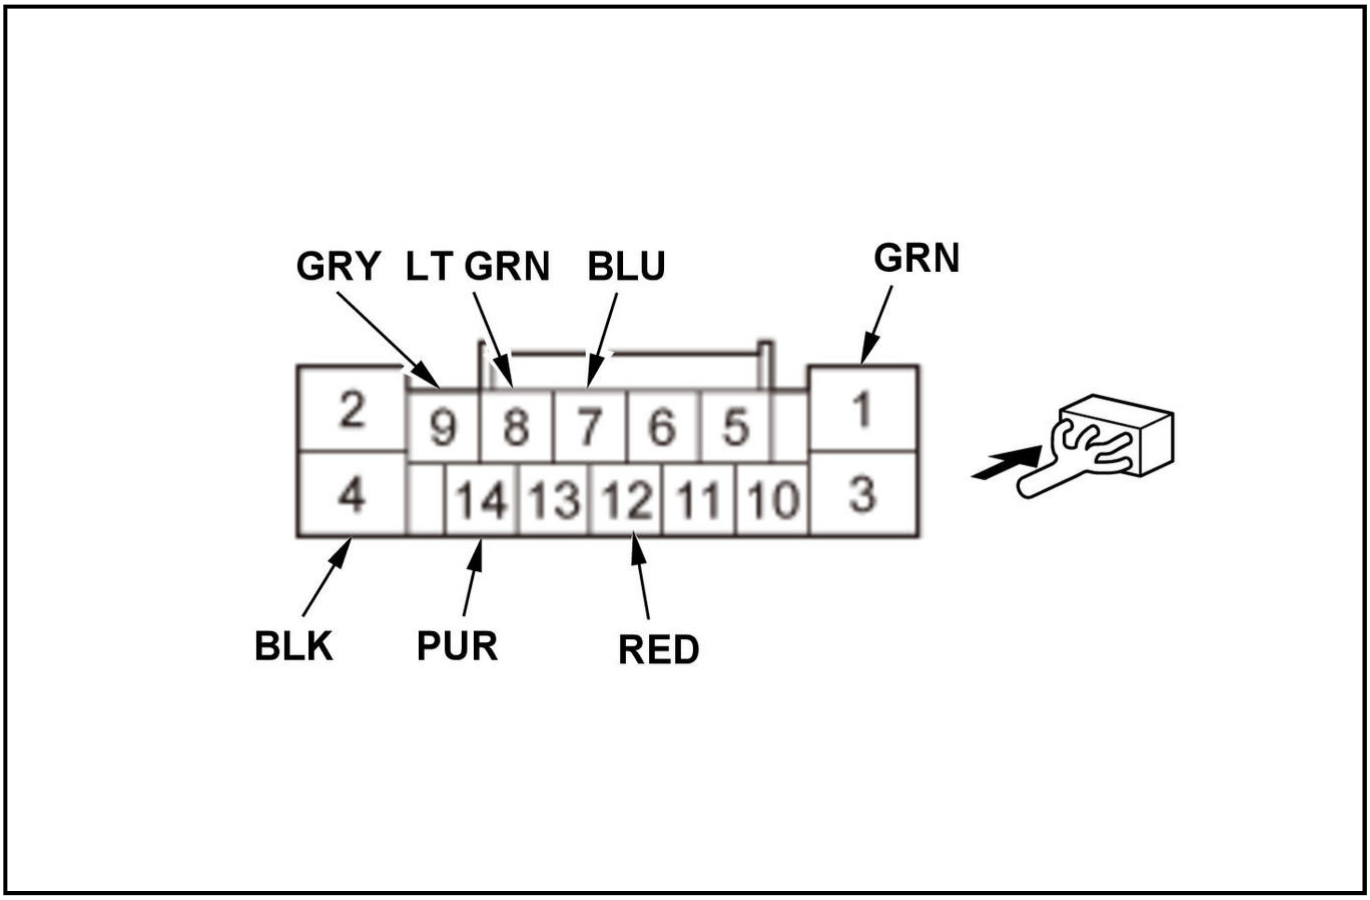
NOTE:

- Make sure the fuses associated with the system is OK.
- If the moonroof works OK manually, but will not work in AUTO, or reverses frequently (obstacle detection), **reset the moonroof motor-control unit** before proceeding with the input test.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the moonroof motor-control unit 14P connector.

Moonroof Motor-Control Unit 14P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

With the connectors still disconnected, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
12	RED	Disconnect these connectors: • Power window master switch 37P connector • Front passenger's power window	Check for continuity between terminal No. 12 and power window master switch 37P connector terminal No. 36:There should be continuity	An open in the LIN(P/W) wire
			Check for continuity between terminal No. 12	An open in the LIN(P/W) wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
		switch 37P connector	and front passenger's power window switch 37P connector terminal No. 34:There should be continuity.	
			Check for continuity to ground: There should be no continuity.	A short to ground in the LIN (P/W) wire

Reconnect the connector, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, **replace the moonroof motor-control unit** .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
1	GRN	Under all conditions	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
4	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
9	GRY	Vehicle ON mode, moonroof switch in CLOSE position	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty moonroof switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Vehicle ON mode, moonroof switch released	Measure the voltage to ground: There should be battery voltage.	• Faulty moonroof switch • A short to ground in the wire
8	LT GRN	Vehicle ON mode, moonroof switch in TILT position	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty moonroof switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Vehicle ON mode, moonroof switch released	Measure the voltage to ground: There should be battery voltage.	• Faulty moonroof switch • A short to ground in the wire
7	BLU	Vehicle ON mode, moonroof switch in OPEN position	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty moonroof switch • Poor ground (G401) or an open in the ground wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
				- An open or high resistance in the wire
		Vehicle ON mode, moonroof switch released	Measure the voltage to ground: There should be battery voltage.	- Faulty moonroof switch - A short to ground in the wire
14	PUR	Vehicle ON mode, moonroof switch in AUTO (OPEN) or AUTO (CLOSE) position	Measure the voltage to ground: There should be less than 0.2 V.	- Faulty moonroof switch - Poor ground (G401) or an open in the ground wire - An open or high resistance in the wire
		Vehicle ON mode, moonroof switch released	Measure the voltage to ground: There should be battery voltage.	- Faulty moonroof switch - A short to ground in the wire

PANORAMIC GLASS ROOF MOTOR-CONTROL UNIT INPUT TEST

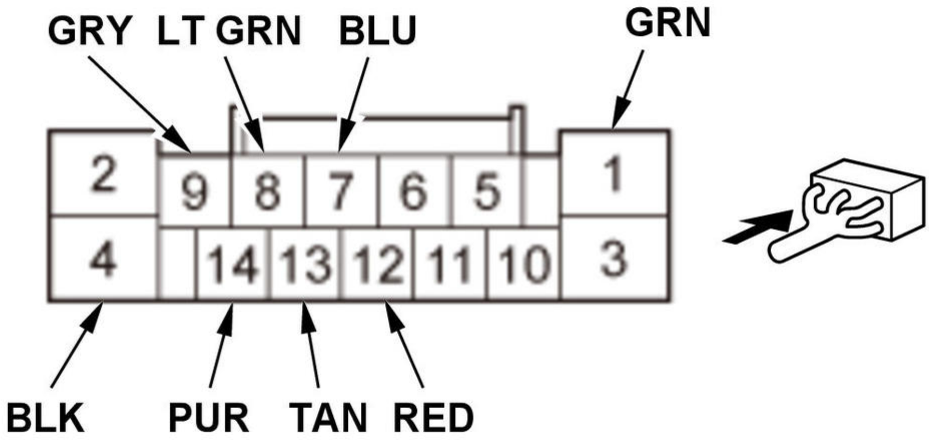
NOTE:

- Make sure the fuses associated with the system is OK.
- If the panoramic glass roof works OK manually, but will not work in AUTO, or reverses frequently (obstacle detection), **reset the panoramic glass roof motor-control unit** before proceeding with the input test.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the panoramic glass roof motor-control unit 14P connector.

Panoramic Glass Roof Motor-Control Unit 14P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

ADJUSTMENT

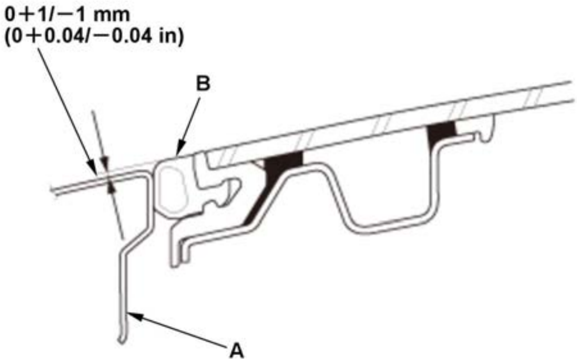
MOONROOF GLASS POSITION ADJUSTMENT

Adjustment

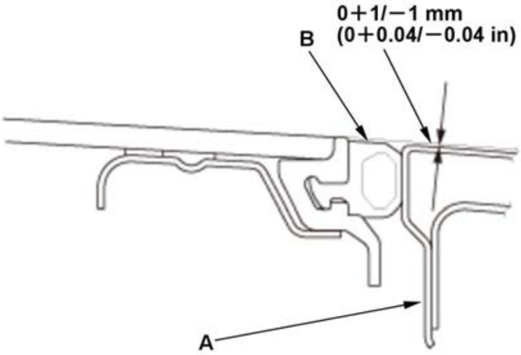
NOTE: How to read the torque specifications

1. Moonroof Glass Position - Check

Front and Rear



Right and Left



1. The roof panel (A) should be even with the glass roof seal (B) within the range shown below. If not, make the following adjustment.

Front and rear:	**0+1/-1 mm (0+0.04/-0.04 in)**
Right and left:	**0+1/-1 mm (0+0.04/-0.04 in)**

2. Moonroof Glass Position - Adjust

 Fastener Locations ▶ : 2 4.2 (0.43, 3.1) A Front	1. Slightly loosen the bolts. 2. Move the glass (A) up or down. 3. Tighten all bolts securely. 4. If necessary, repeat on the opposite side.

3. Moonroof Motor-Control Unit - Reset
4. Water Leaks - Check

PANORAMIC GLASS ROOF GLASS POSITION ADJUSTMENT

Adjustment

NOTE: How to read the torque specifications.

Front Glass

1. Panoramic Glass Front Glass Position - Check

 **Front** **Rear**	1. The roof panel (A) and the rear glass (B) should be even with the front glass roof seal (C) to within 0+1/-1 mm (0+0.04/-0.04 in) all the way around. If not, make the following adjustment.

 0+1/−1 mm (0+0.04/−0.04 in) B C **Side**  0+1/−1 mm (0+0.04/−0.04 in) A C	

Side:	**0+1/-1 mm (0+0.04/-0.04 in)**

Front:	**0+1/-1 mm (0+0.04/-0.04 in)**
Rear:	**0+1/-1 mm (0+0.04/-0.04 in)**

2. **Inner Blind Cover - Remove**
3. Panoramic Glass Front Glass Position - Adjust

 Fastener Locations ▶ : 2 4.2 (0.43, 3.1) A Front	1. Slightly loosen the bolts. 2. Adjust the front glass (A) up or down, and forward or rearward. 3. Tighten all bolts securely. 4. If necessary, repeat on the opposite side.

4. Inner Blind Cover - Install
5. Panoramic Glass Roof Motor-Control Unit - Reset
6. Water Leaks - Check

Rear Glass

7. Panoramic Glass Rear Glass Position - Check

 0+1/−1 mm (0+0.04/−0.04 in) B A **Rear** **Side**	1. The roof panel (A) should be even with the rear glass roof seal (B) to within 0+1/-1 mm (0+0.04/-0.04 in) all the way around. If not, make the following adjustment.

 0+1/−1 mm (0+0.04/−0.04 in) A B	

Side:	**0+1/-1 mm (0+0.04/-0.04 in)**

Rear:	**0+1/-1 mm (0+0.04/-0.04 in)**

8. **Inner Blind Cover - Remove**
9. Panoramic Glass Rear Glass Position - Adjust

 Fastener Locations ▶ : 2 4.2 (0.43, 3.1) A Front	1. Slightly loosen the bolts. 2. Adjust the rear glass (A) up or down, and forward or rearward. 3. Tighten all bolts securely. 4. If necessary, repeat on the opposite side.

10. **Inner Blind Cover - Install**
11. **Water Leaks - Check**

TEST

PANORAMIC GLASS ROOF/POWER SUNSHADE SWITCH TEST

Test

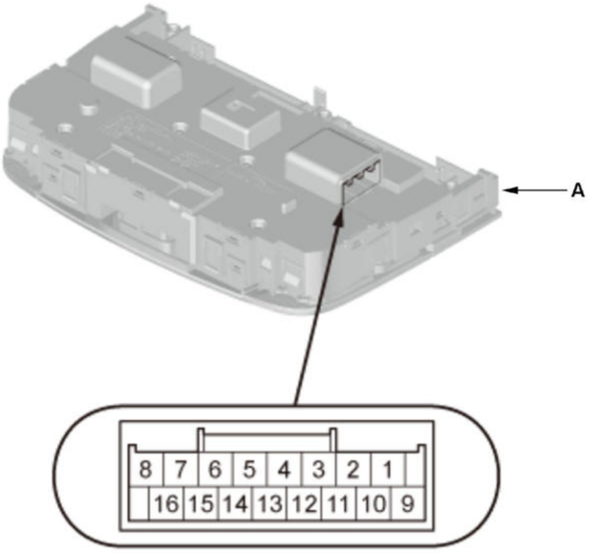
1. **Roof Console Module - Remove**
2. Panoramic Glass Roof/Power Sunshade Switch - Test

NOTE: The panoramic glass roof/power sunshade switch is built into the roof console module (A).

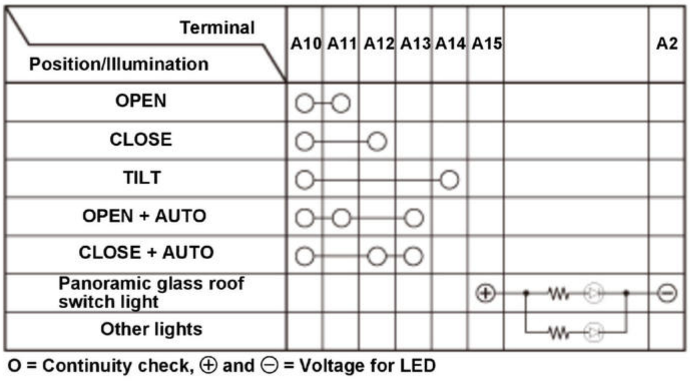
1. Check the switch for continuity according to the table.

NOTE:

- When an LED is located between terminals, check if the LED lights up by connecting power and ground to the LED.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).



Panoramic Glass Roof Switch



Terminal / Position/Illumination	A10	A11	A12	A13	A14	A15		A2
OPEN	O	O						
CLOSE	O		O					
TILT	O				O			
OPEN + AUTO	O	O		O				
CLOSE + AUTO	O		O	O				
Panoramic glass roof switch light						⊕		⊖
Other lights								

O = Continuity check, ⊕ and ⊖ = Voltage for LED

LEARNING RESET CLEAR

RESETTING THE MOONROOF MOTOR-CONTROL UNIT

Procedure

1. Moonroof Control Unit - Reset

   Resetting the moonroof is required when any of the following have occurred:

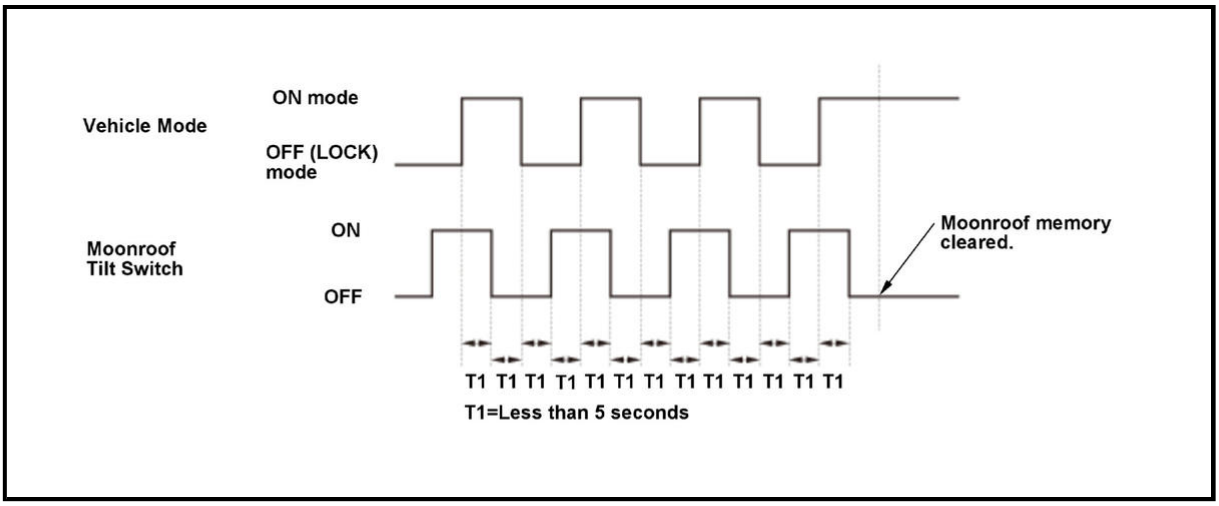
   - The moonroof stops during AUTO/MANUAL operation.
   - The moonroof does not work during auto operation.
   - The moonroof was moved manually while the 12 volt battery was dead or disconnected.
   - The moonroof motor was removed or replaced with a new one.
   - Any of components related to the moonroof were replaced or removed and installed.
   -
     - Wind deflector

-
    - Moonroof glass
-
    - Moonroof seal
-
    - Moonroof glass bracket
-
    - Moonroof frame/drain channel slider and cable assembly
-
    - Moonroof cables, etc.

To reset the moonroof control unit, do these steps:

1. Close the driver's door, and leave it closed until the procedure is complete.

2. Turn the vehicle to the OFF (LOCK) mode.



3. Press and hold the tilt switch, and turn the vehicle to the ON mode.

4. Release the tilt switch, and turn the vehicle to the OFF (LOCK) mode.

5. Repeat steps 3 and 4 three more times.

6. Check if the AUTO OPEN and AUTO CLOSE function still work. If they still work, the AUTO functions have not been cleared, go back to step 1. If the AUTO functions have been cleared, go to step 7.

7. Press and hold the moonroof close switch until the moonroof is fully open in the tilt position.

8. Confirm that the moonroof control unit is reset by using the moonroof AUTO OPEN and AUTO CLOSE function.

RESETTING THE PANORAMIC GLASS ROOF MOTOR-CONTROL UNIT

Procedure

NOTE: Do the panoramic glass roof clear, and then the position learning and the sliding surface learning when any of the following have occurred:

- The panoramic glass roof stops during AUTO/MANUAL operation.
- The panoramic glass roof does not work during AUTO operation.
- The panoramic glass roof was moved manually while the battery was dead or disconnected.

- The panoramic glass roof motor was removed or replaced with a new one.
- Any of components related to the panoramic glass roof were replaced or removed and installed.

1. Panoramic Glass Roof Control Unit - Clear

   To clear the panoramic glass roof control unit and the power sunshade control unit, do these steps:

   1. Close the driver's door, and leave it closed until the procedure is complete.

   2. Turn the vehicle to the OFF (LOCK) mode.

Panoramic glass roof memory cleared.
T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1
T1=Less than 5 seconds

   3. Press and hold the tilt switch, and turn the vehicle to the ON mode.

   4. Release the tilt switch, and turn the vehicle to the OFF (LOCK) mode.

   5. Repeat steps 3 and 4 four times in total.

   6. Check if the AUTO OPEN and AUTO CLOSE function of the panoramic glass roof and the power sunshade still work. If they still work, the AUTO functions have not been cleared, go back to step 1. If the AUTO functions have been cleared, go to the position learning and the sliding surface learning.

2. Panoramic Glass Roof Control Unit - Position Learning

   To perform the position learning on the panoramic glass roof control unit, do these steps:

   1. Press and hold the panoramic glass roof close switch until the panoramic glass roof is tilted fully open.

   2. Press and hold the power sunshade close switch until the power sunshade is fully closed.

   3. Confirm that the AUTO OPEN and the AUTO CLOSE for the panoramic glass roof and the power sunshade work properly.

3. Panoramic Glass Roof Control Unit - Sliding Surface Learning

   To perform the sliding surface learning on the panoramic glass roof control unit, do these steps:

   1. Do the sliding surface learning by operating the AUTO function for open, close and tilt of the panoramic glass roof.

RESETTING THE POWER SUNSHADE MOTOR-CONTROL UNIT

Procedure

NOTE: Do the power sunshade clear, and then the position learning or the sliding surface learning when any of the following have occurred:

- The power sunshade stops during AUTO/MANUAL operation.
- The power sunshade does not work during AUTO operation.
- The power sunshade was moved manually while the battery was dead or disconnected.
- The panoramic glass roof motor was removed or replaced with a new one.
- Any of components related to the power sunshade were replaced or removed and installed.

1. **Power Sunshade Control Unit - Clear**

   NOTE: Refer to procedure of the panoramic glass roof control unit.

2. **Power Sunshade Control Unit- Position Learning**

   NOTE: Refer to procedure of the panoramic glass roof control unit.

3. Power Sunshade Control Unit- Sliding Surface Learning

To perform the sliding surface learning the power sunshade control unit, do these steps: 1. Do the sliding surface learning by operating the AUTO function for both open and close of the power sunshade.

SYMPTOM TROUBLESHOOTING INDEX

MOONROOF ELECTRICAL SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Water leaks from moonroof	• Check for a defective or an improperly installed glass weatherstrip or drain channel. • Check for a gap between the drain channel seal and the roof panel. • Check the glass position adjustment. • Check for a clogged or detached drain tube.	B
Wind noise from moonroof	• Check for excessive clearance between the glass weatherstrip and the roof panel. • Check the glass position adjustment.	B
Motor noise from moonroof	• Check for a loose motor. • Check for a worn gear or bearing. • Check for a deformed cable assembly.	B

Symptom	Diagnostic procedure	Also check for
	- Check for dirt or debris.	
Moonroof glass does not move smoothly.	- **Check for a defective moonroof motor-control unit**. - **Check the moonroof motor**. - **Check the glass position adjustment**. - Check the sliding parts.	B
Moonroof glass does not move, but motor turns.	- Check for foreign matter stuck between the guide rail and the slider. - Make sure the cable assembly is attached properly. - Check for a loose inner cable. - Check for a defective gear or inner cable.	B
Moonroof glass does not move and motor does not turn.	- **Check for a run down 12 volt battery** . - Check for a blown fuse. - **Check for a faulty moonroof switch** . - **Check for a defective moonroof motor-control unit**.	B
Moonroof glass does not stop at proper flush closed position.	- **Reset the moonroof motor-control unit**. - **Check the glass position adjustment**.	B
During auto close operation, moonroof glass reverses when no object is trapped.	- Check for dirt and debris in the track. - **Reset the moonroof motor-control unit**.	B
Moonroof glass moves, but there is no AUTO function.	**Reset the moonroof motor-control unit**.	B

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

DURING AUTO CLOSE OPERATION, MOONROOF GLASS REVERSES WHEN NO OBJECT IS TRAPPED.

Diagnostic procedure

- Check for dirt and debris in the track.
- **Reset the moonroof motor-control unit**.

MOONROOF GLASS DOES NOT MOVE AND MOTOR DOES NOT TURN.

Diagnostic procedure

- **Check for a run down 12 volt battery** .
- Check for a blown fuse.
- **Check for a faulty moonroof switch** .
- **Check for a defective moonroof motor-control unit**.

MOONROOF GLASS DOES NOT MOVE SMOOTHLY.

Diagnostic procedure

- **Check for a defective moonroof motor-control unit**.
- **Check the moonroof motor**.
- **Check the glass position adjustment**.
- Check the sliding parts.

MOONROOF GLASS DOES NOT MOVE, BUT MOTOR TURNS.

Diagnostic procedure

- Check for foreign matter stuck between the guide rail and the slider.
- Make sure the cable assembly is attached properly.
- Check for a loose inner cable.
- Check for a defective gear or inner cable.

MOONROOF GLASS DOES NOT STOP AT PROPER FLUSH CLOSED POSITION.

Diagnostic procedure

- **Reset the moonroof motor-control unit**.
- **Check the glass position adjustment**.

MOONROOF GLASS MOVES, BUT THERE IS NO AUTO FUNCTION.

Diagnostic procedure

- **Reset the moonroof motor-control unit**.

MOTOR NOISE FROM MOONROOF

Diagnostic procedure

- Check for a loose motor.
- Check for a worn gear or bearing.
- Check for a deformed cable assembly.
- Check for dirt or debris.

WATER LEAKS FROM MOONROOF

Diagnostic procedure

- Check for a defective or an improperly installed glass weatherstrip or drain channel.
- Check for a gap between the drain channel seal and the roof panel.
- **Check the glass position adjustment**.
- Check for a clogged or detached drain tube.

WIND NOISE FROM MOONROOF

Diagnostic procedure

- Check for excessive clearance between the glass weatherstrip and the roof panel.
- **Check the glass position adjustment**.

TROUBLESHOOTING

DTC B1125

DTC B1125 : Driver's power window motor A pulse malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1125 Driver's power window motor A pulse malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseA	B	B

   Does the information indicator display DETECT while the window is moving, and display NONE when the window is stopped?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 2.

2. Power window motor pulse check

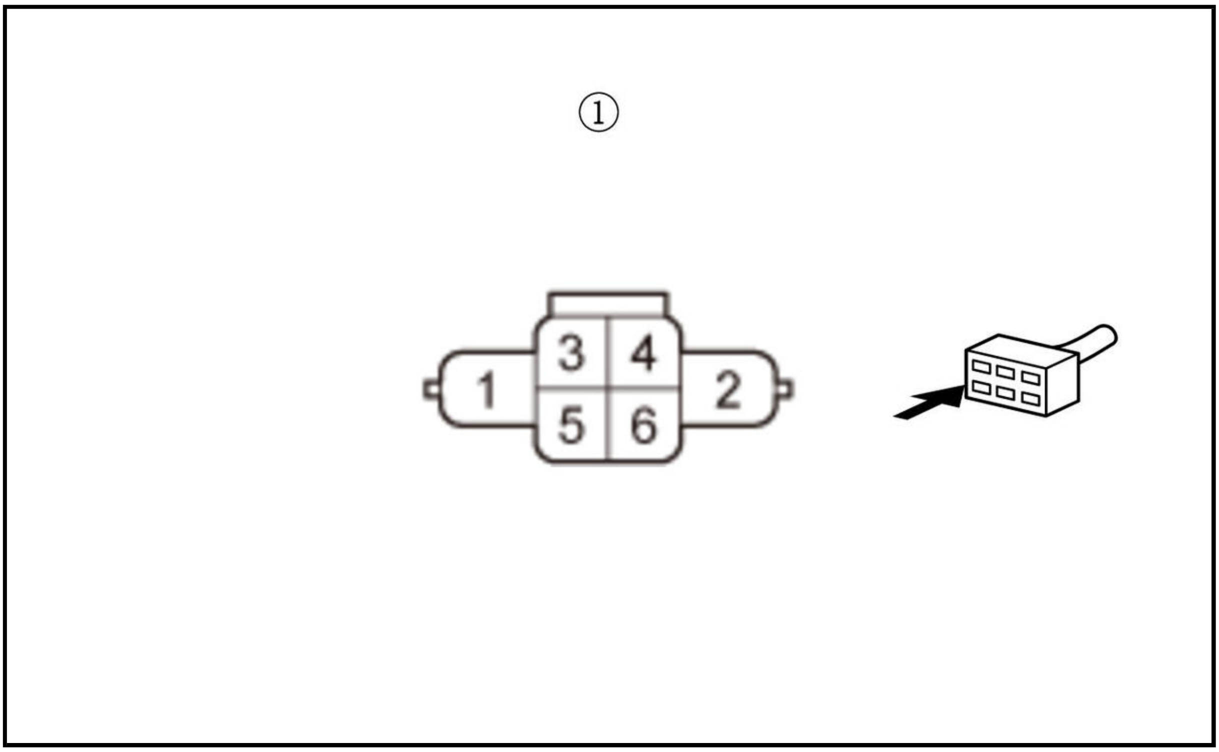
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Driver's power window motor 6P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's power window motor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-4. Connect and disconnect the jumper wire to body ground repeatedly.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseA	B	B

Does the information indicator display DETECT?

YES

Faulty driver's power window motor; **replace the driver's door regulator** .

NO

Go to step 3.

3. Shorted wire check (P/W DR MTR PLSA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's power window motor 6P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 33**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Repair an open or high resistance in the wire.

DTC B1126

DTC B1126 : Driver's power window motor B pulse malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1126 Driver's power window motor B pulse malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseB	B	B

   Does the information indicator display DETECT while the window is moving, and display NONE when the window is stopped?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 2.

2. Power window motor pulse check

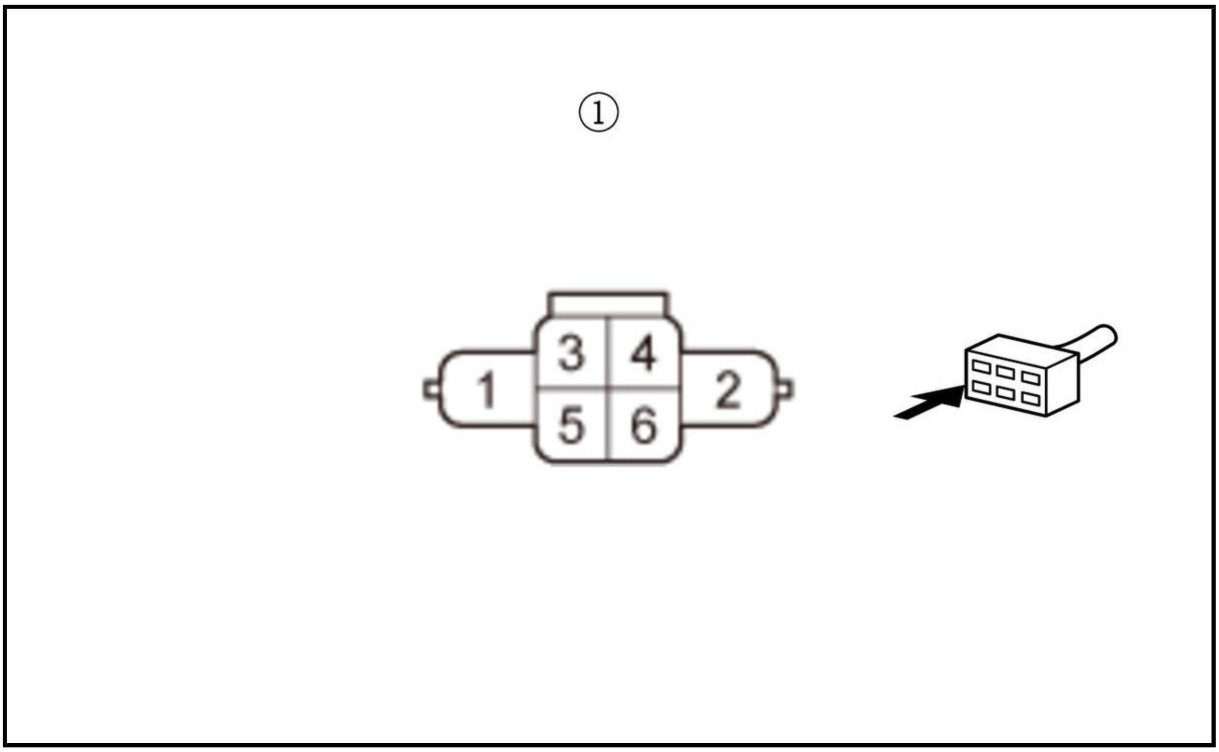
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Driver's power window motor 6P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's power window motor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-4. Connect and disconnect the jumper wire to ground repeatedly.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseB	B	B

Does the information indicator display DETECT?

YES

Faulty driver's power window motor; **replace the driver's door regulator** .

NO

Go to step 3.

3. Shorted wire check (P/W DR MTR PLSB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's power window motor 6P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 35**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Repair an open or high resistance in the wire.

DTC B1127

DTC B1127 : Driver's door lock key cylinder switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1127 Driver's door lock key cylinder switch malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification (driver's door key cylinder switch in the neutral position)

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch(LOCK)	B	B

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch(UNLOCK)	B	B

Is either information indicator ON?

YES

Go to step 4.

NO

Go to step 2.

2. Problem verification (driver's door key cylinder switch in the lock position)

-1. With the driver's door key cylinder in the lock position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch(LOCK)	B	B
Driver's Door Key Cylinder Switch(UNLOCK)	B	B

Are both information indicators ON?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time.

3. Shorted wire check (DR KEY CYL UNLOCK to DR KEY CYL LOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 7**
Terminal B	Body ground

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch(LOCK)	B	B
Driver's Door Key Cylinder Switch(UNLOCK)	B	B

Are both information indicators ON?

YES

Repair a short between the wires.

NO

The DR KEY CYL UNLOCK to DR KEY CYL LOCK wire is OK. Faulty driver's door key cylinder switch; **replace the driver's door latch** .

4. Determine possible failure area (driver's door latch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch (LOCK)	B	B
Driver's Door Key Cylinder Switch (UNLOCK)	B	B

Is either information indicator ON?

YES

Go to step 5.

NO

Faulty driver's door key cylinder switch; **replace the driver's door latch** .

5. Shorted wire check (DR KEY CYL UNLOCK, DR KEY CYL LOCK lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnectedPower window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 7**
Test point 2	Body ground

Test point 1	**Power window master switch 37P connector No. 8**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The DR KEY CYL UNLOCK and DR KEY CYL LOCK wires are OK. **Replace the power window master switch** ..

DTC B1128

DTC B1128 : Driver's door lock switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1128 Driver's door lock switch malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B1128 Driver's door lock switch malfunction	B

Is DTC B1128 indicated?

YES

Replace the power window master switch .

NO

Intermittent failure, the system is OK at this time.

DTC B1129

DTC B1129 : Driver's door lock knob switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1129 Driver's door lock knob switch malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Operate the driver's door lock knob switch several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1129 Driver's door lock knob switch malfunction	B

   Is DTC B1129 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (DR SILCON UNLOCK, DR SILCON LOCK lines)

   -1. With the driver's door lock knob switch in the lock position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Lock Knob Switch(UNLOCK)	B	B

   Is the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) information indicator ON?

   YES

   Go to step 5.

   NO

   Go to step 3.

3. Shorted wire check (DR SILCON LOCK line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Driver's door latch 10P connectorPower window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnectedPower window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 21**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The DR SILCON LOCK wire is not shorted to ground. Go to step 4.

4. Shorted wire check (DR SILCON UNLOCK line to DR SILCON LOCK line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnectedPower window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	**Power window master switch 37P connector No. 21**

Is there continuity?

YES

Repair a short in DR SILCON UNLOCK wire to DR SILCON LOCK wire.

NO

Faulty driver's door lock knob switch; **replace the driver's door latch** .

5. Shorted wire check (DR SILCON UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Driver's door latch 10P connectorPower window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnectedPower window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The DR SILCON UNLOCK wire is not shorted to ground. Go to step 6.

6. Shorted wire check (DR SILCON UNLOCK line to DR SILCON LOCK line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnectedPower window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	**Power window master switch 37P connector No. 21**

   Is there continuity?

   YES

   Repair a short in DR SILCON UNLOCK wire to DR SILCON LOCK wire.

   NO

   Faulty driver's door lock knob switch; **replace the driver's door latch** .

DTC B1130

DTC B1130 : Front passenger's power window motor A pulse malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1130 Front passenger's power window motor A pulse malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Open and close the front passenger's power window by using the front passenger's power window switch manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1130 Front passenger's power window motor A pulse malfunction	B

   Is DTC B1130 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Open wire check (P/W AS MTR PLSA line)

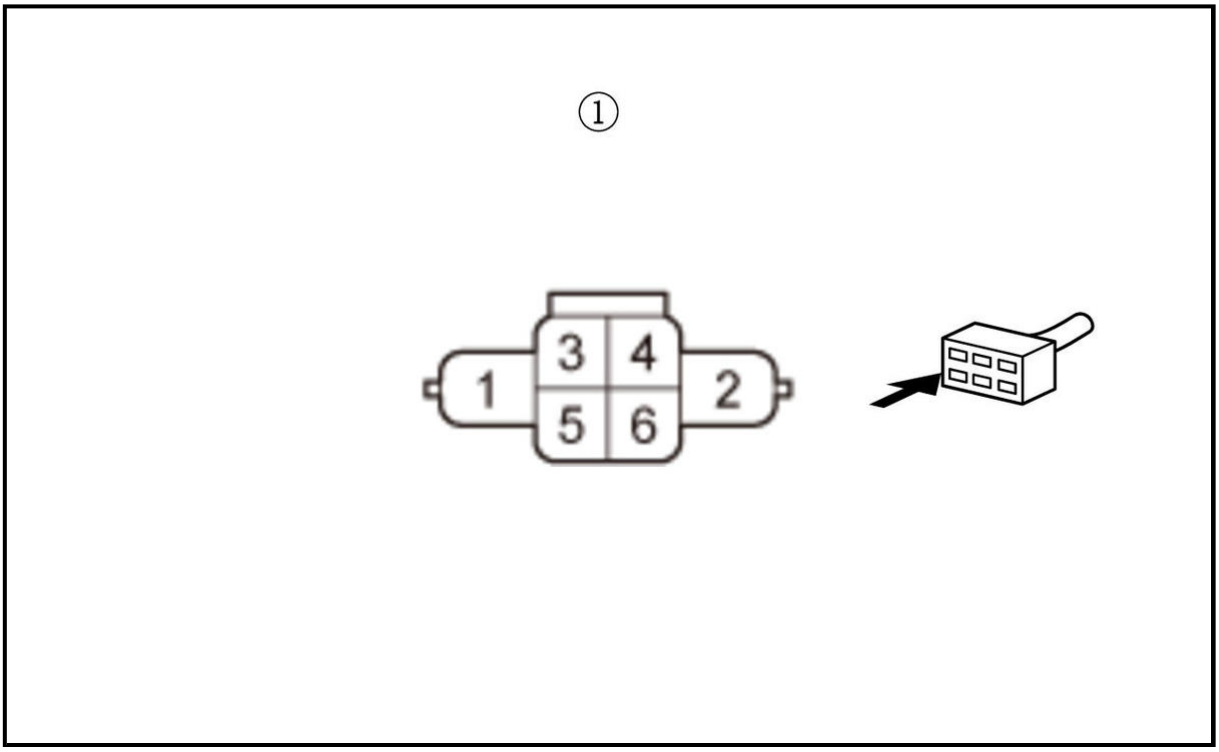
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Front passenger's power window switch 37P connectorFront passenger's power window motor 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's power window switch 37P connector: disconnectedFront passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 35**
Test point 2	Front passenger's power window motor 6P connector (female terminals) No. 5: ①



Is there continuity?

YES

The P/W AS MTR PLSA wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (P/W AS MTR PLSA line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's power window switch 37P connector: disconnectedFront passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 35**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The P/W AS MTR PLSA wire is OK. **Substitute a known good front passenger's power window switch** . If the DTC is still present, **replace the front passenger's door regulator** .

DTC B1131

DTC B1131 : Front passenger's power window motor B pulse malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1131 Front passenger's power window motor B pulse malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Open and close the front passenger's power window by using the front passenger's power window switch manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1131 Front passenger's power window motor B pulse malfunction	B

   Is DTC B1131 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Open wire check (P/W AS MTR PLSB line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

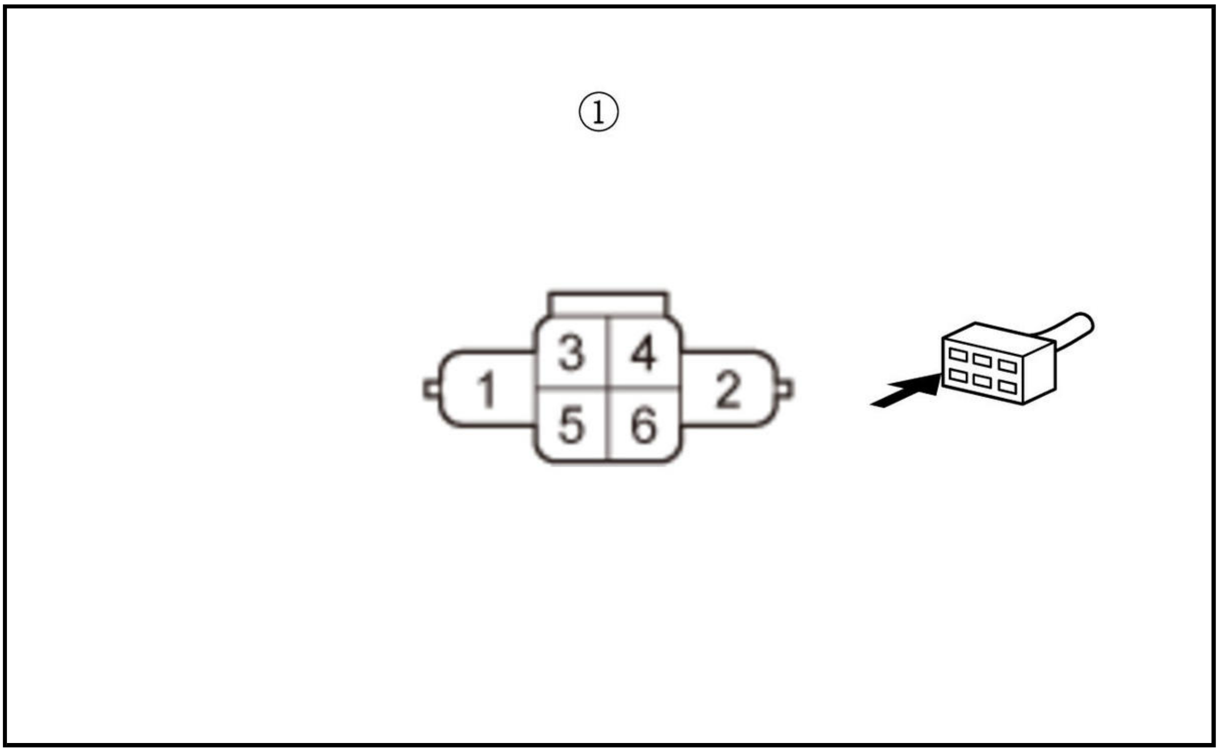
   -2. Disconnect the following connectors.

Front passenger's power window switch 37P connectorFront passenger's power window motor 6P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's power window switch 37P connector: disconnectedFront passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 37**

Test point 2	Front passenger's power window motor 6P connector (female terminals) No. 3: ①



Is there continuity?

YES

The P/W AS MTR PLSB wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (P/W AS MTR PLSB line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's power window switch 37P connector: disconnectedFront passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 37**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The P/W AS MTR PLSB wire is OK. **Substitute a known good front passenger's power window switch** . If the DTC is still present, **replace the front passenger's door regulator** .

DTC B1140

DTC B1140 : Driver's power window position detect circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1140 Driver's power window position detect circuit malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Open and close the driver's power window by using the power window master switch manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1125 Driver's power window motor A pulse malfunction	B
B1126 Driver's power window motor B pulse malfunction	B

   Is DTC B1125 or B1126 indicated?

   YES

   Troubleshoot DTC **B1125** or **B1126**.

   NO

   Resetting the power window master switch .

DTC B1142

DTC B1142 : Door Multiplex Control Unit lost communication with front passenger's power window switch (UART line open)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1142 Door Multiplex Control Unit lost communication with front passenger's power window switch (UART line open)	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1142 Door Multiplex Control Unit lost communication with front passenger's power window switch (UART line open)	B

Is DTC B1142 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Open wire check (LIN(P/W) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power window master switch 37P connectorFront passenger's power window switch 37P connectorPanoramic glass roof motor-control unit 14P connector (with panoramic glass roof)Moonroof motor-control unit 14P connector (with moonroof)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modePower window master switch 37P connector: disconnectedFront passenger's power window switch 37P connector: disconnectedPanoramic glass roof motor-control unit 14P connector (with panoramic glass roof): disconnectedMoonroof motor-control unit 14P connector (with moonroof): disconnected
Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	**Front passenger's power window switch 37P connector No. 34**

Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	**Panoramic glass roof motor-control unit 14P connector No. 12 (with panoramic glass roof)**

Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	**Moonroof motor-control unit 14P connector No. 12 (with moonroof)**

Is there continuity?

YES

The LIN(P/W) wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (LIN(P/W) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modePower window master switch 37P connector: disconnectedFront passenger's power window switch 37P connector: disconnectedPanoramic glass roof motor-control unit 14P connector (with panoramic glass roof): disconnectedMoonroof motor-control unit 14P connector (with moonroof): disconnected
Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The LIN(P/W) wire is not shorted to ground. Go to step 4.

4. Shorted wire check (LIN(P/W) line to power)

   -1. Turn the vehicle to the ON mode.

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON modePower window master switch 37P connector: disconnectedFront passenger's power window switch 37P connector: disconnectedPanoramic glass roof motor-control unit 14P connector (with panoramic glass roof): disconnectedMoonroof motor-control unit 14P connector (with moonroof): disconnected

Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The LIN(P/W) wire is OK. **Do the input test for terminals of the front passenger's power window switch** . If the tests prove OK, **substitute a known good front passenger's power window switch** . If the DTC goes away, **replace the original front passenger's power window switch** . If the DTC is still present, **replace the power window master switch** .

NO

Repair a short to power in the wire.

DTC B1145

DTC B1145 : Front passenger's power window position detect circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1145 Front passenger's power window position detect circuit malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open and close the front passenger's power window by using the front passenger's power window switch manually.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1145 Front passenger's power window position detect circuit malfunction	B

Is DTC B1145 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1130 Front passenger's power window motor A pulse malfunction	B
B1131 Front passenger's power window motor B pulse malfunction	B

Is DTC B1130 or B1131 indicated?

YES

Troubleshoot DTC **B1130** or **B1131**.

NO

Resetting the front passenger's power window switch .

DTC U1280 (MULTIPLEX CONTROL UNIT, DOOR)

DTC U1280 : Communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281, U128D, U1299 (MULTIPLEX CONTROL UNIT, DOOR)

DTC U1281 : Door multiplex control unit lost communication with MICU **DTC U128D** : Door multiplex control unit lost communication with gauge control module **DTC U1299** : Door multiplex control unit lost communication with climate control unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Door multiplex control unit lost communication with MICU	B
U128D Door multiplex control unit lost communication with gauge control module	B
U1299 Door multiplex control unit lost communication with climate control unit	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Door multiplex control unit lost communication with MICU	B
U128D Door multiplex control unit lost communication with gauge control module	B
U1299 Door multiplex control unit lost communication with climate control unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Power window master switch 37P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)
U1299	Climate control unit connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) modePower window master switch 37P connector: disconnectedTransmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	**Power window master switch 37P connector**	No. 32	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 31		No. 21
U128D	B-CAN_H	**Power window master switch 37P connector**	No. 32	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 31		No. 31
U1299	B-CAN_H	**Power window master switch 37P connector**	No. 32	**Climate control unit connector A (32P)**	No. 25
	B-CAN_L		No. 31		No. 8

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.Refer to the DTC shown on the display, then replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U1281	**Body control module**
U128D	**Gauge control module**

DTC	Operation for transmitting control unit
U1064	**Climate control unit**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B1125

DTC B1125 : Driver's power window motor A pulse malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1125 Driver's power window motor A pulse malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseA	B	B

   Does the information indicator display DETECT while the window is moving, and display NONE when the window is stopped?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 2.

2. Power window motor pulse check

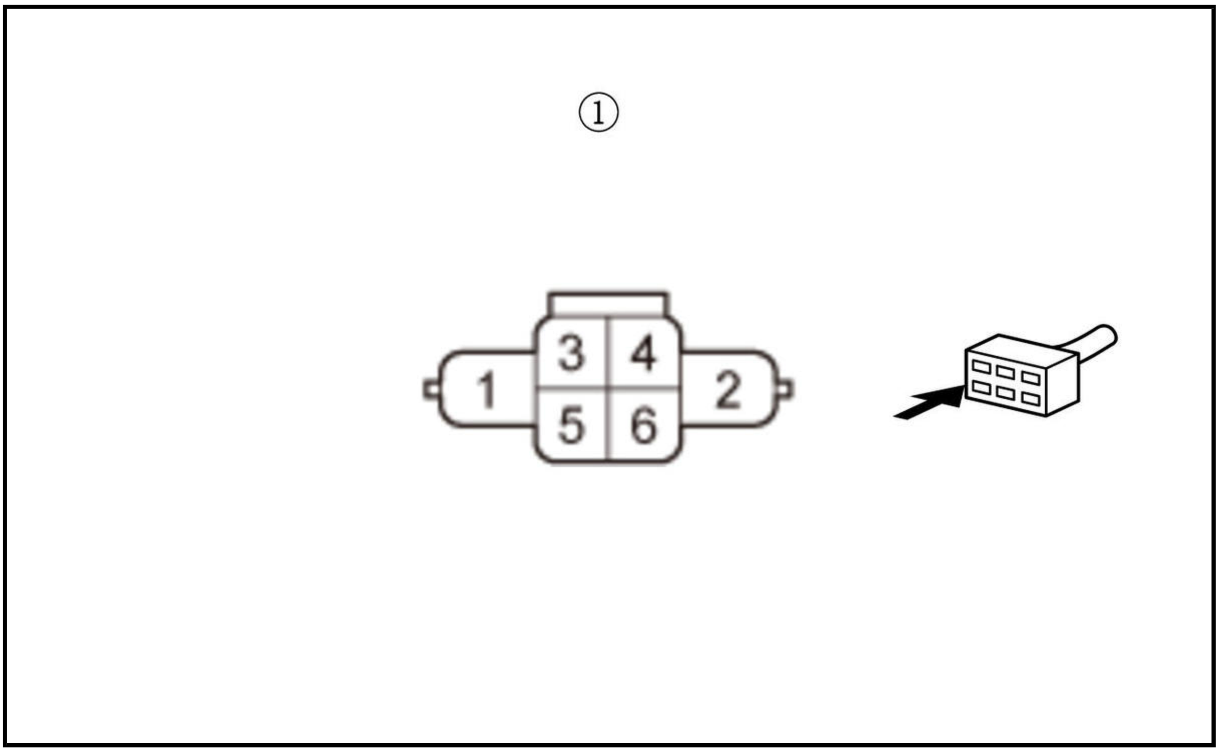
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Driver's power window motor 6P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's power window motor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-4. Connect and disconnect the jumper wire to body ground repeatedly.

-5. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
Driver's P/W Motor PulseA	B	B

Does the information indicator display DETECT?

YES

Faulty driver's power window motor; **replace the driver's door regulator** .

NO

Go to step 3.

3. Shorted wire check (P/W_DR_MTR_PLSA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's power window motor 6P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 33**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Repair an open or high resistance in the wire.

NO

Repair a short to ground in the wire.

DTC B1126

DTC B1126 : Driver's power window motor B pulse malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1126 Driver's power window motor B pulse malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseB	B	B

   Does the information indicator display DETECT while the window is moving, and display NONE when the window is stopped?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 2.

2. Power window motor pulse check

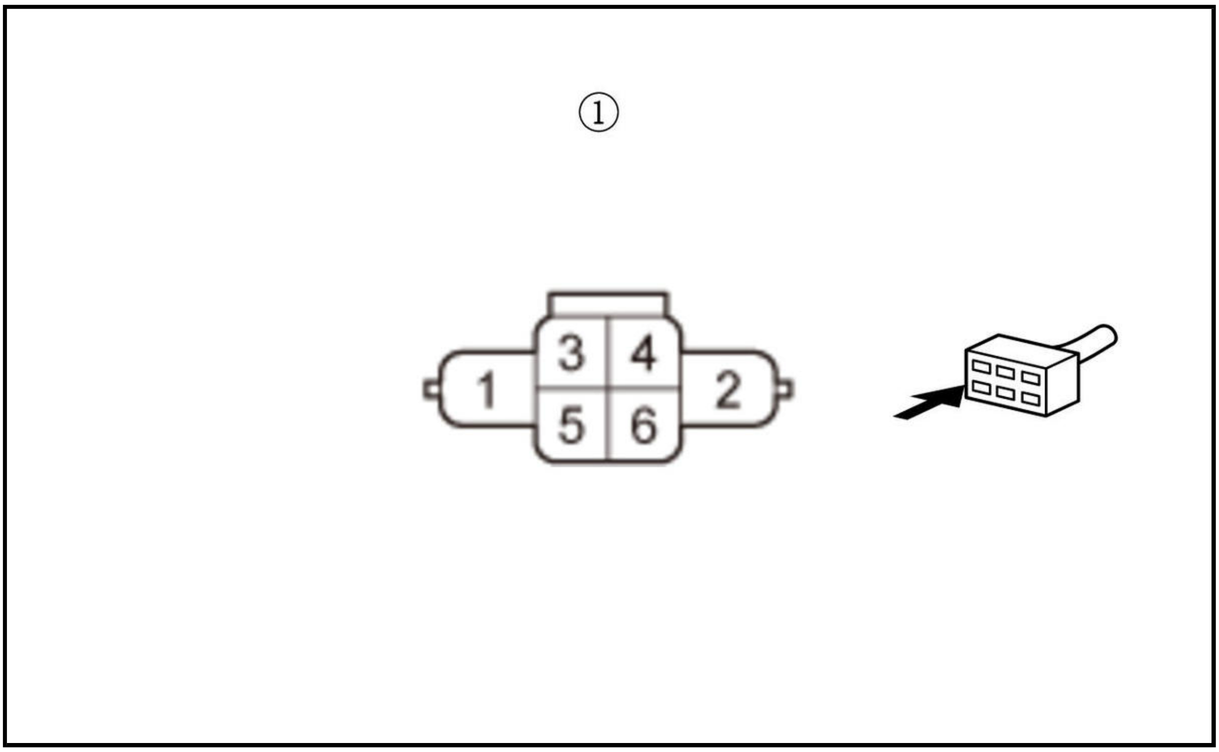
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Driver's power window motor 6P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's power window motor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-4. Connect and disconnect the jumper wire to ground repeatedly.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's P/W Motor PulseB	B	B

Does the information indicator display DETECT?

YES

Faulty driver's power window motor; replace the driver's door regulator .

NO

Go to step 3.

3. Shorted wire check (P/W_DR_MTR_PLSB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's power window motor 6P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	Power window master switch 37P connector No. 35
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Repair an open or high resistance in the wire.

NO

Repair a short to ground in the wire.

DTC B1127

DTC B1127 : Driver's door lock key cylinder switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1127 Driver's door lock key cylinder switch malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification (driver's door key cylinder switch in the neutral position)

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch(LOCK)	B	B
Driver's Door Key Cylinder Switch(UNLOCK)	B	B

   Is either information indicator ON?

   YES

   Go to step 4.

   NO

   Go to step 2.

2. Problem verification (driver's door key cylinder switch in the lock position)

   -1. With the driver's door key cylinder in the lock position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch (LOCK)	B	B
Driver's Door Key Cylinder Switch (UNLOCK)	B	B

   Are both information indicators ON?

   YES

   Go to step 3.

   NO

   Intermittent failure, the system is OK at this time.

3. Shorted wire check (DR_KEY_CYL_UNLOCK to DR_KEY_CYL_LOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 7**
Terminal B	Body ground

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch (LOCK)	B	B
Driver's Door Key Cylinder Switch (UNLOCK)	B	B

Are both information indicators ON?

YES

Repair a short between the wires.

NO

The DR_KEY_CYL_UNLOCK to DR_KEY_CYL_LOCK wire is OK. Faulty driver's door key cylinder switch; **replace the driver's door latch** .

4. Determine possible failure area (driver's door latch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Key Cylinder Switch (LOCK)	B	B
Driver's Door Key Cylinder Switch (UNLOCK)	B	B

Is either information indicator ON?

YES

Go to step 5.

NO

Faulty driver's door key cylinder switch; **replace the driver's door latch** .

5. Shorted wire check (DR_KEY_CYL_UNLOCK, DR_KEY_CYL_LOCK lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 7**
Test point 2	Body ground

Test point 1	**Power window master switch 37P connector No. 8**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DR_KEY_CYL_UNLOCK and DR_KEY_CYL_LOCK wires are OK. **Replace the power window master switch** ..

NO

Repair a short to ground in the wire.

DTC B1128

DTC B1128 : Driver's door lock switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1128 Driver's door lock switch malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B1128 Driver's door lock switch malfunction	B

Is DTC B1128 indicated?

YES

Replace the power window master switch .

NO

Intermittent failure, the system is OK at this time.

DTC B1129

DTC B1129 : Driver's door lock knob switch malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1129 Driver's door lock knob switch malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Operate the driver's door lock knob switch several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1129 Driver's door lock knob switch malfunction	B

   Is DTC B1129 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (DR_SILCON_UNLOCK, DR_SILCON_LOCK lines)

   -1. With the driver's door lock knob switch in the lock position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B

   Is the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) information indicator ON?

   YES

   Go to step 5.

   NO

   Go to step 3.

3. Shorted wire check (DR_SILCON_LOCK line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Driver's door latch 10P connector Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 21**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DR_SILCON_LOCK wire is not shorted to ground. Go to step 4.

NO

Repair a short to ground in the wire.

4. Shorted wire check (DR_SILCON_UNLOCK line to DR_SILCON_LOCK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	**Power window master switch 37P connector No. 21**

Is there 1.0 MΩ or more?

YES

Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Repair a short in DR_SILCON_UNLOCK wire to DR_SILCON_LOCK wire.

5. Shorted wire check (DR_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Driver's door latch 10P connector Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DR_SILCON_UNLOCK wire is not shorted to ground. Go to step 6.

NO

Repair a short to ground in the wire.

6. Shorted wire check (DR_SILCON_UNLOCK line to DR_SILCON_LOCK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	**Power window master switch 37P connector No. 21**

Is there 1.0 MΩ or more?

YES

Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Repair a short in DR_SILCON_UNLOCK wire to DR_SILCON_LOCK wire.

DTC B1130

DTC B1130 : Front Passenger's power window motor A-phase pulse signal input error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1130 Front Passenger's power window motor A-phase pulse signal input error	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Open and close the front passenger's power window by using the front passenger's power window switch manually.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1130 Front Passenger's power window motor A-phase pulse signal input error	B

Is DTC B1130 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Open wire check (P/W_AS_MTR_PLSA line)

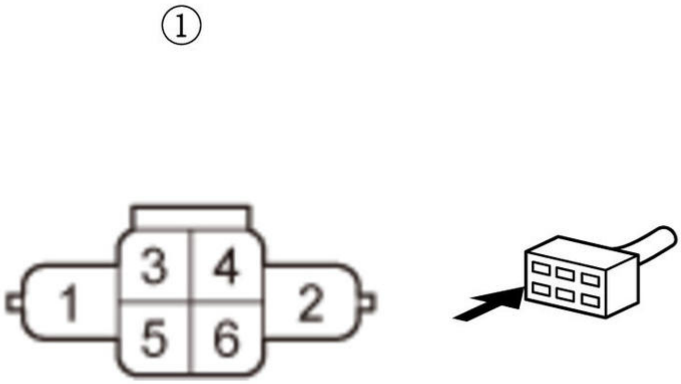
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Front passenger's power window switch 37P connector Front passenger's power window motor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's power window switch 37P connector: disconnected Front passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 35**
Test point 2	Front passenger's power window motor 6P connector (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

The P/W_AS_MTR_PLSA wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (P/W_AS_MTR_PLSA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's power window switch 37P connector: disconnected Front passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 35**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The P/W_AS_MTR_PLSA wire is OK. **Substitute a known good front passenger's power window switch** . If the DTC is still present, **replace the front passenger's door regulator** .

NO

Repair a short to ground in the wire.

DTC B1131

DTC B1131 : Front Passenger's power window motor B-phase pulse signal input error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1131 Front Passenger's power window motor B-phase pulse signal input error	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Open and close the front passenger's power window by using the front passenger's power window switch manually.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1131 Front Passenger's power window motor B-phase pulse signal input error	B

Is DTC B1131 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Open wire check (P/W_AS_MTR_PLSB line)

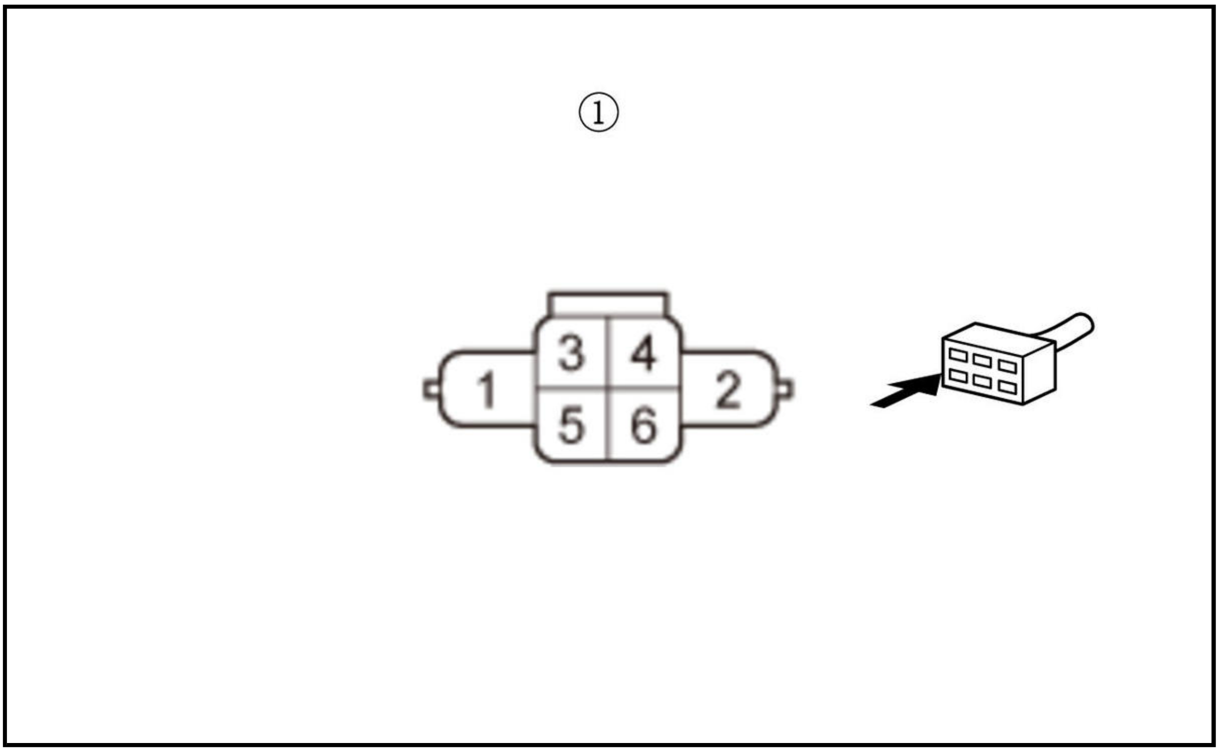
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Front passenger's power window switch 37P connector Front passenger's power window motor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's power window switch 37P connector: disconnected Front passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 37**
Test point 2	Front passenger's power window motor 6P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The P/W_AS_MTR_PLSB wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (P/W_AS_MTR_PLSB line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's power window switch 37P connector: disconnected Front passenger's power window motor 6P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 37**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The P/W_AS_MTR_PLSB wire is OK. **Substitute a known good front passenger's power window switch** . If the DTC is still present, **replace the front passenger's door regulator** .

NO

Repair a short to ground in the wire.

DTC B1140

DTC B1140 : Driver's power window position detect circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1140 Driver's power window position detect circuit malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Open and close the driver's power window by using the power window master switch manually.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1125 Driver's power window motor A pulse malfunction	B
B1126 Driver's power window motor B pulse malfunction	B

Is DTC B1125 or B1126 indicated?

YES

Troubleshoot DTC **B1125** or **B1126**.

NO

Resetting the power window master switch .

DTC B1142

DTC B1142 : Power window master switch lost communication with the other units (UART communication Error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1142 Power window master switch lost communication with the other units (UART communication Error)	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1142 Power window master switch lost communication with the other units (UART communication Error)	B

Is DTC B1142 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Open wire check (LIN(P/W) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power window master switch 37P connector Front passenger's power window switch 37P connector Moonroof motor-control unit 14P connector (with moonroof)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power window master switch 37P connector: disconnected Front passenger's power window switch 37P connector: disconnected Moonroof motor-control unit 14P connector (with moonroof): disconnected
Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	**Front passenger's power window switch 37P connector No. 34**

Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	**Moonroof motor-control unit 14P connector No. 12 (with moonroof)**

Is there 1.0 Ω or less?

YES

The LIN (P/W) wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (LIN (P/W) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power window master switch 37P connector: disconnected

	Front passenger's power window switch 37P connector: disconnected Moonroof motor-control unit 14P connector (with moonroof): disconnected
Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The LIN (P/W) wire is not shorted to ground. Go to step 4.

NO

Repair a short to ground in the wire.

4. Shorted wire check (LIN (P/W) line to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Power window master switch 37P connector: disconnected Front passenger's power window switch 37P connector: disconnected Moonroof motor-control unit 14P connector (with moonroof): disconnected
Test point 1	**Power window master switch 37P connector No. 36**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The LIN(P/W) wire is OK. **Do the input test for terminals of the front passenger's power window switch** . If the tests prove OK, **substitute a known good front passenger's power window switch** . If the DTC goes away, **replace the original front passenger's power window switch** . If the DTC is still present, **replace the power window master switch** .

NO

Repair a short to power in the wire.

DTC B1145

DTC B1145 : Front passenger's window position detect circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1145 Front passenger's window position detect circuit malfunction	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Open and close the front passenger's power window by using the front passenger's power window switch manually.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1145 Front passenger's window position detect circuit malfunction	B

Is DTC B1145 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1130 Front Passenger's power window motor A-phase pulse signal input error	B
B1131 Front Passenger's power window motor B-phase pulse signal input error	B

Is DTC B1130 or B1131 indicated?

YES

Troubleshoot DTC **B1130** or **B1131**.

NO

Resetting the front passenger's power window switch .

DTC U1280 (MULTIPLEX CONTROL UNIT, DOOR)

DTC U1280 : Communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1281, U128D, U1299 (MULTIPLEX CONTROL UNIT, DOOR)

DTC U1281 : Power Window Master Switch lost communication with MICU (body control module)

DTC U128D : Power Window Master Switch lost communication with gauge control module

DTC U1299 : Power Window Master Switch lost communication with climate control unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Power Window Master Switch lost communication with MICU (body control module)	B
U128D Power Window Master Switch lost communication with gauge control module	B
U1299 Power Window Master Switch lost communication with climate control unit	B

DTC (Multiplex Control Unit, Door)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Power Window Master Switch lost communication with MICU (body control module)	B
U128D Power Window Master Switch lost communication with gauge control module	B
U1299 Power Window Master Switch lost communication with climate control unit	B

   Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Power window master switch 37P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)
U1299	Climate control unit connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Power window master switch 37P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	**Power window master switch 37P connector**	No. 32	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 31		No. 21
U128D	B-CAN_H	**Power window master switch 37P connector**	No. 32	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 31		No. 31
U1299	B-CAN_H	**Power window master switch 37P connector**	No. 32	**Climate control unit connector A (32P)**	No. 25
	B-CAN_L		No. 31		No. 8

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	**Body control module**
U128D	**Gauge control module**

DTC	Operation for transmitting control unit
U1064	**Climate control unit**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

HOW TO INFORMATION

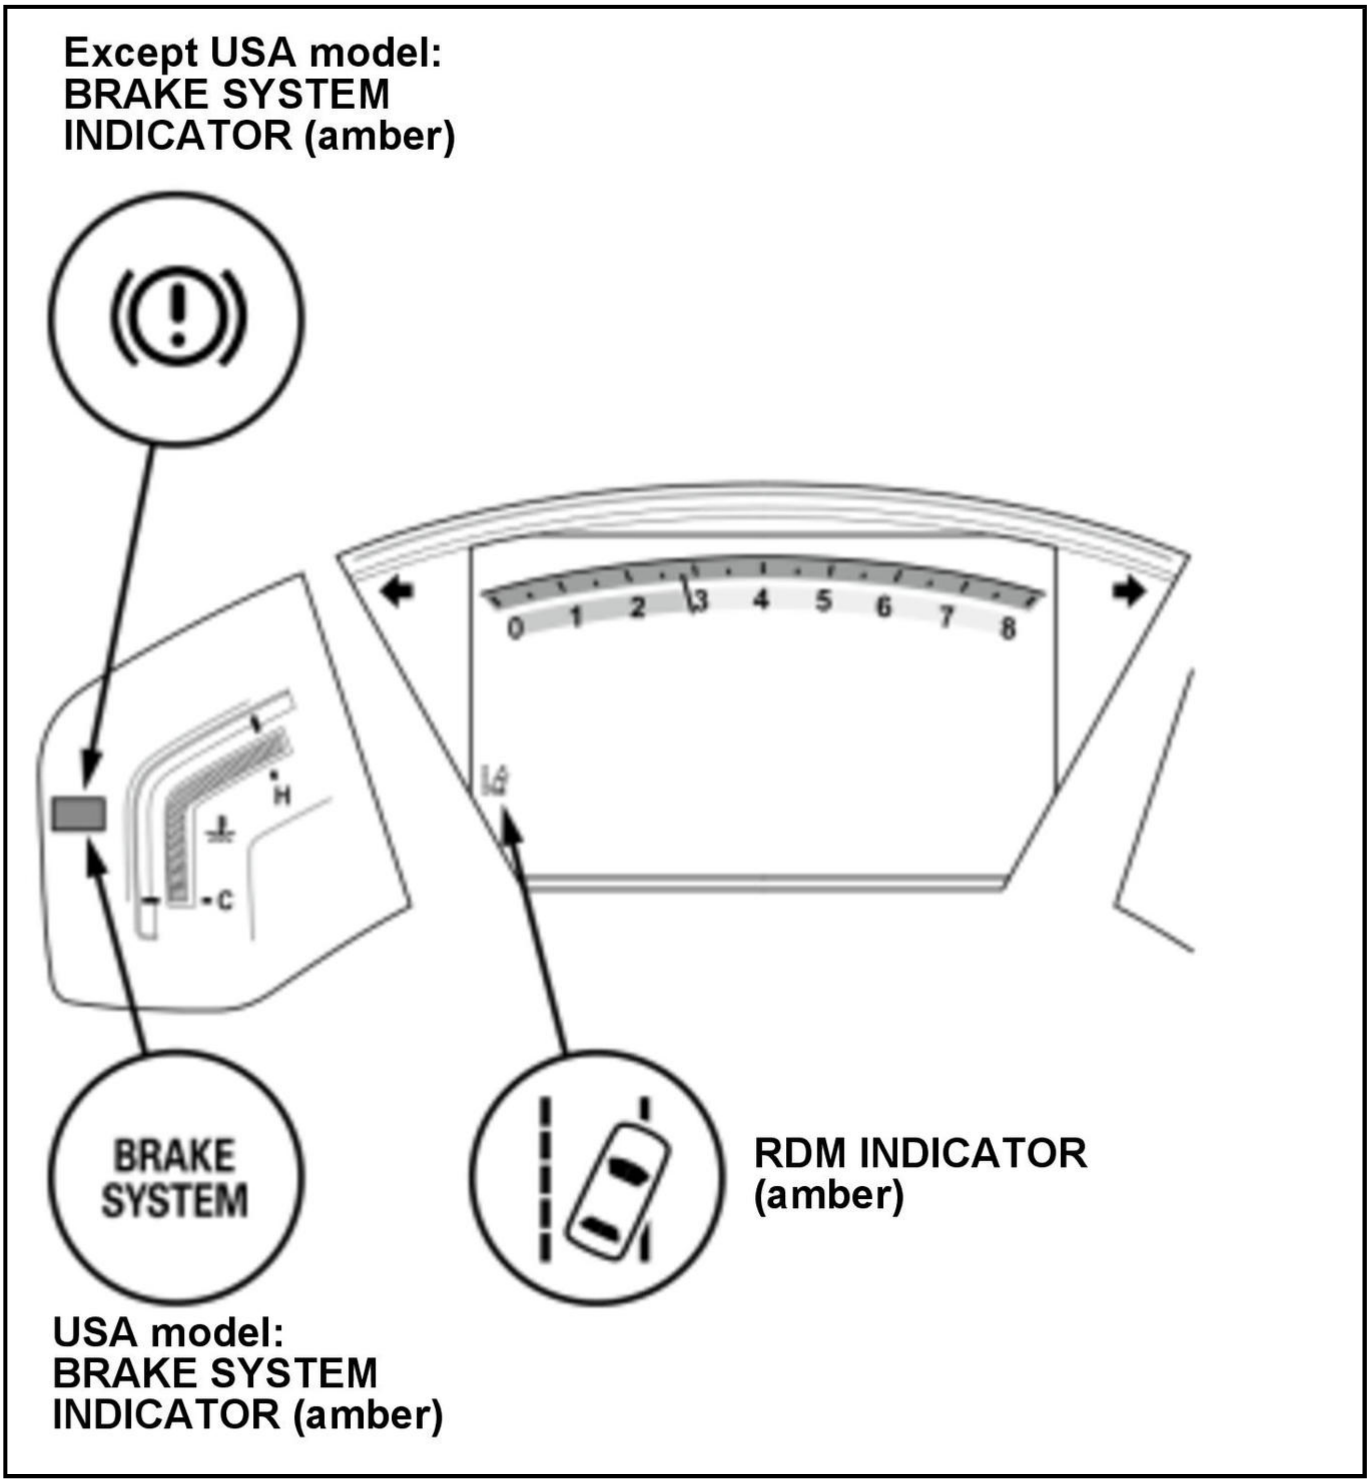
HOW TO TROUBLESHOOT THE ROAD DEPARTURE MITIGATION

RDM Indicator (Amber)

When the RDM system detects a problem during operation, the RDM system stops operating, and the RDM indicator turns on.

NOTE:

- For RDM system function, **review the Road Departure Mitigation System Description** .
- The RDM system communicates with other control units via F-CAN. For RDM system diagram, **refer to the System Diagram for RDM** . If a connected unit malfunctions, the RDM system will not operate. In this case, both RDM indicator and connected unit indicator come on and stay on (except for the gauge control module).



Except USA model:
BRAKE SYSTEM
INDICATOR (amber)

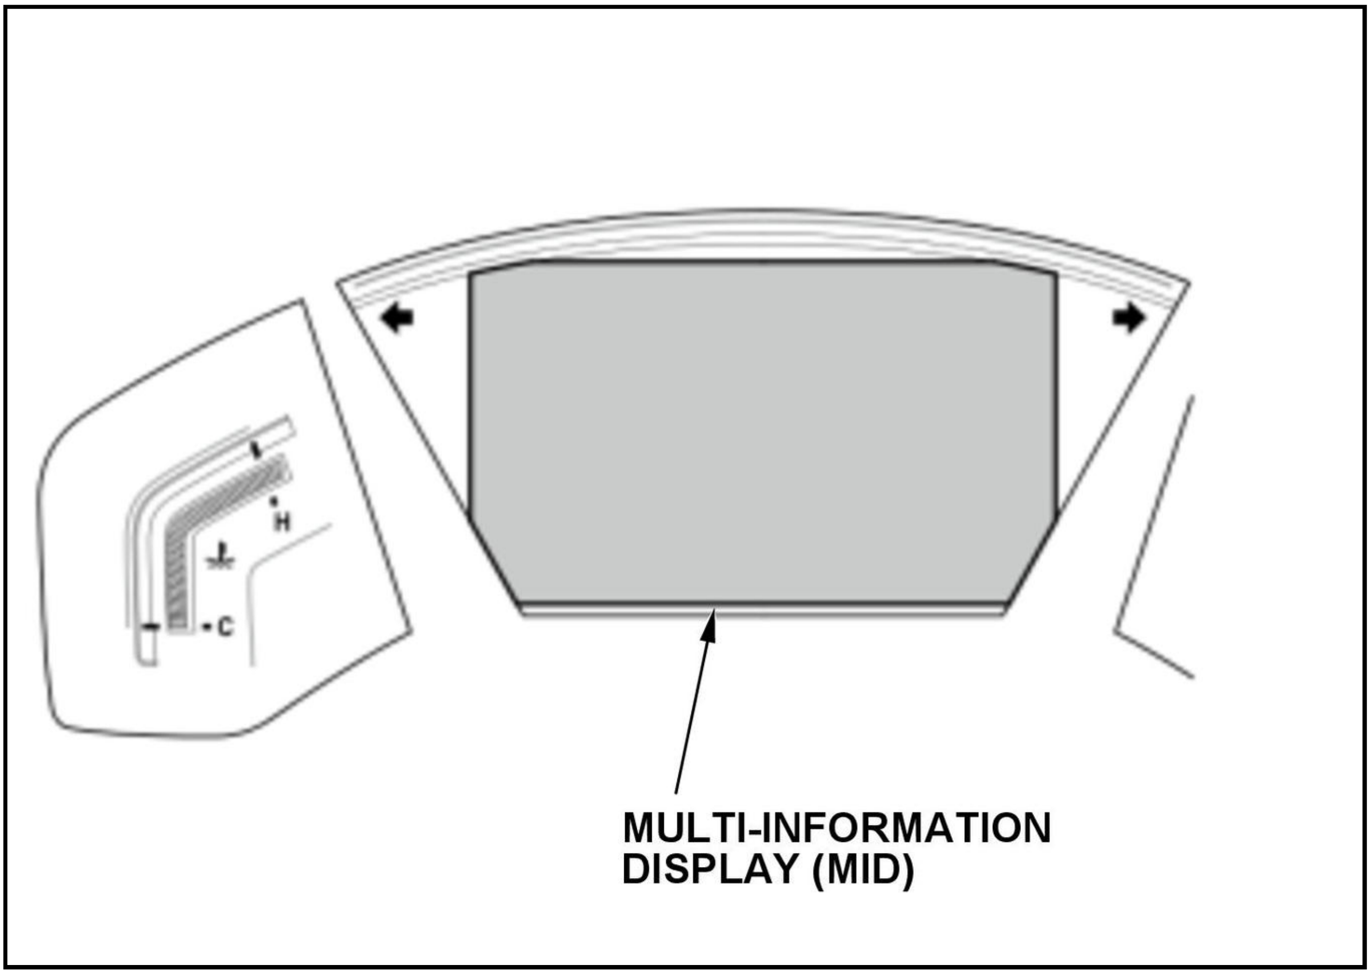
1
2
3
4
5
6
7
8
H
C
BRAKE
SYSTEM
RDM INDICATOR
(amber)
USA model:
BRAKE SYSTEM
INDICATOR (amber)

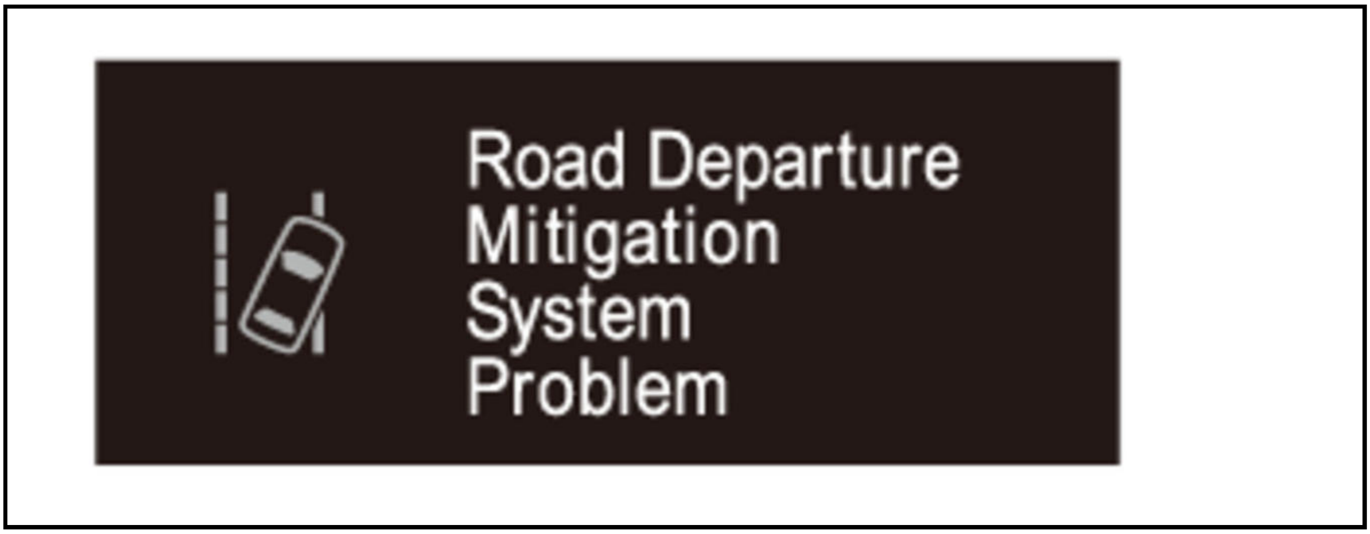
Multi-Information Display (MID) Indication

When the RDM system is OK, the RDM indicates its operation on the MID when the MAIN switch is ON.



Self-Diagnostic Function

The RDM system has a self-diagnostic function. If the self-diagnostic function detects a malfunction, the RDM system stops operating, turns on the RDM indicator, and stores DTCs.



Road Departure Mitigation System Problem

RDM Switch

Press and hold the RDM switch for at least 1 second to turn the RDM system off and on.

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

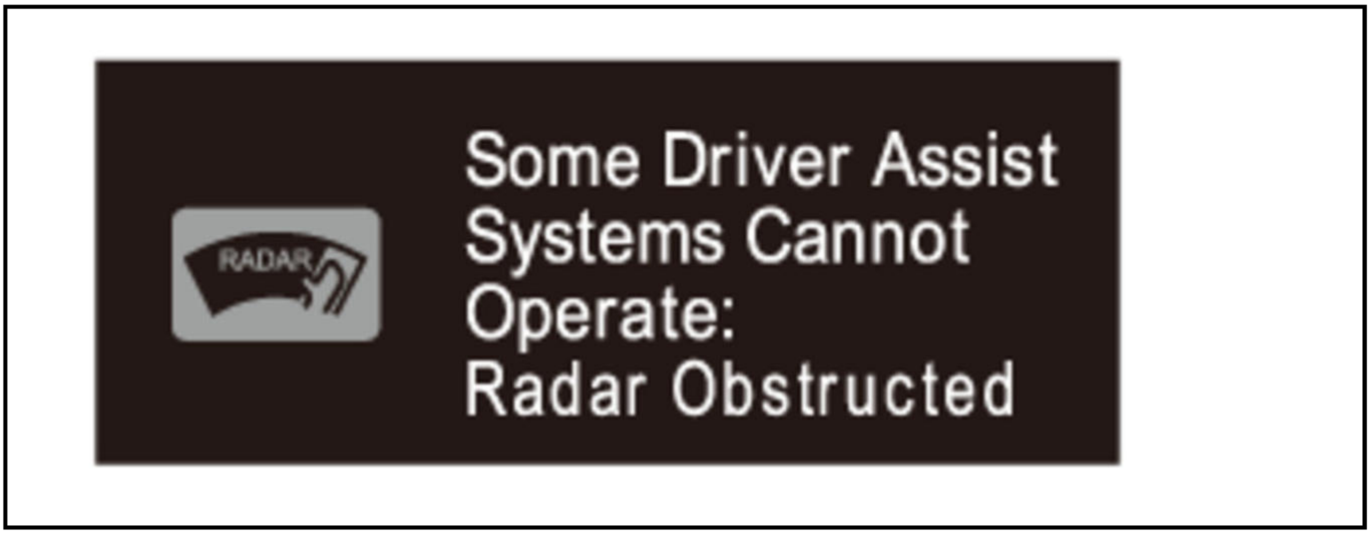
The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the RDM, and turns on the RDM indicator.

Dirt or dust detective function (Clean Millimeter Wave Radar Indication)

If the millimeter wave radar or front grille gets dirty, the RDM system stops operating and the following message on the MID will appear. Clean the millimeter wave radar and the front grille surface. Once the millimeter wave radar and front grille surface are clean, the message on the MID disappears and the RDM system automatically turns on.

NOTE:

- The following MID message may come on temporarily when passing through an enclosed space, such as tunnel.
- Under the above conditions DTC P2583-97 is stored.
- When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille. At this time, DTC P2583-76 is stored depending on the situation.
- After DTC P2583-76 is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage in some models, and then the indicators come on.



Some Driver Assist Systems Cannot Operate:
Radar Obstructed

Millimeter Wave Radar Aiming

If the millimeter wave radar is removed or replaced, you must do the millimeter wave radar aiming procedure, otherwise the RDM indicator blinks.

Multipurpose Camera Unit

The multipurpose camera unit uses input from the EPS control unit, the SRS unit, the PCM, and the VSA modulator-control unit to warn the driver when approaching the vehicle ahead. The multipurpose camera unit communicates with the gauge control module to send the warning signal.

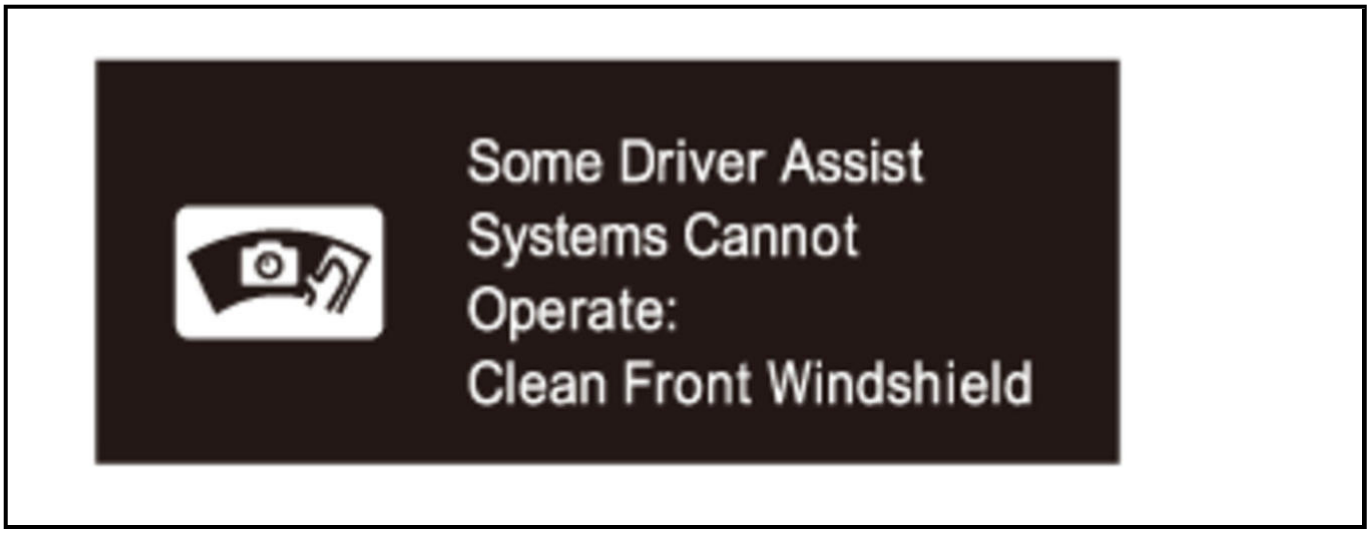
The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar receives this information from the multipurpose camera unit.

Dirt or dust detective function (CLEAN FRONT WINDSHIELD Indication)

If the following message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed, the RDM system stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the indicator on the MID turns off and the RDM system automatically turns back to ON.

NOTE: When millimeter wave radar detected dirt or dust on the multipurpose camera lens or the windshield surface, DTC B2A60-97 is stored as a past failure.

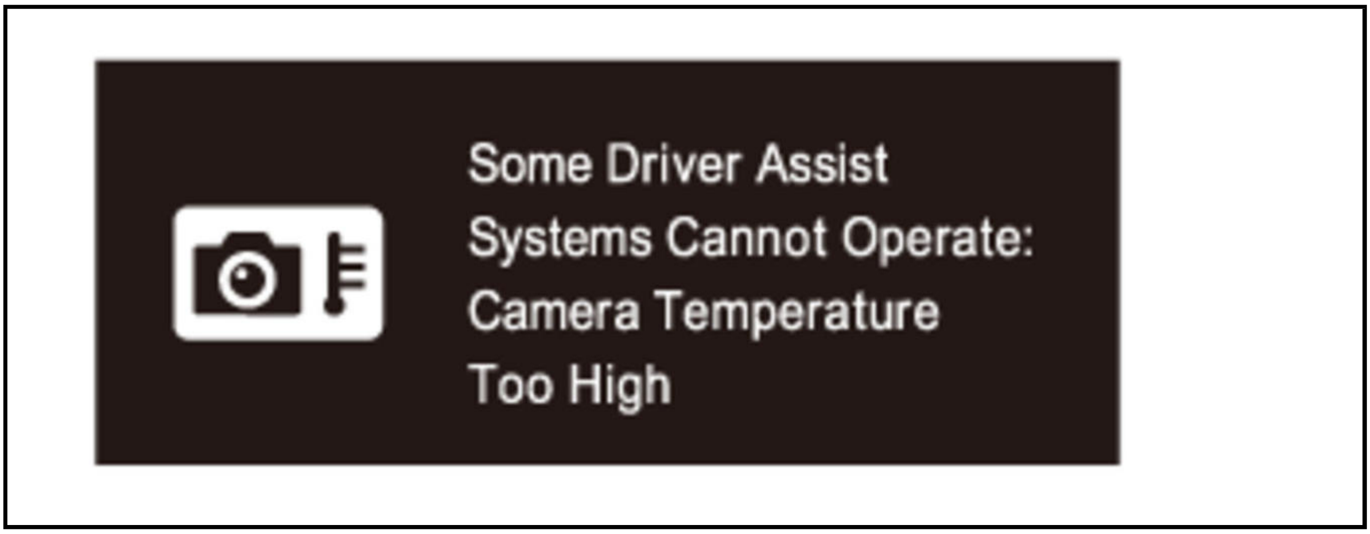


Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the following message appears on the MID, the RDM system stops operating, and stores a DTC.

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the RDM system automatically resumes operation.



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the RDM indicator blinks.

CAN Communication

The RDM system communicates with other control units via F-CAN. For RDM system diagram, **refer to the System Diagram for RDM** .

If the millimeter wave radar and the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the RDM system will not operate even though it is OK. In this case, both the RDM indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

NOTE: For RDM system DTCs, **refer to the DTC troubleshooting index** .

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the RDM indicator does not come on while test-driving, but your troubleshooting was based on the DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the RDM indicator does not come on.
- The RDM system sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs may be stored in these cases.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

DESCRIPTION & OPERATION

NAVIGATION SYSTEM DESCRIPTION

Basic Configuration

The navigation system is a highly-sophisticated, hybrid locating system that uses satellites and a map database to show you where you are and to help guide you to a desired destination.

The navigation system receives signals from the global positioning system (GPS), a network of 24 or more satellites in orbit around the earth. By receiving signals from several of these satellites, the navigation system can determine the latitude, longitude, and elevation of the vehicle. In addition, signals from the navigation unit's own gyro sensor and vehicle information (vehicle speed pulse) enable the system to keep track of the vehicle's direction and speed of travel.

This hybrid system has advantages over a system that is either entirely self-contained or one that relies totally on the GPS. For example, the self-contained portion of the system can keep track of vehicle position even when satellite signals cannot be received. When the navigation system is on, the GPS can keep track of the vehicle position even when the vehicle is transported by ferry.

The navigation system applies all location, direction, and speed information to maps and calculates a route to the destination entered. As you drive to that destination, the system provides both visual and audio guidance.

Audio-Navigation Unit

Refer to the Audio System Description for the audio-navigation unit (display audio) and audio functions .

Navigation Function

The navigation function is installed in the audio-navigation unit as an application. The basic navigation system is composed of the audio-navigation unit, center display unit, vehicle information signals (vehicle speed pulse, reverse signal), and the GPS antenna.

NAVIGATION APPLICATION
Update

Calculation of Vehicle Position

The audio-navigation unit calculates the vehicle position (the driving direction and the current position) by receiving the directional change signals from the gyro sensor, and the travel distance signals from vehicle information (vehicle speed pulse, BACK LT (reverse) signal).

Map Matching Tuning

Map match tuning means that the vehicle's position is properly indicated on mapped roads. The map data transmitted from the SD card is checked against the current vehicle position data and the vehicle's position is indicated on the nearest road. Map matching tuning cannot be done when the vehicle is on an unmapped road, or if the vehicle is far away from a mapped road.

GPS Tuning

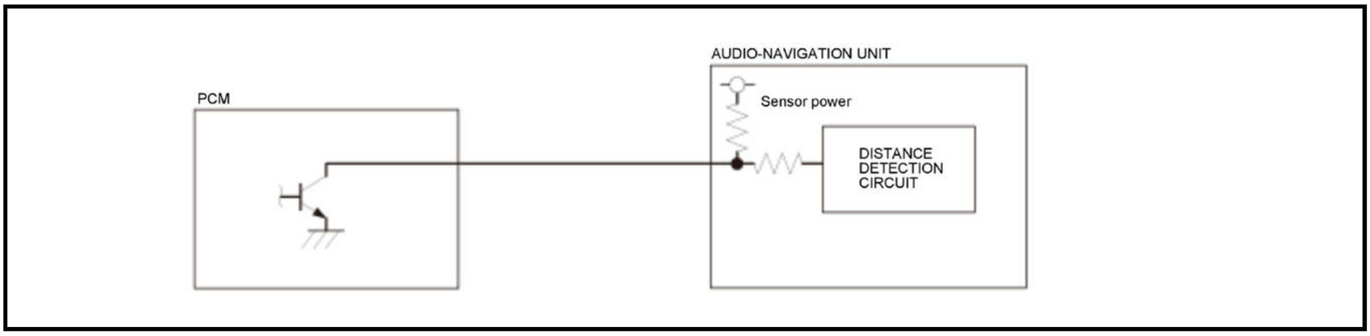
GPS tuning improves the accuracy of the vehicle's actual position in relation to the GPS vehicle position. The audio-navigation unit compares its calculated vehicle position with the GPS position. If there is a large difference between the two positions, the GPS tuning adjusts the calculated vehicle position to the GPS position.

Distance Tuning

The audio-navigation unit compares the vehicles calculated distance using the VSP and the vehicle's actual position based on GPS data. If the values are different, the audio-navigation unit decreases or increases the tuning value depending if the vehicle's calculated position is always ahead or behind the GPS position.

Vehicle Speed Pulse

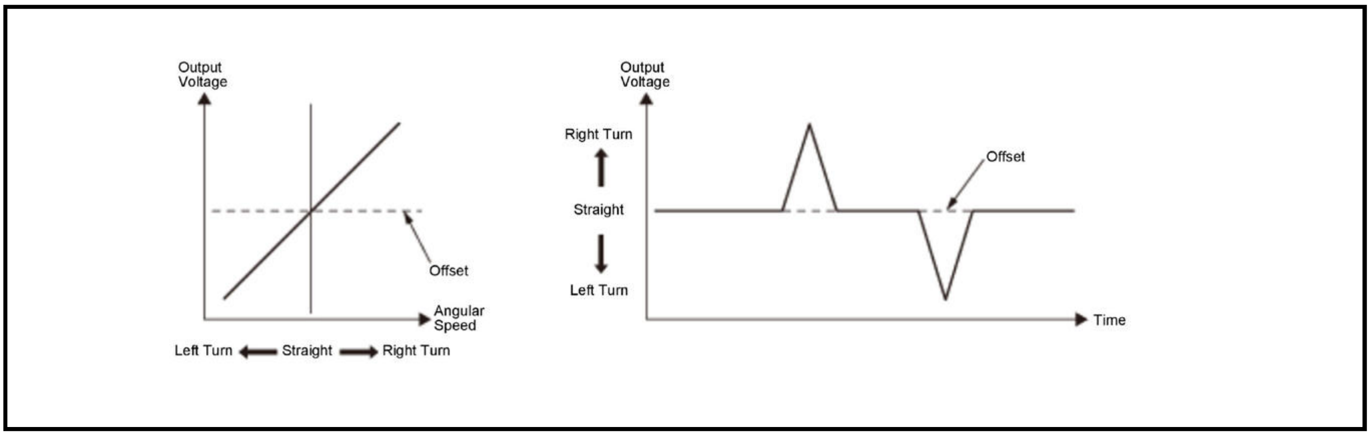
The vehicle speed pulse is sent by the PCM. The PCM receives a signal from the output shaft speed sensor, then processes the signal and transmits it to the speedometer and other systems.



Gyro Sensor

The gyro sensor (located in the audio-navigation unit) detects the direction change (angular speed) and the attitude of the vehicle.

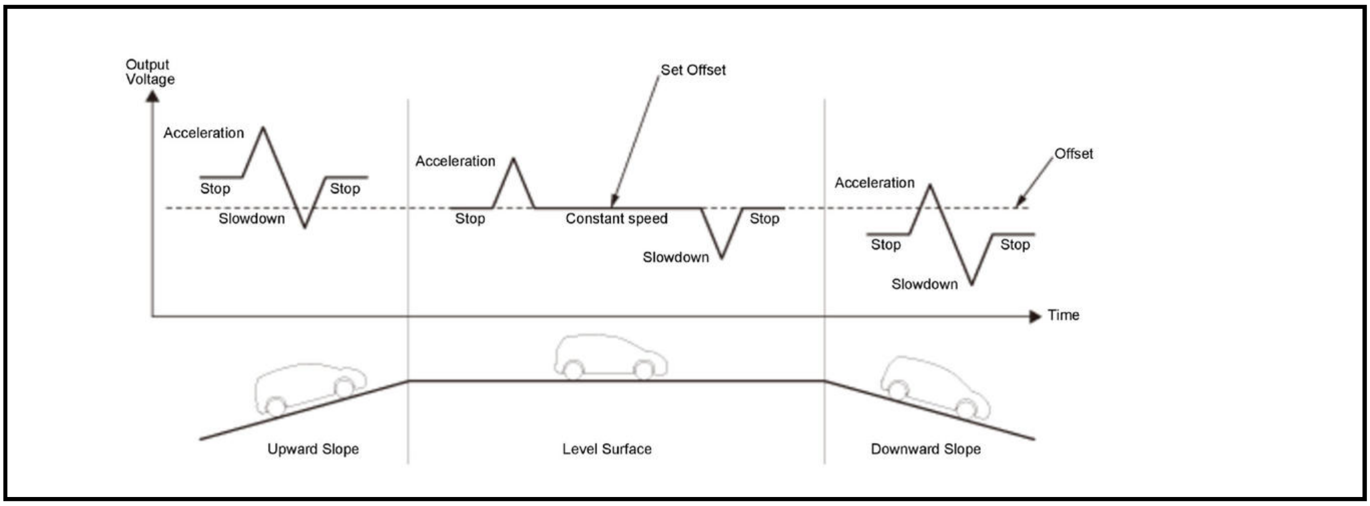
When the vehicle turns left or right, the gyro sensor outputs the voltage. But the sensor outputs the offset voltage when the vehicle is stopped. The audio-navigation unit calculates the relative bearing of the vehicle from the offset voltage. Since the vehicle may generate the yaw rate even when the vehicle is stopped. (when the vehicle is spun on a turn table), the audio-navigation unit prevents incorrect calculations using the gyro sensor temperature information.



When the vehicle repeats acceleration/slowdown, the gyro sensor outputs the voltage. In addition, the gyro sensor is affected by the vehicle's slant angle. The audio-navigation unit calculates the slant angle of the vehicle from the offset voltage.

To correctly calculate when the vehicle is at an angle, the audio-navigation unit sets up the offset in these cases:

- GPS altitude is constant.
- Vehicle speed is constant.



Oscillation Gyro Principles

The piezoelectric parts have electric/mechanical transfer characteristics. They bend vertically when voltage is applied to both sides of the parts, and voltage is generated between both sides of the piezoelectric parts when they are bent by an external force. The oscillation gyro functions by utilizing this characteristic of the piezoelectric parts and Coriolis force. (Coriolis force deflects moving objects as a result of the earth's rotation.) In the oscillation gyro, this force moves the sensor element when angular velocity is applied.

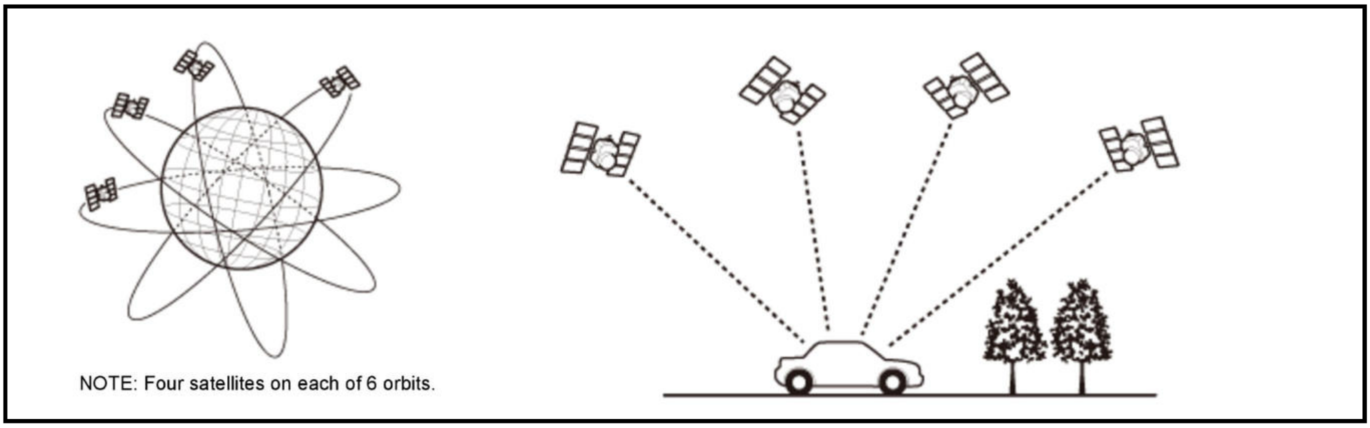
DRIVING PIEZOELECTRIC PART

Global Positioning System (GPS)

The global positioning system (GPS) enables the navigation system to determine the current position of the vehicle by using the signals transmitted from the satellites in orbit around the earth. The satellites transmit the satellite identification signal, orbit information, transmission time signal, and other information. When the GPS receiver receives a signal from four or more satellites simultaneously, it calculates the current position of the vehicle based on the distance to each satellite and the satellite's position in its respective orbit.

Position Detection Image with GPS Satellite



NOTE: Four satellites on each of 6 orbits.

Precision of GPS

The precision of the GPS varies according to the number of satellites from which signals are received and the view of the sky.

Number of Satellites	Condition	Description
None	Faulty reception	The GPS cannot be utilized due to a faulty GPS receiver or antenna, or other fault or interference.
2 or less	Impossible to detect vehicle position	GPS function is normal. The satellite signals received by the GPS are too few to detect the vehicle position.
3	Vehicle position detectable in 2 dimensions	The longitude and latitude of the vehicle position can be detected (less precise than detection in three dimensions).
4 or more	Vehicle position detectable in 3 dimensions (elevation displayed)	The longitude, latitude and the altitude of the vehicle position can be detected (more precise than detection in two dimensions).

GPS Antenna

The GPS antenna amplifies and transmits the signals received from the satellites to the GPS receiver.

GPS Receiver and Clock

The GPS receiver is built into the audio-navigation unit. It calculates the vehicle position by receiving the signal from the GPS antenna. The current time, vehicle position, and signal reception condition are transmitted from the GPS receiver to the navigation system to adjust vehicle position and the clock display in the audio-navigation unit. Also, the audio-navigation unit can set world time zones automatically by calculating the vehicle position.

Audio Guidance

The audio-navigation unit outputs navigation voice guidance before entering an intersection or passing a junction.

- With stereo amplifier: The voice guidance are sent to the stereo amplifier using the analog audio line (AUX NAVI), then outputs them to the front speaker(s) (driver's side).
- Without stereo amplifier: The voice guidance outputs to the front speaker(s) (driver's side).

Muting Signal Logic

When the speaker outputs the voice guidance, audio muting logic is orchestrated by the audio-navigation unit. The audio-navigation unit determines what audio source has priority to use speakers. **Refer to the audio system Description** for muting signal logic with the audio-navigation unit.

Voice Control Function

This navigation system also has voice recognition that allows voice control of most of the audio, navigation, and the HFL functions. The TALK button on the steering wheel activate the voice control. The voice control also allows control of the audio and climate functions.

Muting Signal Logic

When the voice recognition is in use, audio muting logic is orchestrated by the audio-navigation unit. The audio-navigation unit determines what audio source has priority to use speakers Refer to the audio system Overview for muting signal logic with the audio-navigation unit.

Fan Mute Operation

When the voice recognition is in use, the audio-navigation unit sends the fan mute signal to the climate control unit via the B-CAN. The blower fan operating voltage may be reduced depending on the current fan speed.

Turn by Turn Directions

The audio-navigation unit outputs the route guidance (direction) information to the multi-information display (MID) in the gauge control module via the digital signal line (LVDS2). In the case of route guidance mode, the MID shows the simple routing guidance using an arrow. When other than route guidance mode, the MID shows the azimuth (direction) information in 16-directions.

HD Traffic (TM)

The HD Traffic (TM) is a broadcast for delivering traffic information to the driver. The traffic data is coded using the FM broadcast.

The HD Traffic (TM) uses a decoder in the audio-navigation unit to decode the traffic information data. It is integrated directly into a navigation system. The traffic information is displayed with the navigation route guidance. It is used to avoid traffic jams and accidents (see the Navigation System repair service information for more information).

HondaLink Assist

HondaLink delivers remote services to the vehicle using the customer's compatible Bluetooth phone. **Refer to the audio system Description** .

Microphone

The Microphone receives navigation voice command, and transmits them to the audio-navigation unit. **Refer to the HandsFreeLink system Description** .

HFL (Navigation Voice Control) Switch

The HFL (navigation voice control) switch and the audio remote switch are integrated to the audio remote-HFL switch. **Refer to the audio system Description** .

Multi-View Rearview Camera

The multi-view rearview camera allows the driver to see what is behind the vehicle by displaying the image on the audio-navigation unit. There are three different selectable views. **Refer to the audio system Description** .

DIAGNOSIS

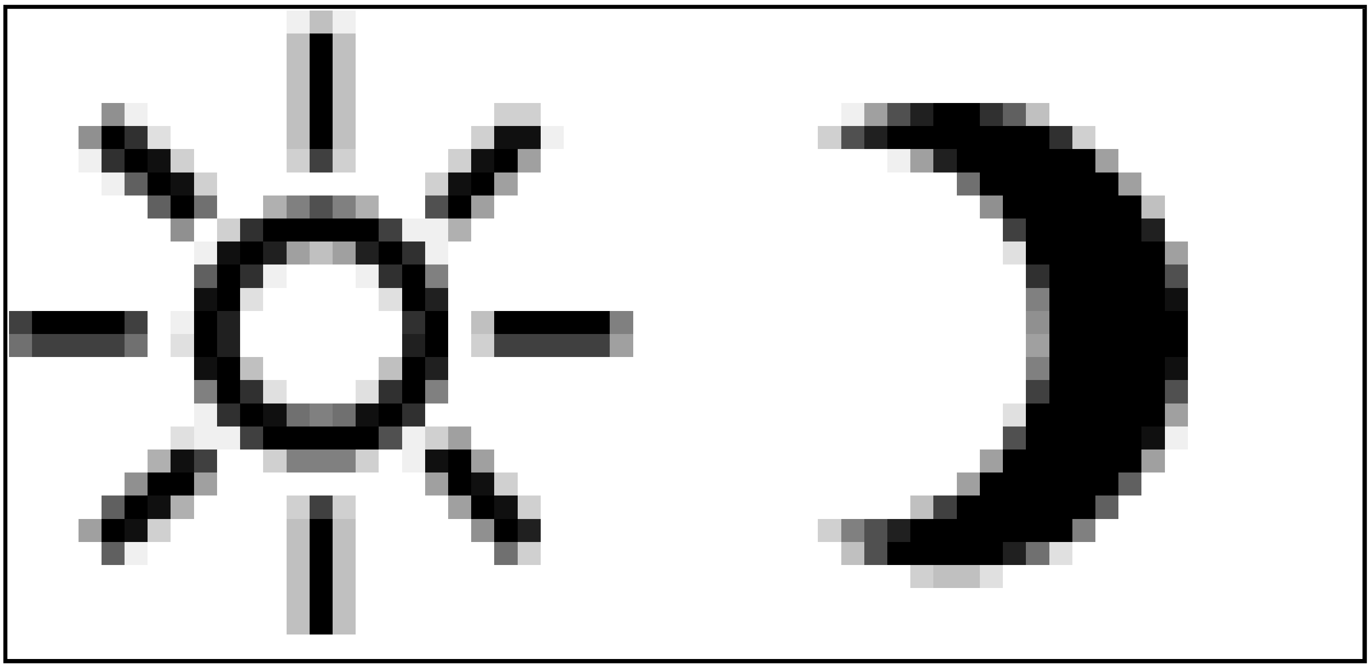
NAVIGATION SYSTEM DIAGNOSTIC MODE

NOTE:

- Check the vehicle 12 volt battery condition first .
- The screens detail indicated may change depending on equipment or specification.

Start-Up Procedure and Diagnostic Menu

1. Turn the vehicle to the ON mode. If needed, start the engine. Press and hold the PHONE button, the DISPLAY MODE (



) button, and the AUDIO POWER (

⏻

) button until the Select Diagnosis Items menu screen is displayed:

NOTE: The buttons needs to be pressed together simultaneously.

- Self-Diagnosis Mode (runs the automatic diagnosis of the navigation system)
- Detail Information and Setting (allows you to manually diagnose the navigation system)

Self-Diagnosis Mode
(Display audio will check internal function, connections, etc.
Perform this test with stopped and engine running)

Detail Information & Setting
(Individual diagnostic screens to confirm a specific diagnostic screen.)

Self-Diagnosis Mode (System Links)

1. Select the Self-Diagnosis Mode from the Select Diagnosis Items menu. The message at the bottom of the screen flashes indicating "Diagnosis in progress...", do not turn the vehicle to the OFF (LOCK) mode.

Press any icon if you want to see details

The diagnosis tests the following:

- Most of the wires connecting the external navigation components shown in the block diagram.
- The results from the various components shown in the block diagram.
- The audio-navigation unit checks the microphone by listening to the "'Pi Pi Pon" sound produced by the audio-navigation unit from the speakers when the diagnosis is started. This requires that the audio system be operating normally.

When the diagnosis finishes, the icons turn different colors based on their test status.

NOTE: By selecting the Help icon, you can see a description for each color.

Icon Colors	Description
Green	The system ran a diagnosis and the results are OK.
Red*	Errors that require replacement of hardware or harness. Examples are connection error or memory diagnosis errors. Select the red icon and check each diagnostic screen (refer to the description for diagnostic screens in the Unit Check).

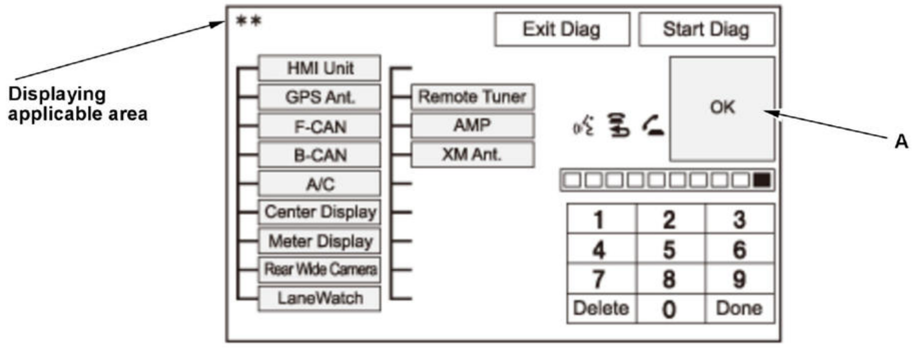
Icon Colors	Description
Yellow	- Errors that do not require hardware replacement, or the connection check is in the state which is not done. Such as leaving the vehicle in the ACCESSORY mode or because of a missing accessory. - When the audio-navigation unit detects a failure, and stores DTC, the Error History icon turns yellow.
White	The diagnosis is running. The screen functions are locked out while the diagnosis runs.
Gray	- The system cannot automatically check this function. You have to select the diagnosis item and manually do additional testing, like checking the audio-navigation unit buttons in the Hard Key test. When you complete the Hard Key test and return to the System Links screen, the gray icon turns green. - The Vehicle Status icon anytime shows gray. - When the audio-navigation unit does not store DTCs, the Error History icon shows gray.

*:	The F-CAN icon and the B-CAN icon turns red when the vehicle is in the ACCESSORY mode. Check the System Links with the engine running, and if the F-CAN icon and the B-CAN icon turns green, the system is OK at this time.

4. Select the icon to see the details of that diagnostic function. The icon colors on the screen may not change until you exit and reenter the Self-Diagnosis mode. In some cases, you may have to restart the engine for the indication to change. After you repair the affected component or harness, repeat this diagnosis.

Factory Diagnostic Screen In Line Diag and Linking

If the vehicle left the factory in the factory diagnostic mode, you will see this screen every time you turn the vehicle to the ON mode. Sometimes this screen also appears after you replace the audio-navigation unit with a new or remanufactured unit. Normally the factory does the steps necessary to verify proper operation and terminate the factory diagnosis. Until the proper confirmation sequence is done, the screen appears every time you turn the vehicle to the ON mode.



NOTE: The system cannot complete a full diagnosis unless vehicle is in the ON mode.

1. Select the Start Diag icon to check the connection between the audio-navigation unit and related components. When the connection diagnosis is in progress, the icon (A) indicates Detecting..., and each icon turns white. If the connection is OK, the icon turns green. If the connection is NG, the icon turns red. Check for connection between the audio-navigation unit and related unit on the failure connection line.

NOTE: When the item is a variation equipment, the icon shows yellow, and it is not reflected in diagnosis.

2. If the connection diagnosis is finished, press the steering commander switch buttons (the TALK button, PICK-UP button, and the HANG-UP/BACK button) to check the HFL switch. As each button is pressed, the corresponding icon on the display should turn green.

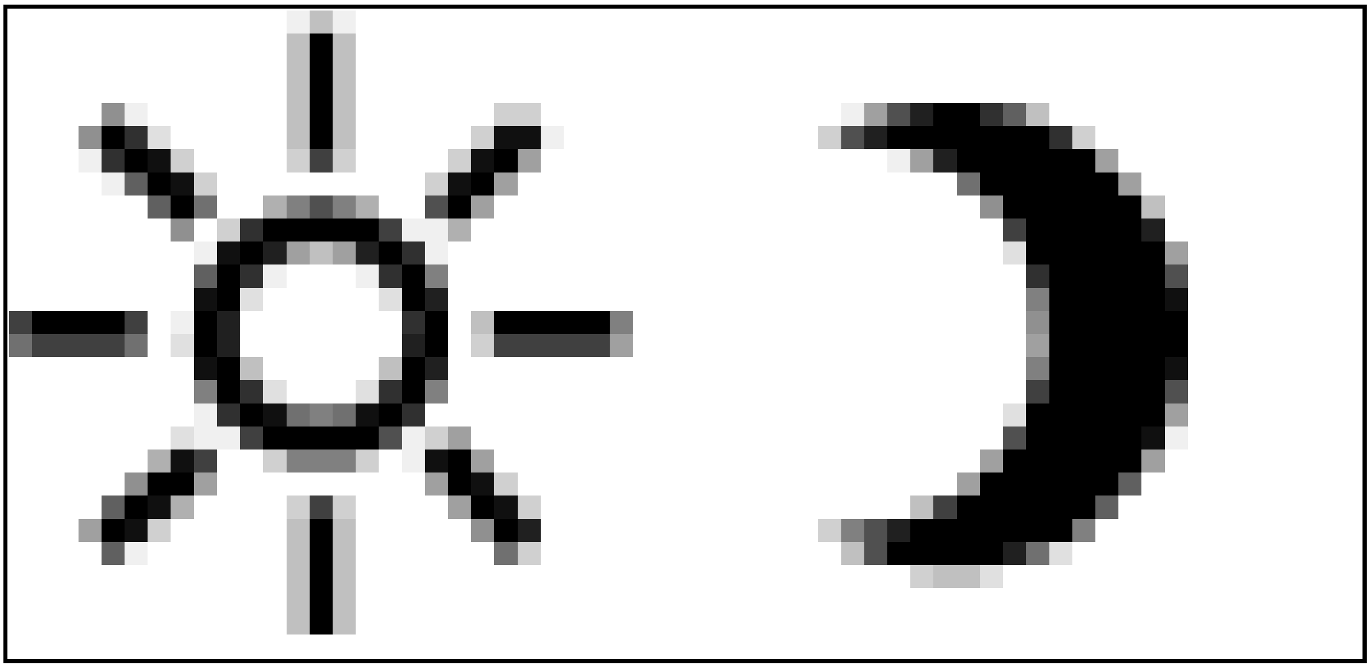
3. Press the TALK button, and within 5 seconds in a normal voice say "testing". The Mic Level indicator on the screen should momentarily turn green.

4. If all the diagnosis are OK, the icon (A) indicates OK. Select the Exit Diag icon to exit the diagnostic mode. The In Line Diag should not appear again.

Forced Completing of In Line Diag and Linking

Follow these steps to prevent the screen from appearing in the future:

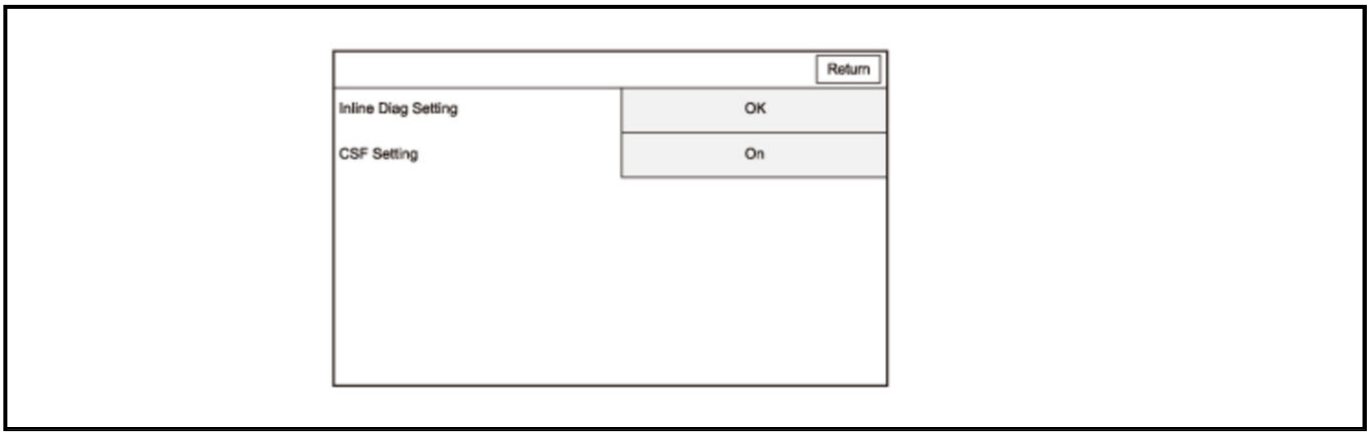
1. While displaying the In Line Diag screen, press and hold the PHONE button, the DISPLAY MODE (



) button, and the AUDIO POWER (

⏻) button until the Select Diagnosis Items menu screen is displayed.

2. While displaying the Select Diagnosis Items menu screen, press and hold the HOME button until the In Line Diag setting screen is displayed.



Inline Diag Setting	OK
CSF Setting	On

3. Set the Inline Diag Setting to OK (complete). The system restarts and a normal start-up process occurs. The In Line Diag should not appear again.

Detail Information and Setting

This section allows you to run a specific diagnosis and allows additional setting choices for some screens that are not shown when touching an icon from the System Links screen.

Select the item you want to check, and the test begins. To return to the previous screen, select the Return icon.

RGB Color

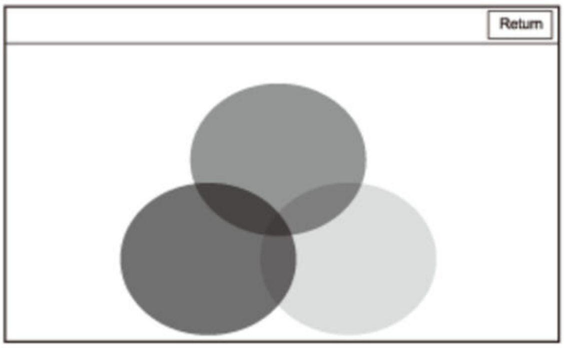
NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen verifies that the display is receiving the video (R, G, B, and Composite sync) signals properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section. If any of the color circles are missing, **replace the center display unit** .

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

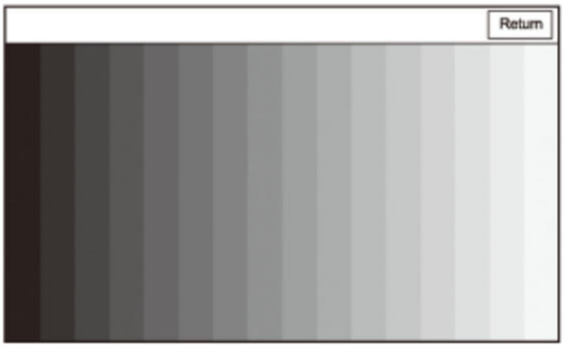


Gray Tone

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks problems with contrast in 16 gradations. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

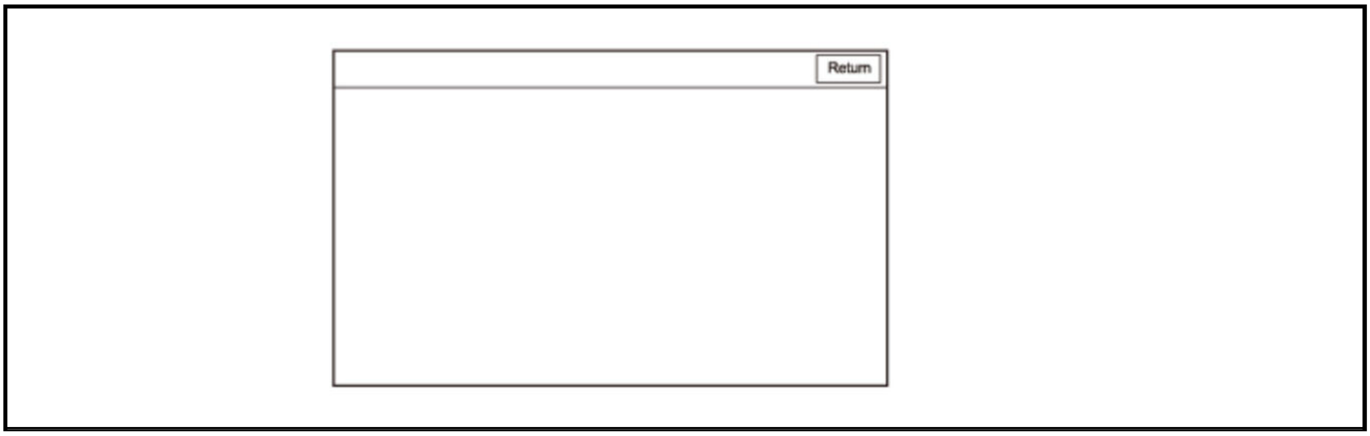


White Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be dead (off). The entire display must be white.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

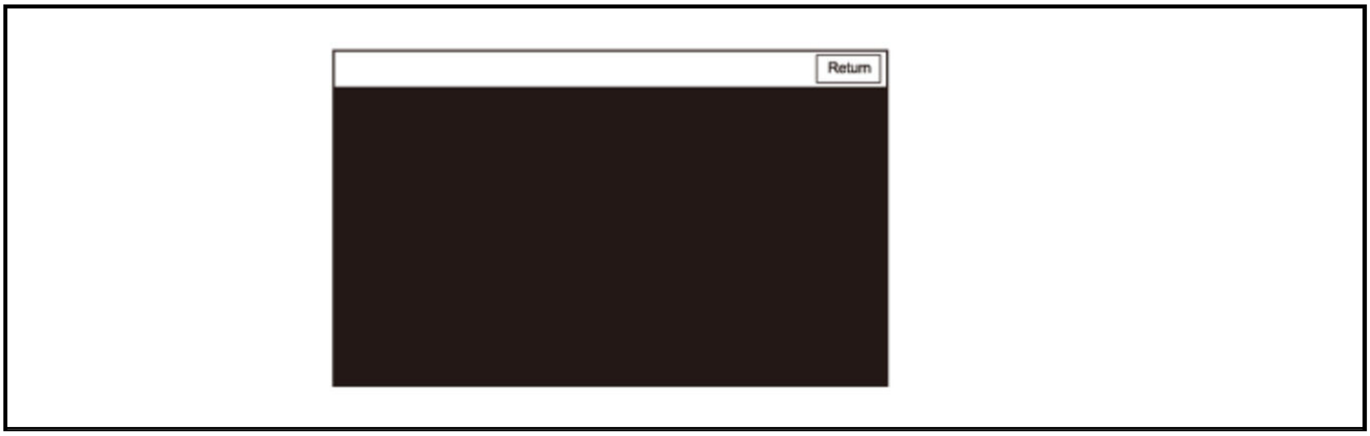


Black Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be stuck on. The entire display must be black.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

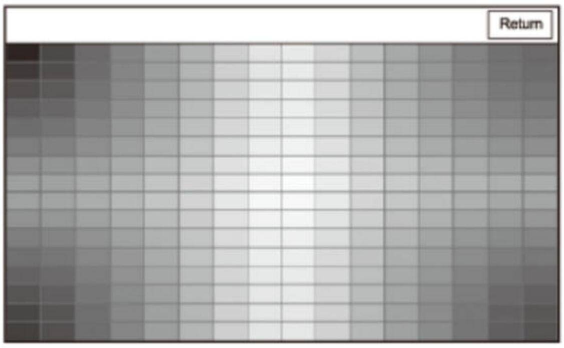


Color Pattern

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

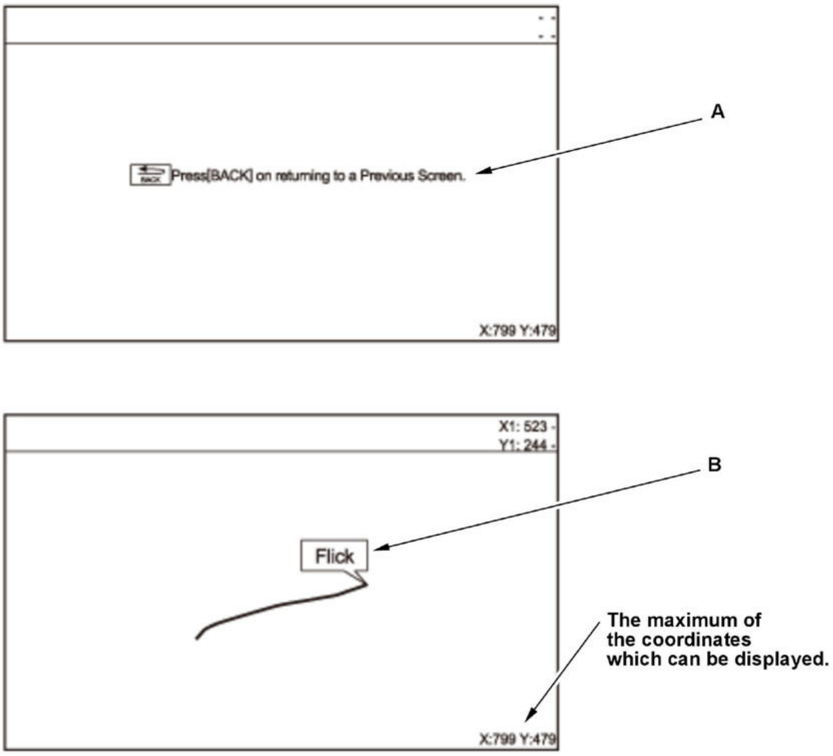
The screen shows the colors being used for the map and menu screens. This is for factory use only. To check the color signal, use the RGB Color diagnosis.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.



Touch Panel Check

This check allows you to check the sensitivity of touch panel. If the screen is operated in the state while the telop (A) is displayed, the track changes to black, and the action name (Tap, Double tap, Pinch, Slide, and Flick) appears on the caption (B) for 5 seconds. The screen displays the coordinates of where the screen was touched. If the BACK button is pressed, the screen returns to the Monitor Check menu. If another location other than the location pressed responds, do the Touch Panel Adjustment.



Press[BACK] on returning to a Previous Screen.

Unit Check (Quick Check)

These screens allow you to diagnose the audio-navigation unit and related units. Some of the tests and screens that are displayed under the Unit Check are same as the checks listed under the Detail Information and Setting.

To start the test, select the item you want to check.

NOTE: These items describe in indication order. Swipe the screen to check the next items.

- HMI unit
- F-CAN
- B-CAN
- USB
- Vehicle status
- HFL/Mic
- Hard Key
- Error history
- Rear wide camera
- Front Camera (not supported)
- LaneWatch (if equiped)
- Remote tuner
- AMP

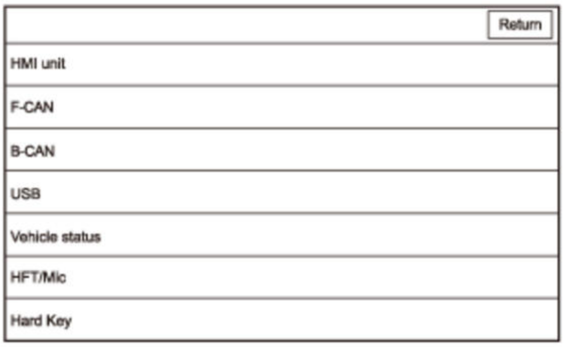
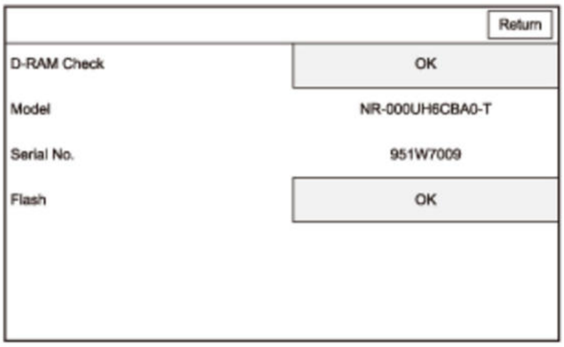
- CD (not supported)
- Center display
- iPhone
- Meter Display
- GPS antenna
- HD Traffic
- Gyro Sensor
- A/C
- Telematics Diag (not supported)
- MirrorLink



HMI Unit

This diagnosis checks for problems in the audio-navigation unit processor. When you start this diagnosis, the audio-navigation unit may freeze or delay up to a minute while the diagnosis runs.

- D-RAM: Displays the result of the access to the D-RAM (OK/NG). If NG, check for hard error codes.
- Model: Displays the audio-navigation unit manufacture's model number.
- Serial No. : Displays the audio-navigation unit serial number. That should be the same as the serial number found on the upper side of the audio-navigation unit.
- Flash: Displays the result of the access to the flash memory (OK/NG). If NG, replace the audio-navigation unit .



D-RAM Check	OK
Model	NR-000UH6CBA0-T
Serial No.	951W7009
Flash	OK

F-CAN

NOTE:

- This diagnosis must have the engine running.
- Swipe the screen to check the next items.

This diagnosis checks whether the audio-navigation unit has received specific F-CAN data. If F-CAN shows NO ERROR, an error is not detected between the F-CAN bus and the audio-navigation unit.

- If F-CAN shows RX ERROR, **replace the audio-navigation unit** .
- If F-CAN shows TIME OUT, There is a possibility that some items are NG (red icon). When all the items from each transmitting unit is NG, check for F-CAN DTCs with the HDS. If DTCs not detected, check for continuity in the F-CAN lines between the audio-navigation unit and the transmitting unit.

HFL/Mic

This diagnosis allows you to independently test the Bluetooth module and the microphone. The Bluetooth module is built into the audio-navigation unit. To properly check the microphones, make sure you are sitting in the driver's seat.

NOTE: Before this diagnosis, check the response of the TALK button on the audio remote-HFL switch by the Hard Key diagnosis.

- If the Bluetooth Connection Diagnosis shows NG, **replace the audio-navigation unit** .
- Press the TALK button, and within 5 seconds in a normal voice say "testing" toward the microphone in the roof console. The Mic Level indicator on the screen should momentarily turn green. The test is set to OK by indicating green more than 6 steps. If there is no Mic Level movement when you speak, **go to HFL does not work properly troubleshooting** .

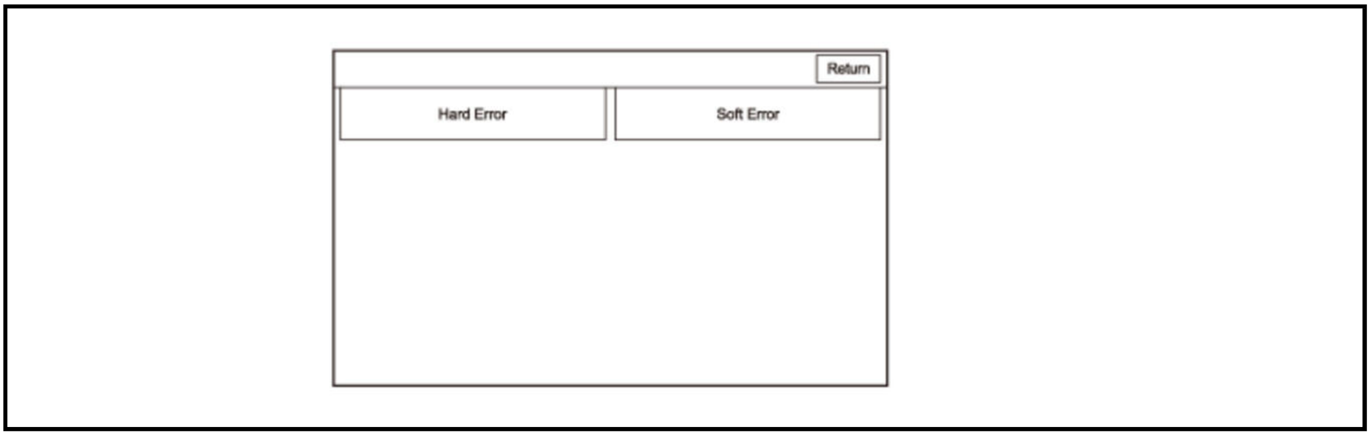
Error History

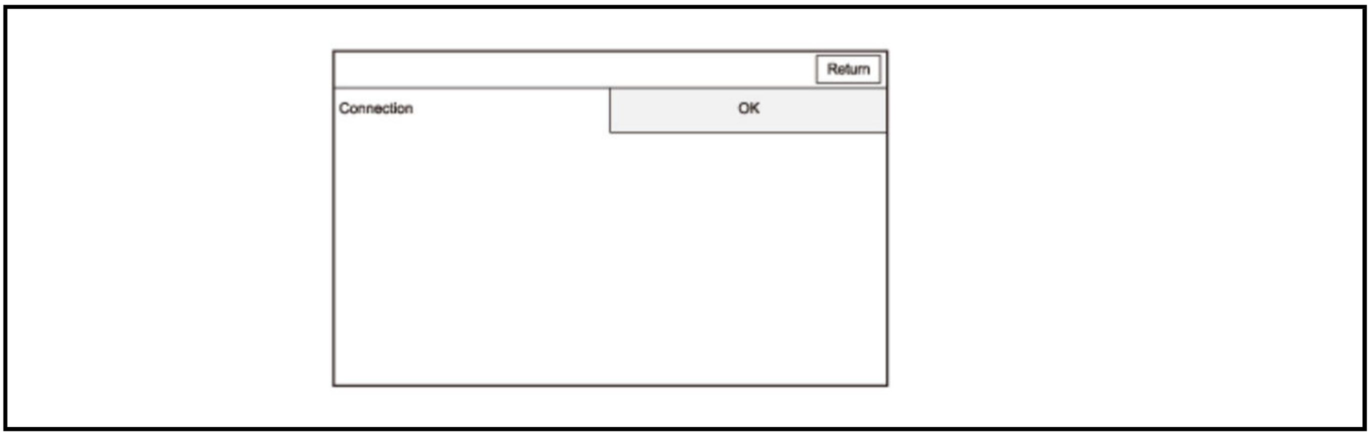
If you select Hard Error or Soft Error, you can see the error information. **Refer to How to Check for Error History to use this diagnosis**.



Rear Wide Camera

This diagnosis checks the rearview camera connection.

- If Connection shows NG, **check for hard error codes**.
- If Connection shows OK, press the HOME button to display the rearview camera image. To return to the previous screen, press the HOME button again.

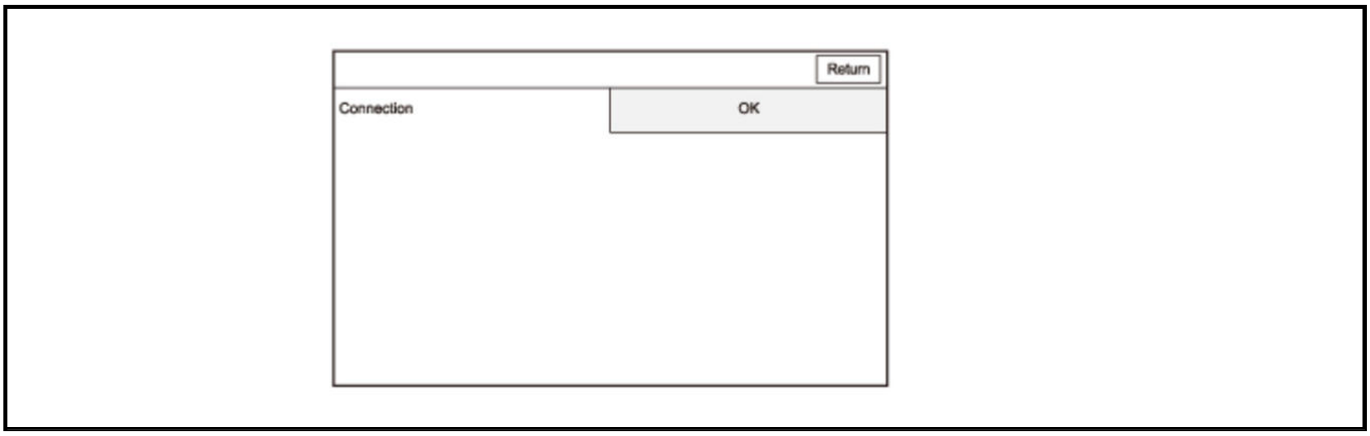


Connection OK

LaneWatch

This diagnosis checks the LaneWatch camera connection.

- If Connection shows NG, **check for hard error codes**.
- If Connection shows OK, press the HOME button to display the LaneWatch camera image. To return to the previous screen, press the HOME button again.



Connection OK

Remote Tuner

NOTE:

- For factory use only. Do not alter any settings unless directed.
- These items describe in indication order. Swipe the screen to check the next items.

This diagnosis displays the external AM/FM radio tuner (tuner unit) status.

- System 'com version display: Displays the tuner unit processor version.
- Serial number display: Displays the tuner unit serial number. That should be the same as the serial number found on the upper side of the tuner unit.
- Frequency: Displays frequency of the radio station which is being received. Frequency can be changed by selecting each icon (A).
- Source can be changed in this order: Radio sources by selecting the Band Change icon.
- Radio reception level display: Displays radio reception level (dB). The AM/FM antenna power status can be changed to on or off by selecting the Ant +B OFF icon.
- Target Area: Displays the destination of the tuner unit at 2 digits.
- Operating status display: If the vehicle has diversity antenna, you can select the radio antenna function from M (Main), S (Sub), or P (Diversity).
- RBDS BER display: Displays the RBDS bit error ratio.
- SNR display: Displays the Sound/Noise ratio about the AM or FM.
- Total preset number: Displays number of radio station preset about the AM or FM.
- HD functions ON/OFF: Displays the HD function is available (YES) or not available (NO).
- VOL: Displays the current volume level.
- Split Mode: Displays the split mode on or off. That can be changed by selecting the Split Mode icon.
- Blend Mode: Displays the blend mode which is being received. The blend mode can be changed to AUTO/ANALOG/DIGITAL by selecting the Blend Mode icon.
- HD Mode: Displays the HD mode status (ON: HD, OFF: analog) at frequency of the radio station which is being received. That can be changed by selecting the HD Mode icon.

Backup Data Clear

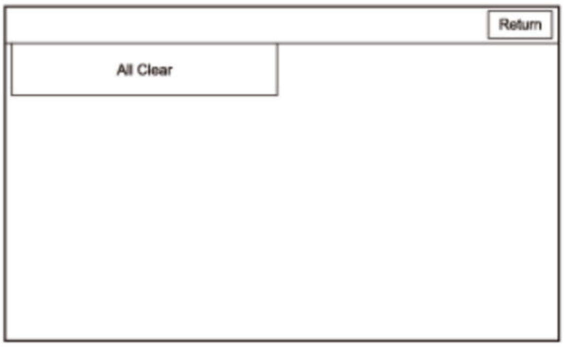
This screen initializes the back-up data in the audio-navigation unit. Select the All Clear icon.

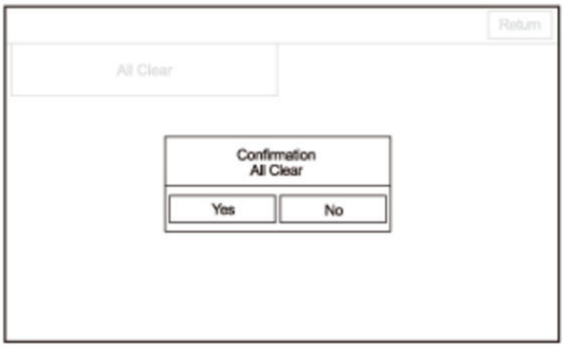


Return
All Clear

All Clear

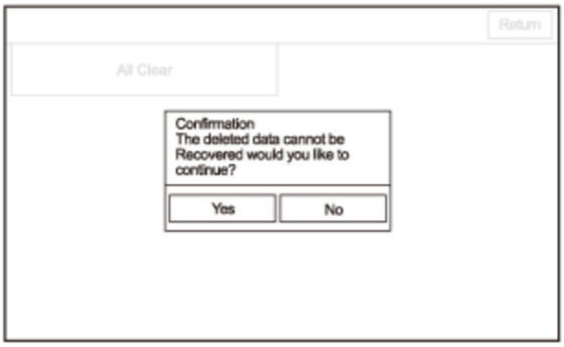
The all clear function deletes the data in the audio-navigation unit, and restores it to the factory defaults. This function is equivalent to Memory Refresh in the System Settings Menu.

When selecting the All Clear icon, the confirmation screen appears.



Confirmation
All Clear

When selecting the Yes icon, the second confirmation screen appears.



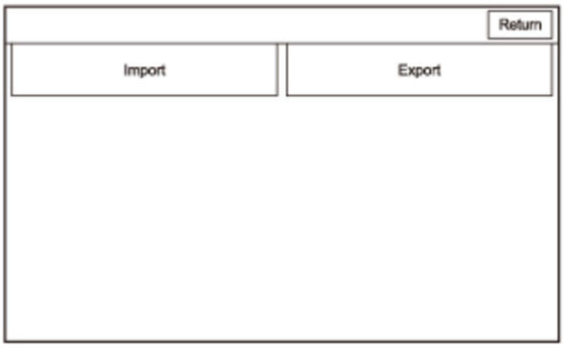
Confirmation
The deleted data cannot be Recovered would you like to continue?

When selecting the Yes icon, the system restarts after performing the All Clear process. After the restart, a normal start-up process occurs.

Save User's Memory

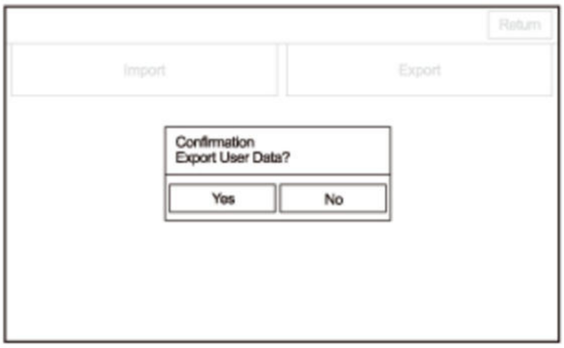
When replacing the audio-navigation unit, this function allows the technician to transfer the customer's personal data to the new audio-navigation unit. The transferred information includes their setup settings and personal addresses. The dealer inserts a USB device into the USB port A or B, and then selects the Save Users Memory function. The two functions in this diagnostic screen are Export and Import. Export saves the customer's data to the USB device, and Import moves the USB device files to the new audio-navigation unit.

This function does not start until you connect a USB device to the USB port.



1. Select the Export icon to move the customer's data from the original audio-navigation unit to the USB device. Select the Yes icon on the Export User Data Confirmation screen. The process takes only a couple of seconds. The system stores. DAT files on the USB device.

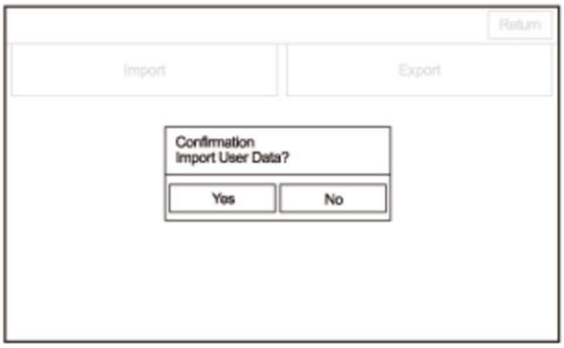
NOTE: If the Export icon is grayed out, check the USB port.



Confirmation
Export User Data?

2. After replacing the new audio-navigation unit, allow the system to boot up. Insert the USB device into the USB port A or B and enter the Save Users Memory in the System Diagnostic Mode.

3. Select the Import icon to move the two files stored by the Export process from the USB device to the new audio-navigation unit. Select the Yes icon on the Import User Data Confirmation screen. When the transfer is finished (a few seconds) the system automatically reboots. After the system reboots, remove the USB device from the USB port.

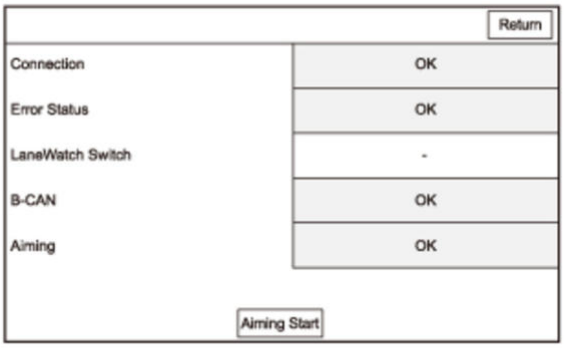


Confirmation
Import User Data?

LaneWatch

This diagnosis checks the LaneWatch status.

- If Connection shows hyphen (-), **check for hard error codes**.
- Error Status: Indicates LaneWatch camera status OK or NG. If Error Status shows NG, replace the LaneWatch camera. When the LaneWatch camera is disconnected, the status shows hyphen (-).
- If Error Status shows OK, press the HOME button to display the LaneWatch camera image. To return to the previous screen, press the HOME button again.
- LaneWatch Switch: LaneWatch switch status on or off. When the LaneWatch switch is pressing, the status shows ON. When the LaneWatch switch is released, the status shows hyphen (-).
- B-CAN: Checks whether the audio-navigation unit has received specific B-CAN data from the body control module. If B-CAN shows NG, check for B-CAN DTCs with the HDS. If DTCs are not detected, check for B-CAN lines continuity between the audio-navigation unit and the body control module.
- If Connection, Error Status, LaneWatch Switch, and B-CAN shows OK, the LaneWatch camera aiming procedure is available. If the LaneWatch camera need to aiming, refer to the How to Start LaneWatch Camera Aiming. When the aiming fails, Aiming shows NG.

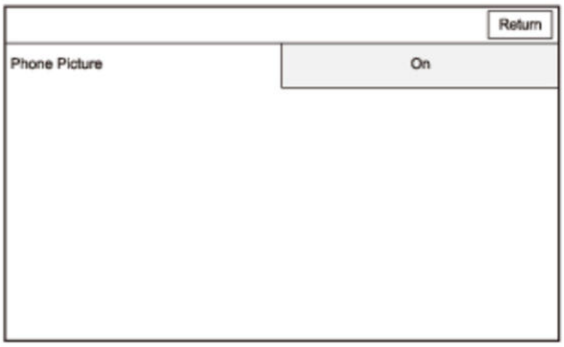


Return
Aiming Start

Connection	OK
Error Status	OK
LaneWatch Switch	-
B-CAN	OK
Aiming	OK

Phone Picture

This screen allows you to enable or disable the Show Contact Picture with On/Off.



Phone Picture	On

Anti-Theft Skip (With Audio System Theft Protection)

This selection can cancel the anti-theft mode temporarily (for 150 seconds).

The Anti-Theft Skip icon is grayed out when the anti-theft mode is already canceled.

Other

Select the item you want to check.

GPS Information

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow numbers) as they would appear in the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Nearby obstructions, like tall buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. The satellite numbers shown on the diagram while pressing the HOME button that correspond to the PRN (satellite ID number). There are always at least 24 active GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares are always parked in orbit, ready to be activated. This is why the PRN can be greater than 24.

NOTE: When you use this screen for troubleshooting, park the vehicle outside, away from buildings, tall trees, and hightension wires for at least 10 minutes with the engine running.

- The Number of Satellites box shows the number of acquired satellites (maximum of 12). It should contain three or more icons.
- The Current Position shows latitude, longitude, and elevation (in feet). If there are less than four satellites, the elevation can be grossly inaccurate.
- The date/time field shows the current date and time that is received from the GPS satellite.

CALIBRATION CORRECTION

NAVIGATION SYSTEM SENSOR CALIBRATION

Procedure

NOTE:

- Check the vehicle 12 volt battery condition first .
- You should do this procedure in an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields.

1. Sensor - Calibration

1. Test-drive the vehicle on the road in a straight line for at least 200 m (656 ft) at a constant speed (turn less than 5 deg/s, accelerate less than 1 mph/s (1.6 km/h/s)).

2. Park the vehicle in an open area, and wait at least 2 minutes with the engine running.

3. Test-drive the vehicle in an open area, and make a 90-degree turn (repeat 2-4 times).

SYMPTOM TROUBLESHOOTING INDEX

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE:

- Before troubleshooting, check any official Honda service website for more information about the navigation system.
- Refer to Audio System Symptom Troubleshooting for information about the symptom of audio-navigation unit which is not in the following table .

Symptom	Diagnostic Procedure	Also Check for
Audio-navigation unit power will not turn on (No information display)	Symptom Troubleshooting	• Blown fuses • Screen settings • Error Messages • Software not up to date
Navigation system stays on the CSF screen	Navigation DTCs	• GPS Initialization • Aftermarket metallic window tint on the front window or electronic aftermarket accessories

Symptom	Diagnostic Procedure	Also Check for
		(possibly hidden) mounted near the GPS antenna or the audio-navigation unit - Disconnected or defective GPS antenna
Poor GPS reception or interference	**Do the GPS Information in the System Diagnostic Mode**	- **Global Positioning System (GPS) Limitations** - Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit
Vehicle position icon wanders across the map when driving (does not follow a displayed road) or map vehicle ICON spins	**Symptom Troubleshooting**	- **Global Positioning System (GPS) Limitations** - **Map Matching** - **Sensor Calibration** - VSP missing - Poor or no GPS reception - Check for any related service bulletin software updates
Navigation touch panel does not work	**Do the Touch Panel Check in the System Diagnostic Mode**	**Forced Rebooting of Audio-Navigation Unit**
Clock will not set to correct time	Â	Check the GPS signal
System always comes up in-line diagnostic mode	**Factory diagnostic screen In Line Diagnostic mode**	Â
The MID does not display the audio-navigation unit information	**Symptom Troubleshooting**	Â
Voice control does not work/respond	Â	Check for any related service bulletin software updates
Voice guidance cannot be heard, is broken up, or there is static	Â	Volume or voice feedback setting (see the Navigation System repair service information)
No HD traffic information	**Go to AM/FM radio display is blank or no station information is displayed troubleshooting**	Local outage or no local broadcast. Compare to a known-good vehicle of the same year and trim.

DTC TROUBLESHOOTING INDEX

NAVIGATION SYSTEM DTC TROUBLESHOOTING INDEX

NOTE: **These DTCs cannot be read with the HDS. To view them, refer to How to Check for Error History (Navigation DTCs)**.

DTC	Description	Circuit
1102	USB Diag	USB

DTC	Description	Circuit
1301	GPS Antenna Error	GPS antenna
1302	GPS Receiver Error 1	GPS receiver
1304	Gyro Error 1	Internal gyro
1306	Vehicle Speed Pulse	PCM or TCM
1702	XM Antenna Error	XM antenna
2608	R-Camera Diag	Rearview camera
2610	DRAM Diag	Audio-navigation unit DRAM
2701	GPS Diag: Antenna	GPS antenna
2703	Aircon Diag	Climate control unit
2706	Gyro Diag: ECU Temp XX deg.C	Internal gyro

SYMPTOM TROUBLESHOOTING

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING - AUDIO-NAVIGATION UNIT POWER WILL NOT TURN ON (NO INFORMATION DISPLAY)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check if the Display Mode (☀ ☽) button has been pressed, and turned off the display (see the Owner's Manual for more information).
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check if the center display unit indicates any information.

   Is any information displayed?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Determine possible failure area (LVDS1 circuit, others)

   -1. Shield the center display unit from the sun with your hand, and check that the display is back lit (only the back light is on).

   Can you see the back light?

   YES

   Go to step 11.

   NO

   Go to step 3.

3. Open wire check (+B_AUDIO line)

-1. Disconnect the following connector.

Center display unit connector A (5P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_AUDIO wire is OK. Go to step 4.

NO

Repair an open in the wire.

4. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 5**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 5.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

5. Determine possible failure area (DISP_CONT line, others)

-1. Reconnect center display unit connector A (5P).

-2. Disconnect the following connector.

Audio-navigation unit connector E (16P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector E (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) No. 4**

Test point 2	Body ground

Is there about 3.3 V?

YES

The DISP_CONT wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (DISP_CONT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector E (16P): disconnected
Test point 1	**Center display unit connector A (5P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

Repair an open in the wire.

NO

Replace the center display unit .

7. Determine possible failure area (center display unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio-navigation unit connector E (16P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector E (16P) No. 4**
Test point 2	Body ground

Is there less than 0.2 V?

Yes

Replace the center display unit .

No

Go to step 8.

8. Open wire check (+B_AUDIO line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector A (24P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_AUDIO wire is OK. Go to step 9.

NO

Repair an open in the wire.

9. Open wire check (ACC line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector A (24P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES

The ACC wire is OK. Go to step 10.

NO

Repair an open in the wire.

10. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio-navigation unit connector A (24P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector A (24P) No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES

Replace the audio-navigation unit .

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

11. Shorted wire check (LVDS1+ line to LVDS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector H (3P)
Center display unit connector B (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector H (3P): disconnected
Â	Center display unit connector B (3P): disconnected
Test point 1	Center display unit connector B (3P) No. 1
Test point 2	Center display unit connector B (3P) No. 2

Is there 1.0 MΩ or more?

YES

The LVDS1+ wire and the LVDS1**-** wire are not shorted. Go to step 12.

NO

There is a short in the wires. Replace the affected shielded harness.

12. Shorted wire check (LVDS1 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector H (3P): disconnected
Â	Center display unit connector B (3P): disconnected
Test point 1	Center display unit connector B (3P) No. 1
Test point 2	Center display unit connector B (3P) No. 3

Test point 1	Center display unit connector B (3P) No. 2
Test point 2	Center display unit connector B (3P) No. 3

Is there 1.0 MΩ or more?

YES

The LVDS1 SH wire is not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Open wire check (LVDS1+ line, LVDS1- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector H (3P): disconnected
Â	Center display unit connector B (3P): disconnected
Test point 1	**Audio-navigation unit connector H (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 1**

Test point 1	**Audio-navigation unit connector H (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 Ω or less?

YES

The LVDS1+ and the LVDS1**-** wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Center display unit check (substitution)

-1. Substitute a known-good center display unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original center display unit .

NO

Replace the audio-navigation unit .

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING - THE MID DOES NOT DISPLAY THE AUDIO-NAVIGATION UNIT INFORMATION

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- If the audio remote-HFL switch does not respond, **go to Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Select Audio, Navigation, and HFL from the multi-information display (MID) menu screen.

Are audio, navigation, and HFL information displayed?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Shorted wire check (LVDS2+ line, LVDS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector J (3P)
Gauge control module connector C (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector J (3P) No. 2**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The LVDS2+ and the LVDS2**-** wires are not shorted to ground. Go to step 3.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

3. Shorted wire check (LVDS2+ line to LVDS2- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	**Audio-navigation unit connector J (3P) No. 2**

Is there 1.0 MΩ or more?

YES

The LVDS2+ wire and the LVDS2**-** wire are not shorted. Go to step 4.

NO

There is a short in the wires. Replace the affected shielded harness.

4. Shorted wire check (LVDS2 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	**Audio-navigation unit connector J (3P) No. 3**

Test point 1	**Audio-navigation unit connector J (3P) No. 2**
Test point 2	**Audio-navigation unit connector J (3P) No. 3**

Is there 1.0 MΩ or more?

YES

The LVDS2 SH wire is not shorted. Go to step 5.

NO

There is a short in the wires. Replace the affected shielded harness.

5. Open wire check (LVDS2+ line, LVDS2- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	**Gauge control module connector C (3P) No. 1**

Test point 1	**Audio-navigation unit connector J (3P) No. 2**
Test point 2	**Gauge control module connector C (3P) No. 2**

Is there 1.0 Ω or less?

YES

The LVDS2+ and the LVDS2**-** wires are OK. Go to step 6.

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Audio-navigation unit check (substitution)

-1. Substitute a known-good audio-navigation unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original audio-navigation unit .

NO

Replace the gauge control module .

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING - VEHICLE POSITION ICON WANDERS ACROSS THE MAP WHEN DRIVING (DOES NOT FOLLOW A DISPLAYED ROAD) OR MAP VEHICLE ICON SPINS

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This is not the same condition as when driving off-road (or on a fire or logging road).
- This condition is caused by a loss of map matching from a bad sensor input. Check for aftermarket or other objects that can block the GPS signal. **Always do the Map Matching** before proceeding with the troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Test-drive the vehicle in an open area, and check if the vehicle position icon displays the actual vehicle position.

   NOTE: Make sure that a known-good vehicle's navigation can follow the displayed map in the test area.

   Does the vehicle position icon wanders across the map?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check

   -1. **Check for hard error codes**.

   Are there any navigation DTCs indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. Determine possible failure area (audio-navigation unit, BACK LT line)

   -1. **Go into the System Diagnostic Mode, and use the Vehicle Status diagnosis to check the BACK signal**.

   -2. Shift the transmission to R position/mode.

   Does the BACK signal change from [0] to [1] when the transmission is shifted from P position/mode to R position/mode?

   YES

   Go to step 5.

   NO

Go to step 4.

4. Open wire check (BACK_LT line)

   -1. Shift the transmission to P position/mode.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Disconnect the following connector.

Audio-navigation unit connector C (32P)

   -4. Turn the vehicle to the ON mode.

   -5. Shift the transmission to R position/mode.

   -6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector C (32P): disconnected
Test point 1	**Audio-navigation unit connector C (32P) No. 15**
Test point 2	Body ground

   Is there battery voltage?

   YES

   Replace the audio-navigation unit .

   NO

   Repair an open in the wire.

5. Audio-navigation unit check (substitution)

   -1. Shift the transmission to P position/mode.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. **Substitute a known-good audio-navigation unit** , and check to see if the problem occurs in the same location.

   Does the problem occur in the same location each time?

   YES

   Try to replicate the problem in a known-good vehicle (same model, year, and trim). If the problem can be duplicated, the problem is in the map database. Report the problem according to the Navigation System Manual under Reporting Errors.

   NO

   Replace the original audio-navigation unit .

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING - VOICE GUIDANCE CANNOT BE HEARD, IS BROKEN UP, OR THERE IS STATIC

NOTE:

- **Check the vehicle 12 volt battery condition first** .

- Check the volume and voice feedback setting for the navigation system in set-up.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Check the navigation voice guidance output.

Does the system output the voice guidance?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Determine possible failure area (voice guidance output circuit, others)

-1. **Go into the System Diagnostic Mode, and use the speaker check mode**.

Did all speakers produce a tone?

YES: With stereo amplifier

Go to step 3.

YES: Without stereo amplifier

Replace the audio-navigation unit .

NO: The sound is cannot be heard in all speakers

Go to No sound is heard from all the speakers (display is normal) troubleshooting .

NO: The sound is cannot be heard in front center speaker

Go to Audio system sound is weak or distorted (display is normal) troubleshooting .

3. Shorted wire check (AUX NAVI line, AUX NAVI GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector B (24P)
Stereo amplifier connector C (16P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector B (24P): disconnected
Â	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 13**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector B (24P) No. 14**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The AUX NAVI and the AUX NAVI GND wires are not shorted to ground. Go to step 4.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

4. Shorted wire check (AUX lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector B (24P): disconnected
Â	Stereo amplifier connector C (16P): disconnected

Test point 1:Audio-navigation unit connector B (24P)	**Test points 2:Audio-navigation unit connector B (24P)**
No. 1	No. 2, No. 13, No. 14

Test point 1:Audio-navigation unit connector B (24P)	**Test points 2:Audio-navigation unit connector B (24P)**
No. 2	No. 13, No. 14
No. 13	No. 14

Is there 1.0 M? or more between any of the terminals?

YES

The AUX wires are not shorted in the wires. Go to step 5.

NO

There is a short in the wires. Replace the affected shielded harness.

5. Open wire check (AUX NAVI line, AUX NAVI GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector B (24P): disconnected
Â	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 13**
Test point 2	**Stereo amplifier connector C (16P) No. 12**

Test point 1	**Audio-navigation unit connector B (24P) No. 14**
Test point 2	**Stereo amplifier connector C (16P) No. 5**

Is there 1.0 Ω or less?

YES

The AUX NAVI and the AUX NAVI GND wires are OK. Go to step 6.

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Stereo amplifier check (substitution)

   -1. **Substitute a known-good stereo amplifier** .

   -2. Reconnect all the connectors, and recheck.

   Does the symptom go away?

   YES

   Replace the original stereo amplifier .

   NO

   Replace the audio-navigation unit .

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE NAVIGATION SYSTEM

General Operation

Refer to the Navigation repair service information for the navigation system operating procedures.

Forced Rebooting of Audio-Navigation Unit

If the system freezes, and the screen does not respond, you can attempt rebooting the audio-navigation unit by pressing and holding the AUDIO POWER (⏻) button for 5 seconds. When the function is effective, the confirmation screen appears.

Anti-Theft Feature (With audio system theft protection)

The audio-navigation unit has an anti-theft protection circuit. When one of the following occurs, the unit enters the anti-theft mode:

- Disconnecting the 12 volt battery terminal.
- Disconnecting audio-navigation unit connector A (24P).
- Removing the +B line's fuses.

After the service, reconnect power to the audio-navigation unit, and turn the vehicle to the ON mode. There are two ways to exit the anti-theft mode:

- Press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio-navigation unit automatically exits the anti-theft mode. If the audio-navigation unit does not exit anti-theft mode, turn the vehicle to the OFF (LOCK) mode then the ON mode (if possible, start the engine), and try to release the anti-theft several times.
- Enter the 5-digit anti-theft code. If the input of code fails 10 times in a row, the screen is locked for 60 minutes.

When the audio-navigation unit is installed in another vehicle (same Year/Model/Trim), like in cases where a known-good unit was substituted for testing, **do the Anti-Theft Skip mode in the System Diagnostic Mode**. This mode will release the anti-theft code for 150 seconds.

Symptom Diagnosis

Certain circumstances and system limitations may result in occasional vehicle positioning errors. Some customers may think this indicates a problem with the navigation system when, in fact, the system is normal. Keep the following items in mind when interviewing customers about symptoms of the navigation system.

Self-Inertial Navigation Limitations

The limitations of the self-inertial portion of the navigation system (the gyro and the vehicle speed signal) can cause discrepancies between the vehicle's actual position and the indicated vehicle's position (GPS vehicle position).

The following circumstances may cause vehicle positioning errors:

- Moving the vehicle with the engine stopped and the vehicle stopped, such as by ferry or tow truck, or if the vehicle is spun on a turn table.
- Tire slippage, changes in tire rolling diameters, and some driving situations may cause discrepancies in travel distances. Examples of this include;
-
  - -

    Continuous tire slippage on a slippery surface

  - -

    Driving with snow chains mounted

  - -

    Abnormal tire pressure

  - -

    Incorrect tire size

  - -

    Frequent lane changes across a wide highway

  - -

    Very bumpy roads

- Tolerances in the system and map inaccuracies sometimes limit how precisely the vehicle's position is indicated. Examples of this include;
-
  - -

    Driving on roads not shown on the map (map matching is not possible)

  - -

    Driving on a road that winds in one direction, such as a loop bridge, an interchange, or a spiral parking garage

  - -

    Driving on a road with a series of sharp hair-pin turns

  - -

Driving near a gradual highway exit or transition

- -

  Driving on one of two close parallel roads

- -

  Making many 90 degree turns

Global Positioning System (GPS) Limitations

The GPS cannot detect the vehicle's position or elevation during the following instances:

- For the first 5 to 10 minutes after reconnecting the 12 volt battery (this process can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.

The accuracy of the GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only three or fewer satellite signals are received (Four satellite signals are required for accurate positioning).
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.
- When the satellite control centers are experiencing problems.

LCD Unit Limitations

The center display unit is touch sensitive. Touch the display directly to select items on the screen.

- Heavy gloves, fingernails or pens cannot be used on the touch panel.
- In cold temperatures, the display may stay dark for the first minute until it warms up.
- When the display is too hot because of direct summer sunlight, it remains dark until the temperature drops (you may see an error message displayed stating this fact).
- Fingerprints on the screen may be noticeable. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard or use abrasive cleaners or shop towels.

Symptom Duplication

When the symptom can be duplicated, verify that it is not a characteristic of the system. Review the Navigation repair service information and compare it to a known-good vehicle (with the same software and database), under the same conditions. If the symptom is not the same as the known-good vehicle, follow the self-diagnostic procedures and the appropriate troubleshooting procedures.

When the symptom does not reappear or only reappears intermittently, ask the customer about the conditions when the symptom occurred.

- Always ask the customer to demonstrate the problem.
- Try to establish possible user error or misunderstanding of the system.
- Try to establish if outside interference may have been the cause.
- Vibration, temperature extremes, and moisture (dew, humidity) are factors that are difficult to duplicate.
- Inspect the vehicle for after-market electronic devices (vehicle locators, amps, radar detectors, etc.) that may be hidden.

When troubleshooting navigation system problems, ensure that the known-good vehicle is the same software version year and model as the vehicle being serviced. Mixing incompatible navigation systems or other system components can delay the troubleshooting process by creating symptoms or issues unrelated to the original problem.

System Initialization

If the navigation system loses power (like the 12 volt battery terminal was disconnected), the navigation system requires initialization. Once completed, your system is ready to use.

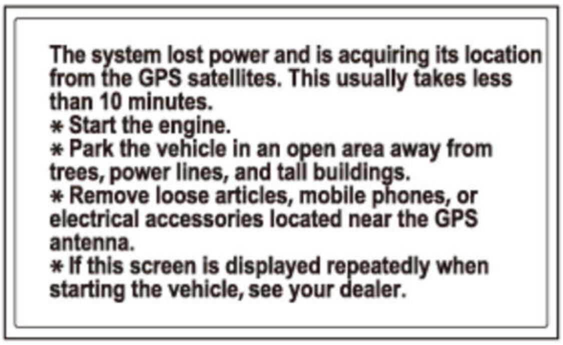
This initialization requires the following:

- With audio system theft protection: Press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio-navigation unit exits the anti-theft mode. Or you can enter the 5-digit anti-theft code.
- GPS initialization (may not be needed depending of the length of time the system was without power).
- Map matching aligns the GPS to a location on the map.

GPS Initialization

NOTE: You must park the vehicle outside with a clear view of the sky.

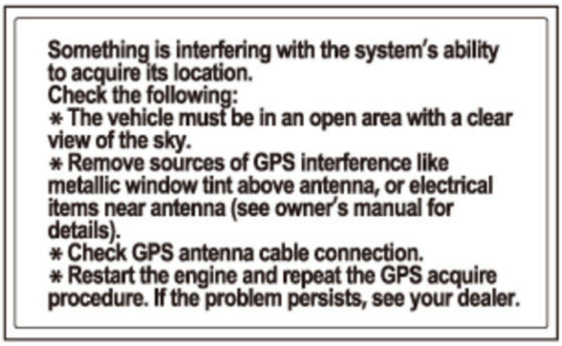
Depending on the length of time the battery was disconnected, your system may require GPS initialization. If it does, the CSF screen appears:



The system lost power and is acquiring its location from the GPS satellites. This usually takes less than 10 minutes.
* Start the engine.
* Park the vehicle in an open area away from trees, power lines, and tall buildings.
* Remove loose articles, mobile phones, or electrical accessories located near the GPS antenna.
* If this screen is displayed repeatedly when starting the vehicle, see your dealer.

If this procedure is not necessary, the system proceeds directly to the Disclaimer screen. During initialization, the system searches for all available GPS satellites, and obtains their orbital information. Park the vehicle out in the open with a clear view of the sky for this procedure.

If the navigation system finds the satellites properly, the CSF screen changes to the Disclaimer screen. If within 10 minutes the system fails to locate a sufficient number of satellites to locate your position, the confirmation screen appears.



Something is interfering with the system's ability to acquire its location.
Check the following:
∗ The vehicle must be in an open area with a clear view of the sky.
∗ Remove sources of GPS interference like metallic window tint above antenna, or electrical items near antenna (see owner's manual for details).
∗ Check GPS antenna cable connection.
∗ Restart the engine and repeat the GPS acquire procedure. If the problem persists, see your dealer.

If this screen appears, turn off the engine, then restart the vehicle and move it to a different location. If the Disclaimer screen appears, the GPS initialization is complete.

NOTE:

- The average acquiring time is less than 10 minutes, but it can take as long as 45 minutes.
- If the system is still unable to acquire a signal, follow the instructions on the screen. If this screen appears again, check for hard error codes.
- Skip a CSF screen by pressing the DISPLAY MODE (☼ ☾) button and the HOME button at the same time for 5 seconds and you can move to the Disclaimer screen.

Map Matching

This part of the initialization matches the GPS coordinates with a road on the map screen. To do this part of the procedure, make sure that the navigation system displays a map, and drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on appears at the bottom of the screen, the entire procedure is complete. Your system is now ready to use.

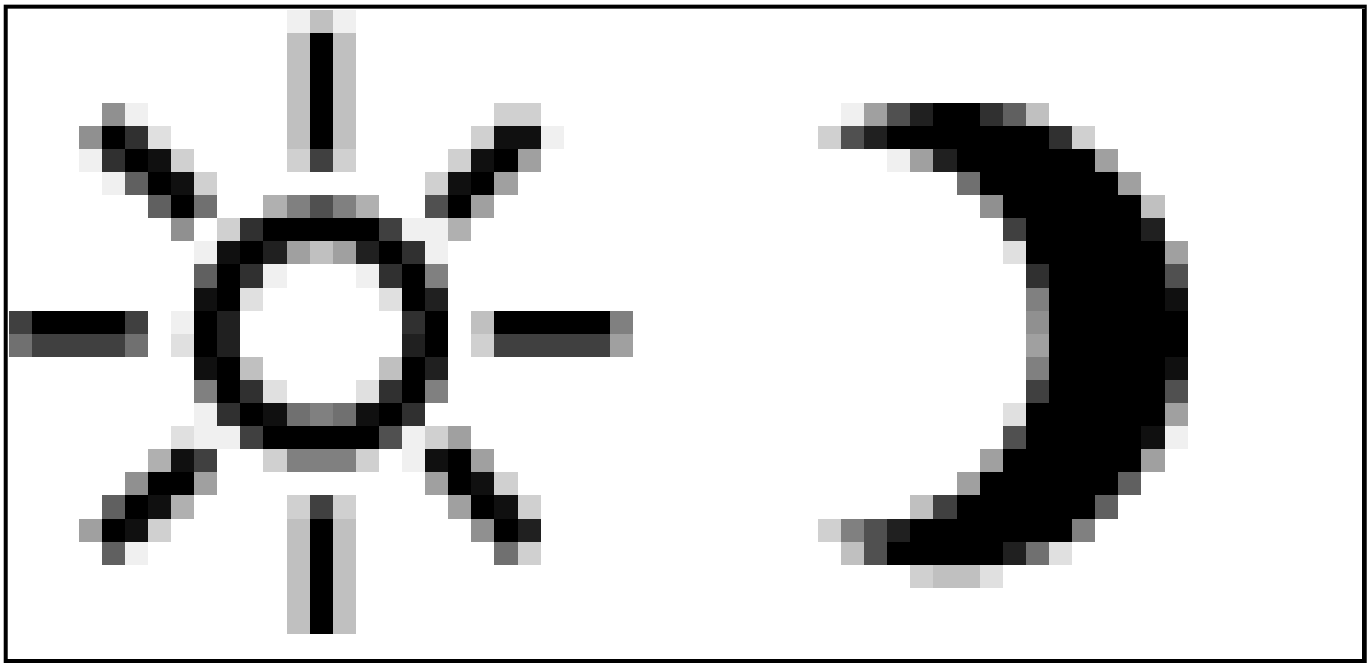
How to Check Error History (Navigation DTCs)

NOTE: The navigation DTCs cannot be retrieved with the HDS.

The Error History feature is to record intermittent audio/navigation issues that occur while the customer is using the system. Sometimes the customer complaint cannot be duplicated. The error history may record the information needed to diagnose the problem. To check the error history:

1. Turn the vehicle to the ON mode.

2. Press and hold the PHONE button, the DISPLAY MODE (



) button, and the AUDIO POWER (

⏻

) button until the Select Diagnosis Items menu screen is displayed.

NOTE: The buttons needs to be pressed together simultaneously.

DESCRIPTION AND OPERATION

NAVIGATION SYSTEM DESCRIPTION

Basic Configuration

The navigation system is a highly-sophisticated, hybrid locating system that uses satellites and a map database to show you where you are and to help guide you to a desired destination.

The navigation system receives signals from the global positioning system (GPS), a network of 24 or more satellites in orbit around the earth. By receiving signals from several of these satellites, the navigation system can determine the latitude, longitude, and elevation of the vehicle. In addition, signals from the navigation unit's own gyro sensor and vehicle information (vehicle speed pulse) enable the system to keep track of the vehicle's direction and speed of travel.

This hybrid system has advantages over a system that is either entirely self-contained or one that relies totally on the GPS. For example, the self-contained portion of the system can keep track of vehicle position even when satellite signals cannot be received. When the navigation system is on, the GPS can keep track of the vehicle position even when the vehicle is transported by ferry.

The navigation system applies all location, direction, and speed information to maps and calculates a route to the destination entered. As you drive to that destination, the system provides both visual and audio guidance.

Audio-Navigation Unit

Refer to the Audio System Description for the audio-navigation unit (display audio) and audio functions .

Navigation Function

The navigation function is installed in the audio-navigation unit as an application. The basic navigation system is composed of the audio-navigation unit, center display unit, vehicle information signals (vehicle speed pulse, reverse signal), and the GPS antenna.

NAVIGATION APPLICATION
Update

Calculation of Vehicle Position

The audio-navigation unit calculates the vehicle position (the driving direction and the current position) by receiving the directional change signals from the gyro sensor, and the travel distance signals from vehicle information (vehicle speed pulse, BACK LT (reverse) signal).

Map Matching Tuning

Map match tuning means that the vehicle's position is properly indicated on mapped roads. The map data transmitted from the SD card is checked against the current vehicle position data and the vehicle's position is indicated on the nearest road. Map matching tuning cannot be done when the vehicle is on an unmapped road, or if the vehicle is far away from a mapped road.

GPS Tuning

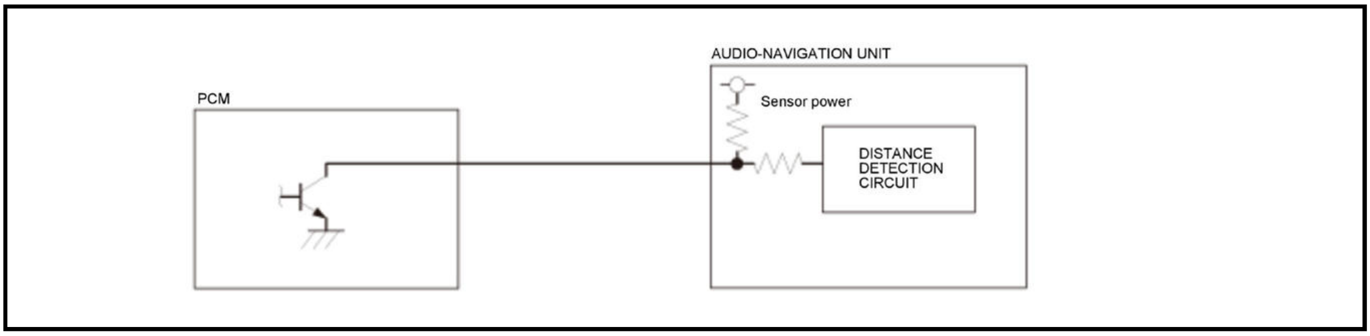
GPS tuning improves the accuracy of the vehicle's actual position in relation to the GPS vehicle position. The audio-navigation unit compares its calculated vehicle position with the GPS position. If there is a large difference between the two positions, the GPS tuning adjusts the calculated vehicle position to the GPS position.

Distance Tuning

The audio-navigation unit compares the vehicles calculated distance using the VSP and the vehicle's actual position based on GPS data. If the values are different, the audio-navigation unit decreases or increases the tuning value depending if the vehicle's calculated position is always ahead or behind the GPS position.

Vehicle Speed Pulse

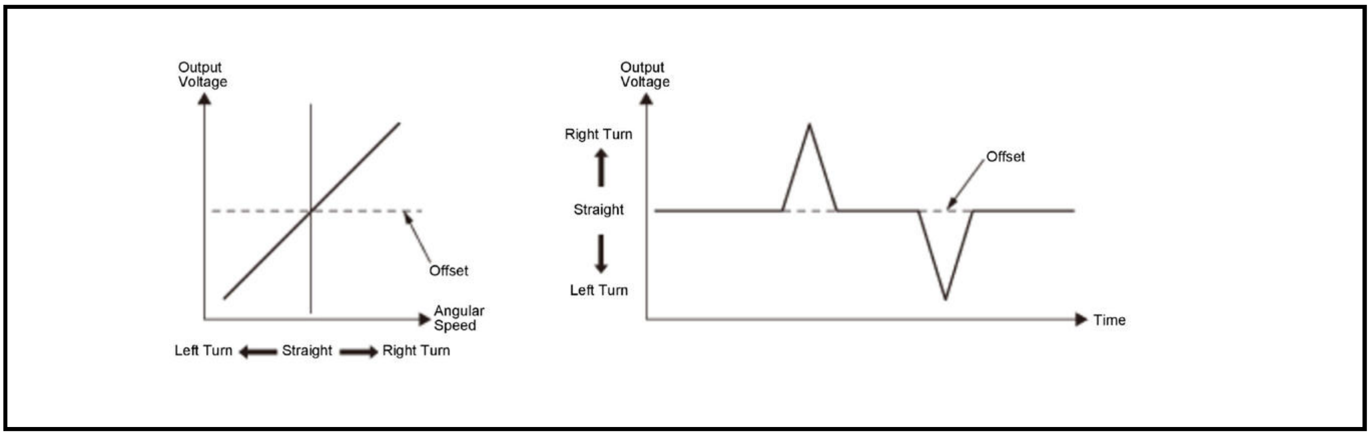
The vehicle speed pulse is sent by the PCM. The PCM receives a signal from the output shaft speed sensor, then processes the signal and transmits it to the speedometer and other systems.



Gyro Sensor

The gyro sensor (located in the audio-navigation unit) detects the direction change (angular speed) and the attitude of the vehicle.

When the vehicle turns left or right, the gyro sensor outputs the voltage. But the sensor outputs the offset voltage when the vehicle is stopped. The audio-navigation unit calculates the relative bearing of the vehicle from the offset voltage. Since the vehicle may generate the yaw rate even when the vehicle is stopped. (when the vehicle is spun on a turn table), the audio-navigation unit prevents incorrect calculations using the gyro sensor temperature information.



When the vehicle repeats acceleration/slowdown, the gyro sensor outputs the voltage. In addition, the gyro sensor is affected by the vehicle's slant angle. The audio-navigation unit calculates the slant angle of the vehicle from the offset voltage.

To correctly calculate when the vehicle is at an angle, the audio-navigation unit sets up the offset in these cases:

- GPS altitude is constant.
- Vehicle speed is constant.

Downward Slope

Oscillation Gyro Principles

The piezoelectric parts have electric/mechanical transfer characteristics. They bend vertically when voltage is applied to both sides of the parts, and voltage is generated between both sides of the piezoelectric parts when they are bent by an external force. The oscillation gyro functions by utilizing this characteristic of the piezoelectric parts and Coriolis force. (Coriolis force deflects moving objects as a result of the earth's rotation.) In the oscillation gyro, this force moves the sensor element when angular velocity is applied.

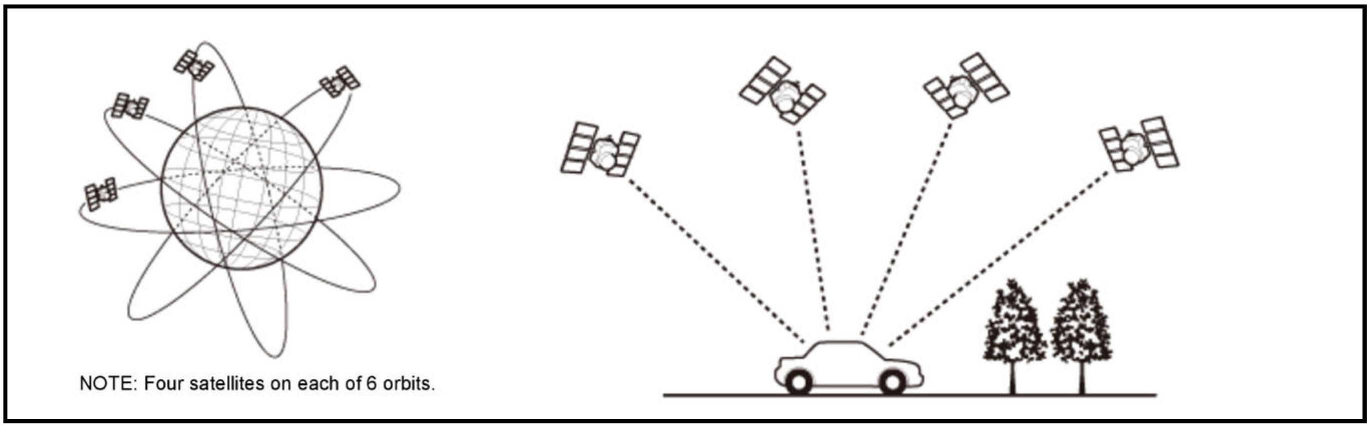
DRIVING PIEZOELECTRIC PART

Global Positioning System (GPS)

The global positioning system (GPS) enables the navigation system to determine the current position of the vehicle by using the signals transmitted from the satellites in orbit around the earth. The satellites transmit the satellite identification signal, orbit information, transmission time signal, and other information. When the GPS receiver receives a signal from four or more satellites simultaneously, it calculates the current position of the vehicle based on the distance to each satellite and the satellite's position in its respective orbit.

Position Detection Image with GPS Satellite



NOTE: Four satellites on each of 6 orbits.

Precision of GPS

The precision of the GPS varies according to the number of satellites from which signals are received and the view of the sky.

Number of Satellites	Condition	Description
None	Faulty reception	The GPS cannot be utilized due to a faulty GPS receiver or antenna, or other fault or interference.
2 or less	Impossible to detect vehicle position	GPS function is normal. The satellite signals received by the GPS are too few to detect the vehicle position.
3	Vehicle position detectable in 2 dimensions	The longitude and latitude of the vehicle position can be detected (less precise than detection in three dimensions).
4 or more	Vehicle position detectable in 3 dimensions (elevation displayed)	The longitude, latitude and the altitude of the vehicle position can be detected (more precise than detection in two dimensions).

GPS Antenna

The GPS antenna amplifies and transmits the signals received from the satellites to the GPS receiver.

GPS Receiver and Clock

The GPS receiver is built into the audio-navigation unit. It calculates the vehicle position by receiving the signal from the GPS antenna. The current time, vehicle position, and signal reception condition are transmitted from the GPS receiver to the navigation system to adjust vehicle position and the clock display in the audio-navigation unit. Also, the audio-navigation unit can set world time zones automatically by calculating the vehicle position.

Audio Guidance

The audio-navigation unit outputs navigation voice guidance before entering an intersection or passing a junction.

- With stereo amplifier: The voice guidance are sent to the stereo amplifier using the analog audio line (AUX NAVI), then outputs them to the front speaker(s) (driver's side).
- Without stereo amplifier: The voice guidance outputs to the front speaker(s) (driver's side).

Muting Signal Logic

When the speaker outputs the voice guidance, audio muting logic is orchestrated by the audio-navigation unit. The audio-navigation unit determines what audio source has priority to use speakers. **Refer to the audio system Description** for muting signal logic with the audio-navigation unit.

Voice Control Function

This navigation system also has voice recognition that allows voice control of most of the audio, navigation, and the HFL functions. The TALK button on the steering wheel activate the voice control. The voice control also allows control of the audio and climate functions.

Muting Signal Logic

When the voice recognition is in use, audio muting logic is orchestrated by the audio-navigation unit. The audio-navigation unit determines what audio source has priority to use speakers Refer to the audio system Overview for muting signal logic with the audio-navigation unit.

Fan Mute Operation

When the voice recognition is in use, the audio-navigation unit sends the fan mute signal to the climate control unit via the B-CAN. The blower fan operating voltage may be reduced depending on the current fan speed.

Turn by Turn Directions

The audio-navigation unit outputs the route guidance (direction) information to the multi-information display (MID) in the gauge control module via the digital signal line (LVDS2). In the case of route guidance mode, the MID shows the simple routing guidance using an arrow. When other than route guidance mode, the MID shows the azimuth (direction) information in 16-directions.

HD Traffic (TM)

The HD Traffic (TM) is a broadcast for delivering traffic information to the driver. The traffic data is coded using the FM broadcast.

The HD Traffic (TM) uses a decoder in the audio-navigation unit to decode the traffic information data. It is integrated directly into a navigation system. The traffic information is displayed with the navigation route guidance. It is used to avoid traffic jams and accidents (see the Navigation System information for more information).

HondaLink Assist

HondaLink delivers remote services to the vehicle using the customer's compatible Bluetooth phone. **Refer to the audio system Description** .

Microphone

The Microphone receives navigation voice command, and transmits them to the audio-navigation unit. **Refer to the HandsFreeLink system Description** .

HFL (Navigation Voice Control) Switch

The HFL (navigation voice control) switch and the audio remote switch are integrated to the audio remote-HFL switch. **Refer to the audio system Description** .

Multi-View Rearview Camera

The multi-view rearview camera allows the driver to see what is behind the vehicle by displaying the image on the audio-navigation unit. There are three different selectable views. **Refer to the audio system Description** .

NAVIGATION SYSTEM DESCRIPTION - SYSTEM DIAGRAM

For locations of each component on vehicle, refer to Navigation System Component Location Index.

CALIBRATION CORRECTION

NAVIGATION SYSTEM SENSOR CALIBRATION

Procedure

NOTE:

- Check the vehicle 12 volt battery condition first .
- You should do this procedure in an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields.

1. Sensor - Calibration

1. Test-drive the vehicle on the road in a straight line for at least 200 m (656 ft) at a constant speed (turn less than 5 deg/s, accelerate less than 1 mph/s (1.6 km/h/s)).

2. Park the vehicle in an open area, and wait at least 2 minutes with the engine running.

3. Test-drive the vehicle in an open area, and make a 90-degree turn (repeat 2-4 times).

DIAGNOSIS

NAVIGATION SYSTEM DIAGNOSTIC MODE

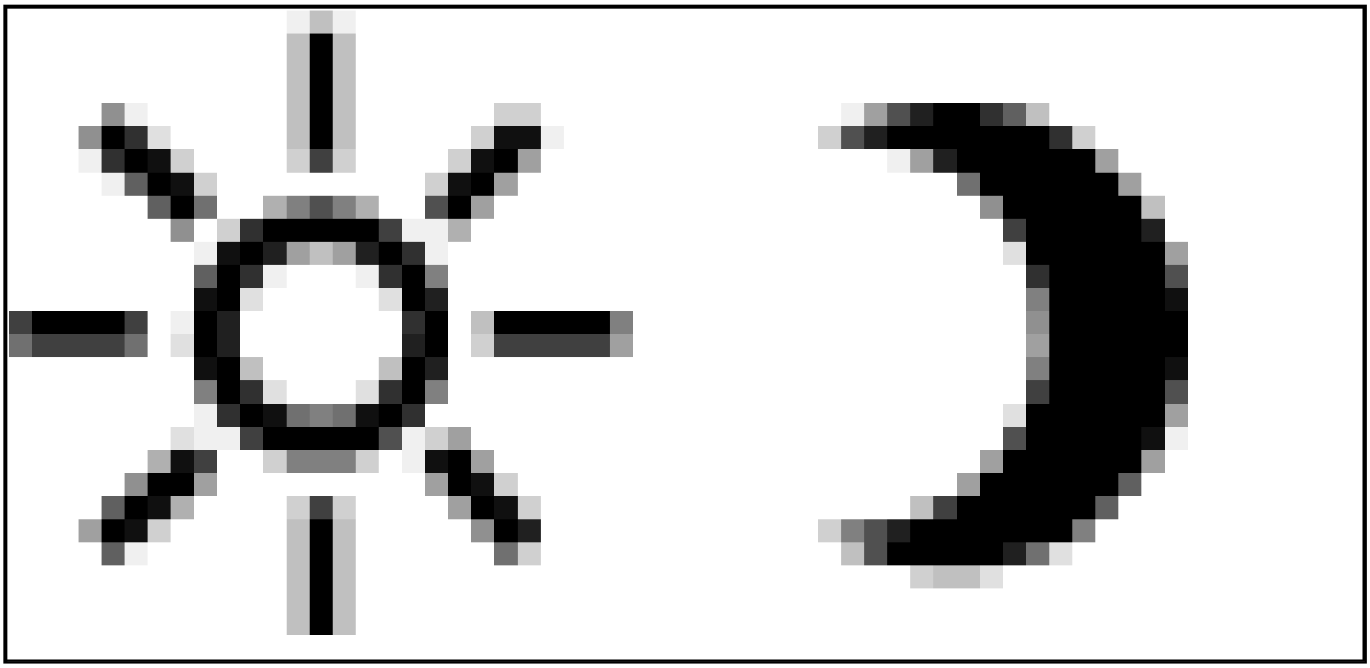
NOTE:

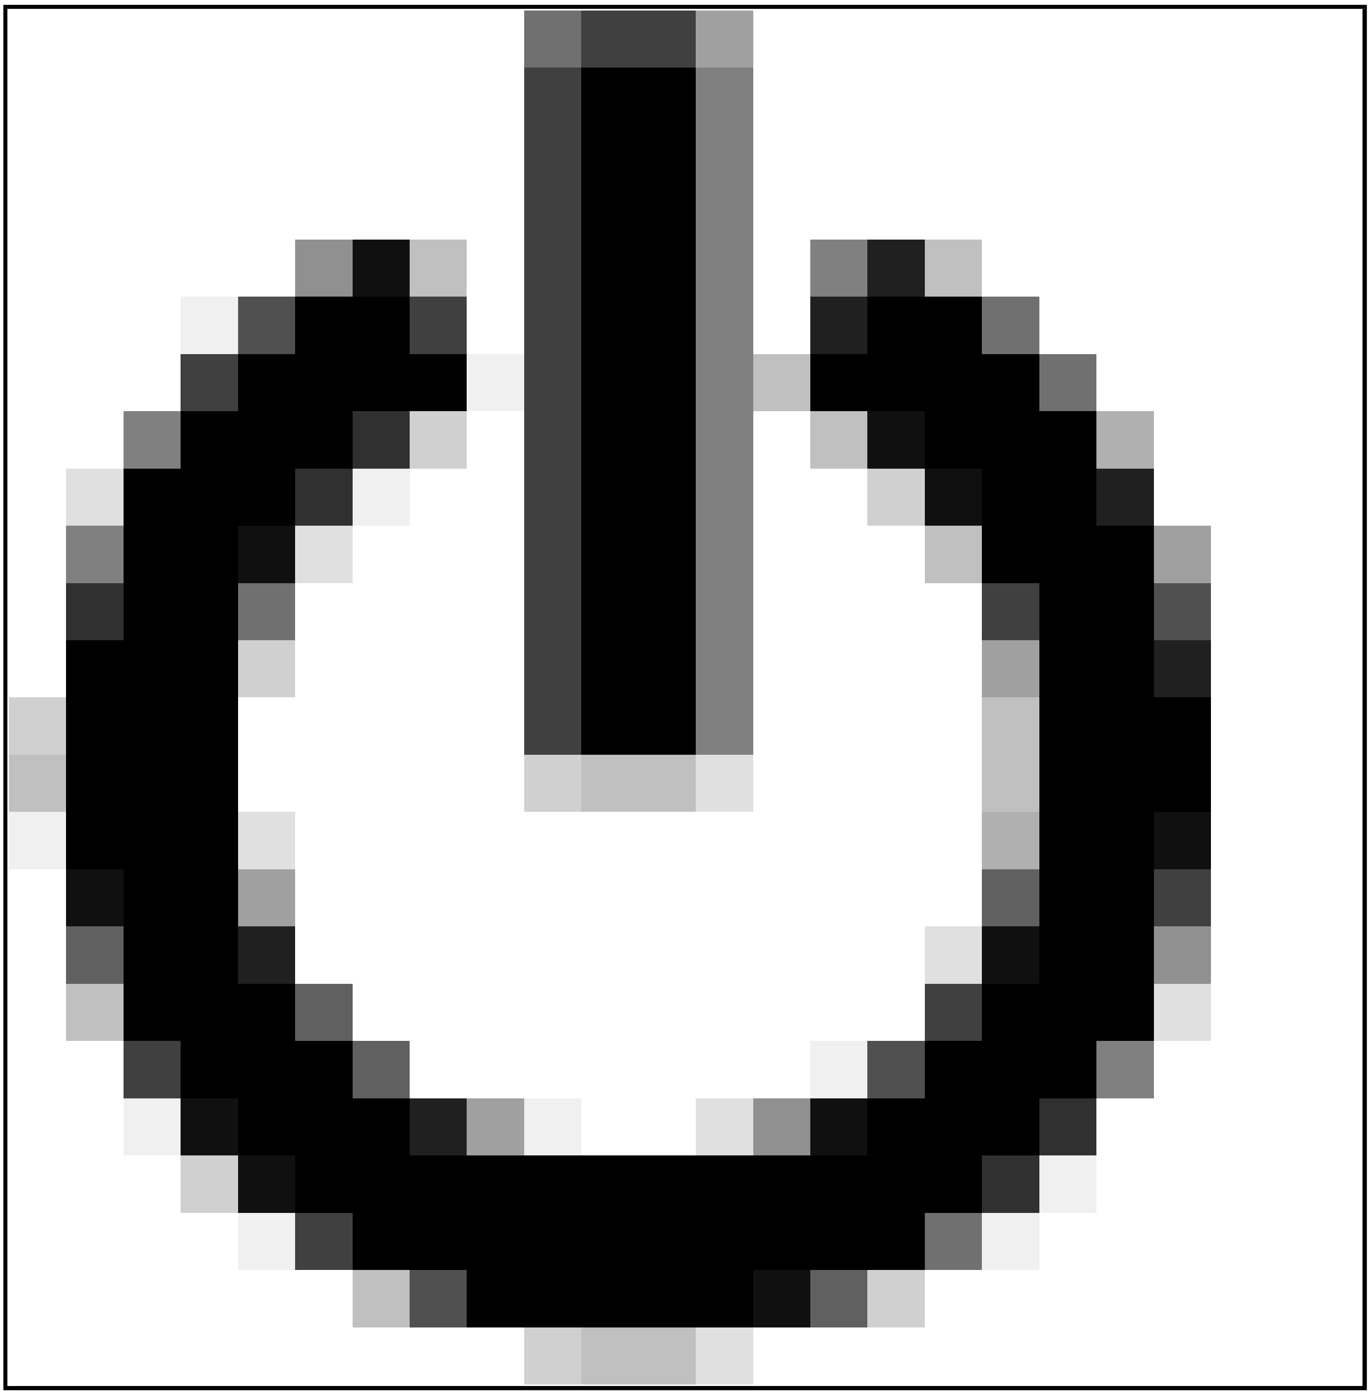
- **Check the vehicle 12 volt battery condition first** .
- The screens detail indicated may change depending on equipment or specification.

Start-Up Procedure and Diagnostic Menu

1. Turn the vehicle to the ON mode. If needed, start the engine.

2. Press and hold the PHONE button, the DISPLAY MODE button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed:





NOTE: The buttons needs to be pressed together simultaneously.

- Self-Diagnosis Mode (runs the automatic diagnosis of the navigation system)
- Detail Information and Setting (allows you to manually diagnose the navigation system)

Press any icon if you want to see details

2. The diagnosis tests the following:

- Most of the wires connecting the external navigation components shown in the block diagram.
- The results from the various components shown in the block diagram.
- The audio-navigation unit checks the microphone by listening to the "Pi Pi Pon" sound produced by the audio-navigation unit from the speakers when the diagnosis is started. This requires that the audio system be operating normally.

3. When the diagnosis finishes, the icons turn different colors based on their test status.

NOTE: By selecting the Help icon, you can see a description for each color.

Icon Colors	Description
Green	The system ran a diagnosis and the results are OK.
Red*	Errors that require replacement of hardware or harness. Examples are connection error or memory diagnosis errors. Select the red icon and check each diagnostic screen (refer to the description for diagnostic screens in the Unit Check).

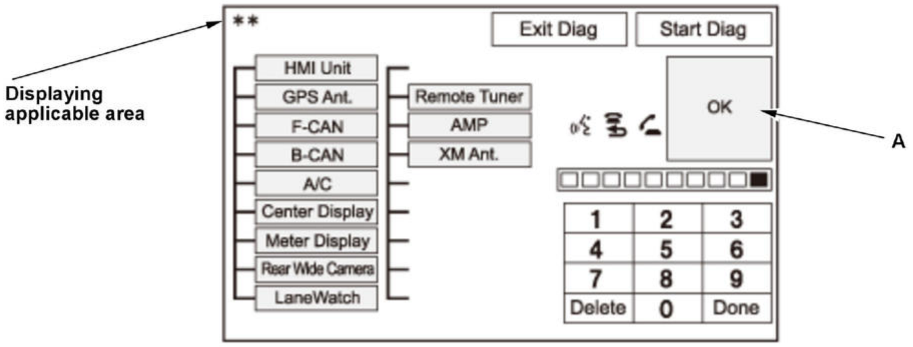
Icon Colors	Description
Yellow	• Errors that do not require hardware replacement, or the connection check is in the state which is not done. Such as leaving the vehicle in the ACCESSORY mode or because of a missing accessory. • When the audio-navigation unit detects a failure, and stores DTC, the Error History icon turns yellow.
White	The diagnosis is running. The screen functions are locked out while the diagnosis runs.
Gray	• The system cannot automatically check this function. You have to select the diagnosis item and manually do additional testing, like checking the audio-navigation unit buttons in the Hard Key test. When you complete the Hard Key test and return to the System Links screen, the gray icon turns green. • The Vehicle Status icon anytime shows gray. • When the audio-navigation unit does not store DTCs, the Error History icon shows gray.

*:	The F-CAN icon and the B-CAN icon turns red when the vehicle is in the ACCESSORY mode. Check the System Links with the engine running, and if the F-CAN icon and the B-CAN icon turns green, the system is OK at this time.

4. Select the icon to see the details of that diagnostic function. The icon colors on the screen may not change until you exit and reenter the Self-Diagnosis mode. In some cases, you may have to restart the engine for the indication to change. After you repair the affected component or harness, repeat this diagnosis.

Factory Diagnostic Screen In Line Diag and Linking

If the vehicle left the factory in the factory diagnostic mode, you will see this screen every time you turn the vehicle to the ON mode. Sometimes this screen also appears after you replace the audio-navigation unit with a new or remanufactured unit. Normally the factory does the steps necessary to verify proper operation and terminate the factory diagnosis. Until the proper confirmation sequence is done, the screen appears every time you turn the vehicle to the ON mode.



NOTE: The system cannot complete a full diagnosis unless vehicle is in the ON mode.

1. Select the Start Diag icon to check the connection between the audio-navigation unit and related components. When the connection diagnosis is in progress, the icon (A) indicates Detecting..., and each icon turns white. If the connection is OK, the icon turns green. If the connection is NG, the icon turns red. Check for connection between the audio-navigation unit and related unit on the failure connection line.

NOTE: When the item is a variation equipment, the icon shows yellow, and it is not reflected in diagnosis.

2. If the connection diagnosis is finished, press the steering commander switch buttons (the TALK button, PICK-UP button, and the HANG-UP/BACK button) to check the HFL switch. As each button is pressed, the corresponding icon on the display should turn green.

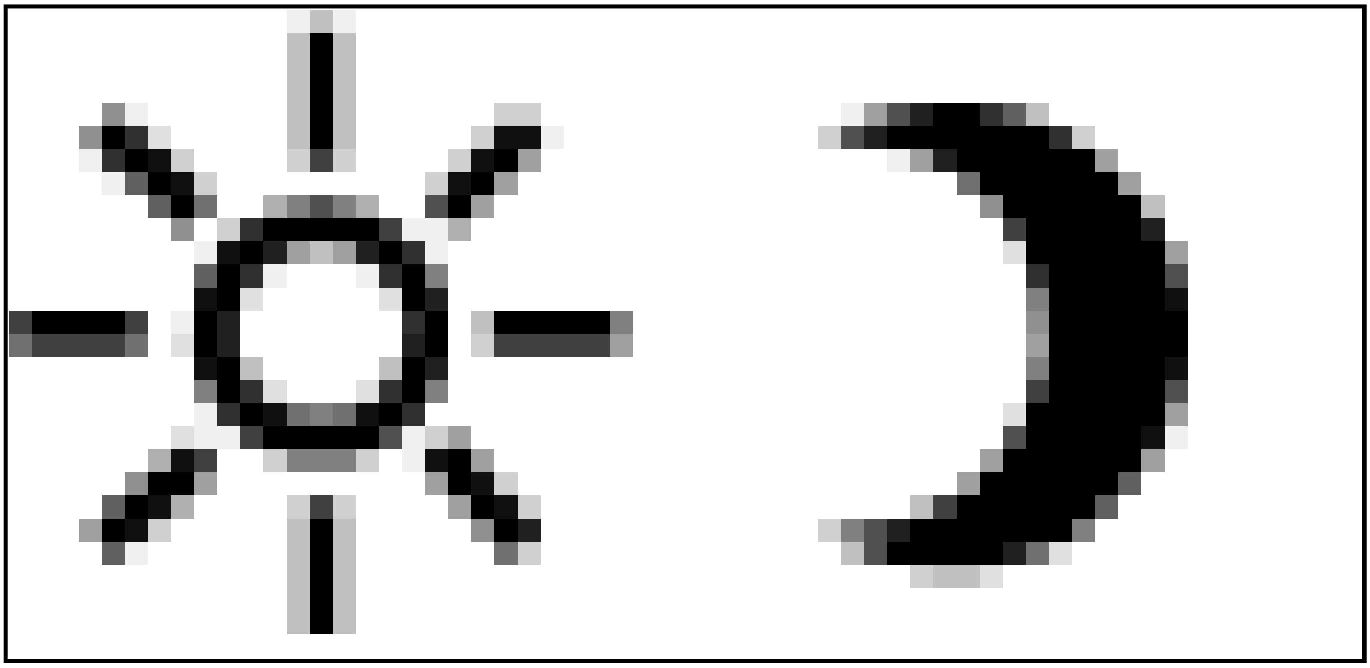
3. Press the TALK button, and within 5 seconds in a normal voice say ' 'testing' '. The Mic Level indicator on the screen should momentarily turn green.

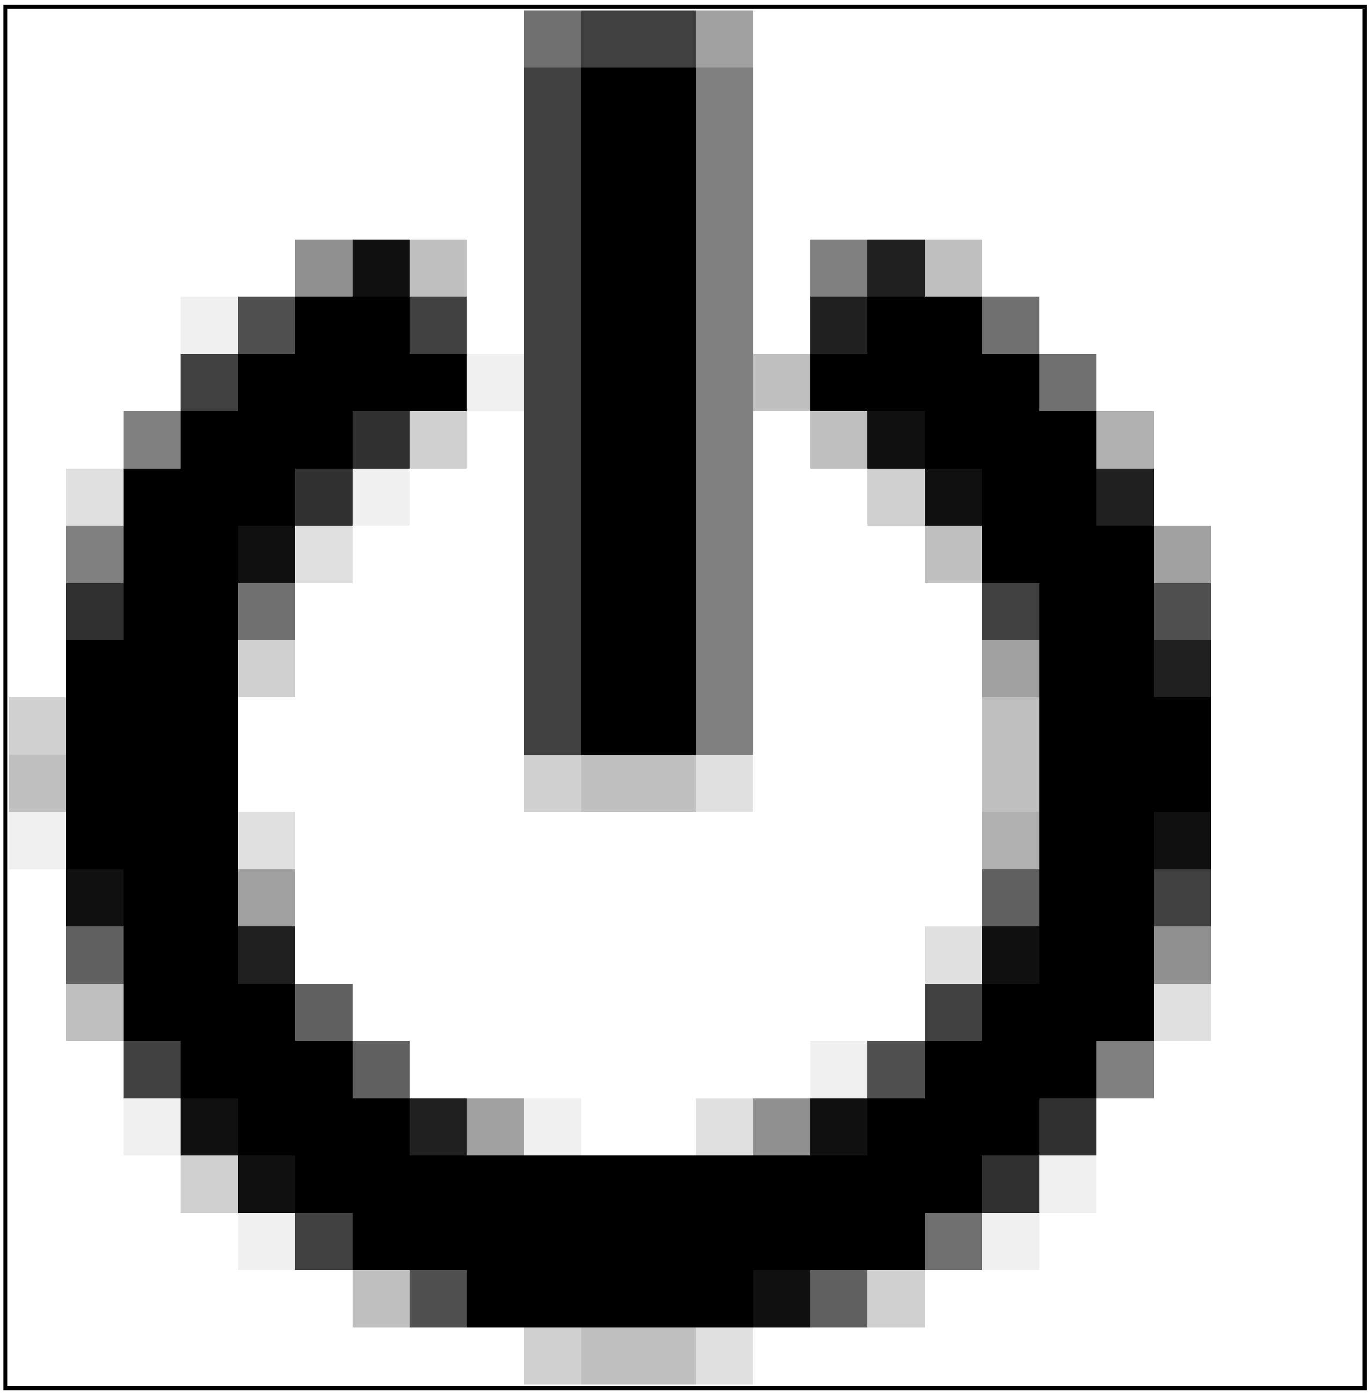
4. If all the diagnosis are OK, the icon (A) indicates OK. Select the Exit Diag icon to exit the diagnostic mode. The In Line Diag should not appear again.

Forced Completing of In Line Diag and Linking

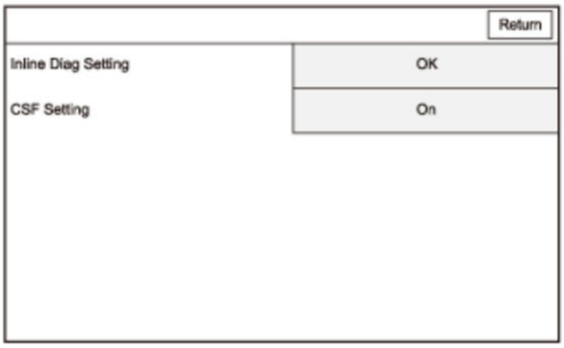
Follow these steps to prevent the screen from appearing in the future:

1. While displaying the In Line Diag screen, press and hold the PHONE button, the DISPLAY MODE button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed.





2. While displaying the Select Diagnosis Items menu screen, press and hold the HOME button until the In Line Diag setting screen is displayed.



Inline Diag Setting	OK
CSF Setting	On

3. Set the Inline Diag Setting to OK (complete). The system restarts and a normal start-up process occurs. The In Line Diag should not appear again.

Detail Information and Setting

This section allows you to run a specific diagnosis and allows additional setting choices for some screens that are not shown when touching an icon from the System Links screen.

Select the item you want to check, and the test begins. To return to the previous screen, select the Return icon.

RGB Color

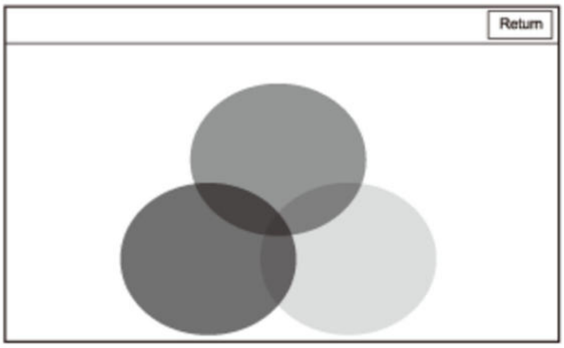
NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen verifies that the display is receiving the video (R, G, B, and Composite sync) signals properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section. If any of the color circles are missing, **replace the center display unit** .

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

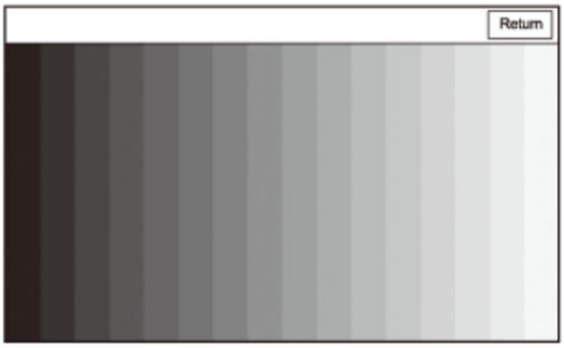


Gray Tone

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks problems with contrast in 16 gradations. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

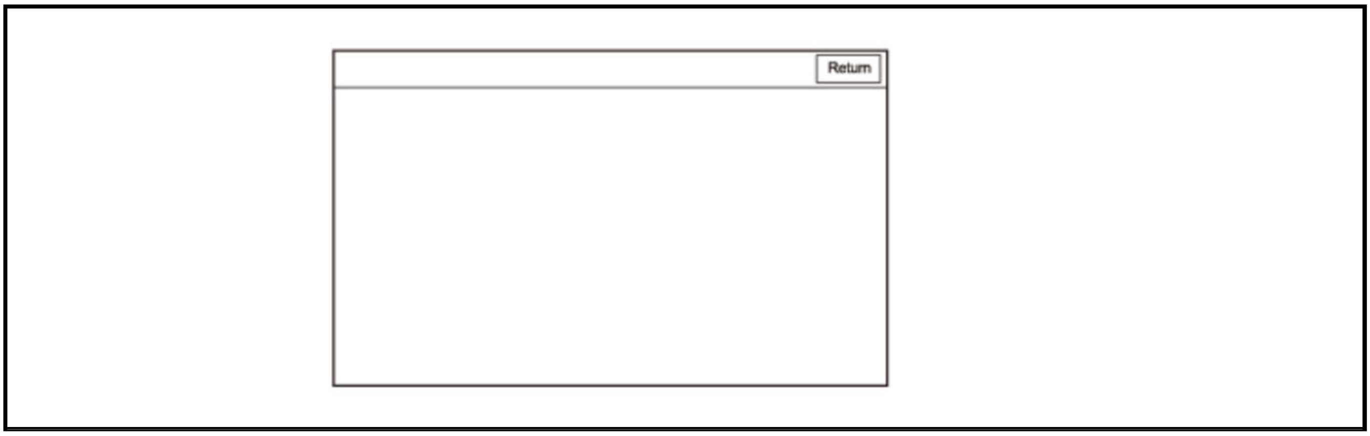


White Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be dead (off). The entire display must be white.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

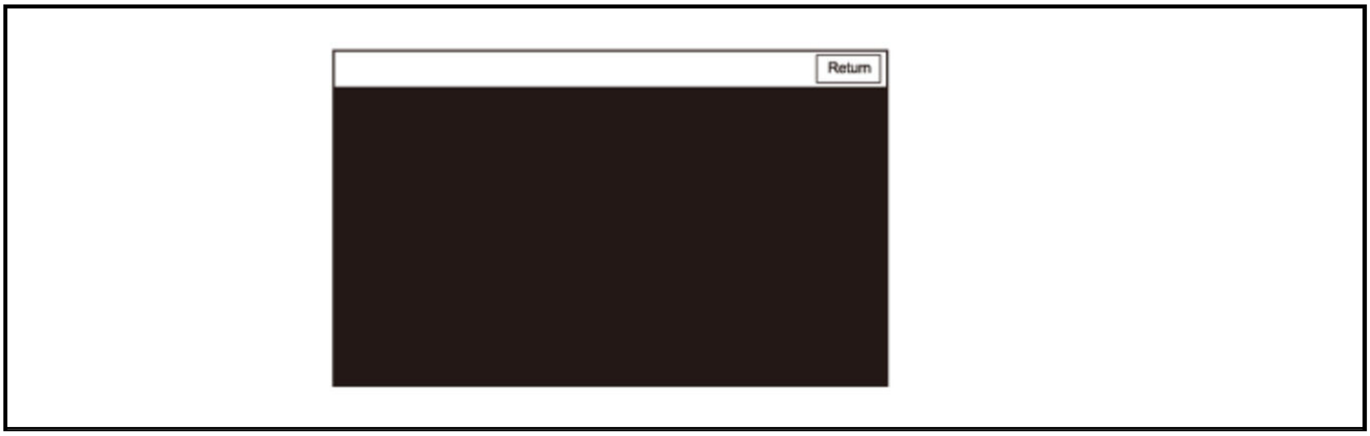


Black Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be stuck on. The entire display must be black.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

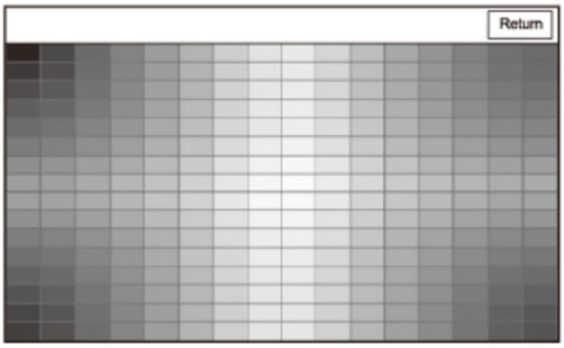


Color Pattern

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

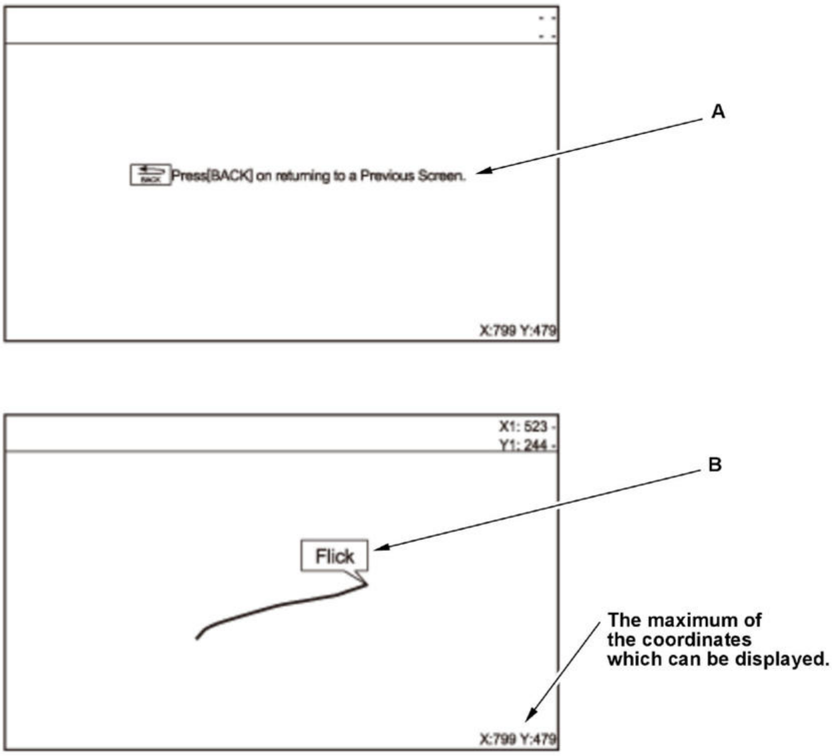
The screen shows the colors being used for the map and menu screens. This is for factory use only. To check the color signal, use the RGB Color diagnosis.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.



Touch Panel Check

This check allows you to check the sensitivity of touch panel. If the screen is operated in the state while the telop (A) is displayed, the track changes to black, and the action name (Tap, Double tap, Pinch, Slide, and Flick) appears on the caption (B) for 5 seconds. The screen displays the coordinates of where the screen was touched. If the BACK button is pressed, the screen returns to the Monitor Check menu. If another location other than the location pressed responds, do the Touch Panel Adjustment.



Press[BACK] on returning to a Previous Screen.

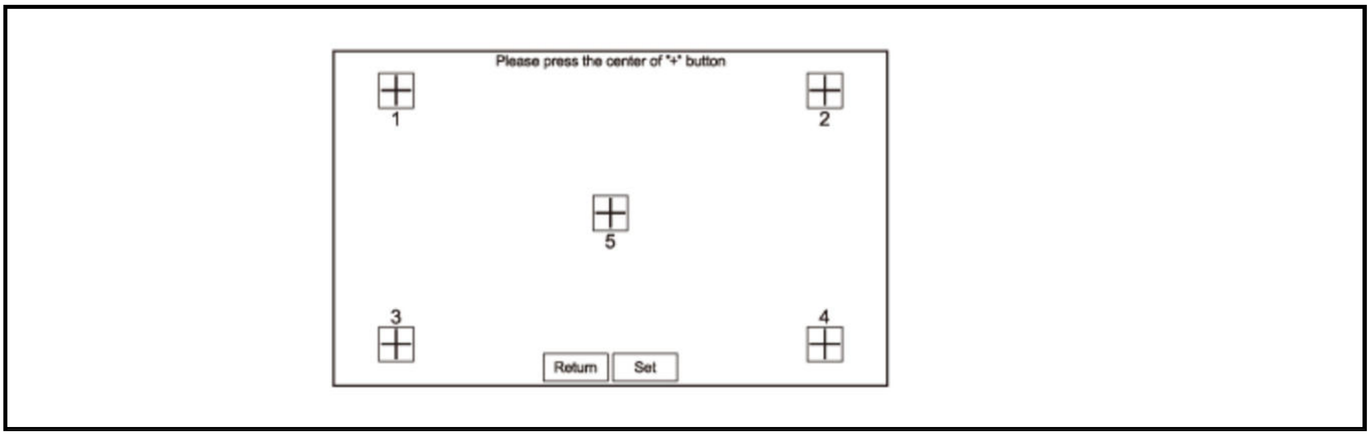
Touch Panel Adjustment

This screen adjusts the alignment of these touch locations with the location of the buttons images on the screen.

The screen consists of the + icons. Touch the center of the five + icons on order 1-5. To store the settings, select the Set.

NOTE: Touch the center of the +icon correctly.

When selecting the Set icon, the audio-navigation unit reflects the result of the touch panel adjustment. Select Return to exit the Touch Panel Adjustment screen.

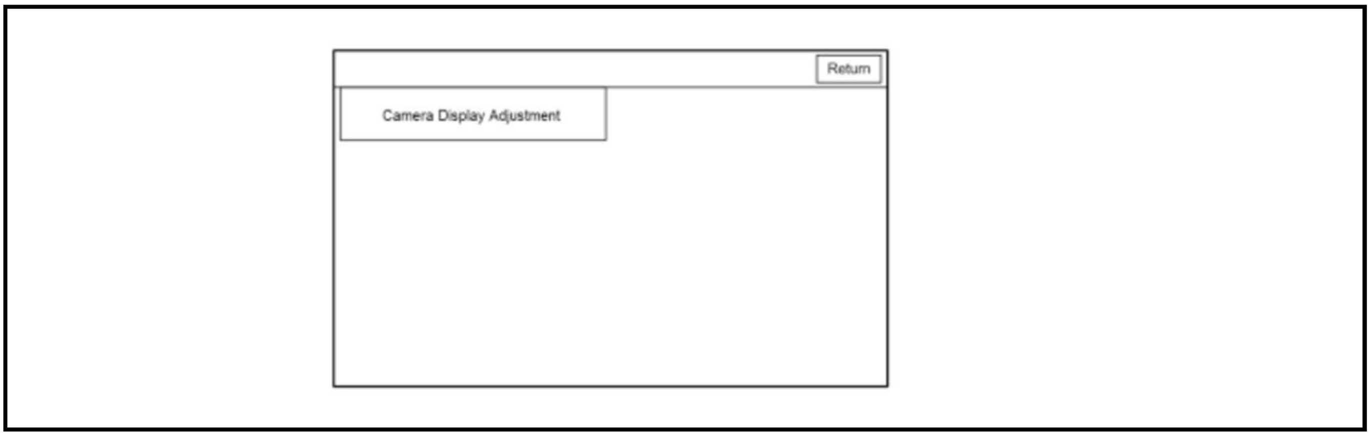


Please press the center of "+" button

Monitor Adjustment

This screen adjusts the brightness, etc. of the camera (rearview or LaneWatch) image.

Select Return to exit the Monitor Adjustment screen.



Unit Check (Quick Check)

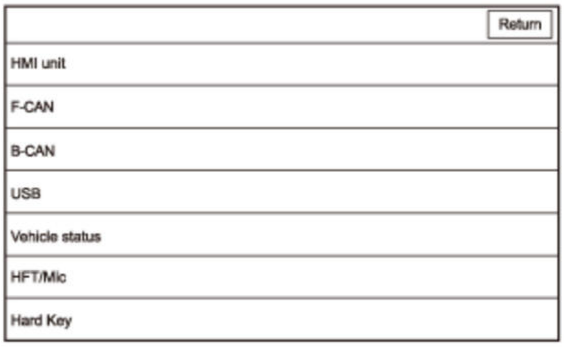
These screens allow you to diagnose the audio-navigation unit and related units. Some of the tests and screens that are displayed under the Unit Check are same as the checks listed under the Detail Information and Setting.

To start the test, select the item you want to check.

NOTE: These items describe in indication order. Swipe the screen to check the next items.

- HMI unit
- F-CAN
- B-CAN
- USB
- Vehicle status
- HFL/Mic
- Hard Key
- Error history
- Rear wide camera
- Front Camera (not supported)
- LaneWatch
- Remote tuner
- AMP
- XM Ant.

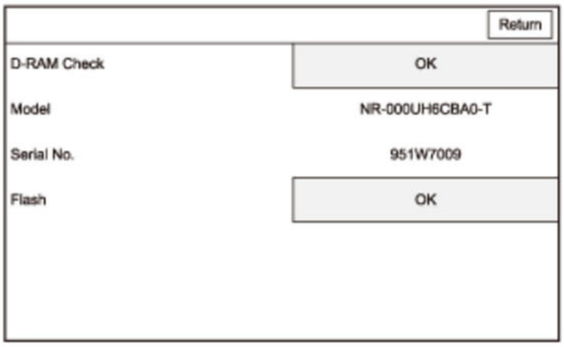
- CD (not supported)
- Center display
- iPhone
- Meter Display
- GPS antenna
- HD Traffic
- Gyro Sensor
- A/C
- Telematics Diag (not supported)
- MirrorLink



HMI Unit

This diagnosis checks for problems in the audio-navigation unit processor. When you start this diagnosis, the audio-navigation unit may freeze or delay up to a minute while the diagnosis runs.

- D-RAM: Displays the result of the access to the D-RAM (OK/NG). If NG, **check for hard error codes**.
- Model: Displays the audio-navigation unit manufacture's model number.
- Serial No. : Displays the audio-navigation unit serial number. That should be the same as the serial number found on the upper side of the audio-navigation unit.
- Flash: Displays the result of the access to the flash memory (OK/NG). If NG, **replace the audio-navigation unit** .



D-RAM Check	OK
Model	NR-000UH6CBA0-T
Serial No.	951W7009
Flash	OK

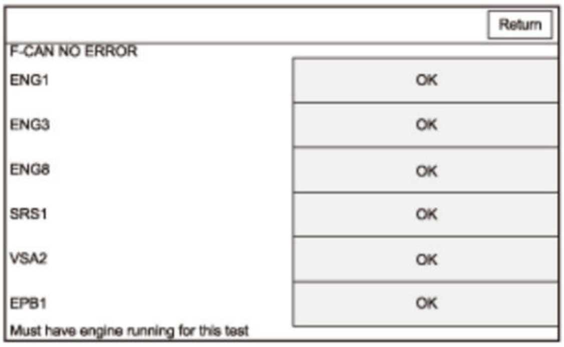
F-CAN

NOTE:

- This diagnosis must have the engine running.
- Swipe the screen to check the next items.

This diagnosis checks whether the audio-navigation unit has received specific F-CAN data. If F-CAN shows NO ERROR, an error is not detected between the F-CAN bus and the audio-navigation unit.

- If F-CAN shows RX ERROR, **replace the audio-navigation unit** .
- If F-CAN shows TIME OUT, There is a possibility that some items are NG (red icon). When all the items from each transmitting unit is NG, check for F-CAN DTCs with the HDS. If DTCs not detected, check for continuity in the F-CAN lines between the audio-navigation unit and the transmitting unit.



F-CAN NO ERROR

Must have engine running for this test

B-CAN

NOTE:

- This diagnosis must have the engine running.
- Swipe the screen to check the next items.

This diagnosis checks whether the audio-navigation unit has received specific B-CAN data. If B-CAN shows NO ERROR, an error is not detected between the B-CAN bus and the audio-navigation unit.

- If B-CAN shows RX ERROR, **replace the audio-navigation unit** .
- If B-CAN shows TIME OUT, There is a possibility that some items are NG (red icon). When all the items from each transmitting unit is NG, check for B-CAN DTCs with the HDS. If DTCs not detected, check for continuity in the B-CAN lines between the audio-navigation unit and the transmitting unit.

Item	Transmitting Unit

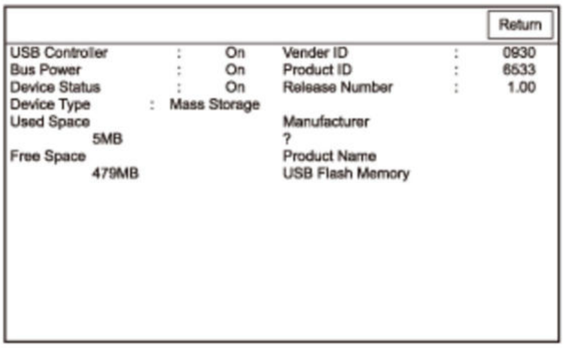
ACSTATE	OK

USB

This diagnosis displays the USB device status that is connected to the audio-navigation unit.

If the USB memory device is connected to the USB port A or B, the screen displays the USB controller status, the Bus power status, and the device status.

When you connect a USB mass storage device, you can see the capacity used and the amount of free space available.



```
USB Controller    :    On        Vender ID         :   0930
Bus Power         :    On        Product ID        :   6533
Device Status     :    On        Release Number    :   1.00
Device Type    :  Mass Storage
Used Space                       Manufacturer
          5MB                    ?

HFL/Mic

This diagnosis allows you to independently test the Bluetooth module and the microphone. The Bluetooth module is built into the audio-navigation unit. To properly check the microphones, make sure you are sitting in the driver's seat.

NOTE: Before this diagnosis, check the response of the TALK button on the audio remote-HFL switch by the Hard Key diagnosis.

- If the Bluetooth Connection Diagnosis shows NG, **replace the audio-navigation unit** .
- Press the TALK button, and within 5 seconds in a normal voice say ' 'testing' ' toward the microphone in the roof console. The Mic Level indicator on the screen should momentarily turn green. The test is set to OK by indicating green more than 6 steps. If there is no Mic Level movement when you speak, **go to HFL does not work properly troubleshooting** .

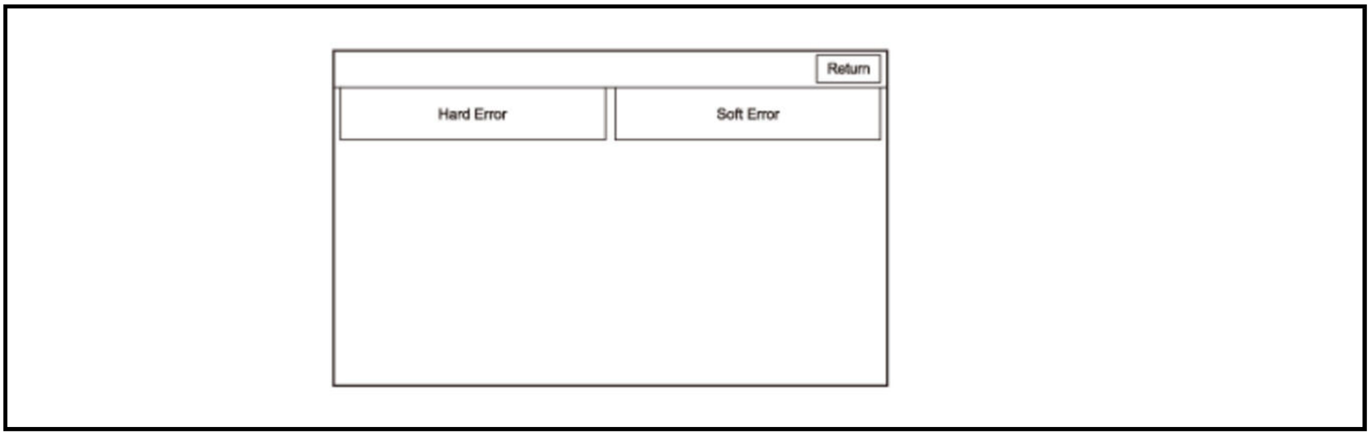
Error History

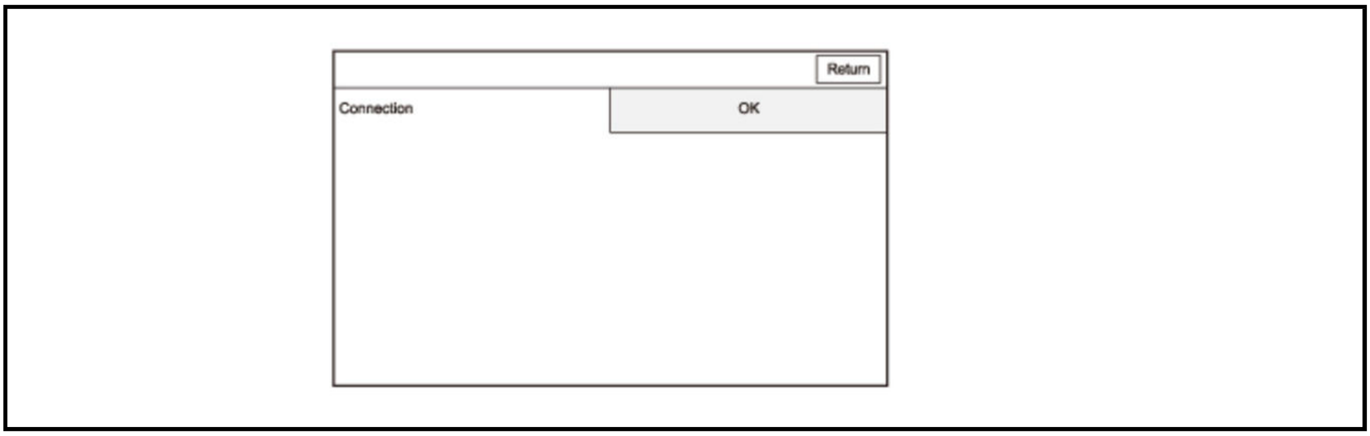
If you select Hard Error or Soft Error, you can see the error information. **Refer to How to Check for Error History to use this diagnosis**.



Rear Wide Camera

This diagnosis checks the rearview camera connection.

- If Connection shows NG, **check for hard error codes**.
- If Connection shows OK, press the HOME button to display the rearview camera image. To return to the previous screen, press the HOME button again.

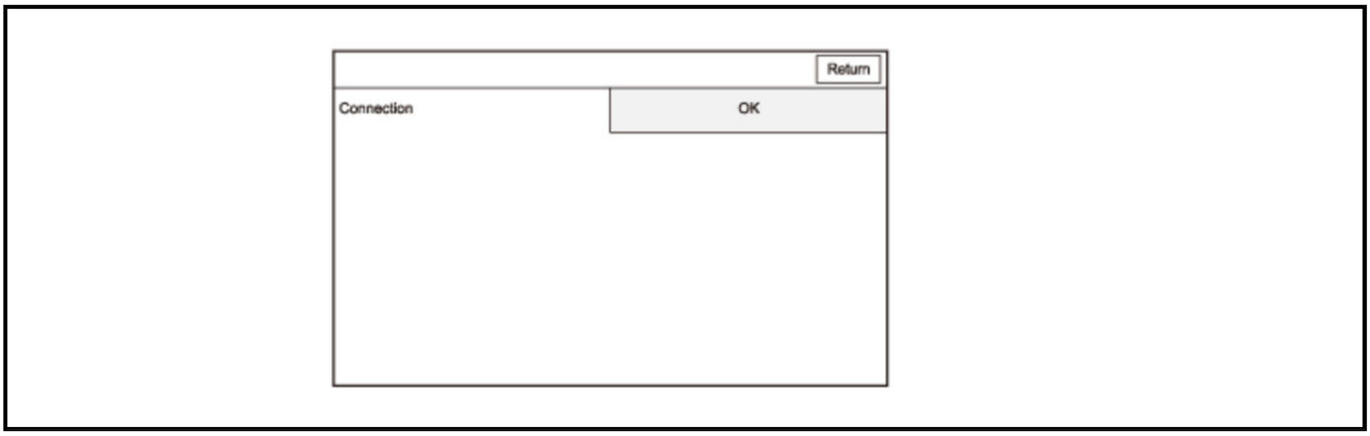


Connection OK

LaneWatch

This diagnosis checks the LaneWatch camera connection.

- If Connection shows NG, **check for hard error codes**.
- If Connection shows OK, press the HOME button to display the LaneWatch camera image. To return to the previous screen, press the HOME button again.



Connection OK

Remote Tuner

NOTE:

- For factory use only. Do not alter any settings unless directed.
- These items describe in indication order. Swipe the screen to check the next items.

This diagnosis displays the external AM/FM radio tuner (tuner unit) status.

- System 'com version display: Displays the tuner unit processor version.
- Serial number display: Displays the tuner unit serial number. That should be the same as the serial number found on the upper side of the tuner unit.
- Frequency: Displays frequency of the radio station which is being received. Frequency can be changed by selecting each icon (A).
- Source can be changed in this order: Radio sources by selecting the Band Change icon.
- Radio reception level display: Displays radio reception level (dB). The AM/FM antenna power status can be changed to on or off by selecting the Ant +B OFF icon.
- Target Area: Displays the destination of the tuner unit at 2 digits.
- Operating status display: If the vehicle has diversity antenna, you can select the radio antenna function from M (Main), S (Sub), or P (Diversity).
- RBDS BER display: Displays the RBDS bit error ratio.
- SNR display: Displays the Sound/Noise ratio about the AM or FM.
- Total preset number: Displays number of radio station preset about the AM or FM.
- HD functions ON/OFF: Displays the HD function is available (YES) or not available (NO).
- VOL: Displays the current volume level.
- Split Mode: Displays the split mode on or off. That can be changed by selecting the Split Mode icon.
- Blend Mode: Displays the blend mode which is being received. The blend mode can be changed to AUTO/ANALOG/DIGITAL by selecting the Blend Mode icon.
- HD Mode: Displays the HD mode status (ON: HD, OFF: analog) at frequency of the radio station which is being received. That can be changed by selecting the HD Mode icon.

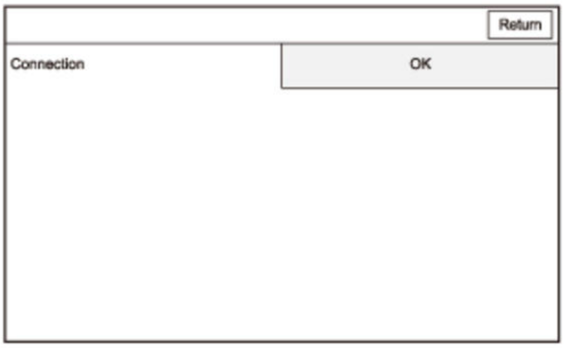
AMP

This diagnosis checks the digital bus (RS485) connection between the audio-navigation unit and the stereo amplifier.

If Connection shows NG, **go to No sound is heard from all the speakers (display is normal) troubleshooting** .

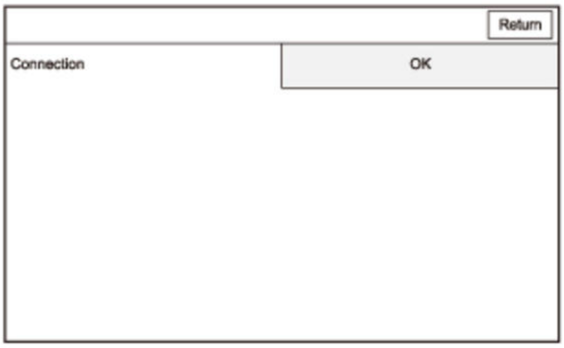


Connection OK

XM Ant.

This diagnosis checks the XM antenna connection between the audio-navigation unit and the roof antenna. The XM radio tuner is built into the audio-navigation unit.

If Connection shows NG, **check for hard error codes**.



Connection OK

Center display

These items describe in indication order. Swipe the screen to check the next items.

This diagnosis checks the digital bus (LVDS1) connection between the audio-navigation unit and the center display unit, and displays the center display unit status.

- Connection: Checks the digital bus (LVDS1) between the audio-navigation unit and the center display unit. This item should indicate OK.
- Unit Status Information: Indicates the center display unit processor status. If any of the status indicates NG, turn the vehicle to the OFF (LOCK) mode then the ON mode, and recheck the status. If the status still indicates NG, **replace the center display unit** .
- Unit Version Information: Displays the center display unit various version number.

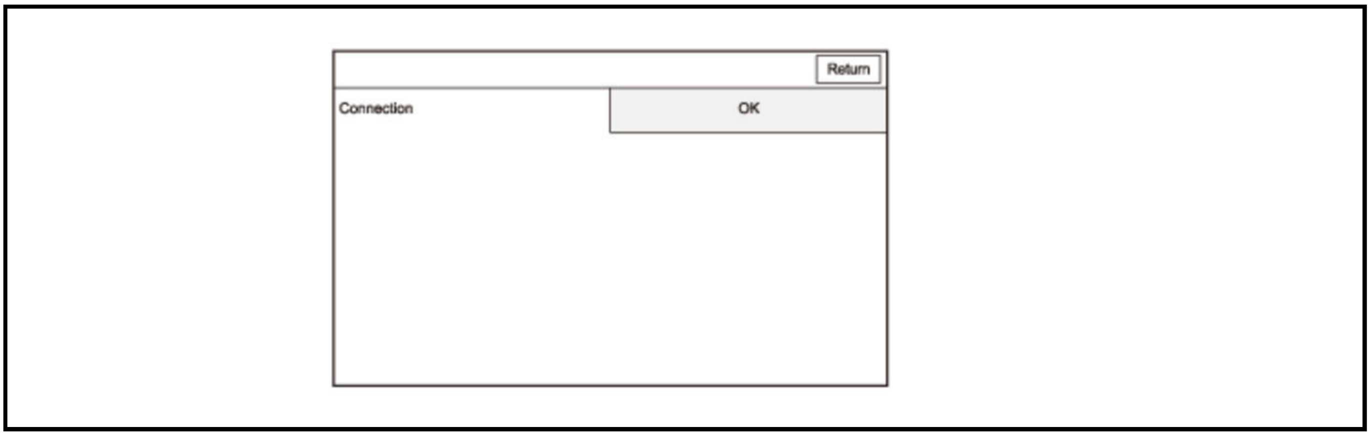
This diagnosis checks the digital bus (LVDS2) between the audio-navigation unit and the gauge control module.

If Connection shows NG, **go to The MID does not display the audio-navigation unit information troubleshooting**.



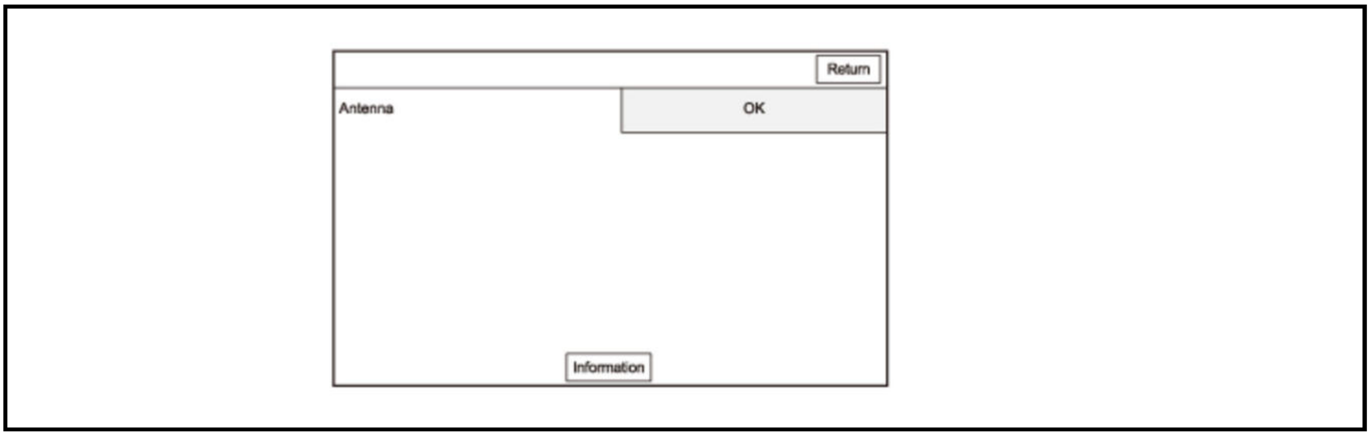
Connection OK

GPS Antenna

This diagnosis checks the GPS antenna connection.

If Antenna shows NG, the GPS antenna may be failure. **Check for hard error codes**.

Select Information to see the GPS satellite details.

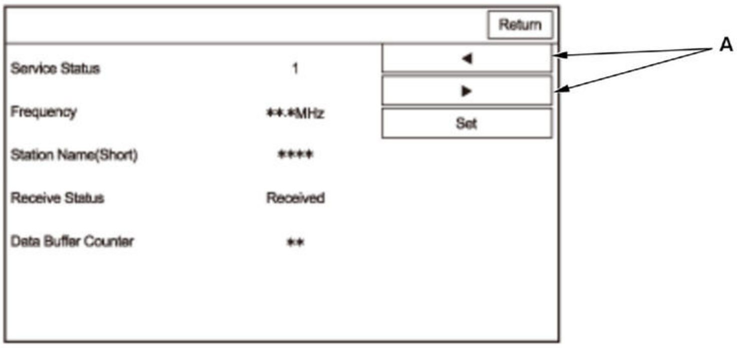


Antenna OK

HD Traffic

This diagnosis displays the HD traffic status.

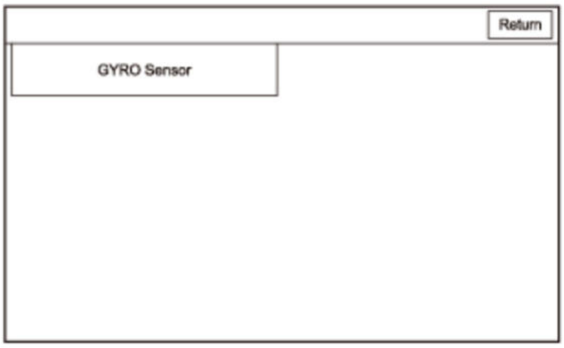
- Service Status: Displays the HD traffic service status on (1) or off (except 1).
- Frequency can be changed by selecting each icon (A).
- Station Name: Displays the call sign of the receiving HD traffic station.
- Receive Status: Displays the reception status of HD traffic.
- Data Buffer Counter: If the unit receives the data from the HD traffic station, displays the number of buffering data.



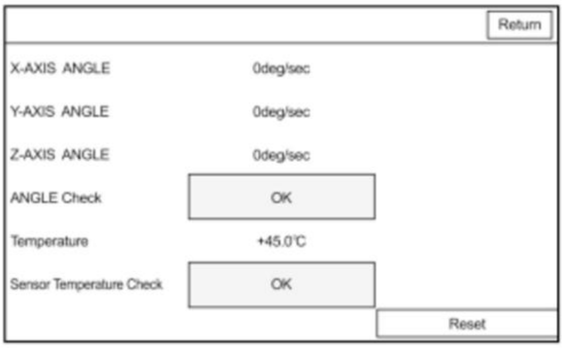
Service Status 1
Frequency **.*MHz
Station Name(Short) ****
Receive Status Received
Data Buffer Counter **

Gyro Sensor

This diagnosis checks the gyro sensor in the audio-navigation unit. This devices detect how the vehicle moves, and repositions the vehicle position icon on the map screen. Select the GYRO Sensor.



- X/Y/Z AXIS ANGLE: Indicates the angular speed of the gyro sensor.
- ANGLE Check: The audio-navigation unit checks if the angular speed is in range of threshold value.
- Temperature: Indicates the temperature of the gyro sensor.
- Sensor Temperature Check: The audio-navigation unit checks if the gyro sensor temperature is in range of threshold value.
- Reset: All values can be reset to the factory specification.

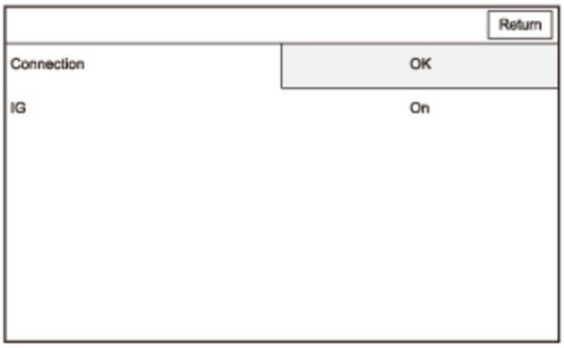


X-AXIS ANGLE 0deg/sec
Y-AXIS ANGLE 0deg/sec
Z-AXIS ANGLE 0deg/sec
ANGLE Check OK
Temperature +45.0℃
Sensor Temperature Check OK

A/C

This diagnosis detects if the vehicle is in the ON mode using information provided over the F-CAN bus, then it tests the climate control signal via the B-CAN bus between the audio-navigation unit and the climate control unit. Make sure the engine is running for this test.

If Connection shows NG, **check for hard error codes**.



Connection OK

IG On

MirrorLink

Backup Data Clear

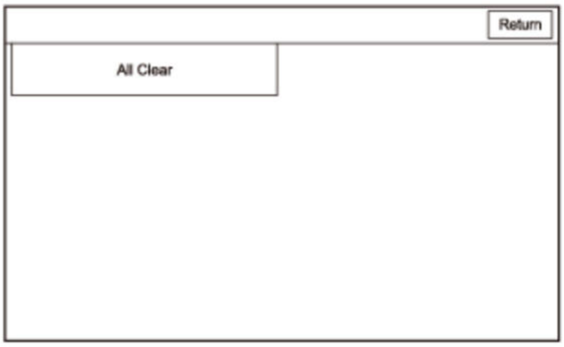
This screen initializes the back-up data in the audio-navigation unit. Select the All Clear icon.

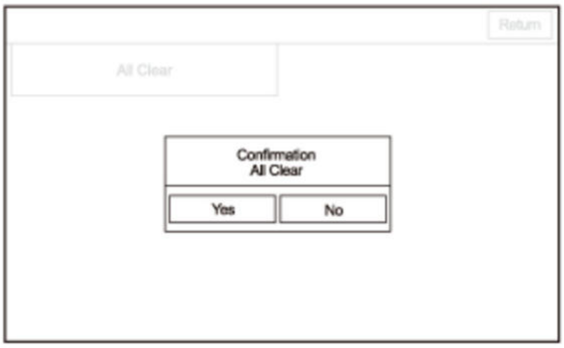


Return
All Clear

All Clear

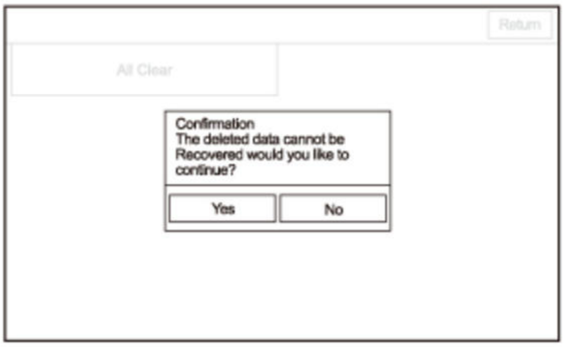
The all clear function deletes the data in the audio-navigation unit, and restores it to the factory defaults. This function is equivalent to Memory Refresh in the System Settings Menu.

When selecting the All Clear icon, the confirmation screen appears.



Confirmation
All Clear

When selecting the Yes icon, the second confirmation screen appears.



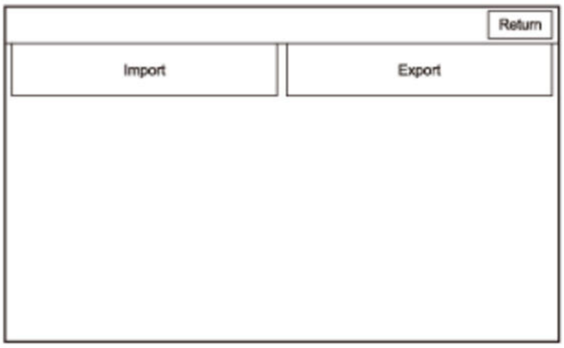
Confirmation
The deleted data cannot be Recovered would you like to continue?

When selecting the Yes icon, the system restarts after performing the All Clear process. After the restart, a normal start-up process occurs.

Save User's Memory

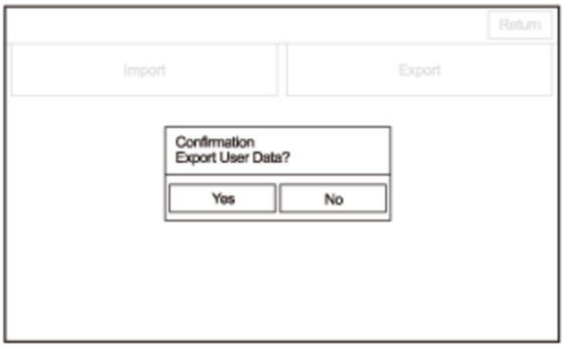
When replacing the audio-navigation unit, this function allows the technician to transfer the customer's personal data to the new audio-navigation unit. The transferred information includes their setup settings and personal addresses. The dealer inserts a USB device into the USB port A or B, and then selects the Save Users Memory function. The two functions in this diagnostic screen are Export and Import. Export saves the customer's data to the USB device, and Import moves the USB device files to the new audio-navigation unit.

This function does not start until you connect a USB device to the USB port.



1. Select the Export icon to move the customer's data from the original audio-navigation unit to the USB device. Select the Yes icon on the Export User Data Confirmation screen. The process takes only a couple of seconds. The system stores.DAT files on the USB device.

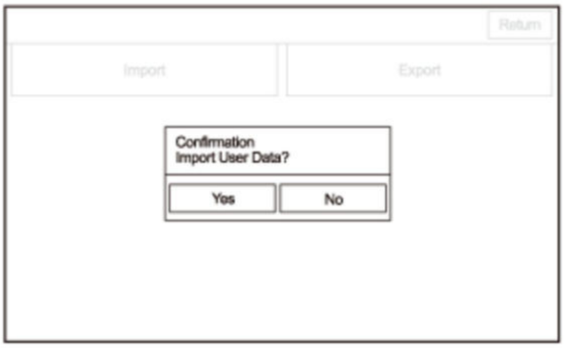
NOTE: If the Export icon is grayed out, check the USB port.



Confirmation
Export User Data?

2. After replacing the new audio-navigation unit, allow the system to boot up. Insert the USB device into the USB port A or B and enter the Save Users Memory in the System Diagnostic Mode.

3. Select the Import icon to move the two files stored by the Export process from the USB device to the new audio-navigation unit. Select the Yes icon on the Import User Data Confirmation screen. When the transfer is finished (a few seconds) the system automatically reboots. After the system reboots, remove the USB device from the USB port.

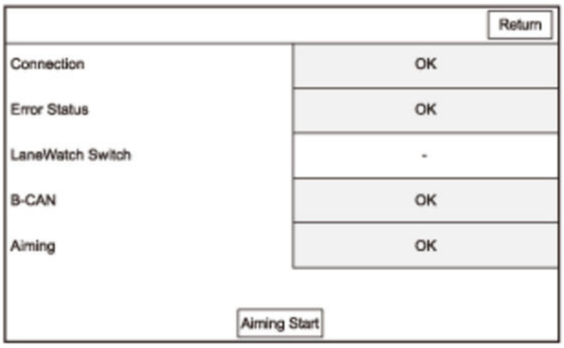


Confirmation
Import User Data?

LaneWatch

This diagnosis checks the LaneWatch status.

- If Connection shows hyphen (-), **check for hard error codes**.
- Error Status: Indicates LaneWatch camera status OK or NG. If Error Status shows NG, **replace the LaneWatch camera** . When the LaneWatch camera is disconnected, the status shows hyphen (-).
- If Error Status shows OK, press the HOME button to display the LaneWatch camera image. To return to the previous screen, press the HOME button again.
- LaneWatch Switch: LaneWatch switch status on or off. When the LaneWatch switch is pressing, the status shows ON. When the LaneWatch switch is released, the status shows hyphen (-).
- B-CAN: Checks whether the audio-navigation unit has received specific B-CAN data from the body control module. If B-CAN shows NG, check for B-CAN DTCs with the HDS. If DTCs are not detected, check for B-CAN lines continuity between the audio-navigation unit and the body control module.
- If Connection, Error Status, LaneWatch Switch, and B-CAN shows OK, the LaneWatch camera aiming procedure is available. If the LaneWatch camera need to aiming, **refer to the How to Start LaneWatch Camera Aiming** . When the aiming fails, Aiming shows NG.



Return

GPS Information

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow numbers) as they would appear in the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Nearby obstructions, like tall buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. The satellite numbers shown on the diagram while pressing the HOME button that correspond to the PRN (satellite ID number). There are always at least 24 active GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares are always parked in orbit, ready to be activated. This is why the PRN can be greater than 24.

NOTE: When you use this screen for troubleshooting, park the vehicle outside, away from buildings, tall trees, and hightension wires for at least 10 minutes with the engine running.

- The Number of Satellites box shows the number of acquired satellites (maximum of 12). It should contain three or more icons.
- The Current Position shows latitude, longitude, and elevation (in feet). If there are less than four satellites, the elevation can be grossly inaccurate.
- The date/time field shows the current date and time that is received from the GPS satellite.

SYMPTOM TROUBLESHOOTING

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING

Audio-navigation unit power will not turn on (No information display)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check if the Display Mode (☼ ☽) button has been pressed, and turned off the display (see the Owner's Manual for more information).
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Check if the center display unit indicates any information (indicates the Honda Globe screen first).

Is any information displayed?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Determine possible failure area (LVDS1 circuit, others)

-1. Shield the center display unit from the sun with your hand, and check that the display is back lit (only the back light is on).

Can you see the back light?

YES

Go to step 11.

NO

Go to step 3.

3. Open wire check (+B BACKUP2 SUB/+B AUDIO line) 1

-1. Disconnect the following connector.

Center display unit connector A (5P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The +B BACKUP2 SUB/+B AUDIO wire is OK. Go to step 4.

NO

Repair an open in the wire.

4. Open wire check (GND line) 1

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 5**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 5.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

5. Determine possible failure area (DISP CONT line, others)

-1. Reconnect center display unit connector A (5P).

-2. Disconnect the following connector.

Audio-navigation unit connector E (16P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector E (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

The DISP CONT wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (DISP CONT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector E (16P): disconnected
Test point 1	**Center display unit connector A (5P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

Repair an open in the wire.

NO

Replace the center display unit .

7. Determine possible failure area (center display unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio-navigation unit connector E (16P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector E (16P) No. 4**
Test point 2	Body ground

Is there less than 0.2 V?

Yes

Replace the center display unit .

No

Go to step 8.

8. Open wire check (+B BACKUP2 SUB/+B AUDIO line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector A (24P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B BACKUP2 SUB/+B AUDIO wire is OK. Go to step 9.

NO

Repair an open in the wire.

9. Open wire check (ACC CUT(VST)/ACC/IG1 WITH DIODE FMVSS line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector A (24P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES

The ACC CUT(VST)/ACC/IG1 WITH DIODE FMVSS wire is OK. Go to step 10.

NO

Repair an open in the wire.

10. Open wire check (GND line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio-navigation unit connector A (24P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector A (24P) No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES

Replace the audio-navigation unit .

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

11. Shorted wire check (LVDS1+ line to LVDS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector H (3P)
Center display unit connector B (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector H (3P): disconnected
Â	Center display unit connector B (3P): disconnected
Test point 1	**Center display unit connector B (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 MΩ or more?

YES

The LVDS1+ wire and the LVDS1- wire are not shorted. Go to step 12.

NO

There is a short in the wires. Replace the affected shielded harness.

12. Shorted wire check (LVDS1 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector H (3P): disconnected
Â	Center display unit connector B (3P): disconnected
Test point 1	**Center display unit connector B (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 3**

Test point 1	**Center display unit connector B (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 3**

Is there 1.0 MΩ or more?

YES

The LVDS1 SH wire is not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Open wire check (LVDS1+ line, LVDS1- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector H (3P): disconnected
Â	Center display unit connector B (3P): disconnected
Test point 1	**Audio-navigation unit connector H (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 1**

Test point 1	**Audio-navigation unit connector H (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 Ω or less?

YES

The LVDS1+ and the LVDS1**-** wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Center display unit check (substitution)

-1. Substitute a known-good center display unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original center display unit .

NO

Replace the audio-navigation unit .

The MID does not display the audio-navigation unit information

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- If the audio remote-HFL switch does not respond, **go to Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Select Audio, Navigation, and HFL from the multi-information display (MID) menu screen.

Are audio, navigation, and HFL information displayed?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Shorted wire check (LVDS2+ line, LVDS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector J (3P)
Gauge control module connector C (3P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector J (3P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The LVDS2+ and the LVDS2**-** wires are not shorted to ground. Go to step 3.

3. Shorted wire check (LVDS2+ line to LVDS2- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	**Audio-navigation unit connector J (3P) No. 2**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The LVDS2+ wire and the LVDS2**-** wire are not shorted. Go to step 4.

4. Shorted wire check (LVDS2 SH line to another lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	**Audio-navigation unit connector J (3P) No. 3**

Test point 1	**Audio-navigation unit connector J (3P) No. 2**
Test point 2	**Audio-navigation unit connector J (3P) No. 3**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The LVDS2 SH wire is not shorted. Go to step 5.

5. Open wire check (LVDS2+ line, LVDS2- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector J (3P): disconnected
Â	Gauge control module connector C (3P): disconnected
Test point 1	**Audio-navigation unit connector J (3P) No. 1**
Test point 2	**Gauge control module connector C (3P) No. 1**

Test point 1	**Audio-navigation unit connector J (3P) No. 2**
Test point 2	**Gauge control module connector C (3P) No. 2**

Is there continuity?

YES

The LVDS2+ and the LVDS2**-** wires are OK. Go to step 6.

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Audio-navigation unit check (substitution)

   -1. Substitute a known-good audio-navigation unit.

   -2. Reconnect all the connectors, and recheck.

   Does the symptom go away?

   YES

   Replace the original audio-navigation unit .

   NO

   Replace the gauge control module .

Vehicle position icon wanders across the map when driving (does not follow a displayed road) or map vehicle ICON spins

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This is not the same condition as when driving off-road (or on a fire or logging road).
- This condition is caused by a loss of map matching from a bad sensor input. Check for aftermarket or other objects that can block the GPS signal. **Always do the Map Matching** before proceeding with the troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Test-drive the vehicle in an open area, and check if the vehicle position icon displays the actual vehicle position.

   NOTE: Make sure that a known-good vehicle's navigation can follow the displayed map in the test area.

   Does the vehicle position icon wanders across the map?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check

   -1. **Check for hard error codes**.

   Are there any navigation DTCs indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. Determine possible failure area (audio-navigation unit, BACK LT line)

-1. **Go into the System Diagnostic Mode, and use the Vehicle Status diagnosis to check the BACK signal**.

-2. Shift the transmission to R position/mode.

Does the BACK signal change from [0] to [1] when the transmission is shifted from P position/mode to R position/mode?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (BACK LT line)

-1. Shift the transmission to P position/mode.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connector.

Audio-navigation unit connector C (32P)

-4. Turn the vehicle to the ON mode.

-5. Shift the transmission to R position/mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Audio-navigation unit connector C (32P): disconnected
Test point 1	**Audio-navigation unit connector C (32P) No. 15**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the audio-navigation unit .

NO

Repair an open in the wire.

5. Audio-navigation unit check (substitution)

-1. Shift the transmission to P position/mode.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. **Substitute a known-good audio-navigation unit** , and check to see if the problem occurs in the same location.

Does the problem occur in the same location each time?

YES

Try to replicate the problem in a known-good vehicle (same model, year, and trim). If the problem can be duplicated, the problem is in the map database. Report the problem according to the Navigation System Manual under Reporting Errors.

NO

Replace the original audio-navigation unit .

Voice guidance cannot be heard, is broken up, or there is static

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the volume and voice feedback setting for the navigation system in set-up.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Check the navigation voice guidance output.

   Does the system output the voice guidance?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Determine possible failure area (voice guidance output circuit, others)

   -1. **Go into the System Diagnostic Mode, and use the speaker check mode**.

   Did all speakers produce a tone?

   YES: With stereo amplifier

   Go to step 3.

   YES: Without stereo amplifier

   Replace the audio-navigation unit .

   NO: The sound is cannot be heard in all speakers

   Go to No sound is heard from all the speakers (display is normal) troubleshooting .

   NO: The sound is cannot be heard in front center speaker

   Go to Audio system sound is weak or distorted (display is normal) troubleshooting .

3. Shorted wire check (AUX NAVI line, AUX NAVI GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector B (24P)
Stereo amplifier connector C (16P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector B (24P): disconnected
Â	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 13**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector B (24P) No. 14**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The AUX NAVI and the AUX NAVI GND wires are not shorted to ground. Go to step 4.

4. Shorted wire check (AUX lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector B (24P): disconnected
Â	Stereo amplifier connector C (16P): disconnected

Test point 1:Audio-navigation unit connector B (24P)	**Test points 2:Audio-navigation unit connector B (24P)**
No. 1	No. 2, No. 13, No. 14

Test point 1:Audio-navigation unit connector B (24P)	**Test points 2:Audio-navigation unit connector B (24P)**
No. 2	No. 13, No. 14
No. 13	No. 14

Is there continuity between any of the terminals?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The AUX wires are not shorted in the wires. Go to step 5.

5. Open wire check (AUX NAVI line, AUX NAVI GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Audio-navigation unit connector B (24P): disconnected
Â	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 13**
Test point 2	**Stereo amplifier connector C (16P) No. 12**

Test point 1	**Audio-navigation unit connector B (24P) No. 14**
Test point 2	**Stereo amplifier connector C (16P) No. 5**

Is there continuity?

YES

The AUX NAVI and the AUX NAVI GND wires are OK. Go to step 6.

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Stereo amplifier check (substitution)

-1. **Substitute a known-good stereo amplifier** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original stereo amplifier .

NO

Replace the audio-navigation unit .

SYMPTOM TROUBLESHOOTING INDEX

NAVIGATION SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE:

- Before troubleshooting, check any official Honda service website for more information about the navigation system.
- **Refer to Audio System Symptom Troubleshooting for information about the symptom of audio-navigation unit which is not in the following table** .

Symptom	Diagnostic Procedure	Also Check for
Audio-navigation unit power will not turn on (No information display)	**Symptom Troubleshooting**	Blown fuses Screen settings **Error Messages** Software not up to date

Symptom	Diagnostic Procedure	Also Check for
Navigation system stays on the CSF screen	**Navigation DTCs**	- **GPS Initialization** - Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit - Disconnected or defective GPS antenna
Poor GPS reception or interference	**Do the GPS Information in the System Diagnostic Mode**	- **Global Positioning System (GPS) Limitations** - Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit
Vehicle position icon wanders across the map when driving (does not follow a displayed road) or map vehicle ICON spins	**Symptom Troubleshooting**	- **Global Positioning System (GPS) Limitations** - **Map Matching** - **Sensor Calibration** - VSP missing - Poor or no GPS reception - Check for any related service bulletin software updates
Navigation touch panel does not work	**Do the Touch Panel Check in the System Diagnostic Mode**	**Forced Rebooting of Audio-Navigation Unit**
Clock will not set to correct time	Â	Check the GPS signal
System always comes up in-line diagnostic mode	**Factory diagnostic screen In Line Diagnostic mode**	Â
The MID does not display the audio-navigation unit information	**Symptom Troubleshooting**	Â
Voice control does not work/respond	Â	Check for any related service bulletin software updates
Voice guidance cannot be heard, is broken up, or there is static	Â	Volume or voice feedback setting (see the Navigation System information)

Symptom	Diagnostic Procedure	Also Check for
No HD traffic information	**Go to AM/FM radio display is blank or no station information is displayed troubleshooting**	Local outage or no local broadcast. Compare to a known-good vehicle of the same year and trim.
LaneWatch camera image does not come on	**Symptom Troubleshooting**	**Navigation DTCs**

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE NAVIGATION SYSTEM

General Operation

Refer to the Navigation information for the navigation system operating procedures.

How to Recognize Audio Unit and Audio-Navigation Unit (Display audio type)

There are two kinds of audio units with 7-inch display unit according to a vehicle model. These units exist as an audio unit (without navigation) and an audio-navigation unit (with navigation), and are look like a same, but the audio-navigation unit displays a Honda Globe screen after displaying a Honda logo screen* every time when you turn the vehicle to the ACCESSORY mode.

*: When the system is turned on first time at cold start.

Forced Rebooting of Audio-Navigation Unit

If the system is frozen, and the screen does not respond, you can attempt rebooting the audio-navigation unit by pressing and holding the AUDIO POWER (⏻) button for 5 seconds. When the function is effective, the confirmation screen appears.

Anti-Theft Feature (With audio system theft protection)

The audio-navigation unit has an anti-theft protection circuit. When one of the following occurs, the unit enters the anti-theft mode:

- Disconnecting the 12 volt battery terminal.
- Disconnecting audio-navigation unit connector A (24P).
- Removing the +B line's fuses.

After the service, reconnect power to the audio-navigation unit, and turn the vehicle to the ON mode. There are two ways to exit the anti-theft mode:

- Press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio-navigation unit automatically exits the anti-theft mode. If the audio-navigation unit does not exit anti-theft mode, turn the vehicle to the OFF (LOCK) mode then the ON mode (if possible, start the engine), and try to release the anti-theft several times.
- Enter the 5-digit anti-theft code. If the input of code fails 10 times in a row, the screen is locked for 60 minutes.

When the audio-navigation unit is installed in another vehicle (same Year/Model/Trim), like in cases where a known-good unit was substituted for testing, do the Anti-Theft Skip mode in the System Diagnostic Mode. This mode will release the anti-theft code for 150 seconds.

Symptom Diagnosis

Certain circumstances and system limitations may result in occasional vehicle positioning errors. Some customers may think this indicates a problem with the navigation system when, in fact, the system is normal. Keep the following items in mind when interviewing customers about symptoms of the navigation system.

Self-Inertial Navigation Limitations

The limitations of the self-inertial portion of the navigation system (the gyro and the vehicle speed signal) can cause discrepancies between the vehicle's actual position and the indicated vehicle's position (GPS vehicle position).

The following circumstances may cause vehicle positioning errors:

- Moving the vehicle with the engine stopped and the vehicle stopped, such as by ferry or tow truck, or if the vehicle is spun on a turn table.
- Tire slippage, changes in tire rolling diameters, and some driving situations may cause discrepancies in travel distances. Examples of this include;
-
    - Continuous tire slippage on a slippery surface
    - Driving with snow chains mounted
    - Abnormal tire pressure
    - Incorrect tire size
    - Frequent lane changes across a wide highway
    - Very bumpy roads
- Tolerances in the system and map inaccuracies sometimes limit how precisely the vehicle's position is indicated. Examples of this include;
-
    - Driving on roads not shown on the map (map matching is not possible)
    - Driving on a road that winds in one direction, such as a loop bridge, an interchange, or a spiral parking garage
    - Driving on a road with a series of sharp hair-pin turns
    - Driving near a gradual highway exit or transition
    - Driving on one of two close parallel roads
    - Making many 90 degree turns

Global Positioning System (GPS) Limitations

The GPS cannot detect the vehicle's position or elevation during the following instances:

- For the first 5 to 10 minutes after reconnecting the 12 volt battery (this process can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.

The accuracy of the GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only three or fewer satellite signals are received (Four satellite signals are required for accurate positioning).
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.
- When the satellite control centers are experiencing problems.

LCD Unit Limitations

The center display unit is touch sensitive. Touch the display directly to select items on the screen.

- Heavy gloves, fingernails or pens cannot be used on the touch panel.
- In cold temperatures, the display may stay dark for the first minute until it warms up.
- When the display is too hot because of direct summer sunlight, it remains dark until the temperature drops (you may see an error message displayed stating this fact).
- Fingerprints on the screen may be noticeable. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard or use abrasive cleaners or shop towels.

Symptom Duplication

When the symptom can be duplicated, verify that it is not a characteristic of the system. Review the Navigation information and compare it to a known-good vehicle (with the same software and database), under the same conditions. If the symptom is not the same as the known-good vehicle, follow the self-diagnostic procedures and the appropriate troubleshooting procedures.

When the symptom does not reappear or only reappears intermittently, ask the customer about the conditions when the symptom occurred.

- Always ask the customer to demonstrate the problem.
- Try to establish possible user error or misunderstanding of the system.
- Try to establish if outside interference may have been the cause.
- Vibration, temperature extremes, and moisture (dew, humidity) are factors that are difficult to duplicate.
- Inspect the vehicle for after-market electronic devices (vehicle locators, amps, radar detectors, etc.) that may be hidden.

When troubleshooting navigation system problems, ensure that the known-good vehicle is the same software version year and model as the vehicle being serviced. Mixing incompatible navigation systems or other system components can delay the troubleshooting process by creating symptoms or issues unrelated to the original problem.

System Initialization

If the navigation system loses power (like the 12 volt battery terminal was disconnected), the navigation system requires initialization. Once completed, your system is ready to use.

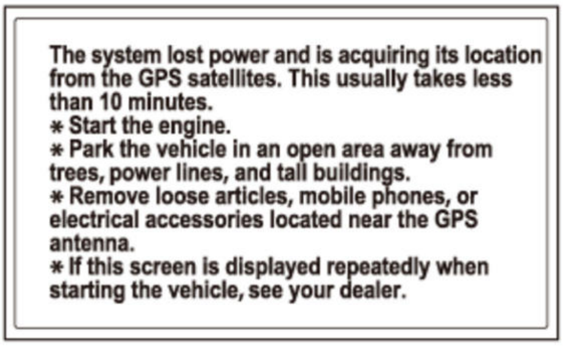
This initialization requires the following:

- With audio system theft protection: Press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio-navigation unit exits the anti-theft mode. Or you can enter the 5-digit anti-theft code.
- GPS initialization (may not be needed depending of the length of time the system was without power).
- Map matching aligns the GPS to a location on the map.

GPS Initialization

NOTE: You must park the vehicle outside with a clear view of the sky.

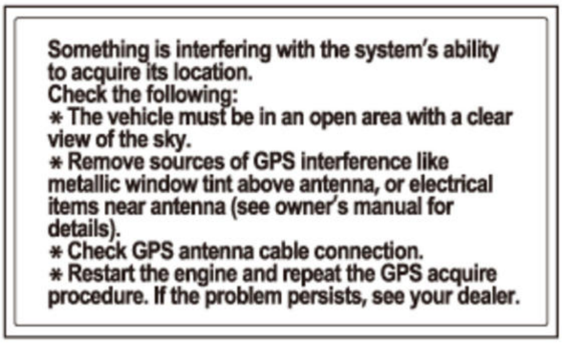
Depending on the length of time the battery was disconnected, your system may require GPS initialization. If it does, the CSF screen appears:



The system lost power and is acquiring its location from the GPS satellites. This usually takes less than 10 minutes.
* Start the engine.
* Park the vehicle in an open area away from trees, power lines, and tall buildings.
* Remove loose articles, mobile phones, or electrical accessories located near the GPS antenna.
* If this screen is displayed repeatedly when starting the vehicle, see your dealer.

If this procedure is not necessary, the system proceeds directly to the Disclaimer screen. During initialization, the system searches for all available GPS satellites, and obtains their orbital information. Park the vehicle out in the open with a clear view of the sky for this procedure.

If the navigation system finds the satellites properly, the CSF screen changes to the Disclaimer screen. If within 10 minutes the system fails to locate a sufficient number of satellites to locate your position, the confirmation screen appears.



Something is interfering with the system's ability to acquire its location.
Check the following:
* The vehicle must be in an open area with a clear view of the sky.
* Remove sources of GPS interference like metallic window tint above antenna, or electrical items near antenna (see owner's manual for details).
* Check GPS antenna cable connection.
* Restart the engine and repeat the GPS acquire procedure. If the problem persists, see your dealer.

If this screen appears, turn off the engine, then restart the vehicle and move it to a different location. If the Disclaimer screen appears, the GPS initialization is complete.

NOTE:

- The average acquiring time is less than 10 minutes, but it can take as long as 45 minutes.
- If the system is still unable to acquire a signal, follow the instructions on the screen. If this screen appears again, check for hard error codes.
- Skip a CSF screen by pressing the DISPLAY MODE (☼ ☽) button and the HOME button at the same time for 5 seconds and you can move to the Disclaimer screen.

Map Matching

This part of the initialization matches the GPS coordinates with a road on the map screen. To do this part of the procedure, make sure that the navigation system displays a map, and drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on appears at the bottom of the screen, the entire procedure is complete. Your system is now ready to use.

How to Check Error History (Navigation DTCs)

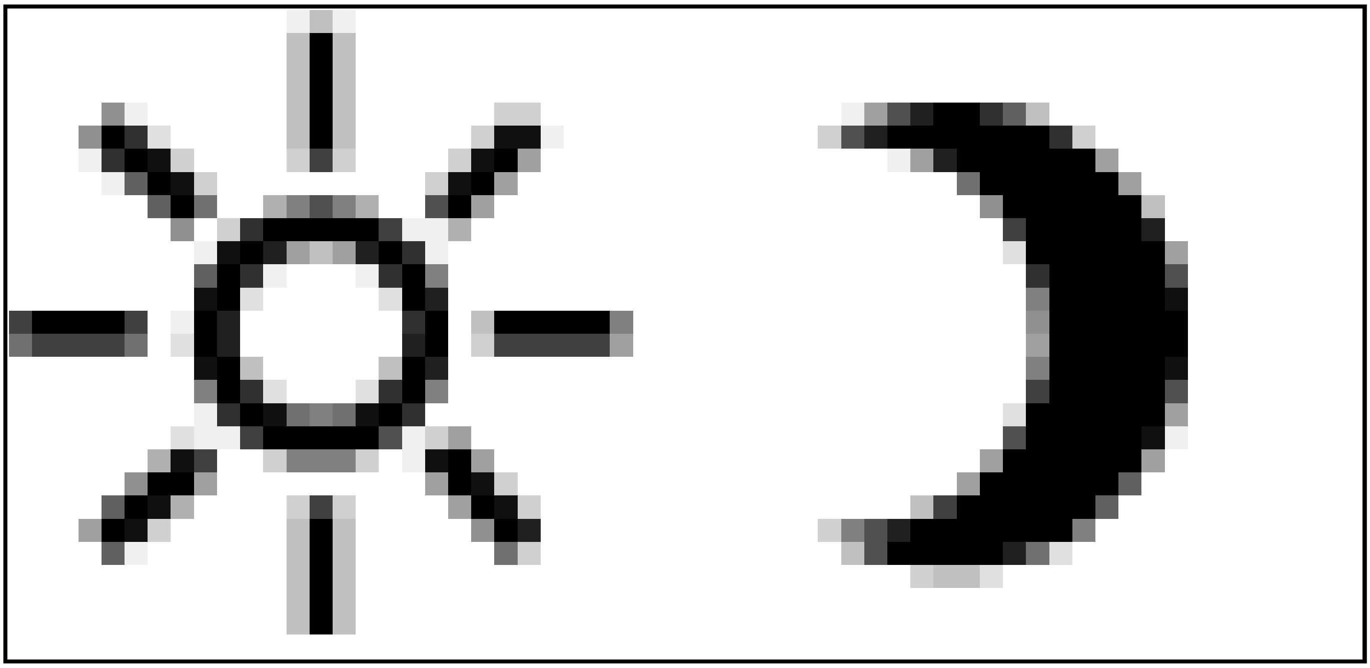
NOTE: The navigation DTCs cannot be retrieved with the HDS.

The Error History feature is to record intermittent audio/navigation issues that occur while the customer is using the system. Sometimes the customer complaint cannot be duplicated. The error history may record the information needed to diagnose the problem. To check the error history:

1. Turn the vehicle to the ON mode.

2. Press and hold the PHONE button, the DISPLAY MODE button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed.

NOTE: The buttons needs to be pressed together simultaneously.



Displaying Select Diagnosis Items Menu Screen

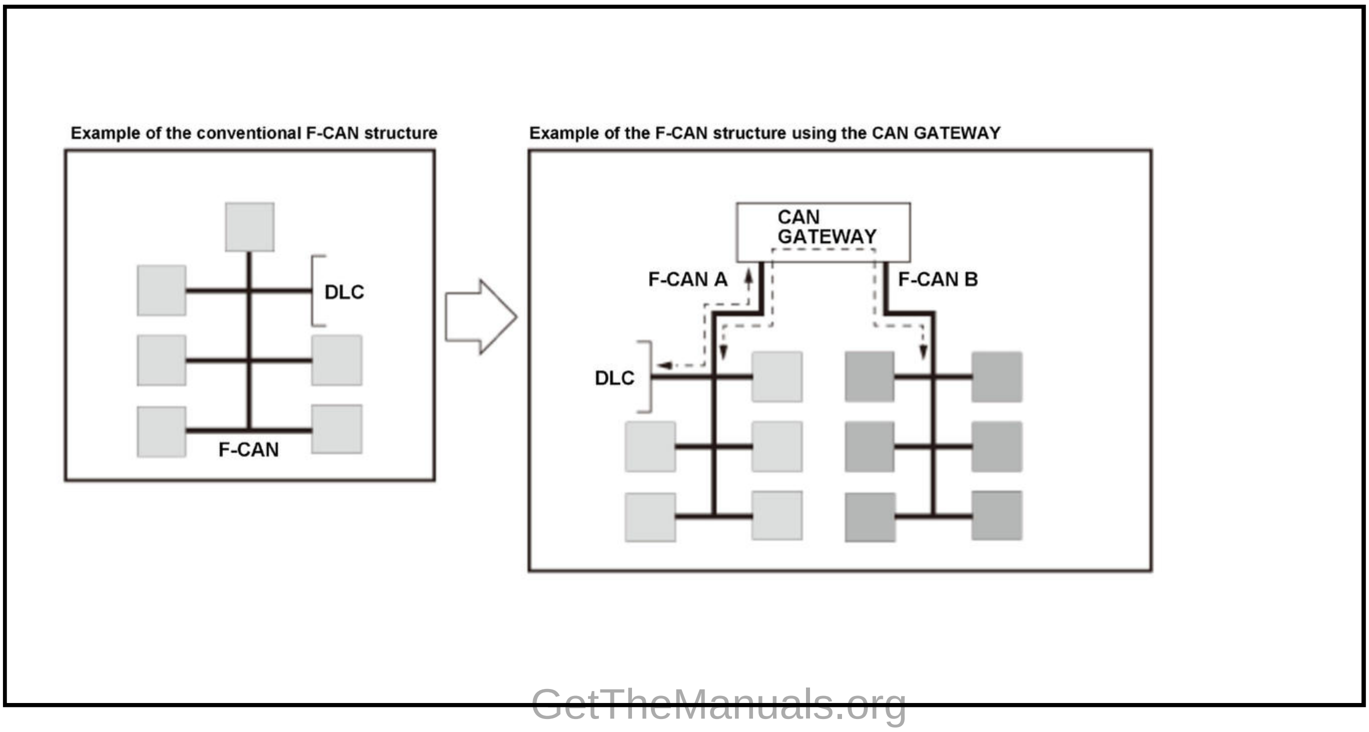
F-CAN (High-speed CAN), CAN Gateway (with CAN gateway)

For locations of each component on vehicle, refer to Component Location Index

The network between the powertrain and control unit for chassis system is called F-CAN and it employs high speed CAN with communication rate at 500 kbps. In order to increase the number of the control units connected to F-CAN bus, it is divided into two F-CAN buses, and the CAN gateway is adapted to connect between each F-CAN bus (F-CAN A: conventional F-CAN structure, F-CAN B: F-CAN structure using the CAN gateway).



Example of the conventional F-CAN structure
DLC

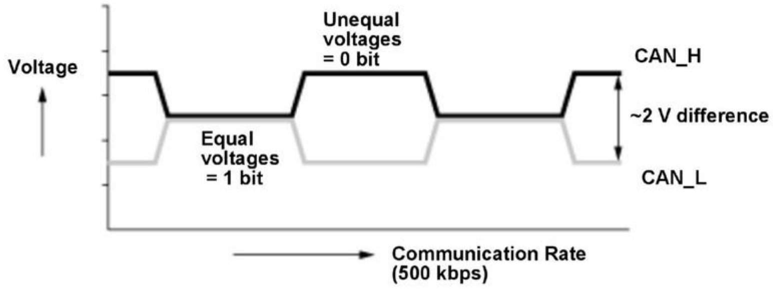
Example of the F-CAN structure using the CAN GATEWAY
CAN GATEWAY
F-CAN A
F-CAN B
DLC

Typical CAN Bus Communication Operation

The F-CAN detects the differential voltage generated between two communication wires (CAN_H and CAN_L) and uses it as a signal level. This is a digital signal that indicates "1" when equal voltage is found and "0" when unequal voltage is found.



NETWORK COMMUNICATIONS SYSTEM DESCRIPTION

CAN (Controller Area Network) and the LIN (Local Interconnect Network)

The vehicle uses the CAN (Controller Area Network) and the LIN (Local Interconnect Network) as the in-vehicle LAN (Local Area Network). These networks enable the control units to exchange information over the CAN bus. The CAN consists of the F-CAN network that enables the control units to exchange the signals regarding the power train/chassis and the B-CAN network for the signals regarding the body. These networks are interconnected at the gauge control module (gateway).

The LIN is used for connecting the PCM to the shutter grille and the 12 volt battery sensor; as well as for connecting the power window master switch, front passenger's power window switch, panoramic glass roof motor-control unit *1, and the moonroof motor-control unit *2, ensuring a reliable communication suitable for the control system.

As multi-communication system between several control units, the system also provides the K-LINE and L-LINE for transmitting the diagnostic results from the HDS (Honda Diagnostic System) and the S-NET for transmitting the immobilizer signals.

CAN

The CAN (control area network) is a multi communication system that ISO has developed and standardized for the automobile. The CAN employs a multi-master system in which multiple control units connected to a bus communicate with each other.

Communicating Method

CAN communication uses a data frame format on the CAN line. The CAN uses the CSMA/CA (Carrier Sense Multiple Access with Collision Avoidance) method to data frame collisions. This method transmits information only when the bus is sensed to be idle. The data frame uses "0" (dominant) and "1" (recessive) to create a message, which consists of the data field (message), arbitration field (data ID), control field (data length), CRC field (sending error detection), and the ACK field (end of message). After sending the data, each control unit classifies the data by the controller ID and controls outputs as commanded.

Arbitration Field

F-CAN

The network connecting the powertrain and chassis is called F-CAN and it employs high speed CAN with communication rate at 500 kbps. The F-CAN was composed of a single F-CAN Bus. To respond to the increase in the number of ECUs connected to the F-CAN and the increase in the amount of communication, the composition of the F-CAN network is divided into multiple bus lines, and an F-CAN gateway with a data-forwarding function is established, enabling the communication among the CAN Bus lines. Connection of each control unit has control units with terminating resistor installed for preventing signal from being reflected back at each end of a pair of twisted signal cable which is comprised of F-CAN_H and F-CAN_L, with other control units in parallel connection between them. By rapidly switching between equal and unequal voltages, digital data can be transmitted in bits.

B-CAN

The network between control units for body electrical system is called B-CAN and it employs low speed CAN with communication rate at 125 kbps. Connection of each control unit has control units with terminating resistor installed for preventing signal from being reflected back at each end of a pair of twisted wire which is comprised of B-CAN_H and B-CAN_L, with other control units in parallel connection between them.

Power Saving Mode Control

Since some control units for the body system are functional even if turning the vehicle in the OFF (LOCK) mode, the power-saving mode is set for these units for the purpose of reducing the dark current. Transition to the power-saving mode (sleep mode) and returning from it (wakeup mode) are controlled by the active, sleep and wakeup signals. The control units that are not in "wait for sleep" state send the active signals to the bus line periodically and stop sending them when it is in "wait for sleep" state. When all control units do not send the active signal anymore, one or more control units send the sleep signals. The control units that received the sleep signals go into the power-saving mode. In the event of inputs from switch or sensor during the power-saving mode, they send the wakeup signals to the bus line. In this case, they return from the power-saving mode.

LIN

Overview

The LIN is a bus based on UART. Communication rate of LIN is slower than that of CAN, and it is used for systems for which a high speed communication is not required. It is able to reduce the wire harness bulk as well as to reduce cost thanks to its connection with each control unit with just single bus. The LIN employs a single-master system, in which only single master control unit serves as a master control unit to control all the signals on the LIN bus. Other units become slave units to serve in accordance with request from the master control unit. This vehicle employs a LIN with a communication speed of 19, 200 bps for connecting the PCM to the shutter grille and the 12 volt battery sensor; and a LIN with a communication speed of 9, 600 bps for connecting the power window master switch, front passenger's window switch, panoramic glass roof *1, and the moonroof control unit/motor* 2.

*1: With panoramic glass roof

*2: With moonroof

Communication System

LIN uses a single-master system, where one ECU controls all bus communication. The other controllers act as slave units, communicating only when requested by the PCM. The message frame is comprised of the header frame that sends the master's request and the response frame that sends the slave's response. The header frame consists of the SYNCH BREAK field for showing the frame start, SYNCH field for correcting the baud rate, and the IDENT field for showing the control unit that requests the response. The response frame consists of the data fields and the CHECK SUM field for detecting transmitting errors.

Power Saving Mode

The body electrical system has a control unit which does not stop operating when the vehicle is turned to the OFF (LOCK) mode in order to perform door lock control and light control. These control units have a power saving mode to reduce the standby power requirement.

Network Communication Troubleshooting

The HDS (Honda Diagnostic System) uses the K-LINE for displaying the control unit and self-diagnostic results both in the F-CAN bus and B-CAN bus. The K-LINE bus is the communication circuit that uses the UART whose baud rate is 10.4 kbps. The vehicles equipped with keyless access system, also have an L-LINE data bus that connects the DLC to the body control module. This line allows the HDS to communicate with the body control module or immobilizer-keyless control unit if the remote or keyless transmitter are lost or malfunctioning, preventing the ignition from being switched on. The S-NET serves as a path to transmit a signal from a transponder integrated into the remote or keyless transmitter, to control units related to the immobilizer system, such as the PCM and body control module. The gauge control module provides the display function for body-system DTC (Diagnostic Trouble Code). The DTCs are displayed when the gauge control module receives the SCS terminal short signal via F-CAN bus or the body control module service check ON signal via B-CAN bus. The gauge control module then reads the self-diagnostic results sent by each control unit via B-CAN bus, and displays the DTCs

TROUBLESHOOTING

DLC CIRCUIT TROUBLESHOOTING (2.4 L ENGINE) (2017 2018 2019)

DLC Circuit Troubleshooting

NOTE: If you suspect the HDS or the HDS DLC cable may be the source of the communication problem, verify that they are working properly by connecting them to a known-good, similar vehicle and system, and checking for communication problems.

1. HDS communication check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect the HDS to the data link connector .

   NOTE: Make sure the HDS is properly connected to the data link connector.

   -3. Turn the vehicle to the ON mode, and turn on the HDS.

Does the HDS identify the vehicle?

YES

Go to step 2.

NO

Go to step 9.

2. Determine possible failure area (PGM-FI system, other systems)

-1. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

DTC (PGM-FI)

Are any Pending or Confirmed DTCs indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

If the HDS does not communicate with the SRS, go to step 3.

NO

If the HDS does not communicate with the IMMOBI (immobilizer) system, go to step 4.

NO

If the HDS does not communicate with the BODY ELECTRICAL system, go to step 5.

3. SRS check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the SRS indicator.

Does the SRS indicator come on and go off?

YES

Go to step 6.

NO

Go to the symptom troubleshooting for SRS indicator stays on, but no DTCs are stored, or cannot be read .

4. Immobilizer system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the security indicator.

Does the security indicator stay on or flash?

YES

Go to the immobilizer system troubleshooting .

NO

The immobilizer system is OK. Go to step 6.

5. Body electrical system check

-1. **Do the gauge self-diagnostic function** .

-2. Check the gauge display.

Is Error 2 indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 6.

6. Open wire check (K LINE line or L-LINE line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the data link connector.

Disconnect the control unit(s) on the K LINE or L-LINE that does not communicate.

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

K LINE

- Audio unit connector A (24P)
- Body control module connector D (40P)
- Immobilizer-keyless control unit 7P connector

L-LINE

- SRS unit connector A (36P)

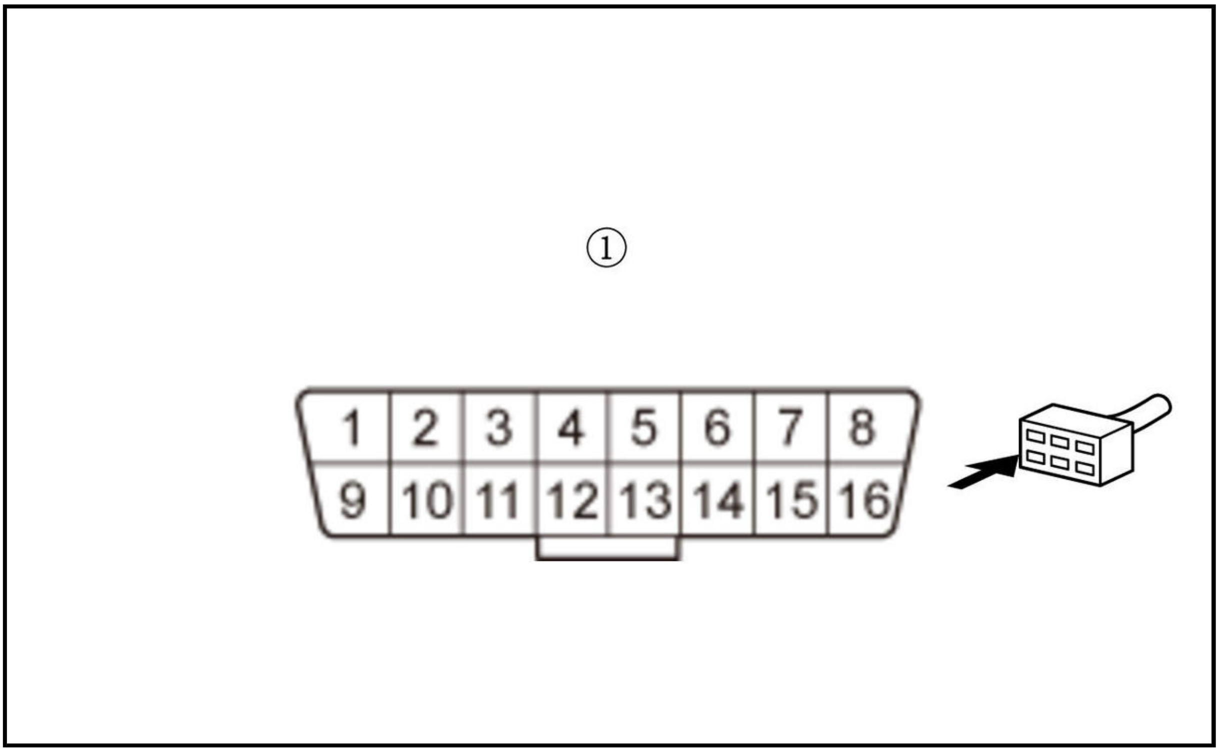
-4. Check for continuity between data link connector (16P: ①) No. 7 (K LINE line) and these connector terminals, or data link connector (16P: ①) No. 15 (L-LINE line) and these connector terminals:

K LINE

Connector	Terminal
Audio unit connector A (24P)	No. 12
Body control module connector D (40P)	No. 36
Immobilizer-keyless control unit 7P connector	No. 3

L-LINE

Connector	Terminal
SRS unit connector A (39P)	No. 33



Is there continuity between the data link connector and the terminals in the chart?

YES

Go to step 7.

NO

Repair an open in the wire between the data link connector (K LINE wire or L-LINE wire) and the appropriate connector.

7. Determine possible failure area (short in K LINE line or L-LINE line, others)

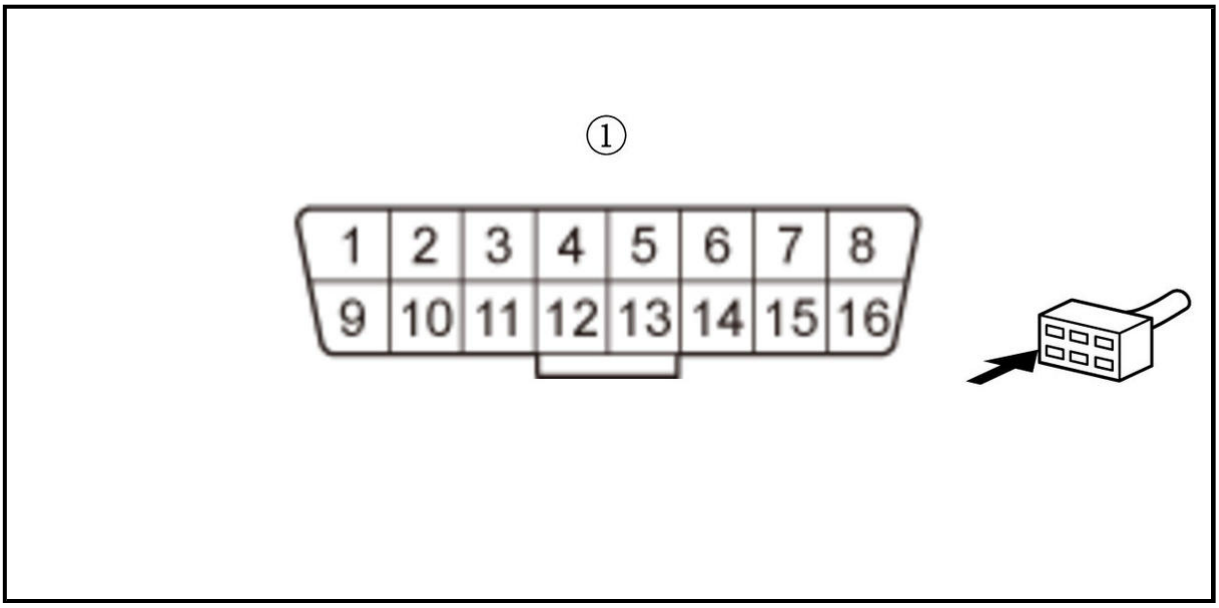
   -1. Reconnect all connectors.

   -2. If the 12 volt battery negative terminal is disconnected in step 6-3, **do the 12 volt battery terminal reconnection procedure** .

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	Data link connector (16P) (female terminal) No. 7 and No. 15: ①
Test point 2	Body ground



Is there any voltage?

YES

Go to step 9.

NO

Go to step 8.

8. Shorted wire check (K LINE line, L-LINE line):

   Continue to measure the voltage between data link connector (16P) No. 7 (K LINE line) and body ground, or data link connector (16P) No. 15 (L-LINE line) and body ground while disconnecting these parts, one at a time:

   NOTE: Turn the vehicle to the OFF (LOCK) mode before disconnecting the connector, and turn the vehicle to the ON mode before measuring the voltage.

   K LINE

   - Audio unit connector A (24P)
   - Body control module connector D (40P)
   - Immobilizer-keyless control unit 7P connector

   L-LINE

   - SRS unit connector A (36P)

   Does voltage come back when one of the above components is disconnected?

   YES

   Replace the part that any voltage was detected when it was disconnected.

   NO

   Repair a short in the wire between data link connector (16P) No. 7 (K LINE) and the audio unit, the immobilizer-keyless control unit, or the body control module, or data link connector (16P) No. 15 (L-LINE) and the SRS unit.

9. Body electrical system (B-CAN) check

-1. **Do the gauge self-diagnostic function** .

-2. Check for gauge control module DTCs without the HDS.

Is DTC U0029 and/or U0100 indicated?

YES

Go to the PCM power and ground circuit troubleshooting .

NO

Go to step 10.

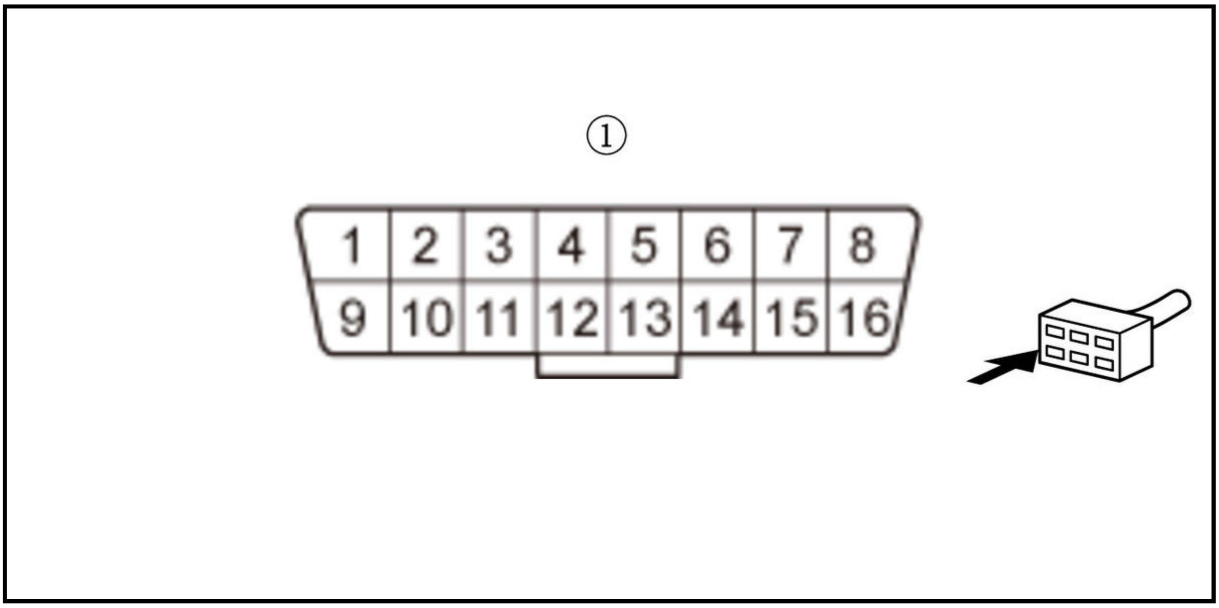
10. Open wire check (+B BACK UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the data link connector.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Data link connector (16P) (female terminal) No. 16: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 11.

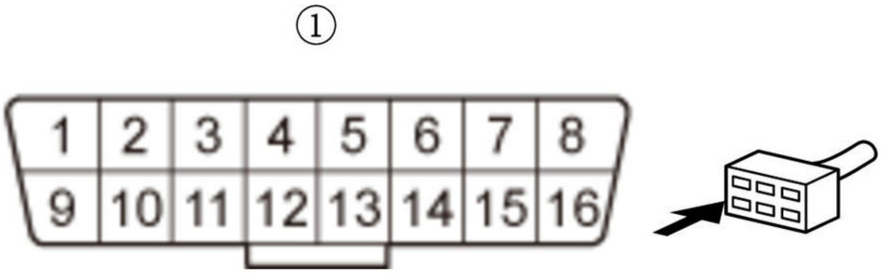
NO

Repair an open in the +B BACK UP wire between data link connector (16P) No. 16 and the No. A18 (10 A) fuse in the under-hood fuse/relay box.

11. Open wire check (GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Data link connector (16P) (female terminal) No. 4: ①
Test point 2	Data link connector (16P) (female terminal) No. 16: ①



Is there battery voltage?

YES

Go to step 12.

NO

Repair an open in the GND wire between data link connector (16P) No. 4 and G401.

12. Open wire check (F-CAN_H line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (51P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 2**

Is there continuity?

YES

The F-CAN_L wire is not open. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and data link connector (16P) No. 14.

DLC CIRCUIT TROUBLESHOOTING (CAN GATEWAY (KA/KC)) (2020 2021)

DLC Circuit Troubleshooting

NOTE: If you suspect the HDS or the HDS DLC cable may be the source of the communication problem, verify that they are working properly by connecting them to a known-good, similar vehicle and system, then check for communication problems.

*1: With navigation
*2: Without navigation

1. HDS communication check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Connect the HDS to the data link connector** .

   NOTE: Make sure the HDS is properly connected to the data link connector.

   -3. Turn the vehicle to the ON mode, and turn on the HDS.

   Does the HDS identify the vehicle?

   YES

   Go to step 2.

   NO

   Go to step 17.

2. Determine possible failure area (PGM-FI system, other systems)

   -1. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   DTC (PGM-FI)

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   If the HDS does not communicate with the PCM, go to step 3.

   NO

If the HDS does not communicate with the SRS, go to step 5.

NO

If the HDS does not communicate with the VSA system, go to step 6.

NO

If the HDS does not communicate with the EPS system, go to step 7.

NO

If the HDS does not communicate with the ELECTRIC BRAKE BOOSTER system, go to step 8.

NO

If the HDS does not communicate with the IMMOBI (immobilizer) system, go to step 9.

NO

If the HDS does not communicate with the ONE PUSH START system, go to step 10.

NO

If the HDS does not communicate with the BODY ELECTRICAL system, go to step 11.

NO

If the HDS does not communicate with the Real Time AWD System, go to step 12.

NO

If the HDS does not communicate with the DRIVING SUPPORT system, go to step 13.

3. Open wire check (F-CAN A_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

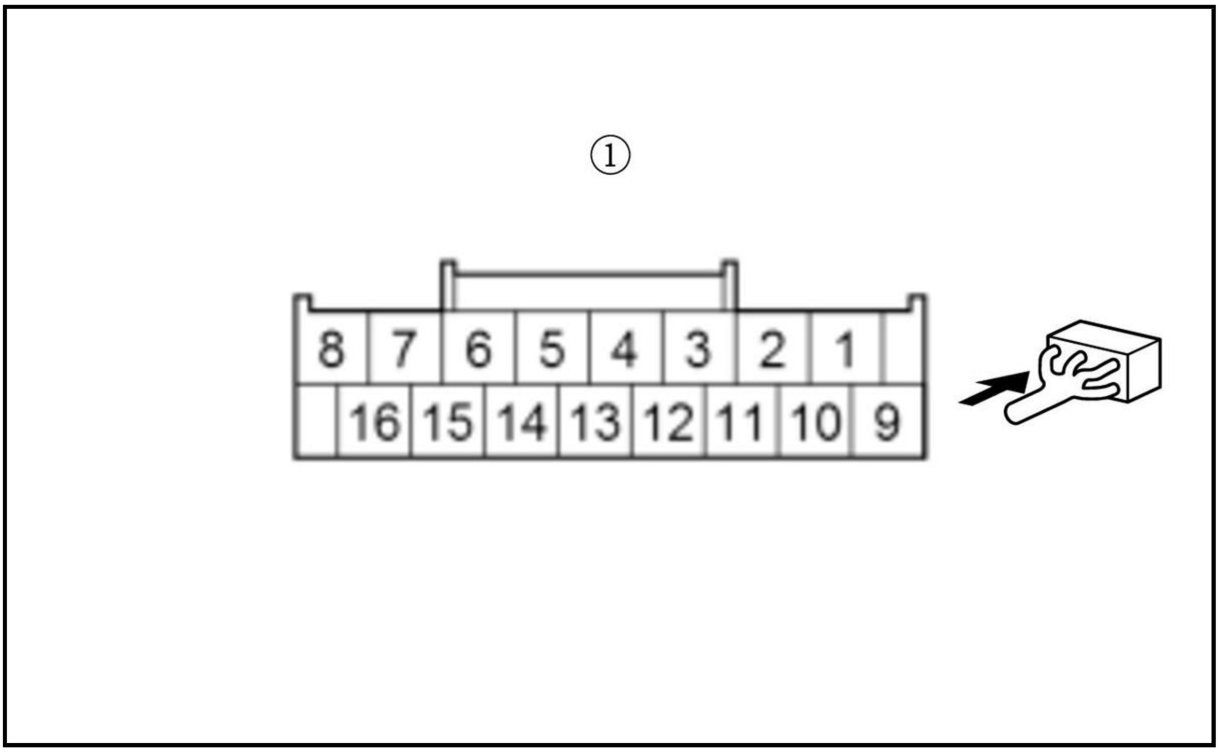
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 37**



Is there 1.0 Ω or less?

YES

Go to step 4.

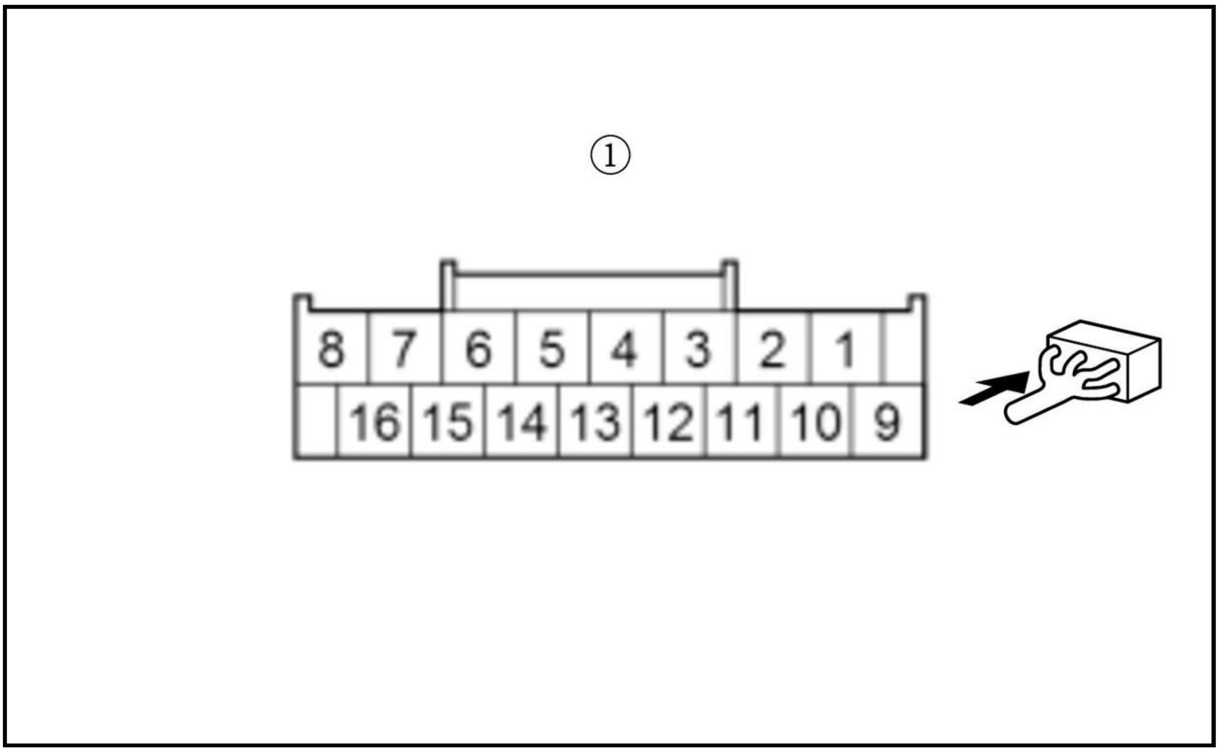
NO

Repair an open in the F-CAN A_H wire between the PCM (A37) and the CAN gateway.

4. Open wire check (F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**PCM connector A (50P) No. 36**



Is there 1.0 Ω or less?

YES

The F-CAN A_L wire is OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. **Go to the PCM power and ground circuit troubleshooting** .

NO

Repair an open in the F-CAN A_L wire between the PCM (A36) and the CAN gateway.

5. SRS check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the SRS indicator.

Does the SRS indicator come on and go off?

YES

Go to step 14.

NO

Go to the symptom troubleshooting for SRS indicator stays on, but no DTCs are stored, or cannot be read .

6. VSA system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the VSA indicator.

Does the VSA indicator come on and go off?

YES

The VSA system is OK. Go to step 14.

NO

Go to the symptom troubleshooting for ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off .

7. EPS system check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Start the engine, and watch the EPS indicator.

   Does the EPS indicator come on and go off?

   YES

   The EPS system is OK. Go to step 14.

   NO

   Go to the symptom troubleshooting for EPS indicator does not go off, and no DTCs are stored .

8. Electric brake booster system check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode, and watch the brake system indicator (amber).

   Does the brake system indicator (amber) come on and go off?

   YES

   The electric brake booster system is OK. Go to step 14.

   NO

   Go to the electric brake booster symptom troubleshooting for brake system indicator (red) and brake system indicator (amber) do not go off .

9. Immobilizer system check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode, and watch the security indicator.

   Does the security indicator stay on or flash?

   YES

   Go to the immobilizer system troubleshooting .

   NO

   The immobilizer system is OK. Go to step 14.

10. Keyless access system check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Turn the vehicle to the ON mode, and watch the keyless access indicator and the security indicator.

    Does the keyless access indicator stay on or the security indicator stay on or flash?

YES

Go to the keyless access system symptom troubleshooting information .

NO

Go to step 14.

11. Body electrical system check

    -1. Do the gauge self-diagnostic function .

    -2. Check the gauge display.

    Is Error 2 indicated?

    YES

    Go to the indicated DTC's troubleshooting.

    NO

    Go to step 14.

12. Real time AWD System check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Turn the vehicle to the ON mode, and watch the AWD system indicator on the multi-information display (MID).

    Is the AWD system indicator indicated?

    YES

    Go to the real time AWD system symptom troubleshooting .

    NO

    The real time AWD system is OK. Go to step 14.

13. Driving support system check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Turn the vehicle to the ON mode, and watch the ACC indicator and the LKAS indicator on the multi-information display (MID).

    Are the ACC indicator and/or the LKAS indicator indicated?

    YES

    Go to the driving support system symptom troubleshooting; ACC , LKAS .

    NO

    The driving support system is OK. Go to step 14.

14. Open wire check (K LINE line or L-LINE line)

    -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the data link connector.

Disconnect the control unit(s) on the K LINE or L-LINE that does not communicate.

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

K LINE

- Audio-navigation unit connector A (24P) *1
- Audio unit connector A (24P) *2
- Body control module connector D (40P)
- ANC/active sound control unit 20P connector
- Immobilizer-keyless control unit 7P connector

L-LINE

- Body control module connector F (36P)
- SRS unit connector A (36P)

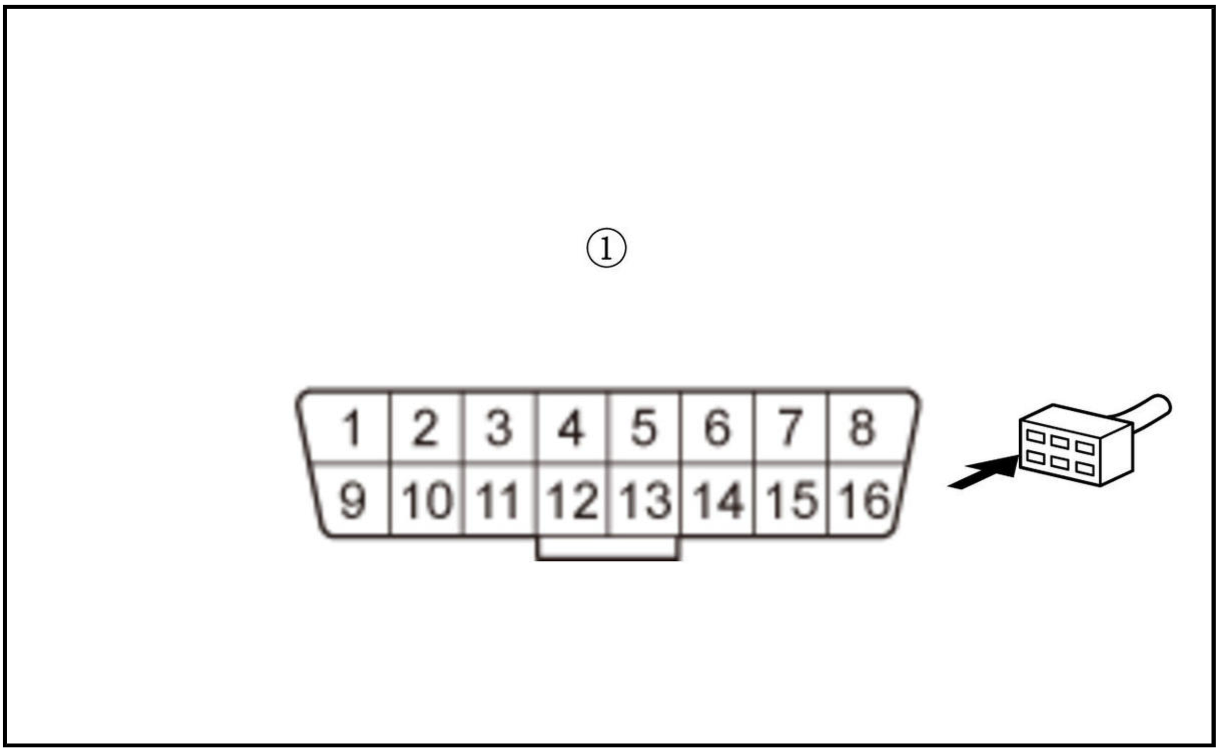
-4. Measure the resistance between data link connector (16P: ①) No. 7 (K LINE line) and these connector terminals, or data link connector (16P: ①) No. 15 (L-LINE line) and these connector terminals:

K LINE

Connector	Terminal
Audio-navigation unit connector A (24P)*1	No. 12
Audio unit connector A (24P)*2	No. 12
Body control module connector D (40P)	No. 36
ANC/active sound control unit 20P connector	No. 14
Immobilizer-keyless control unit 7P connector	No. 3

L-LINE

Connector	Terminal
Body control module connector F (36P)	No. 21
SRS unit connector A (39P)	No. 33



Is there 1.0 Ω or less between the data link connector and the terminals in the chart?

YES

Go to step 15.

NO

Repair an open in the wire between the data link connector (K LINE wire or L-LINE wire) and the appropriate connector.

15. Determine possible failure area (short in K LINE line or L-LINE line, others)

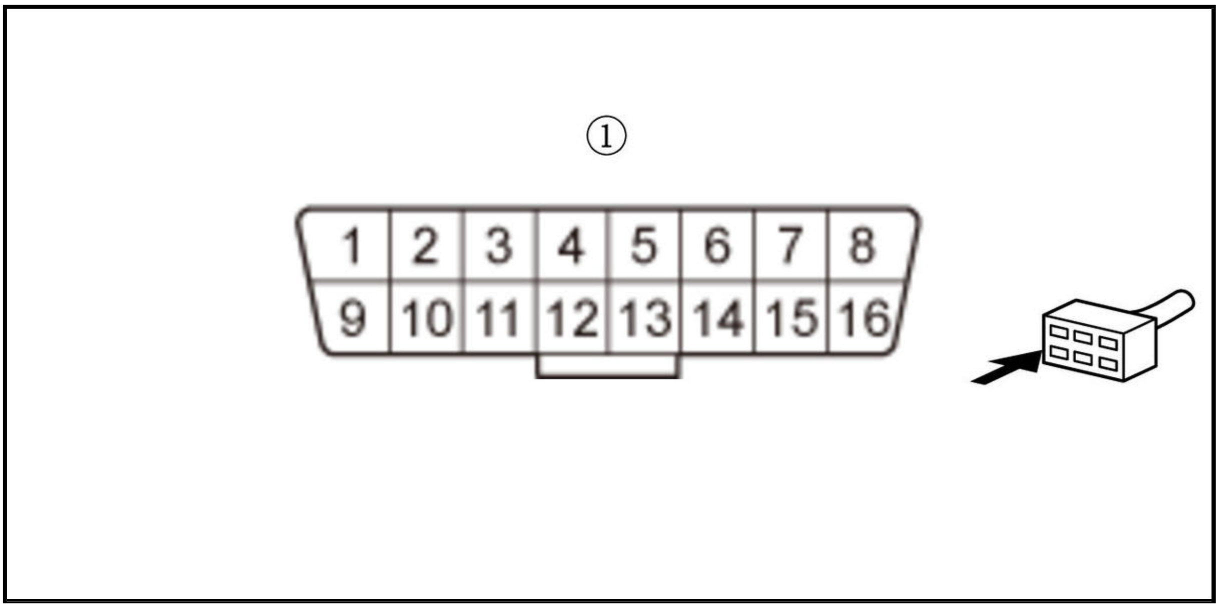
-1. Reconnect all connectors.

-2. If the 12 volt battery negative terminal is disconnected in step 14-3, **do the 12 volt battery terminal reconnection procedure** .

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	Data link connector (16P) (female terminal) No. 7 and No. 15: ①
Test point 2	Body ground



Is there any voltage?

YES

Go to step 17.

NO

Go to step 16.

16. Shorted wire check (K LINE line, L-LINE line):

    Continue to measure the voltage between data link connector (16P) No. 7 (K LINE line) and body ground, or data link connector (16P) No. 15 (L-LINE line) and body ground while disconnecting these parts, one at a time:

    NOTE: Turn the vehicle to the OFF (LOCK) mode before disconnecting the connector, and turn the vehicle to the ON mode before measuring the voltage.

    K LINE

    - Audio-navigation unit connector A (24P) *1
    - Audio unit connector A (24P) *2
    - Body control module connector D (40P)
    - ANC/active sound control unit 20P connector
    - Immobilizer-keyless control unit 7P connector

    L-LINE

    - Body control module connector F (36P)
    - SRS unit connector A (36P)

      NOTE: Before disconnecting the SRS unit connector, do the 12 volt battery terminal disconnection procedure and wait for at least 3 minutes.

    Is there battery voltage when the one of the above components is disconnected?

    YES

    Replace the component that caused the battery voltage to return when it was disconnected.

NO

Repair a short in the wire between data link connector (16P) No. 7 (K LINE) and the audio-navigation unit *1 audio unit *2, the ANC/active sound control unit, immobilizer-keyless control unit, or the body control module, or data link connector (16P) No. 15 (L-LINE) and the body control module or the SRS unit.

17. Body electrical system (B-CAN) check

-1. Do the gauge self-diagnostic function .

-2. Check for gauge control module DTCs without the HDS.

Is DTC U0029 and/or U0100 indicated?

YES

Go to the PCM power and ground circuit troubleshooting .

NO

Go to step 18.

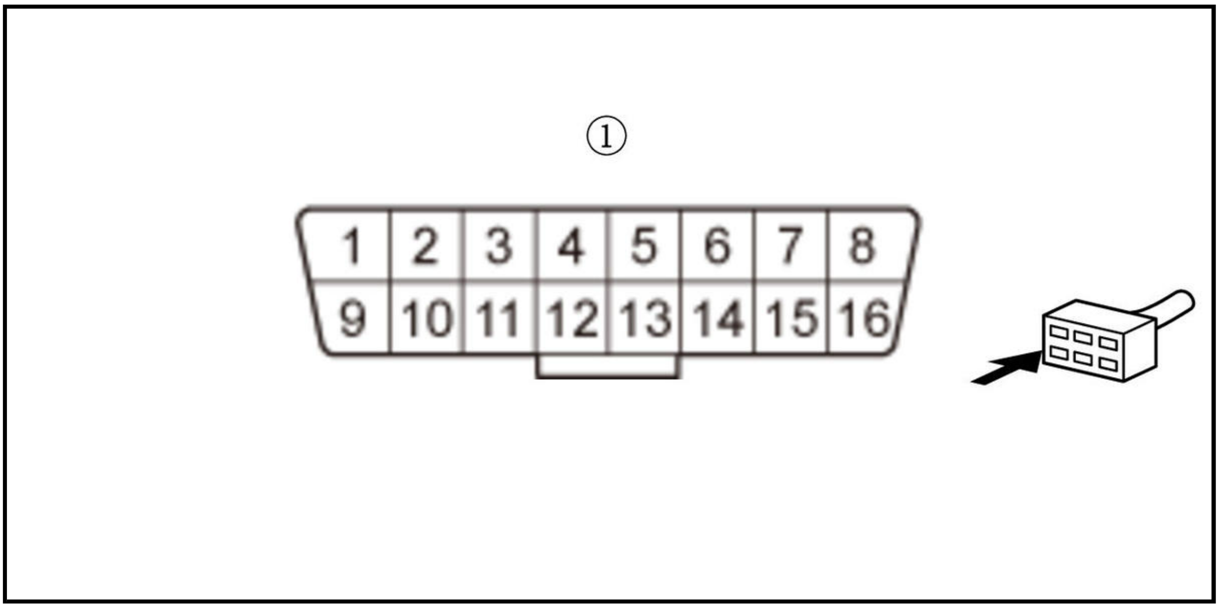
18. Open wire check (+B BACK UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the data link connector.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Data link connector (16P) (female terminal) No. 16: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 19.

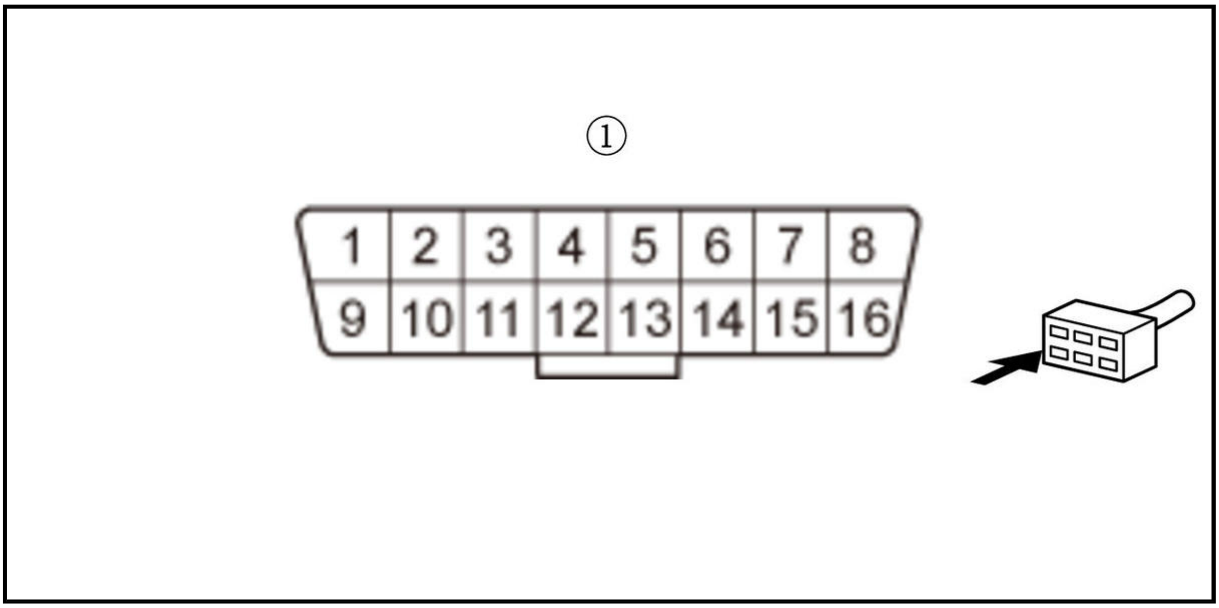
NO

Repair an open in the +B BACK UP wire between data link connector (16P) No. 16 and the **No. A18** .

19. Open wire check (GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Data link connector (16P) (female terminal) No. 4: ①
Test point 2	Data link connector (16P) (female terminal) No. 16: ①



Is there battery voltage?

YES

Go to step 20.

NO

Repair an open in the GND wire between data link connector (16P) No. 4 and G401.

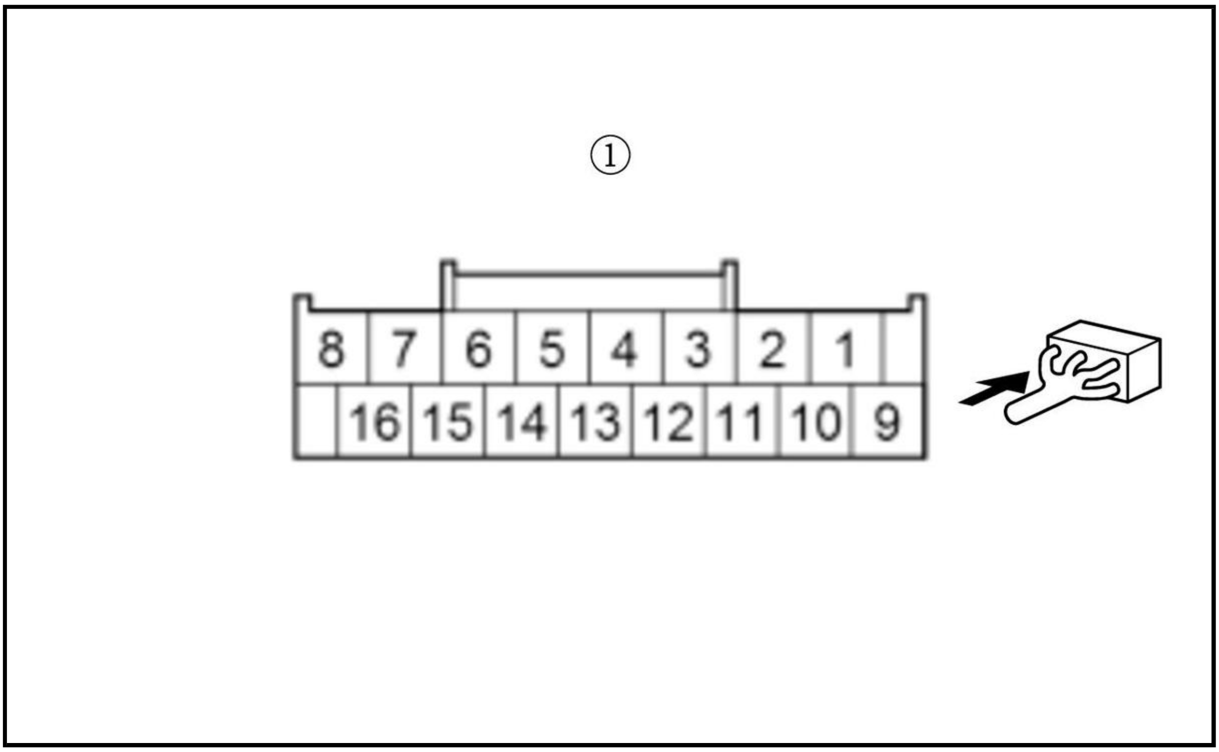
20. Open wire check (+B BACK UP line)

-1. Disconnect the following connector.

CAN gateway 16P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 21.

NO

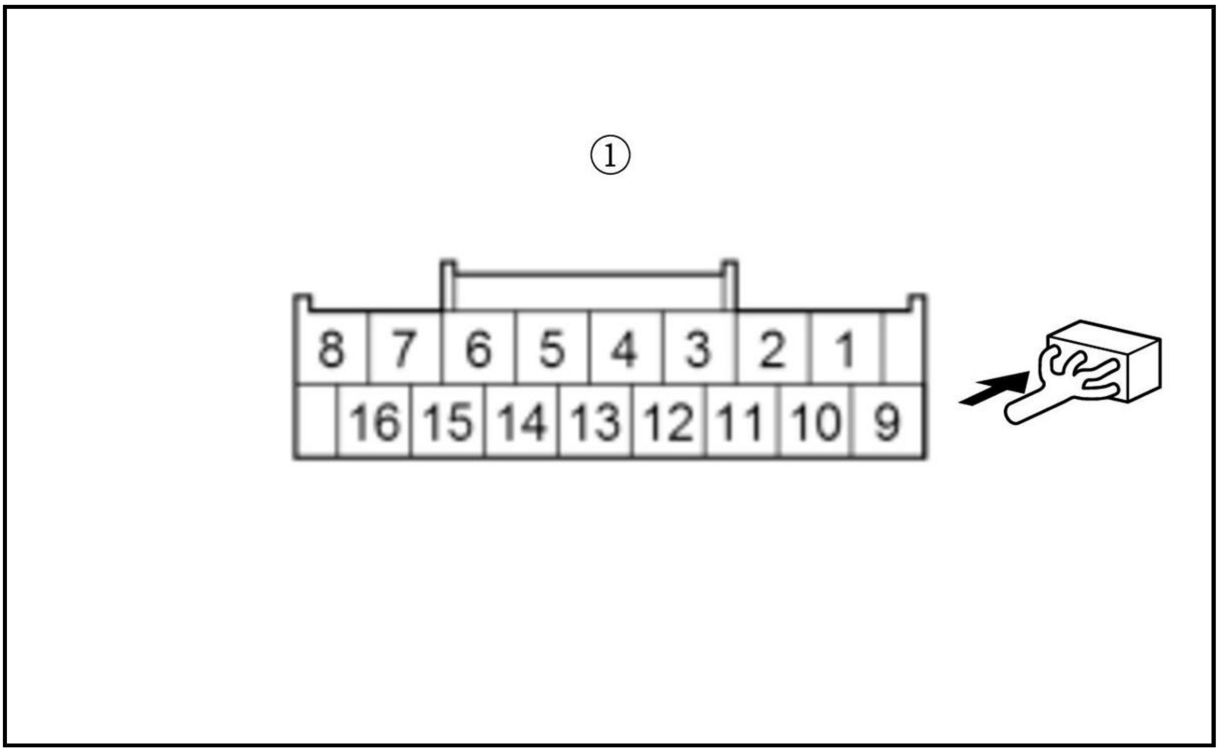
Repair an open in the +B BACK UP wire between the CAN gateway and the **No. A18** .

21. Open wire check (IG1 METER line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 22.

NO

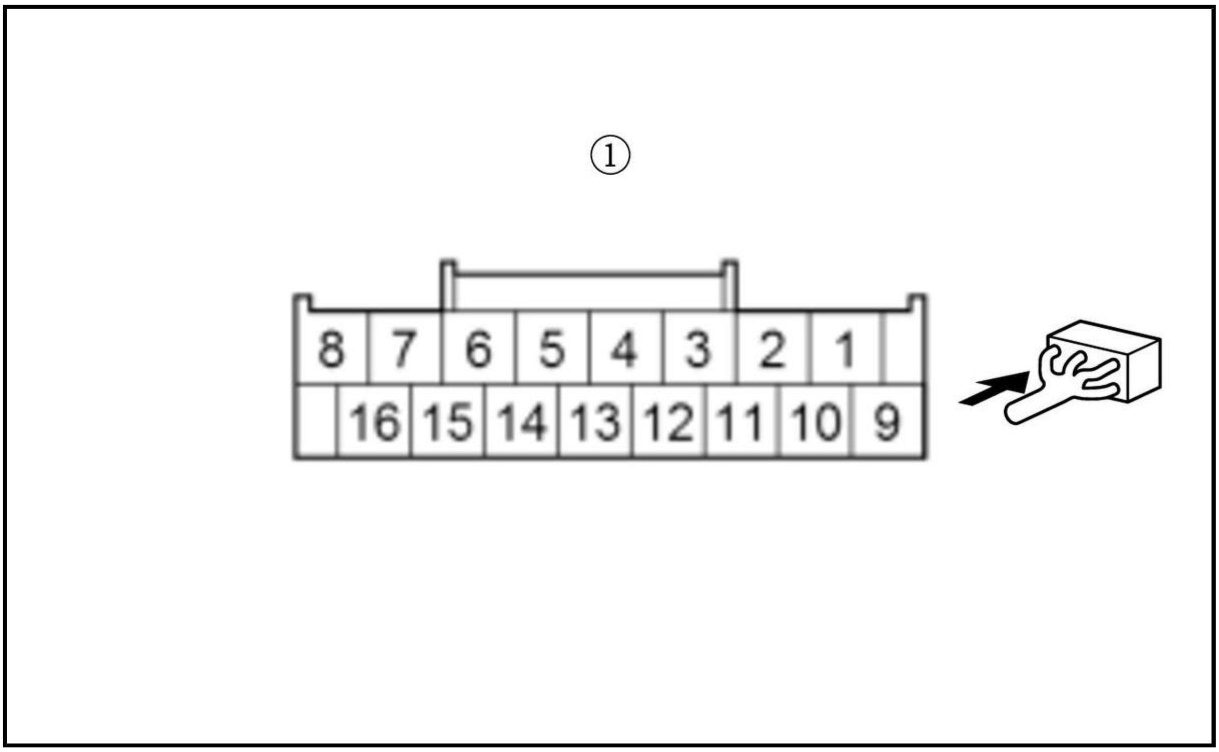
Repair an open in the IG1 METER wire between the CAN gateway and the **No. D7** .

22. Open wire check (GND lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 23.

NO

Repair an open in the GND wire between the CAN gateway and G401.

23. Open wire check (DIAG-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 2: ①
Test point 2	Data link connector (16P) (female terminal) No. 6: ②

Go to step 24.

NO

Repair an open in the DIAG-CAN_H wire between the CAN gateway and data link connector (16P) No. 6.

24. Open wire check (DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 10: ①

Is there 1.0 Ω or less?

YES

Go to step 25.

NO

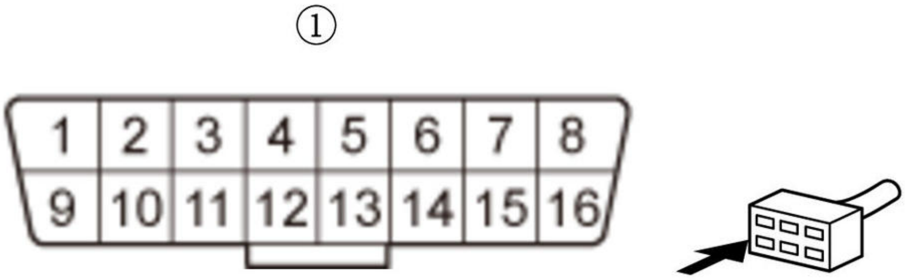
Repair an open in the DIAG-CAN_L wire between the CAN gateway and data link connector (16P) No. 14.

25. Shorted wire check (DIAG-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	CAN gateway 16P connector: disconnected
Test point 1	Data link connector (16P) (female terminal) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 26.

NO

Repair a short in the DIAG-CAN_H wire between the CAN gateway and data link connector (16P) No. 6.

26. Shorted wire check (DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

1 2 3 4 5 6 7 8
9 10 11 12 13 14 15 16

Is there 1 MΩ or more?

YES

Go to step 27.

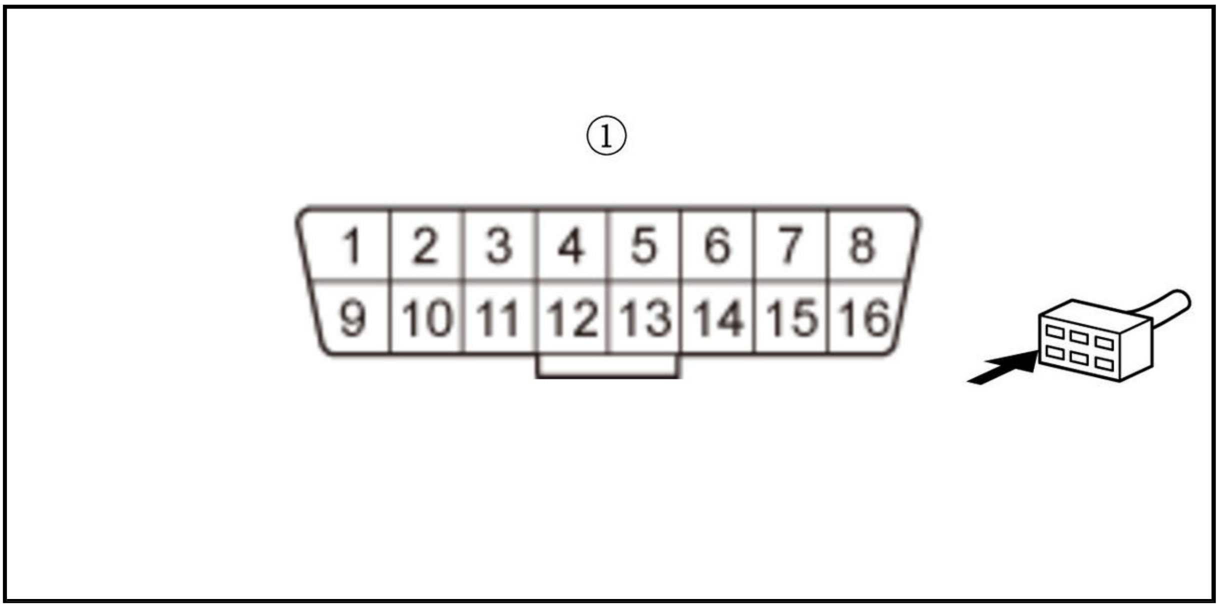
NO

Repair a short in the DIAG-CAN_L wire between the CAN gateway and data link connector (16P) No. 14.

27. Shorted wire check (DIAG-CAN_H line to DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	Data link connector (16P) (female terminal) No. 6: ①
Test point 2	Data link connector (16P) (female terminal) No. 14: ①



①
1 2 3 4 5 6 7 8
9 10 11 12 13 14 15 16

Is there 1 MΩ or more?

YES

The DIAG-CAN_H wire and DIAG-CAN_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good CAN gateway** .

NO

Repair a short in the DIAG-CAN_H wire to the DIAG-CAN_L wire between data link connector (16P) No. 6 and No. 14.

DLC CIRCUIT TROUBLESHOOTING (CAN GATEWAY) (2017 2018 2019)

DLC Circuit Troubleshooting

NOTE: If you suspect the HDS or the HDS DLC cable may be the source of the communication problem, verify that they are working properly by connecting them to a known-good, similar vehicle and system, and checking for communication problems.

*1: With navigation
*2: Without navigation

1. HDS communication check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Connect the HDS to the data link connector** .

   NOTE: Make sure the HDS is properly connected to the data link connector.

   -3. Turn the vehicle to the ON mode, and turn on the HDS.

   Does the HDS identify the vehicle?

   YES

   Go to step 2.

   NO

   Go to step 11.

2. Determine possible failure area (PGM-FI system, other systems)

   -1. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   DTC (PGM-FI)

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTCs troubleshooting.

   NO

   If the HDS does not communicate with the PCM, go to step 3.

NO

If the HDS does not communicate with the SRS, go to step 5.

NO

If the HDS does not communicate with the ONE PUSH START system, go to step 6.

NO

If the HDS does not communicate with the BODY ELECTRICAL system, go to step 7.

3. Open wire check (F-CAN A_H line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

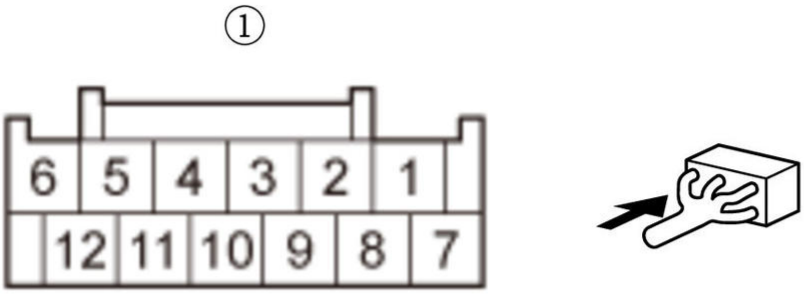
-3. Disconnect the following connectors.

CAN gateway 12P connector
PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	CAN gateway 12P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 3: ①
Test point 2	PCM connector A (50P) No. 37



Is there continuity?

YES

Go to step 4.

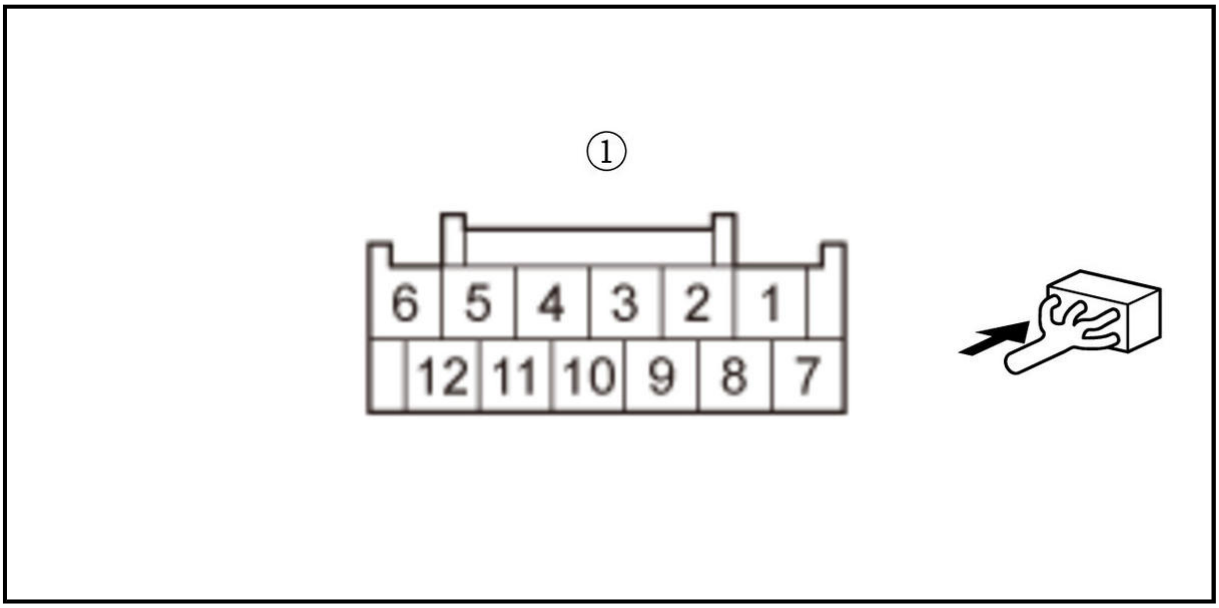
NO

Repair an open in the F-CAN A_H wire between the PCM (A37) and the CAN gateway.

4. Open wire check (F-CAN A_L line) 1

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 9: ①
Test point 2	PCM connector A (50P) No. 36



Is there continuity?

YES

The F-CAN A_L wire is OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Go to the PCM power and ground circuit troubleshooting .

NO

Repair an open in the F-CAN A_L wire between the PCM (A36) and the CAN gateway.

5. SRS check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the SRS indicator.

Does the SRS indicator come on and go off?

YES

Go to step 8.

NO

Go to the symptom troubleshooting for SRS indicator stays on, but no DTCs are stored, or cannot be read .

6. Keyless access system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the keyless access indicator and the security indicator.

Does the keyless access indicator stay on or the security indicator stay on or flash?

YES

Go to the keyless access system symptom troubleshooting information .

NO

Go to step 8.

7. Body electrical system check

-1. **Do the gauge self-diagnostic function** .

-2. Check the gauge display.

Is Error 2 indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 8.

8. Open wire check (K LINE line or L-LINE line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the data link connector.

Disconnect the control unit(s) on the K LINE or L-LINE that does not communicate.

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

K LINE

- Audio-navigation unit connector A (24P) *1
- Audio unit connector A (24P) *2
- Body control module connector D (40P)
- ANC/active sound control unit 20P connector

L-LINE

- Body control module connector F (36P)
- SRS unit connector A (36P)

-4. Check for continuity between data link connector (16P: ①) No. 7 (K LINE line) and these connector terminals, or data link connector (16P: ①) No. 15 (L-LINE line) and these connector terminals:

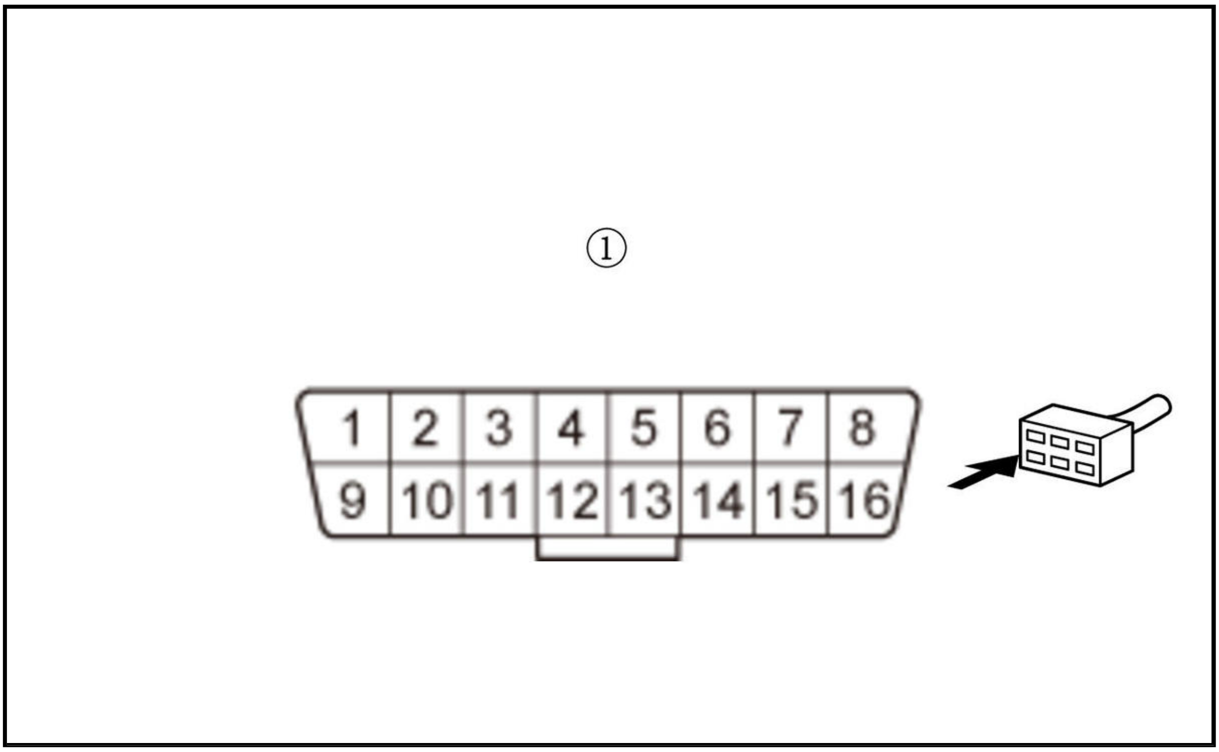
K LINE

Connector	Terminal
Audio-navigation unit connector A (24P)*1	No. 12
Audio unit connector A (24P)*2	No. 12
Body control module connector D (40P)	No. 36

Connector	Terminal
ANC/active sound control unit 20P connector	No. 14

L-LINE

Connector	Terminal
Body control module connector F (36P)	No. 21
SRS unit connector A (39P)	No. 33



Is there continuity between the data link connector and the terminals in the chart?

YES

Go to step 9.

NO

Repair an open in the wire between the data link connector (K LINE wire or L-LINE wire) and the appropriate connector.

9. Determine possible failure area (short in K LINE line or L-LINE line, others)

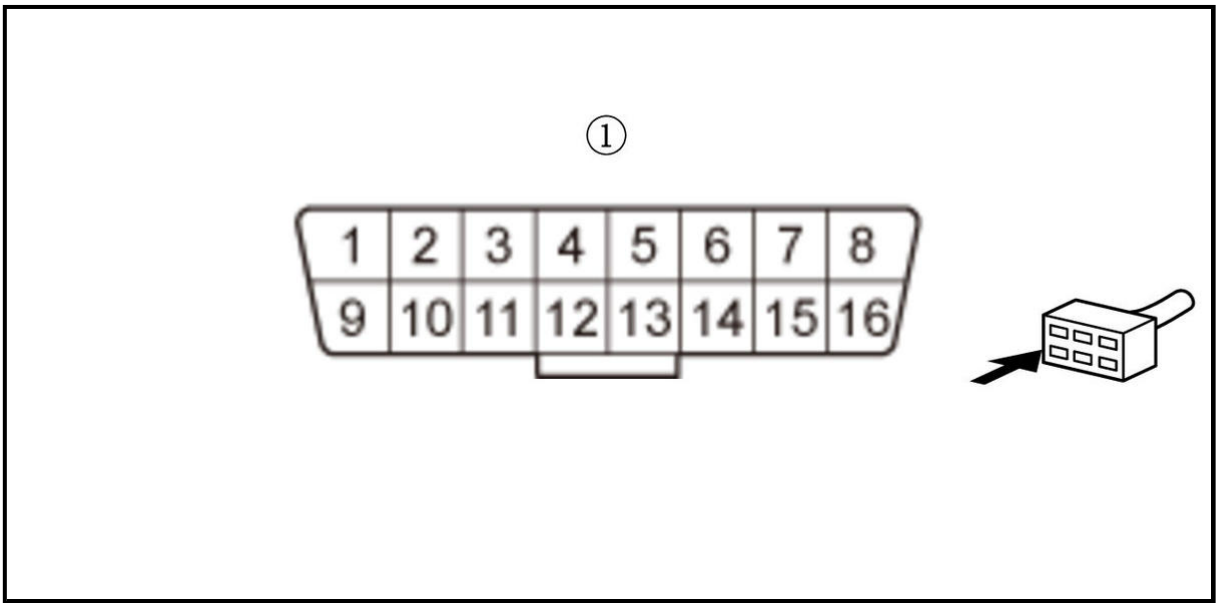
-1. Reconnect all connectors.

-2. If the 12 volt battery negative terminal is disconnected in step 8-3, **do the 12 volt battery terminal reconnection procedure** .

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	Data link connector (16P) (female terminal) No. 7 and No. 15: ①
Test point 2	Body ground



Is there any voltage?

YES

Go to step 11.

NO

Go to step 10.

10. Shorted wire check (K LINE line, L-LINE line):

    Continue to measure the voltage between data link connector (16P) No. 7 (K LINE line) and body ground, or data link connector (16P) No. 15 (L-LINE line) and body ground while disconnecting these parts, one at a time:

    NOTE: Turn the vehicle to the OFF (LOCK) mode before disconnecting the connector, and turn the vehicle to the ON mode before measuring the voltage.

    K LINE

    - Audio-navigation unit connector A (24P) *1
    - Audio unit connector A (24P) *2
    - Body control module connector D (40P)
    - ANC/active sound control unit 20P connector

    L-LINE

    - Body control module connector F (36P)
    - SRS unit connector A (36P)

    Does voltage come back when one of the above components is disconnected?

    YES

    Replace the part that any voltage was detected when it was disconnected.

NO

Repair a short in the wire between data link connector (16P) No. 7 (K LINE) and the audio-navigation unit *1 audio unit *2, the ANC/active sound control unit, or the body control module, or data link connector (16P) No. 15 (L-LINE) and the body control module or the SRS unit.

11. Body electrical system (B-CAN) check

-1. **Do the gauge self-diagnostic function** .

-2. Check for gauge control module DTCs without the HDS.

Is DTC U0029 and/or U0100 indicated?

YES

Go to the PCM power and ground circuit troubleshooting .

NO

Go to step 12.

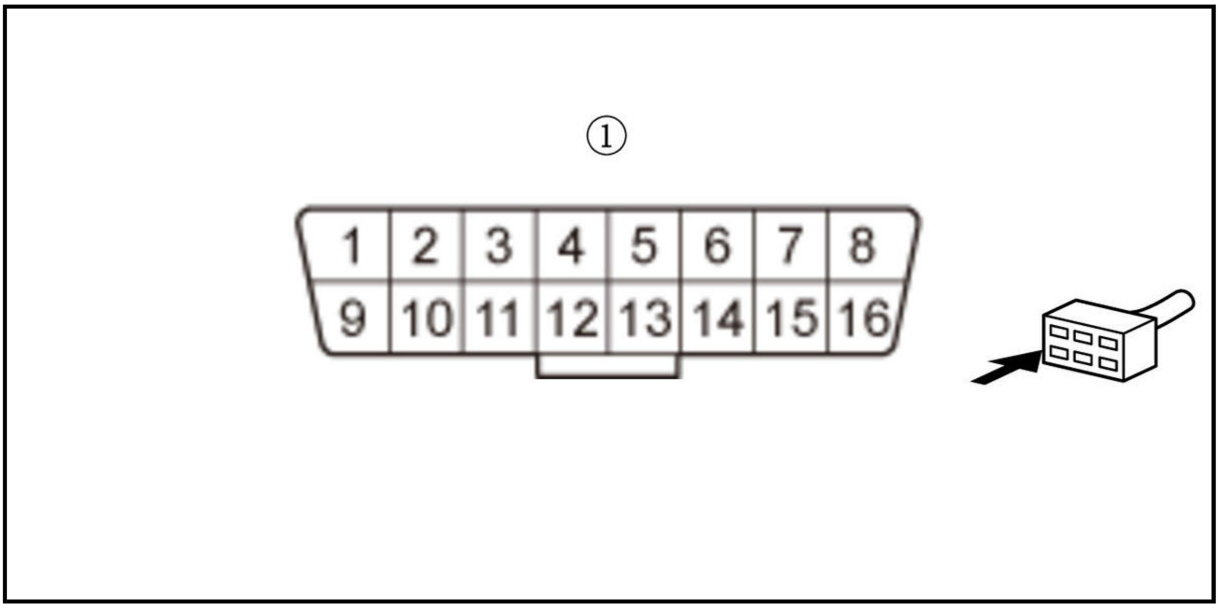
12. Open wire check (+B BACK UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the data link connector.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Data link connector (16P) (female terminal) No. 16: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 13.

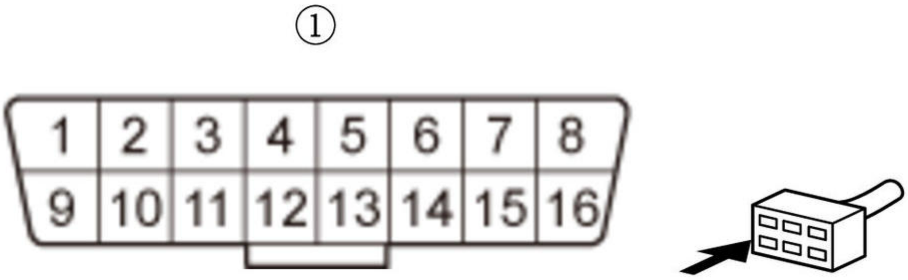
NO

Repair an open in the +B BACK UP wire between data link connector (16P) No. 16 and the No. A18 (10 A) fuse in the under-hood fuse/relay box.

13. Open wire check (GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Data link connector (16P) (female terminal) No. 4: ①
Test point 2	Data link connector (16P) (female terminal) No. 16: ①



Is there battery voltage?

YES

Go to step 14.

NO

Repair an open in the GND wire between data link connector (16P) No. 4 and G401.

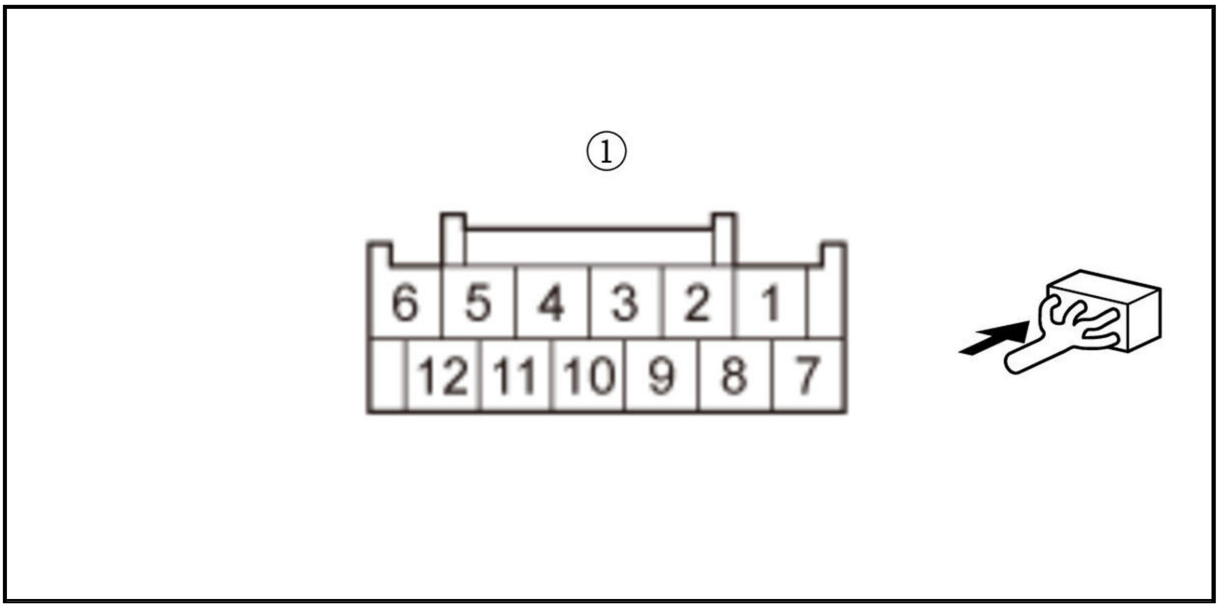
14. Open wire check (+B BACK UP line)

-1. Disconnect the following connector.

CAN gateway 12P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 15.

NO

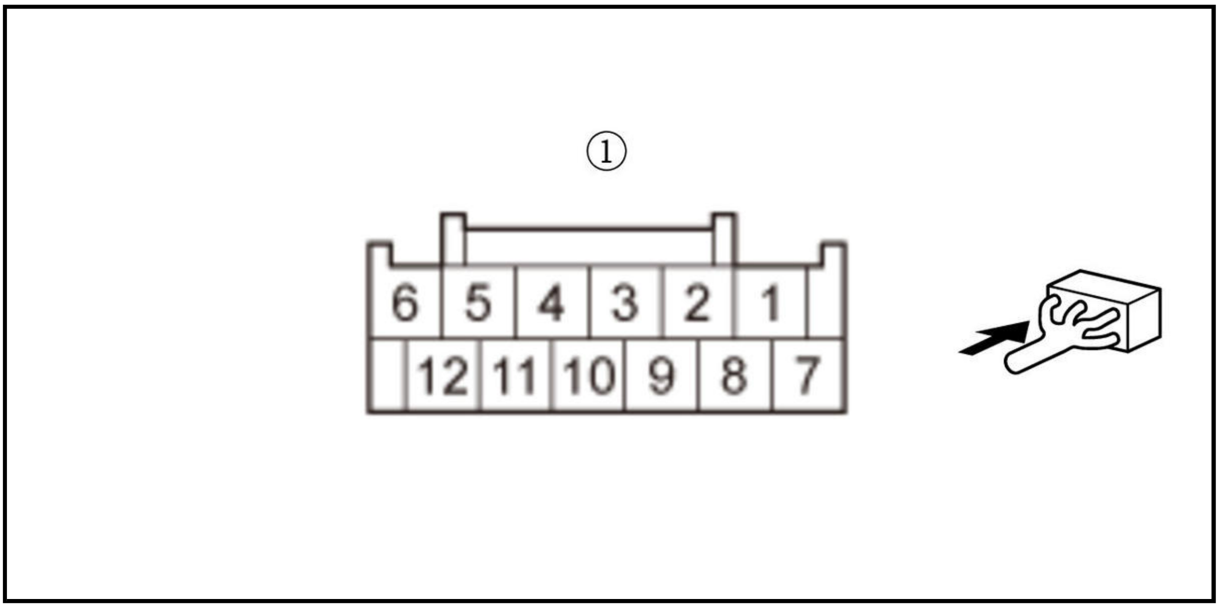
Repair an open in the +B BACK UP wire between the CAN gateway and the No. A18 (10 A) fuse in the under-hood fuse/relay box.

15. Open wire check (IG1 METER line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CAN gateway 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 7: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 16.

NO

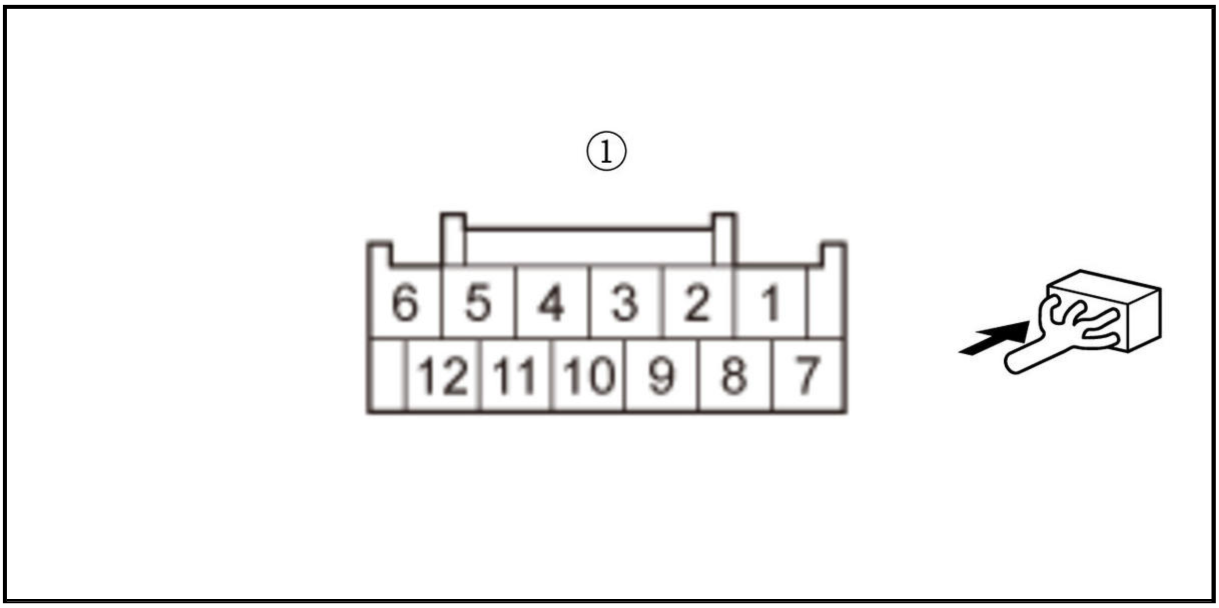
Repair an open in the IG1 METER wire between the CAN gateway and the No. D7 (10 A) fuse in the under-dash fuse/relay box.

16. Open wire check (GND lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 10: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 17.

NO

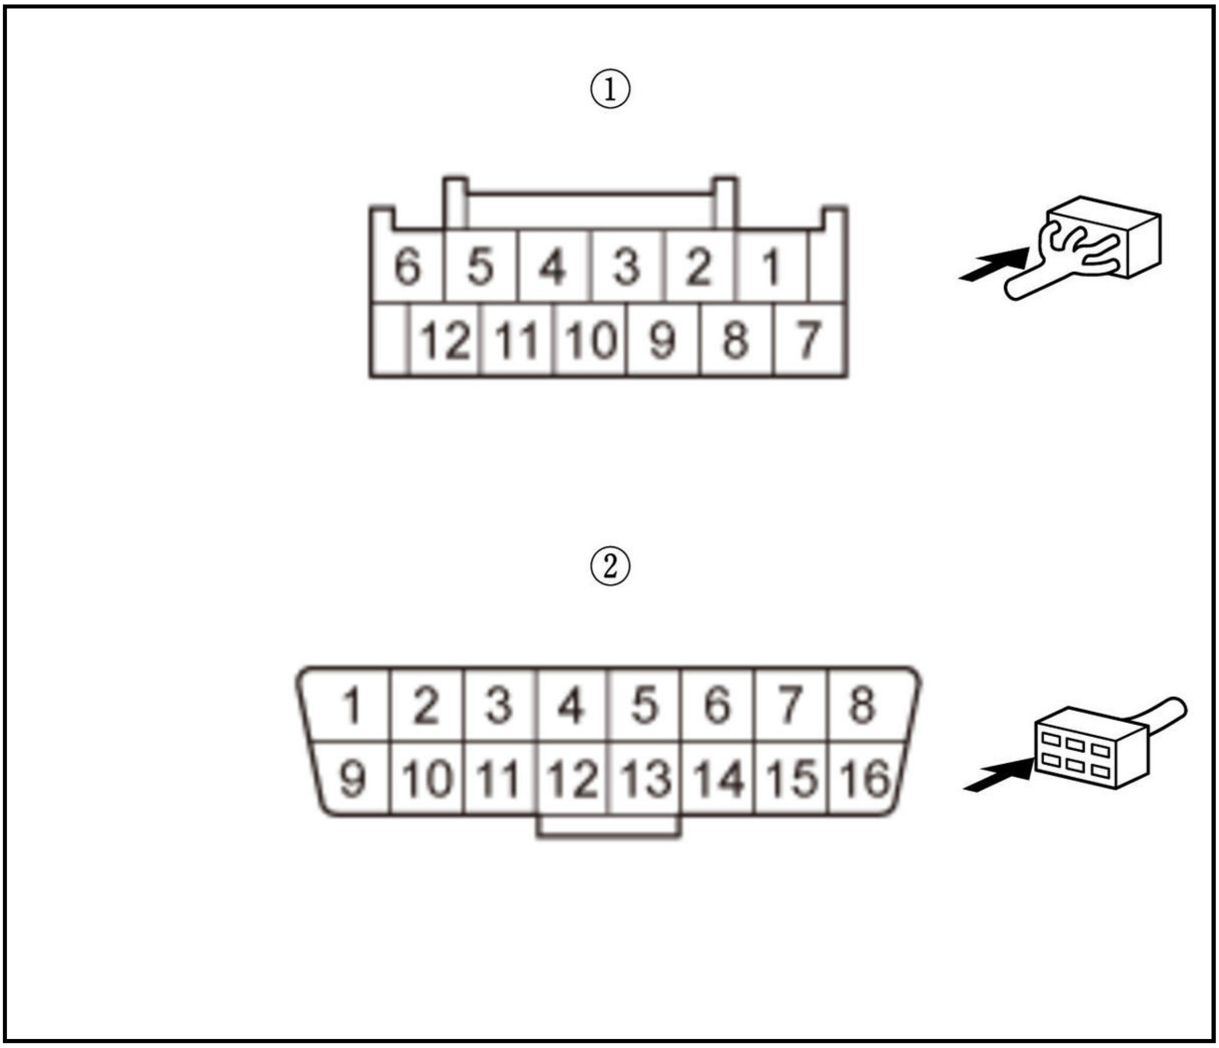
Repair an open in the GND wire between the CAN gateway and G401.

17. Open wire check (F-CAN A_H line) 2

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected

Test point 1	CAN gateway 12P connector (female terminal) No. 3: ①
Test point 2	Data link connector (16P) (female terminal) No. 6: ②



Is there continuity?

YES

Go to step 18.

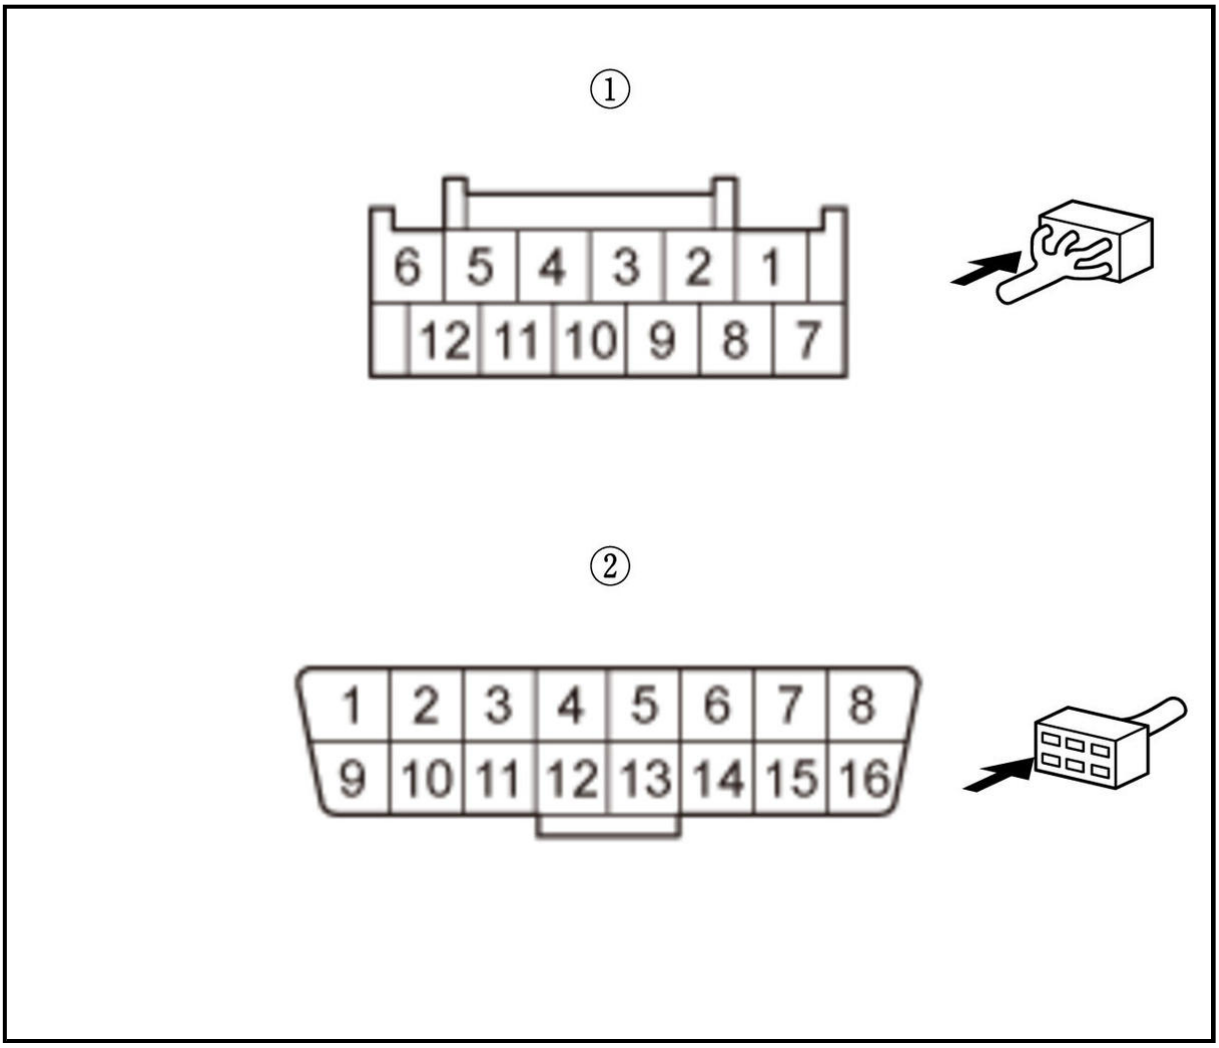
NO

Repair an open in the F-CAN A_H wire between the CAN gateway and data link connector (16P) No. 6.

18. Open wire check (F-CAN A_L line) 2

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 9: ①
Test point 2	Data link connector (16P) (female terminal) No. 14: ②



Is there continuity?

YES

Go to step 19.

NO

Repair an open in the F-CAN A_L wire between the CAN gateway and data link connector (16P) No. 14.

19. Open wire check (F-CAN A_H line) 3

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

PCM connector A (50P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 37**

NO

The F-CAN A_H wire and F-CAN A_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good CAN gateway** .

F-CAN CIRCUIT TROUBLESHOOTING (2.4 L ENGINE) (2017 2018 2019)

NOTE:

- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.
- Before disconnecting the electric brake booster connector, turn the vehicle to the OFF (LOCK) mode with driver's door open, then wait 3 minutes. Do not open and close the driver's door.

1. F-CAN circuit resistance check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (51P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 1**
Test point 2	**PCM connector A (51P) No. 2**

   Is there about 85-107 Ω?

   YES

   Go to step 16.

   NO

   Go to step 2.

2. Shorted wire check (F-CAN_H line to F-CAN_L line):

   Disconnect the following connectors.

   - Gauge control module connector A (32P)
   - VSA modulator-control unit 46P connector
   - EPS control unit connector B (6P)
   - Body control module connector B (36P)
   - SRS unit connector A (39P)
   - Electric brake booster 26P connector
   - Real time AWD control unit 24P connector (with AWD)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**PCM connector A (51P) No. 1**
Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES

Repair a short in the F-CAN_H wire to F-CAN_L wire between the PCM terminals A1 and A2.

NO

The F-CAN_H and F-CAN_L wires are not shorted. Go to step 3.

3. Open wire check (F-CAN_H line) 1

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Gauge control module connector A (32P) No. 19**
Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES

The F-CAN_H wire is not open. Go to step 4.

NO

Repair an open in the F-CAN_H wire between the PCM (A2) and the gauge control module.

4. Open wire check (F-CAN_H line) 2

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected

	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES

The F-CAN_H wire is not open. Go to step 5.

NO

Repair an open in the F-CAN_H wire between the PCM (A2) and the VSA modulator-control unit.

5. Open wire check (F-CAN_H line) 3

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES

The F-CAN_H wire is not open. Go to step 6.

NO

Repair an open in the F-CAN_H wire between the PCM (A2) and the EPS control unit.

6. Open wire check (F-CAN_H line) 4

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected

	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Electric brake booster 26P connector No. 26**
Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES

The F-CAN_H wire is not open. Go to step 7.

NO

Repair an open in the F-CAN_H wire between the PCM (A2) and the electric brake booster.

7. Open wire check (F-CAN_H line) 5

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Body control module connector B (36P) No. 22**

Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES (with AWD)

The F-CAN_H wire is not open. Go to step 8.

YES (without real time AWD)

The F-CAN_H wire is not open. Go to step 9.

NO

Repair an open in the F-CAN_H wire between the PCM (A2) and the body control module.

8. Open wire check (F-CAN_H line) 6

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected

	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Real time AWD control unit 24P connector No. 14**
Test point 2	**PCM connector A (51P) No. 2**

Is there continuity?

YES

The F-CAN_H wire is not open. Go to step 9.

NO

Repair an open in the F-CAN_H wire between the PCM (A2) and the real time AWD control unit.

9. Open wire check (F-CAN_L line) 1

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Gauge control module connector A (32P) No. 20**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN_L wire is not open. Go to step 10.

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and the gauge control module.

10. Open wire check (F-CAN_L line) 2

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected

	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN_L wire is not open. Go to step 11.

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and the VSA modulator-control unit.

11. Open wire check (F-CAN_L line) 3

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN_L wire is not open. Go to step 12.

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and the EPS control unit.

12. Open wire check (F-CAN_L line) 4

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Electric brake booster 26P connector No. 18**

Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN_L wire is not open. Go to step 13.

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and the electric brake booster.

13. Open wire check (F-CAN_L line) 5

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Body control module connector B (36P) No. 23**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES (with AWD)

The F-CAN_L wire is not open. Go to step 14.

YES (without real time AWD)

The F-CAN_L wire is not open. Go to step 15.

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and the body control module.

14. Open wire check (F-CAN_L line) 6

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**Real time AWD control unit 24P connector No. 24**

Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN_L wire is not open. Go to step 15.

NO

Repair an open in the F-CAN_L wire between the PCM (A1) and the real time AWD control unit.

15. VSA modulator-control unit internal resistance check

-1. Reconnect VSA modulator-control unit 46P connector.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**PCM connector A (51P) No. 1**
Test point 2	**PCM connector A (51P) No. 2**

Is there about 112-136 Ω?

YES

Go to step 16.

NO

Replace the VSA modulator-control unit .

16. Shorted wire check (F-CAN_H line):

Disconnect the following connectors.

- Gauge control module connector A (32P)
- VSA modulator-control unit 46P connector
- EPS control unit connector B (6P)
- Body control module connector B (36P)
- SRS unit connector A (39P)
- Electric brake booster 26P connector
- Real time AWD control unit 24P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected

	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**PCM connector A (51P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the F-CAN_H wire between the PCM (A2) and the gauge control module, the VSA modulator-control unit, the EPS control unit, the body control module, the SRS unit, the electric brake booster, the real time AWD control unit, or the DLC.

NO

The F-CAN_H wire is OK. Go to step 17.

17. Shorted wire check (F-CAN_L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (51P): disconnected
	Gauge control module connector A (32P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	EPS control unit connector B (6P): disconnected
	Body control module connector B (36P): disconnected
	SRS unit connector A (39P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector (with AWD): disconnected
Test point 1	**PCM connector A (51P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the F-CAN_L wire between the PCM (A1) and the gauge control module, the VSA modulator-control unit, the EPS control unit, the body control module, the SRS unit, the electric brake booster, the real time AWD control unit, or the DLC.

NO

The F-CAN_L wire is OK. Go to step 18.

18. Gauge control module check

-1. Reconnect all connectors.

-2. Connect the HDS to the DLC.

-3. Disconnect the following connector.

Gauge control module connector A (32P)

-4. Turn the vehicle to the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES

Replace the gauge control module .

NO (without real time AWD)

Reconnect gauge control module connector A (32P) with vehicle in OFF (LOCK) mode, then go to step 20.

NO (with AWD)

Reconnect gauge control module connector A (32P) with vehicle in OFF (LOCK) mode, then go to step 19.

19. Real time AWD control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Real time AWD control unit 24P connector

-3. Turn the vehicle to the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES

Replace the real time AWD control unit .

NO

Reconnect real time AWD control unit 24P connector with vehicle in OFF (LOCK) mode, then go to step 20.

20. VSA modulator-control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Turn the vehicle to the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES

Replace the VSA modulator-control unit .

NO

Reconnect the VSA modulator-control unit 46P connector with vehicle in OFF (LOCK) mode, then go to step 21.

21. EPS control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector B (6P)

-3. Turn the vehicle to the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES

Replace the EPS control unit .

NO

Reconnect EPS control unit connector B (6P) with vehicle in OFF (LOCK) mode, then go to step 22.

22. Electric brake booster check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric brake booster 26P connector

-3. Turn the vehicle to the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES

Replace the electric brake booster .

NO

- **Substitute a known-good body control module** , then recheck. If the HDS identifies the vehicle and the body control module was substituted, **replace the original body control module** .
- Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DIAGNOSIS

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)

Shift to Test Mode 1

Check the PCM for DTCs and troubleshoot PCM or F-CAN loss of communication errors first, then do this diagnosis if the HDS is not available.

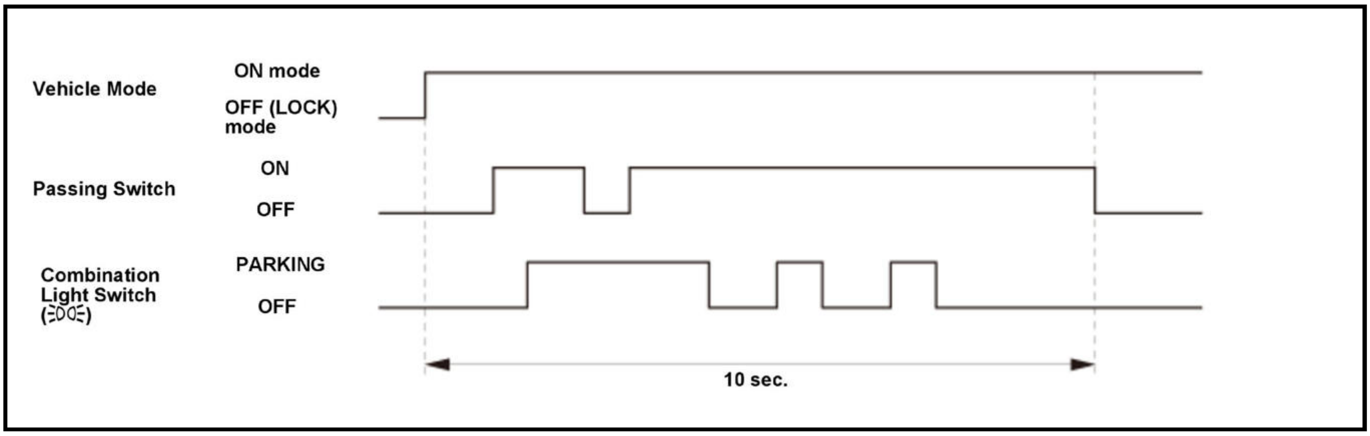
1. Check the BACK UP fuse and the FI MAIN fuse. If a fuse is blown, find and correct the cause, then replace the fuse.

2. Move the front individual map light switch OFF, the interior light switch to the DOOR position, the ceiling light switch to the MIDDLE position, and close all doors.

NOTE: **Do steps 3-7 within 10 seconds.**

3. Turn the vehicle to the ON mode.

4. Pull and hold the passing switch in its PASSING position.



5. While holding the combination light switch is in PASSING position, turn to the PARKING position, then release, pull, and hold the combination light switch in its PASSING position.

6. Turn the combination light switch to OFF, then turn to the PARKING position, and turn to OFF two more times.

7. Release the combination light switch.

8. Wait 5 seconds, and watch the front individual map lights and the ceiling light. When the lights flash quickly once, the system enters in Test Mode 1.

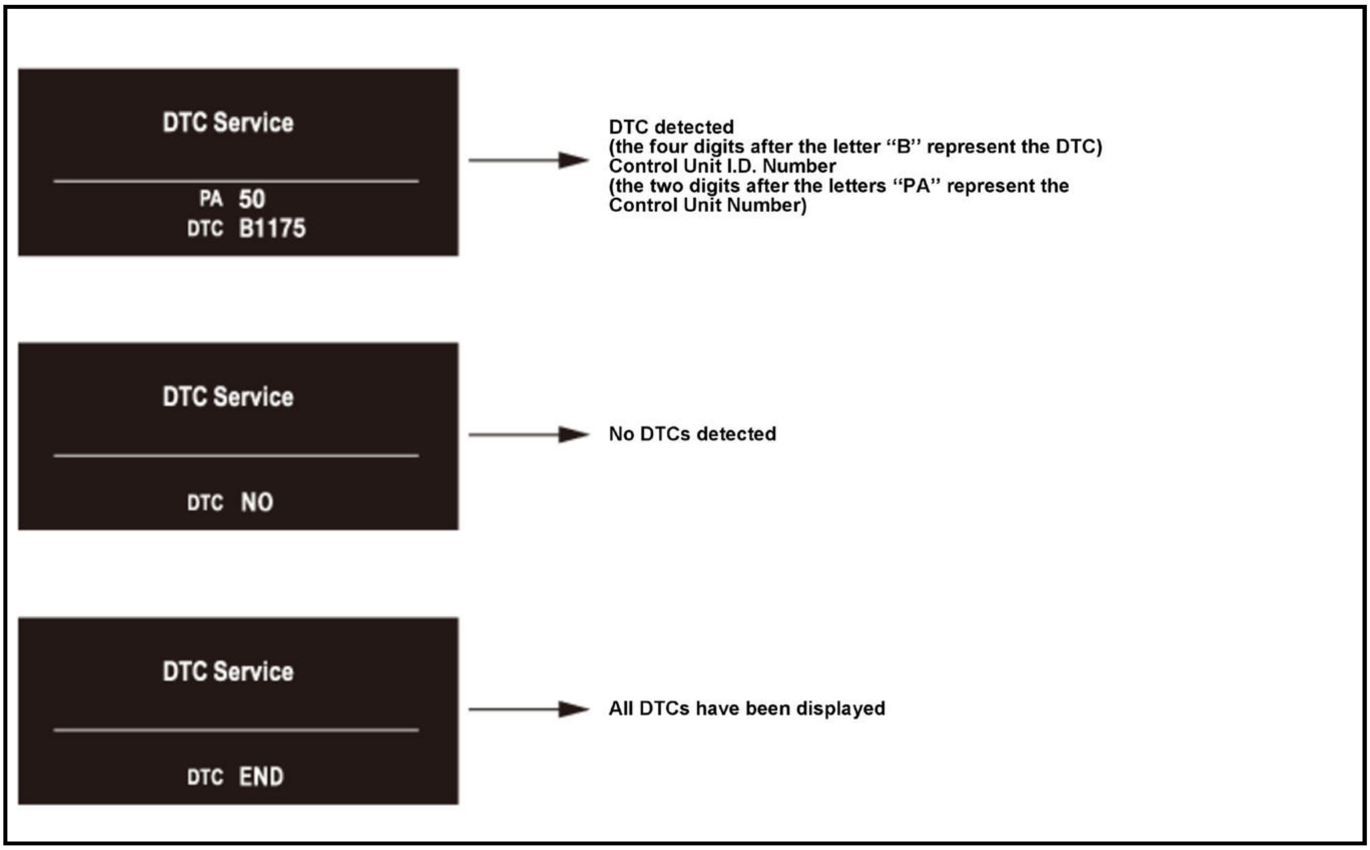
9. If the front individual map lights and the ceiling light keeps blinking after entering Test Mode 1. Check for B-CAN unit communication error.

Error	Display code(blinking pattern)
Communication bus line error (BUS OFF).	1
The body control module cannot receive signals from the gauge control module.	5

10. Check for B-CAN DTCs indicated by the LCD display while still in Test Mode 1. Press the TRIP button to display the next code. After you get to the last code, the display shows END. If no DTCs are stored, the display reads NO.

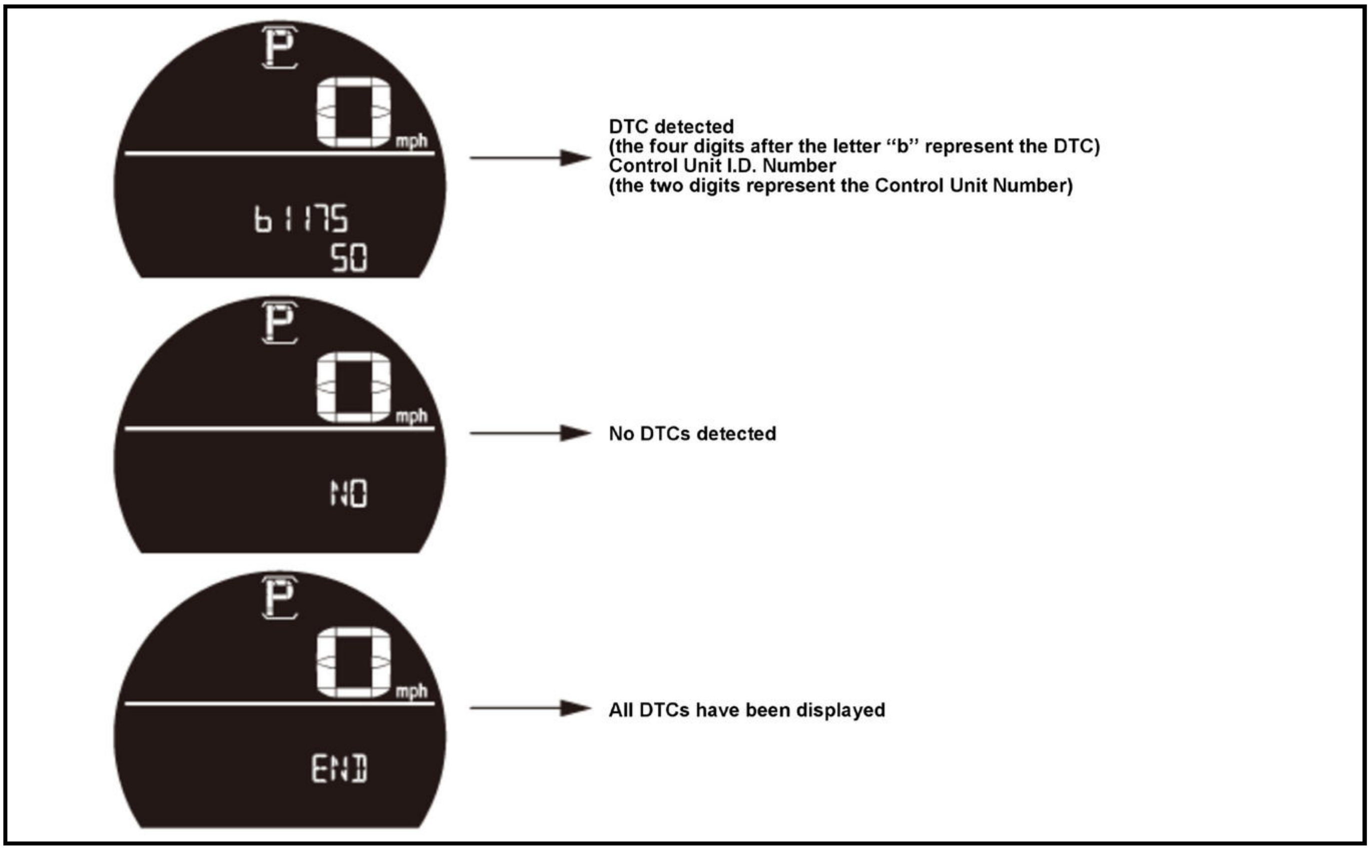
NOTE: **If the test times out, turn the vehicle to the OFF (LOCK) mode, and repeat steps 3**

With Multi-Information Display (MID)



DTC Service
PA 50
DTC B1175
DTC detected
(the four digits after the letter "B" represent the DTC)
Control Unit I.D. Number
(the two digits after the letters "PA" represent the Control Unit Number)
DTC Service
DTC NO
No DTCs detected
DTC Service
DTC END
All DTCs have been displayed

Without Multi-Information Display (MID)



P
0

b1175
50
DTC detected
(the four digits after the letter "b" represent the DTC)
Control Unit I.D. Number
(the two digits represent the Control Unit Number)
P
0
mph
NO
No DTCs detected
P
0
mph
END
All DTCs have been displayed

The control unit that has stored the code can be identified by the number shown after the letter "PA" on the multi-information display (MID).

Control Unit	Control Unit I.D. Number
Relay control module	11
Body control module	18
Power window master switch	30

Control Unit	Control Unit I.D. Number
Power tailgate control unit	31
Gauge control module	50
Climate control unit / HVAC control unit	51
Automatic lighting control unit-sensor	72
Power seat control unit	95
Immobilizer-keyless control unit	96
Parking and back-up sensor control unit	9A
Left side BSI radar unit	9F
Front seat heater control unit	A2
Right side BSI radar unit	A7
Wireless charger	AF

NOTE: You can also check B-CAN communication status by the following methods:

- The body control module self-diagnostic function Test Mode 1 and Test Mode 2 can check some communication statuses and some switch circuits.
- The gauge control module self-diagnostic function can check communication status .

Record all DTCs and sort them by DTC type, then troubleshoot them in this order:

- Internal error DTCs
- Loss of communication DTCs
- Signal error DTCs

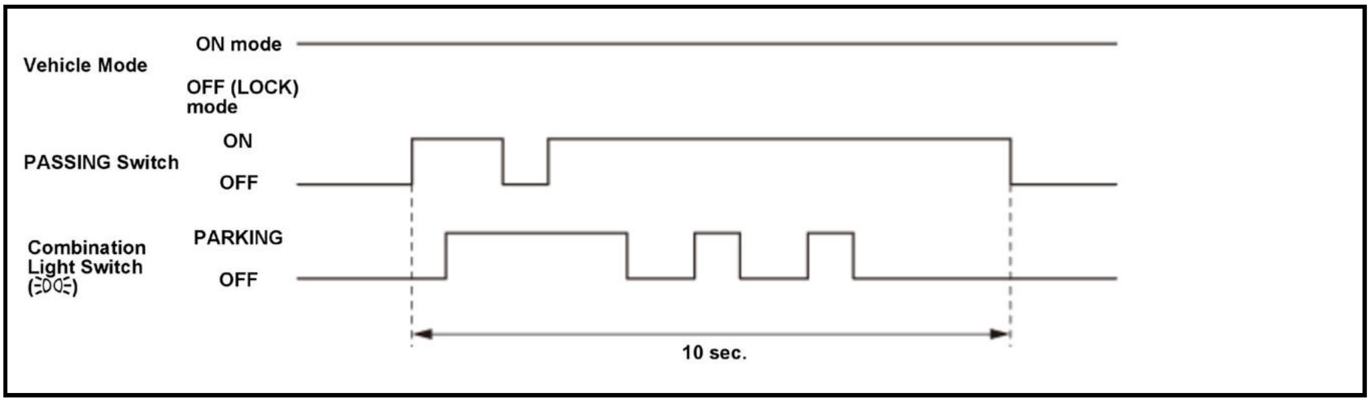
12. Clear the DTCs by pressing and holding the SEL/RESET knob for about 10 seconds.

13. You will hear a beep to confirm the codes have been cleared. Operate the devices that failed, and recheck for codes.

Shift to Test Mode 2

NOTE: Do steps 14-17 within 10 seconds.

14. Pull and hold the combination light switch in its PASSING position.



15. While holding the combination light switch is in PASSING position, turn to the PARKING position, then release, pull, and hold the combination light switch in its PASSING position.

16. Turn the combination light switch to OFF, then turn to the PARKING position, and turn to OFF two more times.

17. Release the combination light switch.

18. Wait 5 seconds, and watch the front individual map lights and the ceiling light. When the lights flash two times quickly and then go off, the system is in Test Mode 2.

NOTE: **If you repeat this procedure, the system automatically returns to Test Mode 1.**

19. The following tables list the circuits that can be checked in Test Mode 2. Operate the switch that is most closely related to the problem. If the circuit is OK, the individual map lights, and ceiling light blink once. If the circuit is faulty, there is no such indication.

- -

  If the front individual map lights and ceiling light do not blink even when a switch is operated, check two or three other circuits listed in the table. If the front individual map lights and ceiling light blink for each circuit, the additional circuits are OK; repair the short or open circuit that failed the test in step 19.

- -

  If the front individual map lights and ceiling light do not blink again, this means that the control unit has failed without triggering a DTC. Test a few more circuits. If they also fail, check the related control units using their input tests.

Body Control Module

Item	
Driver's door switch	Ignition key switch
Front passenger's door switch	Turn signal switch (LEFT)
Left rear door switch	Turn signal switch (RIGHT)
Right rear door switch	Hazard warning switch
Tailgate latch switch	Headlight switch (ON)
Tailgate outer handle switch	Headlight switch (OFF)
Left rear door lock knob switch (UNLOCK)	Lighting switch
Right rear door lock knob switch (UNLOCK)	Passing switch
Windshield wiper HI/LO switch	Front fog light switch
Windshield wiper INT/LO switch	Park pin switch
Windshield wiper MIST switch	Brake pedal position switch
Windshield wiper intermittent dwell time controller	Back-up light switch
Windshield washer switch	Transmission range switch
Rear window wiper switch	Driver's door outer handle touch sensor
Rear window wiper INT switch	Front passenger's door outer handle touch sensor
Rear window washer switch	Driver's door outer handle lock switch
Electric parking brake switch	Front passenger's door outer handle lock switch
Hands free access power tailgate control unit/sensor	B

Relay Control Module

Item	
Hood latch switch	B

Door Multiplex Control Unit

Item	
Driver's door lock switch (UNLOCK)	Power window master switch(Driver's window UP, DOWN, AUTO)
Driver's door lock switch (LOCK)	

Item	
Driver's door lock knob switch (UNLOCK)	Power window master switch(Front passenger's window UP, DOWN, AUTO)
Driver's door lock knob switch (LOCK)	
Driver's door key cylinder switch (UNLOCK)*	Power window master switch(Left rear window UP, DOWN, AUTO)
Driver's door key cylinder switch (LOCK)*	
Driving position memory switch (SET)	Power window master switch(Right rear window UP, DOWN, AUTO)
Driving position memory switch (POSITION 1)	

*: A second key is necessary to check the key cylinder inputs. Be sure to rotate the key cylinder switch two times to each position (lock and lock, unlock and unlock) to ensure the door lock knob switch is in the appropriate position.

Item	
Driving position memory switch (POSITION 2)	B

*: A second key is necessary to check the key cylinder inputs. Be sure to rotate the key cylinder switch two times to each position (lock and lock, unlock and unlock) to ensure the door lock knob switch is in the appropriate position.

Gauge Control Module

Item	
Electric parking brake/automatic brake hold switch	Audio remote-HFL switch
VSA OFF switch	Cruise control/ACC combination switch
TPMS switch	ECON switch
Brake fluid level switch	CMBS OFF switch
Washer fluid level switch	Idle stop OFF switch

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A - INITIAL COMMUNICATION AND DTC CHECKS

Check the PCM for DTCs and troubleshoot PCM or F-CAN loss of communication errors first, then do this diagnosis if the symptom is related to the B-CAN system.

Compare the symptom with this list of B-CAN related systems:

- Gauge control module
- Exterior lights
- Turn signals
- Entry light control
- Interior lights
- Safety indicators
- Horns (security and panic)
- Reminder chimes (seat belt, lights-on, and parking brake)
- Power window/panoramic glass roof/moonroof timer
- Wiper/washer
- Security
- Keyless entry
- Key interlock
- Power door locks
- Dashlights brightness
- Immobilizer

- Daytime running lights
- Driving position memory system
- Keyless access control
- Climate control
- BSI system
- Seat heater
- Parking and back-up sensor system
- Power tailgate
- Wireless charger

- -

  If the symptom is related to the B-CAN system, go to step 2.

- -

  If the symptom is not related to the B-CAN system, go to the system symptom troubleshooting.

2. **Connect the HDS to the data link connector (DLC)** .From the BODY ELECTRICAL system, select Mode Menu, then select the Connected Unit Menu to see if the following control units are communicating with the HDS.

- Body Control Module
- Relay control module
- Gauge control module
- Climate control unit
- Automatic lighting control unit-sensor
- Keyless access control unit
- Immobilizer-keyless control unit
- Door multiplex control unit
- Power tailgate control unit
- Power seat control unit
- Front seat heater control unit
- Parking and back-up sensor control unit
- Wireless charger

NOTE:

- If a unit is communicating with the HDS, "DETECT" is displayed.
- If a unit is not communicating or the vehicle is not equipped, "NOT AVAILABLE" is displayed.
- The HDS only checks the status one time when BODY ELECTRICAL is selected. To recheck the status after repair, reboot the HDS.

- -

  If all control units are communicating with the HDS, go to step 4.

- -

  If any of the control units are not communicating, go to **B-CAN System Diagnosis Test Mode B**.

- -

If all units are not communicating or only the body control module is communicating, go to **body control module DTC U1280 troubleshooting** .

4. Select the system that has the problem from the BODY ELECTRICAL SYSTEM SELECT menu, then select DTCs.

- -

  If any DTCs are indicated, go to step 5.

Record all DTCs, and sort them by DTC type, then troubleshoot them in this order:

- Internal error DTCs.
- Loss of communication DTCs.
- Signal error DTCs.

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE B - CONTROL UNIT NOT COMMUNICATING

Do this diagnosis if any of the control units are not communicating (NOT AVAILABLE is displayed in the HDS) as found by the **B-CAN System Diagnosis Test Mode A**.

1. Using the HDS, select the system that has the symptom from the BODY ELECTRICAL SYSTEM SELECT menu.

2. Select DTCs, and then check for loss of communication DTCs.

- -

  If any loss of communication DTCs are indicated, go to step 3.

- -

  If any loss of communication DTCs are not indicated, **replace the body control module** .

Do the power, ground, and communication part of the input test for the unit(s) not communicating with the HDS.

- Body Control Module
- Relay control module
- Gauge control module

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE C - NO DTCS AND OUTPUT WON'T SHUT OFF

Body Electrical Troubleshooting - B-CAN System Diagnosis Test Mode C - No DTCs and Output Won't Shut OFF

Do this diagnosis if a component that is controlled by the B-CAN system does not stop or turn off.

NOTE:

- If the component does not turn on, go to **B-CAN System Diagnosis Test Mode D**.
- See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and control the output devices.

1. Check for DTCs by selecting the system MODE MENU from the HDS.

- -

  If any DTCs are indicated, go to **B-CAN System Diagnosis Test Mode A**.

- -

  If any DTCs are not indicated, go to step 2.

2. Turn off the switch that controls the malfunctioning component.

3. Select the applicable system from the system MODE MENU, then select DATA LIST, and check the input of the switch that controls the related component.

- -

  If HDS indicates the switch is OFF, go to step 4.

- -

  If HDS indicates the switch is not OFF, go to step 6.

4. In the DATA LIST, check the output signal of the malfunctioning component.

- -

  If the output signal is OFF, go to step 5.

- -

  If the output signal is not OFF, replace the control unit that controls the device that will not turn OFF.

5. Check the relay that does not stop or turn off, if applicable, then check for a short in the wire between the relay and the component, the relay and control unit, or the component and control unit.

- -

  If the relay and the wire harness are OK, replace the control unit that controls the component that will not stop or turn OFF.

- -

  If the relay and the wire harness are not OK, replace the relay or repair/replace the wire harness.

6. Check the switch, then check for a short in the wire between the switch and the control unit that monitors the switch.

- -

  If the switch and the wire harness are OK, replace the control unit that monitors the switch.

- -

  If the switch and the wire harness are not OK, replace the switch or repair/replace the appropriate wire harness.

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE D - NO DTCS AND OUTPUT WON'T TURN ON

Do this diagnosis if a component that is controlled by the B-CAN system does not run or come on.

NOTE:

- If the component does not turn off or stop, go to **B-CAN System Diagnosis Test Mode C**.
- See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and control the output devices.

1. Check the fuse of the malfunctioning output device.

- -

  If the fuse is OK, go to step 2.

- -

  If the fuse is not OK, replace the fuse. If the fuse blows again, repair the short to ground on the fuse circuit of the malfunctioning device.

2. Check for DTCs by selecting the system MODE MENU from the HDS.

- -

  If any DTCs are indicated, go to **B-CAN System Diagnosis Test Mode A**.

- -

  If any DTCs are not indicated, go to step 3.

3. Turn ON the switch that controls the malfunctioning component.

4. Select the applicable system from the system MODE MENU, then select DATA LIST, and check the input of the switch that controls the related component.

- -

  If there is an output signal, go to step 5.

- -

  If there is not an output signal, go to step 9.

5. Check the relay (if applicable) and ground, then check for an open or a short in the circuit for the malfunctioning component.

- -

  If the relay and the wire harness are OK, go to step 6.

- -

  If the relay and the wire harness are not OK, replace the relay or repair the wire circuit.

6. Do the function test for the malfunctioning component.

- -

  If the output device pass the function test, go to step 7.

- -

  If the output device does not pass the function test, replace the component.

7. With the malfunctioning output device connected, connect a voltmeter between the malfunctioning output device and body ground on the wire that the control unit uses to control the output device circuit.

8. Select FUNCTIONAL TESTS from the system MODE MENU, and do the forced operation test of the malfunctioning component.

- -

  If the voltage changes (12 V to 0 V, or 0 V to 12 V), inspect the ground for the component. If OK, replace the component.

- -

  If the voltage does not change, replace the control unit that controls the malfunctioning component.

9. Select DATA LIST from the system MODE MENU, and make sure the switch signal input for the malfunctioning system indicates a change when operated.

- -

  If the switch input indicates ON when the switch is ON, replace the control unit that controls the malfunctioning component.

- -

  If the switch input does not indicate ON when the switch is ON, go to step 10.

10. Check the switch and its ground (if applicable), then check for an open or a short in the wire between the switch and the control unit that monitors it.

- -

  If the switch and the wire harness are OK, replace the control unit that monitors the switch.

- -

  If the switch and the wire harness are not OK, replace the switch, or repair/replace the wire harness.

DTC TROUBLESHOOTING INDEX

NETWORK COMMUNICATION DTC TROUBLESHOOTING INDEX

NOTE: Record all DTCs, and sort them by DTC type using the DTC troubleshooting index, then troubleshoot the DTC(s) in this order:

- Internal error DTCs
- Loss of communication DTCs
- Signal error DTCs

Automatic Lighting Control Unit

DTC	Description	DTC type
B1575	Auto light sensor error	Internal error
U1280	BUS OFF state is detected by CAN controller	Loss of communication
U1281	Auto light control unit lost communication with MICU	Loss of communication
U128D	Auto light control unit lost communication with gauge control module	Loss of communication

Body Control Module

DTC	Description	DTC type
B1002	MICU internal error (EEPROM error)	Internal error
B1003	MICU Update Error	Internal error
B1028	Rear wiper motor(Park) signal error	Signal error
B1032	MICU lost communication with SRS unit (CDS message)	Signal error
B1036	IG1 Power Supply Circuit Malfunction	Signal error
B1038	IMMOBILIZER F-CAN Authentication ID Not Received	Signal error
B1039	IMMOBILIZER F-CAN Authentication ID Unmatch	Signal error
B1040	BCM lost communication with Front wiper	Loss of communication
B1041	Front Wiper motor malfunction	Signal error
B1042	Front Wiper security line error	Signal error
B1043	Front Wiper unit internal error (EEPROM error)	Internal error
B1077	Windshield wiper motor (Park) signal error	Signal error
B1275	Head light OFF position Circuit Malfunction	Signal error
B1276	Head light switch parking (small) position Circuit Malfunction	Signal error
B1277	Head light AUTO position Circuit Malfunction	Signal error
B1278	Head light ON position Circuit Malfunction	Signal error
B1279	Dimmer switch Circuit Malfunction	Signal error
B1280	Turn signal switch Circuit Malfunction	Signal error
B1281	Front wiper MIST position Circuit Malfunction	Signal error
B1282	Front wiper INT(AUTO) position Circuit Malfunction	Signal error
B1283	Front wiper LOW position Circuit Malfunction	Signal error
B1284	Front wiper HIGH position Circuit Malfunction	Signal error
B2352	Rain Light Sensor Unit Internal error (EEPROM error)	Signal error
B2375	Rain Sensing malfunction	Signal error
B2376	Light sensing malfunction	Signal error
U0073	F-CAN communication bus line error	Loss of communication
U0100	BCM lost communication with ECM/PCM	Loss of communication
U0122	BCM lost communication with VSA/ABS	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	MICU lost communication with gauge control module	Loss of communication

DTC	Description	DTC type
U1291	MICU lost communication with relay control module	Loss of communication

Front Seat Heater Control Unit

DTC	Description	DTC type
B1C55	Driver's heater thermistor circuit open	Signal error
B1C56	Driver's heater thermistor circuit short	Signal error
B1C57	Passenger's heater thermistor circuit open	Signal error
B1C58	Passenger's heater thermistor circuit short	Signal error
B1C60	Driver's heater current abnormal high	Signal error
B1C61	Driver's heater current abnormal low	Signal error
B1C62	Passenger's heater current abnormal high	Signal error
B1C63	Passenger's heater current abnormal low	Signal error
B1C68	Driver's heater not heating	Signal error
B1C69	Passenger's heater not heating	Signal error
B1C70	Driver's main heater switch failure	Signal error
B1C71	Passenger's main heater switch failure	Signal error
U1064	Seat heater control unit lost communication with climate control unit	Loss of communication
U1280	Seat heater control unit communication bus line error (BUS-OFF)	Loss of communication

Gauge Control Module

DTC	Description	DTC type
B1175	Fuel level sensor (Fuel gauge sending unit) circuit malfunction	Signal error
B1176	Fuel level sensor (Fuel gauge sending unit) circuit short	Signal error
B1195	Gauge control module lost communication with Audio Remote Switch(LIN bus connected)	Loss of communication
U0029	F-CAN communication line error	Loss of communication
U0100	Gauge control module lost communication with ENG/AT	Loss of communication
U0101	Gauge control module lost communication with AT	Loss of communication
U0104	Gauge Control Module Lost Communication With Driving Support System Control Unit	Loss of communication
U0114	Gauge control module lost communication with All Wheel Drive Control Module	Loss of communication
U0122	Gauge control module lost communication with VSA modulator-control unit	Loss of communication
U0128	Gauge control module lost communication with EPB	Loss of communication
U0131	Gauge control module lost communication with EPS Unit	Loss of communication
U0151	Gauge control module lost communication with SRS unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Gauge control module lost communication with MICU (MICU frame)	Loss of communication
U1288	Gauge control module lost communication with PARKSR	Loss of communication
U128F	Gauge control module lost communication with BSI unit	Loss of communication

DTC	Description	DTC type
U129C	Gauge control module lost communication with multi purpose camera unit	Loss of communication
U3000-49	ECU internal circuit malfunction	Internal error
U3000-51	Reprogramming error	Internal error

Immobilizer-Keyless Control Unit

DTC	Description	DTC type
B1901	Immobilizer Unit Internal error (CPU error)	Internal error
B1902	Immobilizer Unit Internal error (EEPROM error)	Internal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication

DTC	Description	DTC type
U0155	Immobilizer-keyless control unit lost communication with gauge control module	Loss of communication
U0199	Immobilizer-keyless control unit lost communication with door multiplex control unit	Loss of communication
U1281	Lost communication with MICU (MICU frame)	Loss of communication
U128D	Lost communication with METER	Loss of communication

Keyless Access Backup Control Unit

DTC	Description	DTC type
B1926	Backup Control Antenna Open or Short	Internal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	Backup Control Unit Lost Communication with Gauge Control Module	Loss of communication

Keyless Access Control Unit

DTC	Description	DTC type
B1601	Keyless access control unit internal (CPU) error	Internal error
B1602	Keyless access control unit internal (EEPROM) error	Internal error
B1632	MTR CONT Signal Error	Signal error
B1640	RF1 antenna not connected or malfunction	Signal error
B1645	Driver's Door LF Antenna Circuit Short	Signal error
B1646	Driver's Door LF Antenna Circuit Open	Signal error
B1647	Passenger's Door LF Antenna Circuit Short	Signal error
B1648	Passenger's Door LF Antenna Circuit Open	Signal error
B1657	Rear Bumper LF Antenna Circuit Short	Signal error
B1658	Rear Bumper LF Antenna Circuit Open	Signal error
B1659	Front Interior LF Antenna Circuit Short	Signal error
B1660	Front Interior LF Antenna Circuit Open	Signal error
B1661	Middle Interior Antenna Circuit Shorted	Signal error
B1662	Middle Interior Antenna Circuit Opened	Signal error
B1663	Rear Interior LF Antenna Circuit Short	Signal error
B1664	Rear Interior LF Antenna Circuit Open	Signal error
B1667	Rear Shelf (Middle Interior) LF Antenna Circuit Short	Signal error
B1668	Rear Shelf (Middle Interior) LF Antenna Circuit Open	Signal error
U1280	Keyless access control unit communication bus line error (BUS-OFF)	Loss of communication

DTC	Description	DTC type
U1281	Keyless Access Control Unit Lost Communication with MICU	Loss of communication
U128D	Keyless Access Control Unit Lost Communication with Gauge Control Module	Loss of communication

Keyless Access Power Control Unit

DTC	Description	DTC type
B12C5	Engine Start/Stop Switch Failure	Signal error
B12C6	Electric Steering Lock Switch C/D Monitor Circuit Failure	Signal error
B12C7	Electric Steering Lock Motor Circuit Failure	Signal error
B12D0	Power Control Unit IG1A Circuit Error	Internal error
B12D1	Power Control Unit IG1B Circuit Error	Internal error
B12D2	Power Control Unit IG2 Circuit Error	Internal error
B12D3	Power Control Unit IG Latch Circuit Error	Internal error
B12E0	Electric Steering Lock Switch Internal Error	Internal error
B12E1	Electric Steering Lock Motor Internal Error	Internal error
B12E2	Electric Steering Lock Low Level Failure of MTRCUT1	Signal error
B12E3	Electric Steering Lock High Level Failure of MTRCUT1	Signal error
B12E4	Electric Steering Lock High Level Failure of MTRCUT2	Signal error
B12E5	Incorrect assembly of control unit for electric steering lock equipped vehicle	Signal error
B12F0	Power Control Unit Lost Communication with Electric Steering Lock	Loss of communication
U0073	F-CAN Communication Bus Line Error	Loss of communication
U0100	Power Control Unit Lost Communication with PCM	Loss of communication
U0122	Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power Control Unit Lost Communication with MICU	Loss of communication
U128D	Power Control Unit Lost Communication with Gauge Control Module	Loss of communication

Multiplex Control Unit, Door (Power Window Master Switch)

DTC	Description	DTC type
B1125	Driver's power window motor A pulse malfunction	Signal error
B1126	Driver's power window motor B pulse malfunction	Signal error
B1127	Driver's door lock key cylinder switch malfunction	Signal error
B1128	Driver's door lock switch malfunction	Signal error
B1129	Driver's door lock knob switch malfunction	Signal error
B1130	Front passenger's power window motor A pulse malfunction	Signal error
B1131	Front passenger's power window motor B pulse malfunction	Signal error
B1140	Driver's power window position detect circuit malfunction	Signal error

DTC	Description	DTC type
B1142	Door Multiplex Control Unit lost communication with front passenger's power window switch (UART line open)	Loss of communication
B1145	Front passenger's power window position detect circuit malfunction	Signal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Door multiplex control unit lost communication with MICU	Loss of communication
U128D	Door multiplex control unit lost communication with gauge control module	Loss of communication
U1299	Door multiplex control unit lost communication with climate control unit	Loss of communication

Parking and Back-Up Sensor Control Unit

DTC	Description	DTC type
B2601	Parking Sensor CPU Error	Internal error
B2602	Parking Sensor EEPROM Error	Internal error
B2610	Front 1st sensor failure	Signal error
B2611	Front 2nd sensor failure	Signal error
B2612	Front 3rd sensor failure	Signal error
B2613	Front 4th sensor failure	Signal error
B2614	Rear 1st sensor failure	Signal error
B2615	Rear 2nd sensor failure	Signal error
B2616	Rear 3rd sensor failure	Signal error
B2617	Rear 4th sensor failure	Signal error

DTC	Description	DTC type
B2618	Front 1st sensor data failure	Signal error
B2619	Front 2nd sensor data failure	Signal error
B261A	Front 3rd sensor data failure	Signal error
B261B	Front 4th sensor data failure	Signal error
B261C	Rear 1st sensor data failure	Signal error
B261D	Rear 2nd sensor data failure	Signal error
B261E	Rear 3rd sensor data failure	Signal error
B261F	Rear 4th sensor data failure	Signal error
B2646	Front sensor power failure	Signal error
B2647	Rear sensor power failure	Signal error
B2648	Front sensor signal short to ground	Signal error
B2649	Rear sensor signal short to ground	Signal error
B264A	Indicator circuit short to power	Signal error
B264B	Indicator circuit short to ground	Signal error
B264D	Front sensor combination error	Signal error
U0155	Lost communication with Gauge Control Module	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Lost communication with MICU	Loss of communication

Power Seat Control Unit

DTC	Description	DTC type
B1802	Power seat control unit internal (EEPROM) error	Internal error
B1825	Slide pulse error(no change in pulse for 1 second)	Signal error
B1826	Front height pulse error(no change in pulse for 1 second)	Signal error
B1827	Rear height pulse error(no change in pulse for 1 second)	Signal error
B1828	Recline pulse error(no change in pulse for 1 second)	Signal error
B1829	AT-P signal and VSP signal mismatch	Signal error
B1836	Power Seat Position Sensor circuit short	Signal error
B1837	Memory position calling timeout	Signal error
B1844	Power Seat Slide switch circuit malfunction	Signal error
B1845	Power Seat Recline switch circuit malfunction	Signal error
B1846	Power Seat Front Up-Down switch circuit malfunction	Signal error
B1847	Power Seat Rear Up-Down switch circuit malfunction	Signal error
U0199	Power seat control unit lost communication with door multiplex control unit (DRLockSW frame)	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power seat control unit lost communication with MICU (MICU frame)	Loss of communication
U128D	Lost Communication With Gauge Control Module (VSP/NE frame)	Loss of communication

Power Tailgate Control Unit

DTC	Description	DTC type
B1352	Power Tailgate Control Unit Internal error (EEPROM error)	Internal error
B1375	Driver's side PTG switch circuit malfunction	Signal error
B1376	Tailgate Outer Handle switch circuit malfunction	Signal error
B1377	Power Tailgate Inner switch circuit malfunction	Signal error
B1378	Power Tailgate Right Touch/Pinch sensor circuit malfunction	Signal error
B1379	Power Tailgate Left Touch/Pinch sensor circuit malfunction	Signal error
B1380	Tailgate Closer Unit Neutral switch circuit malfunction	Signal error

DTC	Description	DTC type
B1382	Tailgate Closer Unit Full Latch switch circuit malfunction	Signal error
B1383	Tailgate Closer Unit Ratchet switch circuit malfunction	Signal error
B1384	Tailgate Closer Unit Half Latch switch circuit malfunction	Signal error
B1385	Power Tailgate temperature sensor malfunction	Signal error
B1386	Power Tailgate sensor Pulse A circuit malfunction	Signal error
B1387	Power Tailgate sensor Pulse B circuit malfunction	Signal error
B1388	Power Tailgate Drive Motor circuit malfunction	Signal error
B1390	Power Tailgate Closer Motor function error	Signal error
U0199	Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	Loss of communication
U1280	Communication Bus line Error(a bus OFF state is detected by Power Tail Gate ECU)	Loss of communication
U1281	Lost communication with MICU (MICU frame)	Loss of communication

DTC	Description	DTC type
U128D	Power Tailgate Control Unit lost communication with GAUGE Control Module	Loss of communication

Relay Control Module

DTC	Description	DTC type
B1051	Relay control module internal (CPU) error	Internal error
B1052	Relay control module internal (EEPROM) error	Internal error
B1075	Headlight switch malfunction	Signal error
B1080	Power supply circuit (IG1 line) input error for Relay Control Module and MICU	Signal error
B1085	Head Light Low Beam Power Source Abnormality	Signal error
B108A	Right Side Parking Light Circuit Shorted	Signal error
B108B	Left Side Parking Light Circuit Shorted	Signal error
B108C	Right Side Head Light Low Beam Circuit Shorted	Signal error
B108D	Left Side Head Light Low Beam Circuit Shorted	Signal error
B108E	Right Side Head Light High Beam Circuit Shorted	Signal error
B108F	Left Side Head Light High Beam Circuit Shorted	Signal error
B1090	Illumination Circuit Shorted	Signal error
B1091	DRL Circuit Shorted	Signal error
B1092	Interior Light Cut Circuit Shorted	Signal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Relay control module lost communication with MICU(MICU frame)	Loss of communication
U128D	Relay control module lost communication with gauge control module(VSP/NE frame)	Loss of communication

Wireless Charger

DTC	Description	DTC Type
B22A0	Wireless charger unit failure	Internal error
B22A1	Wireless charger unit ACC input circuit failure	Signal error
U1280	Communication bus line Error (BUS-OFF)	Loss of communication
U1281	Wireless charger unit lost communication with MICU	Loss of communication
U1286	Wireless charger unit lost communication with Keyless Access Control Unit	Loss of communication
U128D	Wireless charger unit lost communication with Gauge control module	Loss of communication
U128E	Wireless charger unit lost communication with Audio-Navigation Unit	Loss of communication

REWRITE

CAN GATEWAY UPDATE (CAN GATEWAY)

Procedure

1. CAN Gateway - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Refer to User Manual of the Update Device for more information about updating control units.

DESCRIPTION & OPERATION

NETWORK COMMUNICATIONS SYSTEM DESCRIPTION

CAN (Controller Area Network) and the LIN (Local Interconnect Network)

The vehicle uses the CAN (Controller Area Network) and the LIN (Local Interconnect Network) as the in-vehicle LAN (Local Area Network). These networks enable the control units to exchange information over the CAN bus. The CAN consists of the F-CAN network that enables the control units to exchange the signals regarding the power train/chassis and the B-CAN network for the signals regarding the body. These networks are interconnected at the gauge control module (gateway).

The LIN is used for connecting the gauge to the audio remote-HFL switch; as well as for connecting the PCM to the shutter grille and the 12 volt battery sensor; as well as for connecting the power window master switch, front passenger's power window switch, and the moonroof motor-control unit *, ensuring a reliable communication suitable for the control system.

As multi-communication system between several control units, the system also provides the K-LINE and L-LINE for transmitting the diagnostic results from the HDS (Honda Diagnostic System) and the S-NET for transmitting the immobilizer signals.

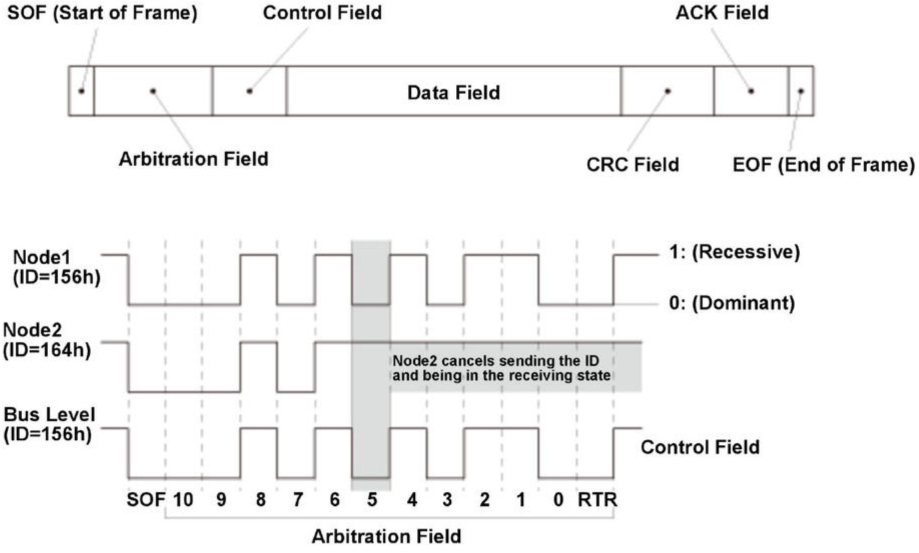
CAN

The CAN (control area network) is a multi communication system that ISO has developed and standardized for the automobile. The CAN employs a multi-master system in which multiple control units connected to a bus communicate with each other.

Communicating Method

CAN communication uses a data frame format on the CAN line. The CAN uses the CSMA/CA (Carrier Sense Multiple Access with Collision Avoidance) method to data frame collisions. This method transmits information only when the bus is sensed to be idle. The data frame uses "0" (dominant) and "1" (recessive) to create a message, which consists of the data field (message), arbitration field (data ID), control field (data length), CRC field (sending error detection), and the ACK field (end of message). After sending the data, each control unit classifies the data by the controller ID and controls outputs as commanded.



F-CAN

The network connecting the powertrain and chassis is called F-CAN and it employs high speed CAN with communication rate at 500 kbps. The F-CAN was composed of a single F-CAN Bus. To respond to the increase in the number of ECUs connected to the F-CAN and the increase in the amount of communication, the composition of the F-CAN network is divided into multiple bus lines, and an F-CAN gateway with a data-forwarding function is established, enabling the communication among the CAN Bus lines. Connection of each control unit has control units with terminating resistor installed for preventing signal from being reflected back at each end of a pair of twisted signal cable which is comprised of F-CAN_H and F-CAN_L, with other control units in parallel connection between them. By rapidly switching between equal and unequal voltages, digital data can be transmitted in bits.

B-CAN

The network between control units for body electrical system is called B-CAN and it employs low speed CAN with communication rate at 125 kbps. Connection of each control unit has control units with terminating resistor installed for preventing signal from being reflected back at each end of a pair of twisted wire which is comprised of B-CAN_H and B-CAN_L, with other control units in parallel connection between them.

Power Saving Mode Control

Since some control units for the body system are functional even if turning the vehicle in the OFF (LOCK) mode, the power-saving mode is set for these units for the purpose of reducing the dark current. Transition to the power-saving mode (sleep mode) and returning from it (wakeup mode) are controlled by the active, sleep and wakeup signals. The control units that are not in "wait for sleep" state send the active signals to the bus line periodically and stop sending them when it is in "wait for sleep" state. When all control units do not send the active signal anymore, one or more control units send the sleep signals. The control units that received the sleep signals go into the power-saving mode. In the event of inputs from switch or sensor during the power-saving mode, they send the wakeup signals to the bus line. In this case, they return from the power-saving mode.

LIN

Overview

The LIN is a bus based on UART. Communication rate of LIN is slower than that of CAN, and it is used for systems for which a high speed communication is not required. It is able to reduce the wire harness bulk as well as to reduce cost thanks to its connection with each control unit with just single bus. The LIN employs a single-master system, in which only single master control unit serves as a master control unit to control all the signals on the LIN bus. Other units become slave units to serve in accordance with request from the master control unit. This vehicle employs a LIN with a communication speed of 19, 200 bps for connecting the gauge to the audio remote-HFL switch; as well as for connecting the PCM to the shutter grille and the 12 volt battery sensor; and a LIN with a communication speed of 9, 600 bps for connecting the power window master switch, front passenger's window switch, and the moonroof motor-control unit *.

*1: With moonroof

Communication System

LIN uses a single-master system, where one ECU controls all bus communication. The other controllers act as slave units, communicating only when requested by the PCM. The message frame is comprised of the header frame that sends the master's request and the response frame that sends the slave's response. The header frame consists of the SYNCH BREAK field for showing the frame start, SYNCH field for correcting the baud rate, and the IDENT field for showing the control unit that requests the response. The response frame consists of the data fields and the CHECK SUM field for detecting transmitting errors.

Power Saving Mode

The body electrical system has a control unit which does not stop operating when the vehicle is turned to the OFF (LOCK) mode in order to perform door lock control and light control. These control units have a power saving mode to reduce the standby power requirement.

Network Communication Troubleshooting

The HDS (Honda Diagnostic System) uses the K-LINE for displaying the control unit and self-diagnostic results both in the F-CAN bus and B-CAN bus. The K-LINE bus is the communication circuit that uses the UART whose baud rate is 10.4 kbps. The vehicles equipped with keyless access system, also have an L-LINE data bus that connects the DLC to the body control module. This line allows the HDS to communicate with the body control module if the remote is lost or malfunctioning, preventing the ignition from being switched on. The S-NET serves as a path to transmit a signal from a transponder integrated into the remote, to control units related to the immobilizer system, such as the PCM and body control module. The gauge control module provides the display function for body-system DTC (Diagnostic Trouble Code). The DTCs are displayed when the gauge control module receives the SCS terminal short signal via F-CAN bus or the body control module service check ON signal via B-CAN bus. The gauge control module then reads the self-diagnostic results sent by each control unit via B-CAN bus, and displays the DTCs

DIAGNOSIS

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)

Shift to Test Mode 1

Check the PCM for DTCs and troubleshoot PCM or F-CAN loss of communication errors first, then do this diagnosis if the HDS is not available.

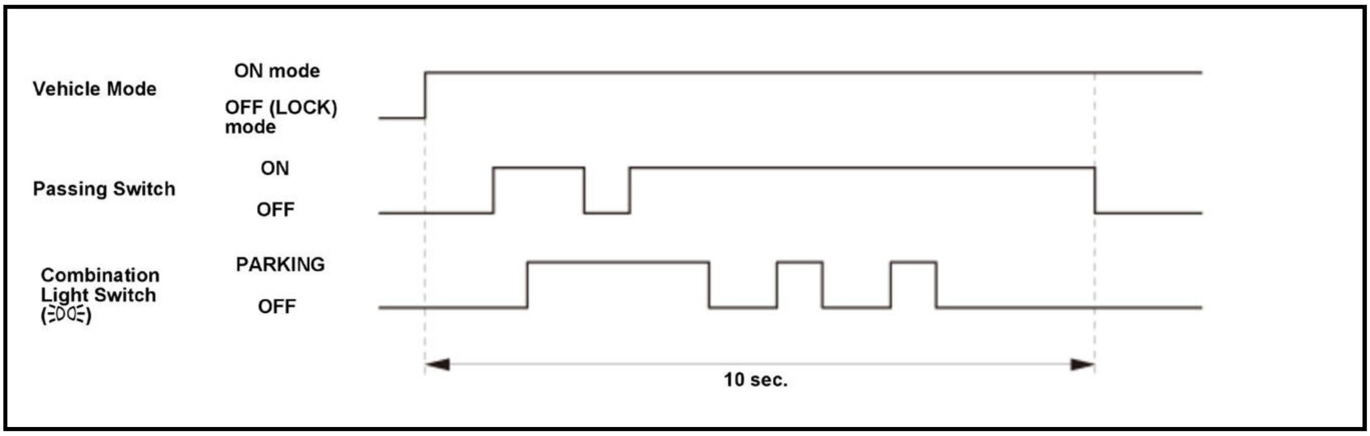
1. Check the BACK UP fuse and the FI MAIN fuse. If either fuse is blown, find and correct the cause, then replace the fuse.

2. Move the front individual map light switch OFF, the interior light switch to the DOOR position, the ceiling light switch to the MIDDLE position, and close all doors.

NOTE: Do steps 3-7 within 10 seconds.

3. Turn the vehicle to the ON mode.

4. Pull and hold the passing switch in its PASSING position.



5. While holding the combination light switch is in PASSING position, turn to the PARKING position, then release, pull, and hold the combination light switch in its PASSING position.

6. Turn the combination light switch to OFF, then turn to the PARKING position, and turn to OFF two more times.

7. Release the combination light switch.

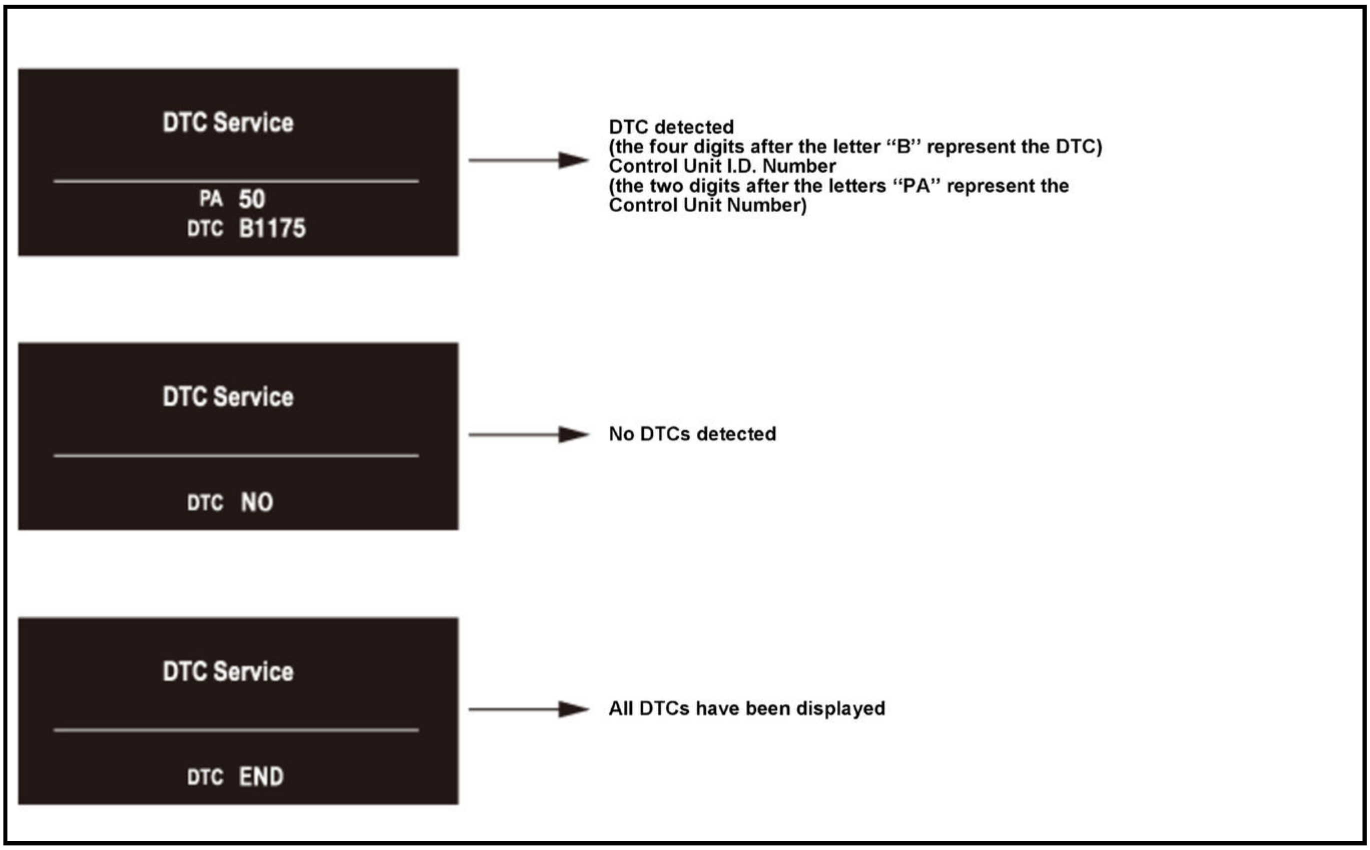
8. Wait 5 seconds, and watch the front individual map lights and the ceiling light. When the lights flash quickly once, the system enters in Test Mode 1.

9. If the front individual map lights and the ceiling light keeps blinking after entering Test Mode 1, check for B-CAN unit communication error.

Error	Display code (blinking pattern)
Communication bus line error (BUS OFF).	1
The body control module cannot receive signals from the gauge control module.	5

10. Check for B-CAN DTCs indicated by the LCD display while still in Test Mode 1. Press the TRIP button to display the next code. After you get to the last code, the display shows END. If no DTCs are stored, the display reads NO.

NOTE: If the test times out, turn the vehicle to the OFF (LOCK) mode, and repeat steps 3



DTC Service
PA 50

Control Unit I.D. Number
(the two digits after the letters "PA" represent the
Control Unit Number)
DTC Service
DTC NO
No DTCs detected
DTC Service
DTC END
All DTCs have been displayed

The control unit that has stored the code can be identified by the number shown after the letter "PA" on the multi-information display (MID).

Control Unit	Control Unit I.D. Number
Relay control module	11
Body control module	18
Power window master switch	30
Power tailgate control unit	31
Gauge control module	50
Climate control unit	51
Automatic lighting control unit-sensor	72
Power seat control unit	95
Left side BSI radar unit	9F
Front seat heater control unit	A2
Right side BSI radar unit	A7
Wireless charger	AF

NOTE: You can also check B-CAN communication status by the following methods:

- The body control module self-diagnostic function Test Mode 1 and Test Mode 2 can check some communication statuses and some switch circuits.
- The gauge control module self-diagnostic function can check communication status .

Record all DTCs and sort them by DTC type, then troubleshoot them in this order:

- Internal error DTCs
- Loss of communication DTCs
- Signal error DTCs

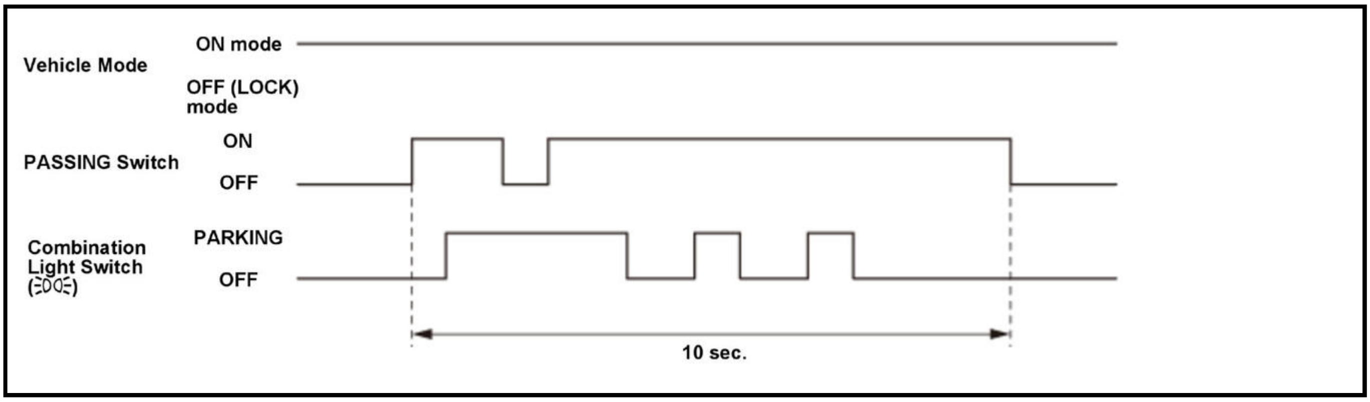
12. Clear the DTCs by pressing and holding the SEL/RESET knob for about 10 seconds.

13. You will hear a beep to confirm the codes have been cleared. Operate the devices that failed, and recheck for codes.

Shift to Test Mode 2

NOTE: Do steps 14-17 within 10 seconds.

14. Pull and hold the combination light switch in its PASSING position.



15. While holding the combination light switch is in PASSING position, turn to the PARKING position, then release, pull, and hold the combination light switch in its PASSING position.

16. Turn the combination light switch to OFF, then turn to the PARKING position, and turn to OFF two more times.

17. Release the combination light switch.

18. Wait 5 seconds, and watch the front individual map lights and the ceiling light. When the lights flash two times quickly and then go off, the system is in Test Mode 2.

NOTE: If you repeat this procedure, the system automatically returns to Test Mode 1.

19. The following tables list the circuits that can be checked in Test Mode 2. Operate the switch that is most closely related to the problem. If the circuit is OK, the individual map lights, and ceiling light blink once. If the circuit is faulty, there is no such indication.

- -

  If the front individual map lights and ceiling light do not blink even when a switch is operated, check two or three other circuits listed in the table. If the front individual map lights and ceiling light blink for each circuit, the additional circuits are OK; repair the short or open circuit that failed the test in step 19.

- -

  If the front individual map lights and ceiling light do not blink again, this means that the control unit has failed without triggering a DTC. Test a few more circuits. If they also fail, check the related control units using their input tests.

Body Control Module

Item	
Driver's door switch	Turn signal switch (LEFT)
Front passenger's door switch	Turn signal switch (RIGHT)
Left rear door switch	Hazard warning switch
Right rear door switch	Headlight switch (ON)
Tailgate latch switch	Headlight switch (OFF)

Item	
Tailgate outer handle switch	Lighting switch
Tailgate lock switch	Passing switch
Left rear door lock knob switch (UNLOCK)	Front fog light switch
Right rear door lock knob switch (UNLOCK)	Brake pedal position switch
Windshield wiper HI/LO switch	Driver's door outer handle touch sensor

Item	
Windshield wiper INT/LO switch	Front passenger's door outer handle touch sensor
Windshield wiper MIST switch	Electric parking brake switch
Windshield wiper intermittent dwell time controller	Hands free access power tailgate control unit/sensor
Windshield washer switch	B
Rear window wiper switch	
Rear window wiper INT switch	
Rear window washer switch	

Relay Control Module

Item	
Hood latch switch	B

Door Multiplex Control Unit

Item	
Driver's door lock switch (UNLOCK)	Power window master switch (Driver's window UP, DOWN, AUTO)
Driver's door lock switch (LOCK)	
Driver's door lock knob switch (UNLOCK)	Power window master switch (Front passenger's window UP, DOWN, AUTO)
Driver's door lock knob switch (LOCK)	
Driver's door key cylinder switch (UNLOCK)*	Power window master switch (Left rear window UP, DOWN, AUTO)
Driver's door key cylinder switch (LOCK)*	
Driving position memory switch (SET)	Power window master switch (Right rear window UP, DOWN, AUTO)
Driving position memory switch (POSITION 1)	
Driving position memory switch (POSITION 2)	B

*: A second key is necessary to check the key cylinder inputs. Be sure to rotate the key cylinder switch two times to each position (lock and lock, unlock and unlock) to ensure the door lock knob switch is in the appropriate position.

Gauge Control Module

Item	
Electric parking brake/automatic brake hold switch	Audio remote-HFL switch
VSA OFF switch	ACC combination switch
CMBS OFF switch	ECON switch
Brake fluid level switch	EV switch
B	SPORT mode switch

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A - INITIAL COMMUNICATION AND DTC CHECKS

Check the PCM for DTCs and troubleshoot PCM or F-CAN loss of communication errors first, then do this diagnosis if the symptom is related to the B-CAN system.

Compare the symptom with this list of B-CAN related systems:

- Gauge control module
- Exterior lights
- Turn signals
- Entry light control
- Interior lights
- Safety indicators
- Horns (security and panic) (if equipped)
- Reminder chimes (seat belt, lights-on, and parking brake)
- Power window timer (if equipped, panoramic glass roof or moonroof aiso apply)
- Wiper/washer
- Security (if equipped)
- Keyless entry
- Key interlock
- Power door locks
- Dashlights brightness
- Immobilizer
- Daytime running lights
- Keyless access control
- Climate control
- Seat heater

- -

  If the symptom is related to the B-CAN system, go to step 2.

- -

  If the symptom is not related to the B-CAN system, go to the system symptom troubleshooting.

2. **Connect the HDS to the data link connector (DLC)** . From the BODY ELECTRICAL system, select Mode Menu, then select the Connected Unit Menu to see if the following control units are communicating with the HDS.

- Acoustic vehicle alerting control unit
- Automatic lighting control unit-sensor
- Body Control Module
- BSI radar unit
- Climate control unit
- Front seat heater control unit
- Gauge control module
- Keyless access control unit
- Door multiplex control unit
- Parking and back-up sensor control unit
- Power seat control unit
- Power tailgate control unit
- Relay control module
- Wireless charger

NOTE:

- If a unit is communicating with the HDS, "DETECT" is displayed.
- If a unit is not communicating or the vehicle is not equipped, "NOT AVAILABLE" is displayed.
- The HDS only checks the status one time when BODY ELECTRICAL is selected. To recheck the status after repair, reboot the HDS.

- -

  If all control units are communicating with the HDS, go to step 4.

- -

  If any of the control units are not communicating, go to **B-CAN System Diagnosis Test Mode B**.

- -

  If all units are not communicating or only the body control module is communicating, go to **body control module DTC U1280 troubleshooting** .

Select the system that has the problem from the BODY ELECTRICAL SYSTEM SELECT menu, then select DTCs.

- -

  If any DTCs are indicated, go to step 5.

- -

  If the problem is related to one of the following items and the system that is malfunctioning does not stop or turn off, go to **B-CAN System Diagnosis Test Mode C**.

- -

  If the problem is related to one of the following items and the system that is malfunctioning does not run or turn on, go to **B-CAN System Diagnosis Test Mode D**.

-
  - Exterior lights
  - Turn signals
  - Entry light control
  - Interior lights
  - Horns (security and panic)
  - Wiper/washer
  - Power window
  - Power door locks
- -

  If the problem is related to one of the following items, go to the troubleshooting for that individual system.

-
  - Gauge control module
  - Safety indicators
  - Reminder chimes (seat belt, lights-on, and parking brake)

    - Security
    - Keyless entry
    - Dashlights brightness
    - Immobilizer
    - Rear window defogger (climate control)
    - Climate control
    - Keyless access control
    - Seat heater

Record all DTCs, and sort them by DTC type, then troubleshoot them in this order:

- Internal error DTCs.
- Loss of communication DTCs.
- Signal error DTCs.

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE B - CONTROL UNIT NOT COMMUNICATING

Do this diagnosis if any of the control units are not communicating (NOT AVAILABLE is displayed in the HDS) as found by the **B-CAN System Diagnosis Test Mode A**.

1. Using the HDS, select the system that has the symptom from the BODY ELECTRICAL SYSTEM SELECT menu.

2. Select DTCs, and then check for loss of communication DTCs.

- -

  If any loss of communication DTCs are indicated, go to step 3.

- -

  If any loss of communication DTCs are not indicated, **replace the body control module** .

Do the power, ground, and communication part of the input test for the unit(s) not communicating with the HDS.

- Acoustic vehicle alerting control unit
- Automatic lighting control unit-sensor
- Body Control Module
- BSI radar unit
- Climate control unit
- Front seat heater control unit
- Gauge control module
- Keyless access control unit
- Door multiplex control unit
- Parking and back-up sensor control unit
- Power seat control unit
- Power tailgate control unit
- Relay control module
- Wireless charger

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE C - NO DTCS AND OUTPUT WON'T SHUT OFF

Do this diagnosis if a component that is controlled by the B-CAN system does not stop or turn off.

NOTE:

- If the component does not turn on, go to **B-CAN System Diagnosis Test Mode D**.
- See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and control the output devices.

1. Check for DTCs by selecting the system MODE MENU from the HDS.

- -

  If any DTCs are indicated, go to **B-CAN System Diagnosis Test Mode A**.

- -

  If any DTCs are not indicated, go to step 2.

2. Turn off the switch that controls the malfunctioning component.

3. Select the applicable system from the system MODE MENU, then select DATA LIST, and check the input of the switch that controls the related component.

- -

  If HDS indicates the switch is OFF, go to step 4.

- -

  If HDS indicates the switch is not OFF, go to step 6.

4. In the DATA LIST, check the output signal of the malfunctioning component.

- -

  If the output signal is OFF, go to step 5.

- -

  If the output signal is not OFF, replace the control unit that controls the device that will not turn OFF.

5. Check the relay that does not stop or turn off, if applicable, then check for a short in the wire between the relay and the component, the relay and control unit, or the component and control unit.

- -

  If the relay and the wire harness are OK, replace the control unit that controls the component that will not stop or turn OFF.

- -

  If the relay and the wire harness are not OK, replace the relay or repair/replace the wire harness.

6. Check the switch, then check for a short in the wire between the switch and the control unit that monitors the switch.

- -

If the switch and the wire harness are OK, replace the control unit that monitors the switch.

- -

  If the switch and the wire harness are not OK, replace the switch or repair/replace the appropriate wire harness.

BODY ELECTRICAL TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE D - NO DTCS AND OUTPUT WON'T TURN ON

Do this diagnosis if a component that is controlled by the B-CAN system does not run or come on.

NOTE:

- If the component does not turn off or stop, go to B-CAN System Diagnosis Test Mode C.
- See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and control the output devices.

1. Check the fuse of the malfunctioning output device.

- -

  If the fuse is OK, go to step 2.

- -

  If the fuse is not OK, replace the fuse. If the fuse blows again, repair the short to ground on the fuse circuit of the malfunctioning device.

2. Check for DTCs by selecting the system MODE MENU from the HDS.

- -

  If any DTCs are indicated, go to B-CAN System Diagnosis Test Mode A.

- -

  If any DTCs are not indicated, go to step 3.

3. Turn ON the switch that controls the malfunctioning component.

4. Select the applicable system from the system MODE MENU, then select DATA LIST, and check the input of the switch that controls the related component.

- -

  If there is an output signal, go to step 5.

- -

  If there is not an output signal, go to step 9.

5. Check the relay (if applicable) and ground, then check for an open or a short in the circuit for the malfunctioning component.

- -

  If the relay and the wire harness are OK, go to step 6.

- -

If the relay and the wire harness are not OK, replace the relay or repair the wire circuit.

6. Do the function test for the malfunctioning component.

- -

  If the output device pass the function test, go to step 7.

- -

  If the output device does not pass the function test, replace the component.

7. With the malfunctioning output device connected, connect a voltmeter between the malfunctioning output device and body ground on the wire that the control unit uses to control the output device circuit.

8. Select FUNCTIONAL TESTS from the system MODE MENU, and do the forced operation test of the malfunctioning component.

- -

  If the voltage changes (12 V to 0 V, or 0 V to 12 V), inspect the ground for the component. If OK, replace the component.

- -

  If the voltage does not change, replace the control unit that controls the malfunctioning component.

9. Select DATA LIST from the system MODE MENU, and make sure the switch signal input for the malfunctioning system indicates a change when operated.

- -

  If the switch input indicates ON when the switch is ON, replace the control unit that controls the malfunctioning component.

- -

  If the switch input does not indicate ON when the switch is ON, go to step 10.

10. Check the switch and its ground (if applicable), then check for an open or a short in the wire between the switch and the control unit that monitors it.

- -

  If the switch and the wire harness are OK, replace the control unit that monitors the switch.

- -

  If the switch and the wire harness are not OK, replace the switch, or repair/replace the wire harness.

REWRITE

CAN GATEWAY UPDATE

Procedure

1. CAN Gateway - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Refer to User service information of the Update Device for more information about updating control units.

DTC TROUBLESHOOTING INDEX

NETWORK COMMUNICATION DTC TROUBLESHOOTING INDEX

NOTE: Record all DTCs, and sort them by DTC type using the DTC troubleshooting index, then troubleshoot the DTC(s) in this order:

- Internal error DTCs
- Loss of communication DTCs
- Signal error DTCs

Acoustic Vehicle Alerting Control Unit

DTC	Description	DTC type
B2890-13	An open in the acoustic vehicle alerting speaker circuit	Signal error
U0029-00	F-CAN communication line error	Loss of communication
U0100-00	Acoustic vehicle alerting control unit lost communication with PCM	Loss of communication
U0101-00	Acoustic vehicle alerting control unit lost communication with PCM/TCM	Loss of communication
U0122-00	Acoustic vehicle alerting control unit lost communication with VSA modulator-control unit	Loss of communication
U0128-00	Acoustic vehicle alerting control unit lost communication with Electric parking brake control unit	Loss of communication
U0129-00	Acoustic vehicle alerting control unit lost communication with Electric servo brake control unit	Loss of communication
U0155-00	Acoustic vehicle alerting control unit lost communication with Gauge control module	Loss of communication

Automatic Lighting Control Unit

DTC	Description	DTC type
B1575	Auto light sensor error	Internal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Auto Light Control Unit lost communication with MICU (body control module)	Loss of communication
U128D	Auto light control unit lost communication with gauge control module	Loss of communication

Body Control Module

DTC	Description	DTC type
B1002	BCM internal error (EEPROM error)	Internal error
B1003	BCM Update error	Internal error
B1028	Rear wiper motor (park) signal error	Signal error
B1032	CDS (Collision detection signal) signal error	Signal error
B1036	IG1 Power supply Circuit Malfunction	Signal error
B1038	IMMOBILIZER F-CAN Authentication ID Not Received	Signal error
B1039	IMMOBILIZER F-CAN Authentication ID Unmatch	Signal error
B1040	BCM lost communication with Front wiper	Loss of communication
B1041	Front Wiper motor malfunction	Signal error

DTC	Description	DTC type
B1042	Front Wiper security line error	Signal error
B1043	Front Wiper unit internal error (EEPROM error)	Internal error
B1077	Front wiper auto stop switch signal error	Signal error
B1275	Head light OFF position Circuit Malfunction	Signal error
B1276	Headlight Switch Parking (Small) Position Circuit Malfunction	Signal error
B1277	Head light AUTO position Circuit Malfunction	Signal error
B1278	Head light ON position Circuit Malfunction	Signal error
B1279	Dimmer switch Circuit Malfunction	Signal error
B1280	Turn signal switch Circuit Malfunction	Signal error

DTC	Description	DTC type
B1281	Front wiper MIST position Circuit Malfunction	Signal error
B1282	Front wiper INT(AUTO) position Circuit Malfunction	Signal error
B1283	Front wiper LOW position Circuit Malfunction	Signal error
B1284	Front wiper HIGH position Circuit Malfunction	Signal error
B2352	Rain Light Sensor Unit Internal error (EEPROM error)	Signal error
B2375	Rain Sensing malfunction in Rain/Light sensor	Signal error
B2376	Light sensing malfunction in Rain/Light sensor	Signal error
U0073	F-CAN communication bus line error (BUS-OFF)	Loss of communication
U0100	BCM lost communication with ECM/PCM	Loss of communication
U0122	BCM lost communication with VSA/ABS	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	BCM lost communication with gauge control module	Loss of communication
U1291	BCM lost communication with relay control module	Loss of communication

Front Seat Heater Control Unit

DTC	Description	DTC type
B1C55	Driver's heater thermistor circuit open	Signal error
B1C56	Driver's heater thermistor circuit short	Signal error
B1C57	Passenger's heater thermistor circuit open	Signal error
B1C58	Passenger's heater thermistor circuit short	Signal error
B1C60	Driver's heater current abnormal high	Signal error
B1C61	Driver's heater current abnormal low	Signal error
B1C62	Passenger's heater current abnormal high	Signal error
B1C63	Passenger's heater current abnormal low	Signal error
B1C68	Driver's heater not heating	Signal error
B1C69	Passenger's heater not heating	Signal error
B1C70	Driver's main heater switch failure	Signal error
B1C71	Passenger's main heater switch failure	Signal error
U1064	Seat heater control unit lost communication with climate control unit	Loss of communication
U1280	Seat heater control unit communication bus line error (BUS-OFF)	Loss of communication

Gauge Control Module

DTC	Description	DTC type
B1175	Fuel level sensor (Fuel gauge sending unit) circuit malfunction	Signal error
B1176	Fuel level sensor (Fuel gauge sending unit) circuit short	Signal error
B1195	Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	Loss of communication
U0029	F-CAN communication line error	Loss of communication
U0100	Gauge control module lost communication with ENG/AT	Loss of communication
U0101	Gauge control module lost communication with AT	Loss of communication
U0104	Gauge Control Module Lost Communication With Driving Support System Control Unit	Loss of communication
U0111	Gauge control module lost communication with Battery Condition Monitor Module	Loss of communication
U0114	Gauge control module lost communication with All Wheel Drive Control Module	Loss of communication
U0122	Gauge control module lost communication with VSA modulator-control unit	Loss of communication
U0128	Gauge control module lost communication with EPB	Loss of communication

DTC	Description	DTC type
U0131	Gauge control module lost communication with EPS Unit	Loss of communication
U0151	Gauge control module lost communication with SRS unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Gauge control module lost communication with MICU (body control module) (MICU frame)	Loss of communication
U1288	Gauge control module lost communication with PARKSR	Loss of communication
U128F	Gauge control module lost communication with BSI unit	Loss of communication
U129C	Gauge control module lost communication with multi purpose camera unit	Loss of communication
U12A0	Gauge control module lost communication with Acoustic Vehicle Alert System (AVAS)	Loss of communication
U3000-49	ECU internal circuit malfunction	Internal error
U3000-51	Reprogramming error	Internal error

Keyless Access Backup Control Unit

DTC	Description	DTC type
B1926	Backup Control Antenna Open or Short	Internal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U128D	Backup Control Unit Lost Communication with Gauge Control Module	Loss of communication

Keyless Access Control Unit

DTC	Description	DTC type
B1601	Keyless access control unit internal (CPU) error	Internal error
B1602	Keyless access control unit internal (EEPROM) error	Internal error
B1640	RF1 antenna not connected or malfunction	Signal error
B1645	Driver's Door LF Antenna Circuit Short	Signal error

DTC	Description	DTC type
B1646	Driver's Door LF Antenna Circuit Open	Signal error
B1647	Passenger's Door LF Antenna Circuit Short	Signal error
B1648	Passenger's Door LF Antenna Circuit Open	Signal error
B1657	Rear Bumper LF Antenna Circuit Short	Signal error
B1658	Rear Bumper LF Antenna Circuit Open	Signal error
B1659	Front Interior LF Antenna Circuit Short	Signal error
B1660	Front Interior LF Antenna Circuit Open	Signal error
B1661	Middle Interior Antenna Circuit Shorted	Signal error
B1662	Middle Interior Antenna Circuit Opened	Signal error
B1663	Rear Interior LF Antenna Circuit Short	Signal error
B1664	Rear Interior LF Antenna Circuit Open	Signal error
B1667	Rear Shelf (Middle Interior) LF Antenna Circuit Short	Signal error
B1668	Rear Shelf (Middle Interior) LF Antenna Circuit Open	Signal error
U1280	Keyless access control unit communication bus line error (BUS-OFF)	Loss of communication
U1281	Keyless Access Control Unit Lost Communication with MICU	Loss of communication
U128D	Keyless Access Control Unit Lost Communication with Gauge Control Module	Loss of communication

Keyless Access Power Control Unit

DTC	Description	DTC type
B12C5	Engine Start/Stop Switch (Power Switch) Failure	Signal error
B12D0	Power Control Unit IG1A Circuit Error	Internal error
B12D1	Power Control Unit IG1B Circuit Error	Internal error
B12D2	Power Control Unit IG2 Circuit Error	Internal error
B12D3	Power Control Unit IG Latch Circuit Error	Internal error
B12E5	Incorrect assembly of control unit for electric steering lock equipped vehicle	Signal error
B12F3	Power Control Unit Lost Communication with Transmission Control Unit	Loss of communication
U0073	F-CAN Communication Bus Line Error	Loss of communication
U0100	Power Control Unit Lost Communication with PCM	Loss of communication
U0122	Power Control Unit Lost Communication with ABS/VSA Modulator-Control Unit	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power Control Unit Lost Communication with MICU	Loss of communication
U128D	Power Control Unit Lost Communication with Gauge Control Module	Loss of communication

Multiplex Control Unit, Door (Power Window Master Switch)

DTC	Description	DTC type
B1125	Driver's power window motor A pulse malfunction	Signal error
B1126	Driver's power window motor B pulse malfunction	Signal error
B1127	Driver's door lock key cylinder switch malfunction	Signal error
B1128	Driver's door lock switch malfunction	Signal error
B1129	Driver's door lock knob switch malfunction	Signal error

DTC	Description	DTC type
B1130	Front Passenger's power window motor A-phase pulse signal input error	Signal error
B1131	Front Passenger's power window motor B-phase pulse signal input error	Signal error
B1140	Driver's power window position detect circuit malfunction	Signal error
B1142	Power window master switch lost communication with the other units (UART communication Error)	Loss of communication
B1145	Front passenger's window position detect circuit malfunction	Signal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1281	Power Window Master Switch lost communication with MICU (body control module)	Loss of communication
U128D	Power Window Master Switch lost communication with gauge control module	Loss of communication
U1299	Power Window Master Switch lost communication with climate control unit	Loss of communication

Parking and Back-Up Sensor Control Unit

DTC	Description	DTC type
B2601	Parking Sensor CPU Error	Internal error
B2602	Parking Sensor EEPROM Error	Internal error
B2610	Front 1st sensor failure	Signal error
B2611	Front 2nd sensor failure	Signal error
B2612	Front 3rd sensor failure	Signal error
B2613	Front 4th sensor failure	Signal error
B2614	Rear 1st sensor failure	Signal error
B2615	Rear 2nd sensor failure	Signal error
B2616	Rear 3rd sensor failure	Signal error
B2617	Rear 4th sensor failure	Signal error

DTC	Description	DTC type
B2618	Front 1st sensor data failure	Signal error
B2619	Front 2nd sensor data failure	Signal error
B261A	Front 3rd sensor data failure	Signal error
B261B	Front 4th sensor data failure	Signal error
B261C	Rear 1st sensor data failure	Signal error
B261D	Rear 2nd sensor data failure	Signal error
B261E	Rear 3rd sensor data failure	Signal error
B261F	Rear 4th sensor data failure	Signal error
B2646	Front sensor power failure	Signal error
B2647	Rear sensor power failure	Signal error
B2648	Front sensor signal short to ground	Signal error
B2649	Rear sensor signal short to ground	Signal error
B264A	Indicator circuit short to power	Signal error
B264B	Indicator circuit short to ground	Signal error
B264D	Front sensor combination error	Signal error
U0155	Lost communication with Gauge Control Module	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication

DTC	Description	DTC type
U1281	Lost communication with MICU	Loss of communication

Power Seat Control Unit

DTC	Description	DTC type
B1802	Power seat control unit internal (EEPROM) error	Internal error
B1825	Slide pulse error (no change in pulse for 1 second)	Signal error
B1826	Front height pulse error (no change in pulse for 1 second)	Signal error
B1827	Rear height pulse error (no change in pulse for 1 second)	Signal error
B1828	Driver seat recline motor pulse error	Signal error
B1829	AT-P signal and VSP or ESL_WHEEL signal mismatch	Signal error
B1836	Power Seat Position Sensor circuit short	Signal error
B1837	Memory position calling timeout	Signal error
B1844	Power Seat Slide switch circuit malfunction	Signal error
B1845	Power Seat Recline switch circuit malfunction	Signal error
B1846	Power Seat Front Up-Down switch circuit malfunction	Signal error
B1847	Power Seat Rear Up-Down switch circuit malfunction	Signal error
U0199	Power seat control unit lost communication with PW master SW	Loss of communication
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Power seat control unit lost communication with MICU (body control module) (MICU frame)	Loss of communication
U128D	Lost Communication With Gauge Control Module (VSP/NE or ESL_WHEEL frame)	Loss of communication

Power Tailgate Control Unit

DTC	Description	DTC type
B1352	Power Tailgate Control Unit Internal error (EEPROM error)	Internal error
B1375	Driver's side PTG switch circuit malfunction	Signal error
B1376	Tailgate Outer Handle switch circuit malfunction	Signal error
B1377	Power Tailgate Inner switch circuit malfunction	Signal error
B1378	Power Tailgate Right Touch/Pinch sensor circuit malfunction	Signal error
B1379	Power Tailgate Left Touch/Pinch sensor circuit malfunction	Signal error
B1380	Tailgate Closer Unit Neutral switch circuit malfunction	Signal error
B1382	Tailgate Closer Unit Full Latch switch circuit malfunction	Signal error
B1383	Tailgate Closer Unit Ratchet switch circuit malfunction	Signal error
B1384	Tailgate Closer Unit Half Latch switch circuit malfunction	Signal error
B1385	Power Tailgate temperature sensor malfunction	Signal error
B1386	Power Tailgate sensor Pulse A circuit malfunction	Signal error
B1387	Power Tailgate sensor Pulse B circuit malfunction	Signal error
B1388	Power Tailgate Drive Motor circuit malfunction	Signal error
B1390	Power Tailgate Closer Motor circuit malfunction	Signal error

DTC	Description	DTC type
U0199	Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	Loss of communication
U1280	Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)	Loss of communication
U1281	Lost communication with MICU (MICU frame)	Loss of communication
U128D	Power Tailgate Control Unit lost communication with GAUGE Control Module	Loss of communication

Relay Control Module

DTC	Description	DTC type
B1051	Relay control module internal (CPU) error	Internal error
B1052	Relay control module internal (EEPROM) error	Internal error
B1075	Headlight switch malfunction	Signal error
B1080	Power supply circuit (IG1 line) input error for Relay Control Module and MICU	Signal error
B1085	Head Light Low Beam Power Source Abnormality	Signal error
B108A	Right Side Parking Light Circuit Shorted	Signal error
B108B	Left Side Parking Light Circuit Shorted	Signal error
B108C	Right Side Head Light Low Beam Circuit Shorted	Signal error
B108D	Left Side Head Light Low Beam Circuit Shorted	Signal error
B108E	Right Side Head Light High Beam Circuit Shorted	Signal error
B108F	Left Side Head Light High Beam Circuit Shorted	Signal error
B1090	Illumination Circuit Shorted	Signal error
B1091	DRL Circuit Shorted	Signal error
B1092	Interior Light Cut Circuit Shorted	Signal error
U1280	B-CAN communication bus line error (BUS-OFF)	Loss of communication
U1281	Relay control module lost communication with MICU (MICU frame)	Loss of communication
U128D	Relay control module lost communication with gauge control module (VSP/NE frame)	Loss of communication

Wireless Charger

DTC	Description	DTC Type
B22A0	Wireless charger unit failure	Internal error
B22A1	Wireless charger unit ACC input circuit failure	Signal error
U1280	Communication bus line Error (BUS-OFF)	Loss of communication
U1281	Wireless charger unit lost communication with MICU	Loss of communication
U1286	Wireless charger unit lost communication with Keyless Access Control Unit	Loss of communication
U128D	Wireless charger unit lost communication with Gauge control module	Loss of communication
U128E	Wireless charger unit lost communication with Audio-Navigation Unit	Loss of communication

TROUBLESHOOTING

DLC CIRCUIT TROUBLESHOOTING

NOTE: If you suspect the HDS or the HDS DLC cable may be the source of the communication problem, verify that they are working properly by connecting them to a known-good, similar vehicle and system, and check for communication problems.

*1: With navigation	
*2: Without navigation	

1. HDS communication check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Connect the HDS to the DLC** .

   NOTE: Make sure the HDS is properly connected to the DLC.

   -3. Turn the vehicle to the ON mode, and turn on the HDS.

   Does the HDS identify the vehicle?

   YES

   Go to step 2.

   NO

   Go to step 14.

2. Determine possible failure area (PGM-FI system, other systems)

   -1. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   If the HDS does not communicate with the PCM, go to step 3.

   NO

   If the HDS does not communicate with the SRS, go to step 5.

   NO

   If the HDS does not communicate with the VSA system, go to step 6.

   NO

   If the HDS does not communicate with the EPS system, go to step 7.

   NO

   If the HDS does not communicate with the ONE-PUSH START system, go to step 8.

   NO

If the HDS does not communicate with the BODY ELECTRICAL system, go to step 9.

NO

If the HDS does not communicate with the DRIVING SUPPORT system, go to step 10.

3. Open wire check (F-CAN A_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

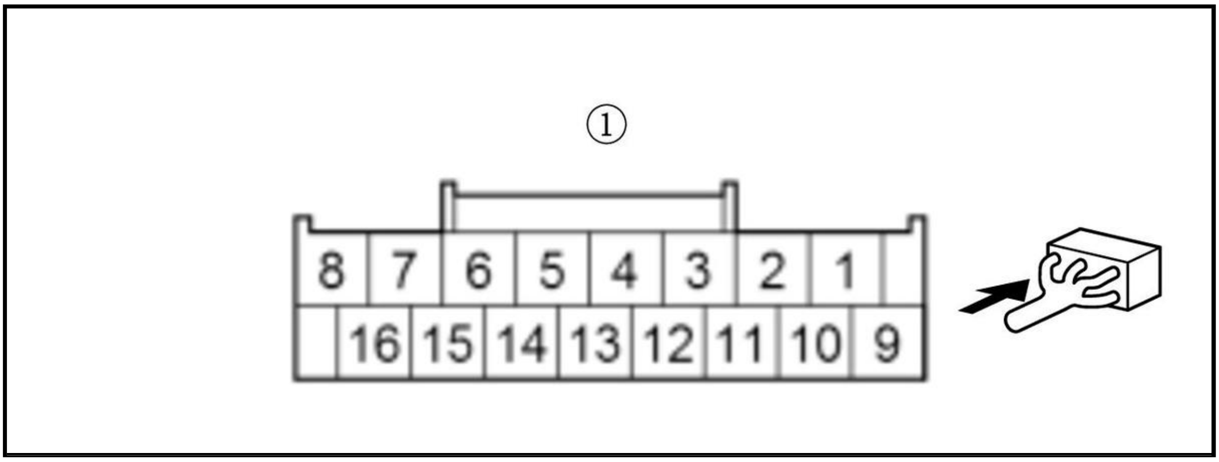
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	PCM connector A (50P) No. 37



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire is OK. Go to step 4.

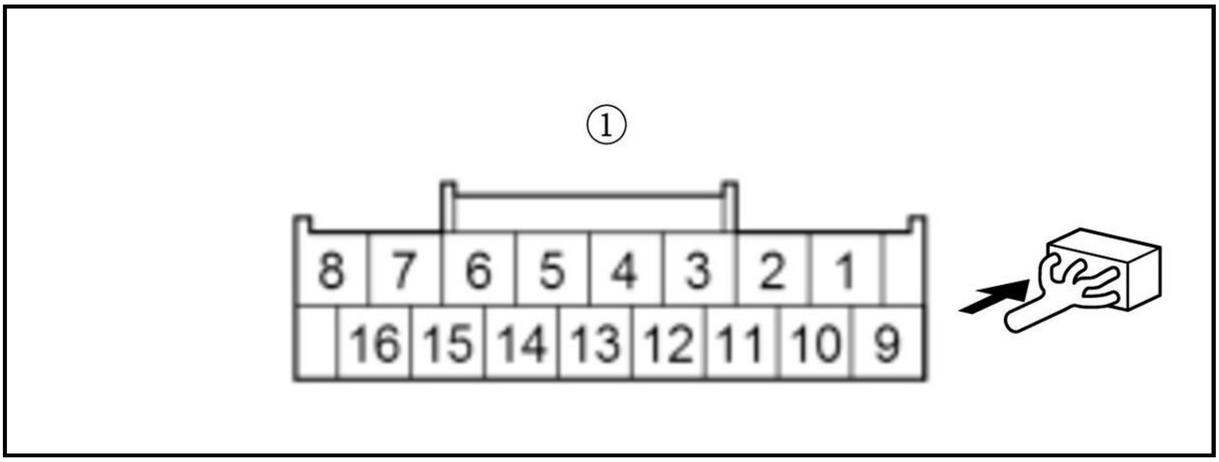
NO

Repair an open in the F-CAN A_H wire between the PCM (A37) and the CAN gateway.

4. Open wire check (F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**PCM connector A (50P) No. 36**



Is there 1.0 Ω or less?

YES

The F-CAN A_L wire is OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. **Go to the PCM power and ground circuit troubleshooting** .

NO

Repair an open in the F-CAN A_L wire between the PCM (A36) and the CAN gateway.

5. SRS check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the SRS indicator.

Does the SRS indicator come on and go off?

YES

The SRS is OK. Go to step 11.

NO

Go to the symptom troubleshooting for SRS indicator stays on, but no DTCs are stored, or cannot be read .

6. VSA system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the VSA indicator.

Does the VSA indicator come on and go off?

YES

The VSA system is OK. Go to step 11.

NO

Go to the symptom troubleshooting for ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off .

7. EPS system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Enter the maintenance mode , then start the engine, and watch the EPS indicator.

Does the EPS indicator come on and go off?

YES

The EPS system is OK. Go to step 11.

NO

Go to the EPS symptom troubleshooting for EPS indicator does not go off, and no DTCs are stored .

8. Keyless access system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the security indicator.

Does the security indicator stay on or blinkΩ

YES

Go to the keyless access system symptom troubleshooting information .

NO

The keyless access system is OK. Go to step 11.

9. Body electrical system check

-1. Do the gauge control module self-diagnostic function .

-2. Check the gauge display.

Is Error 2 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

The body electrical system is OK. Go to step 11.

10. Driving support system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and watch the ACC indicator, the CMBS indicator, the LKAS indicator, the RDM indicator, and the auto high-beam activation indicator.

Does the ACC indicator, the CMBS indicator, the LKAS indicator, the RDM indicator, and/or the auto high-beam activation indicator come on and go off?

YES

The driving support system is OK. Go to step 11.

NO

Go to the driving support system symptom troubleshooting; **ACC** , **CMBS** , **LKAS** , **RDM** , **Auto High-Beam** .

11. Open wire check (K-LINE line or L-LINE line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the HDS from the DLC.

Disconnect the control unit(s) on the K-LINE or L-LINE that does not communicate.

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

K-LINE

- Audio-navigation unit connector A (24P) *1
- Audio unit connector A (24P) *2
- ANC/active sound control unit 20P connector
- Body control module connector D (40P)

L-LINE

- Body control module connector F (36P)
- SRS unit connector A (39P)

-4. Measure the resistance between DLC (16P) No. 7 (K-LINE line) and these connector terminals, or DLC (16P) No. 15 (L-LINE line) and these connector terminals:

K-LINE

Connector	Terminal
Audio-navigation unit connector A (24P)*1	No. 12
Audio unit connector A (24P)*2	No. 12
ANC/active sound control unit 20P connector	No. 14
Body control module connector D (40P)	No. 36

L-LINE

Connector	Terminal
Body control module connector F (36P)	No. 21
SRS unit connector A (39P)	No. 33

Is there 1.0 Ω or less between the DLC and the terminals in the chart?

YES

Go to step 12.

NO

Repair an open in the wire between the DLC (K-LINE wire or L-LINE wire) and the appropriate connector.

12. Determine possible failure area (short in K-LINE line or L-LINE line, others)

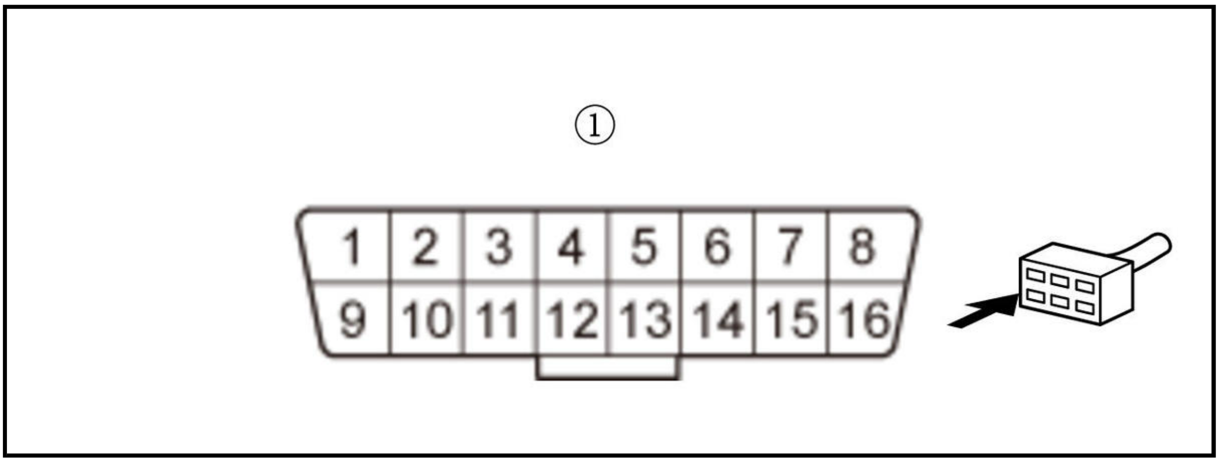
    -1. Reconnect all connectors.

    -2. If the 12 volt battery negative terminal is disconnected in step 11-3, **do the 12 volt battery terminal reconnection procedure** .

    -3. Turn the vehicle to the ON mode.

    -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	DLC (16P) (female terminals) No. 7 and No. 15: ①
Test point 2	Body ground



Is there any voltage?

YES

Go to step 14.

NO

Go to step 13.

13. Shorted wire check (K-LINE line, L-LINE line):

    Continue to measure the voltage between DLC (16P) No. 7 (K-LINE line) and body ground, or DLC (16P) No. 15 (L-LINE line) and body ground while disconnecting these parts, one at a time:

    NOTE: Turn the vehicle to the OFF (LOCK) mode before disconnecting the connector, and turn the vehicle to the ON mode before measuring the voltage.

    K-LINE

    - Audio-navigation unit connector A (24P) *1
    - Audio unit connector A (24P) *2
    - ANC/active sound control unit 20P connector
    - Body control module connector D (40P)

L-LINE

- Body control module connector F (36P)
- SRS unit connector A (39P)

  NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

Is there battery voltage when the one of the above components is disconnected?

YES

Replace the component that caused the battery voltage to return when it was disconnected.

NO

Repair a short in the wire between the DLC (16P) No. 7 (K-LINE) and the audio-navigation unit *1, audio unit *2, the ANC/active sound control unit, the body control module, or the DLC (16P) No. 15 (L-LINE) and the body control module, the SRS unit.

14. Body electrical system (B-CAN) check

    -1. **Do the gauge control module self-diagnostic function** .

    -2. Check for gauge control module DTCs without the HDS.

    Is DTC U0029 and/or U0100 indicated?

    YES

    Do the PCM power and ground circuit troubleshooting .

    NO

    Go to step 15.

15. Open wire check (+B_BACK_UP line)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the HDS from the DLC.

    -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

Is there battery voltage?

YES

The +B_BACK_UP wire is OK. Go to step 16.

NO

Repair an open in the +B_BACK_UP wire between data link connector (16P) No. 16 and the **No. A18 fuse** .

16. Open wire check (GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

Is there battery voltage?

YES

The GND wire is OK. Go to step 17.

NO

Repair an open in the GND wire between DLC (16P) No. 4 and G401.

17. Open wire check (+B_BACK_UP line)

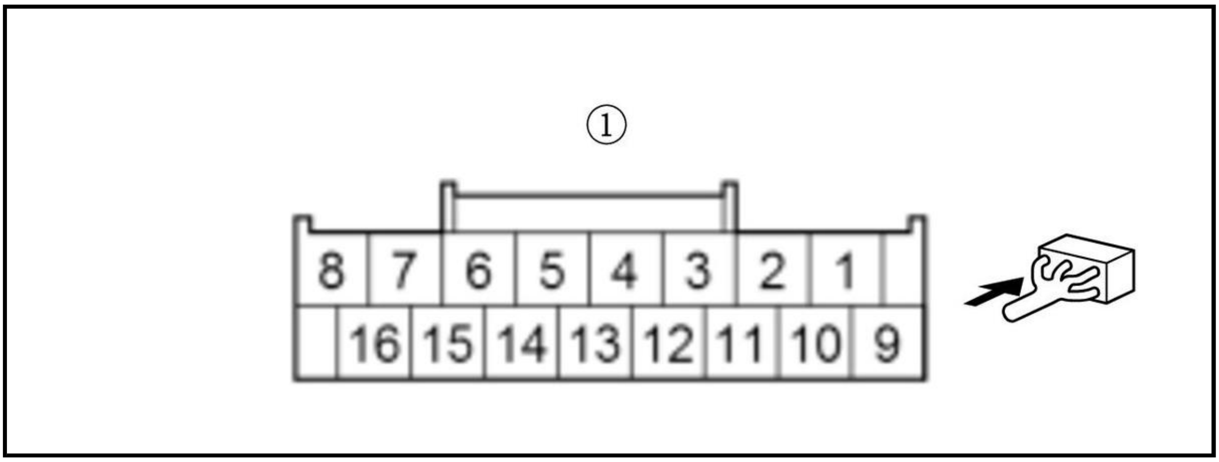
-1. Disconnect the following connector.

CAN gateway 16P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	CAN gateway 16P connector (female terminals) No. 1: ①

Test point 2	Body ground



Is there battery voltage?

YES

The +B_BACK_UP wire is OK. Go to step 18.

NO

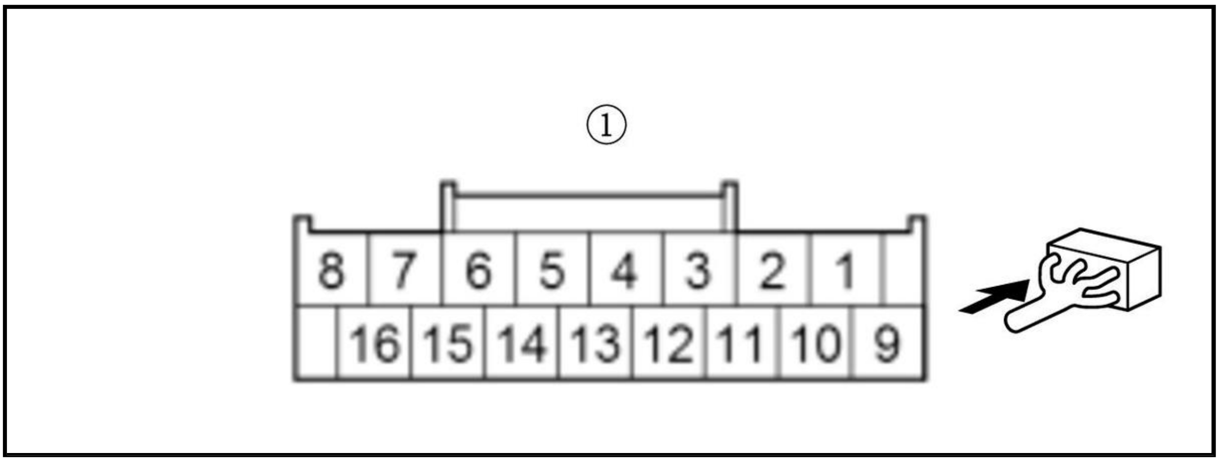
Repair an open in the +B_BACK_UP wire between CAN gateway (16P) No. 1 and the **No. A18 fuse** .

18. Open wire check (IG1_METER line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1_METER wire is OK. Go to step 19.

NO

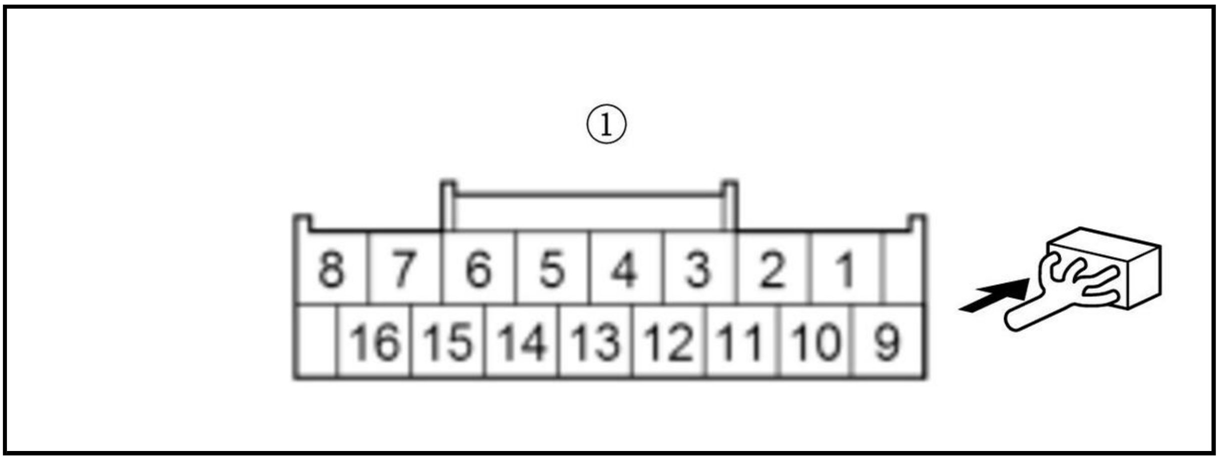
Repair an open in the IG1_METER wire between the CAN gateway and the **No. D7 fuse** .

19. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 20.

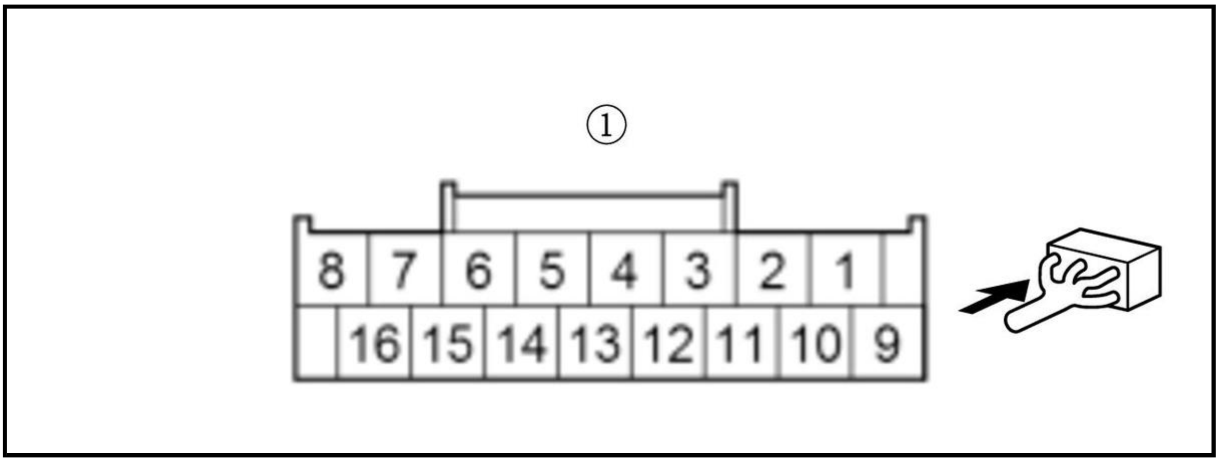
NO

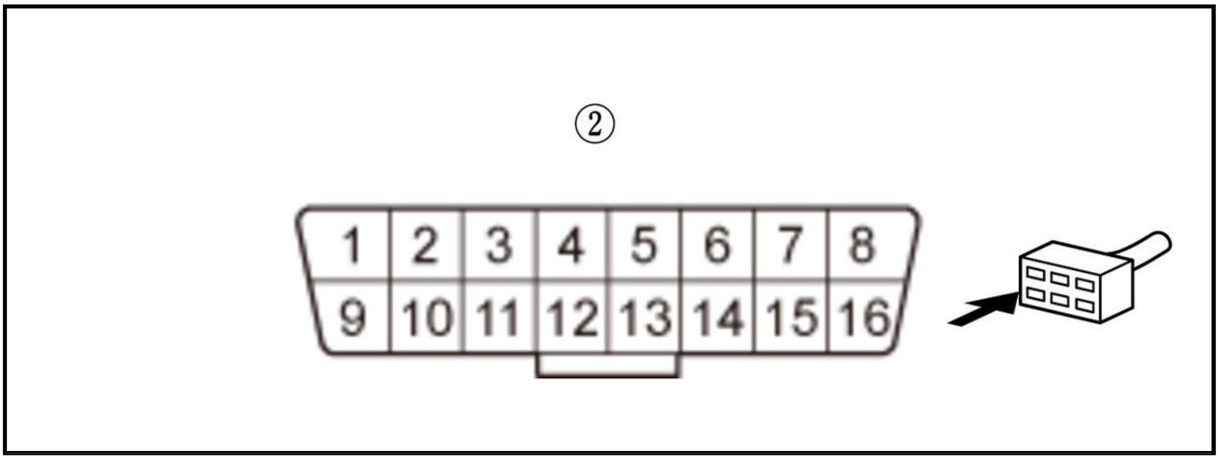
Repair an open in the GND wire between the CAN gateway and G401.

20. Open wire check (DIAG-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 2: ①
Test point 2	DLC (16P) (female terminals) No. 6: ②





Is there 1.0 Ω or less?

YES

The DIAG-CAN_H wire is not open. Go to step 21.

NO

Repair an open in the DIAG-CAN_H wire between the CAN gateway and the DLC (16P) No. 6.

21. Open wire check (DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 10: ①

Is there 1.0 Ω or less?

YES

The DIAG-CAN_L wire is not open. Go to step 22.

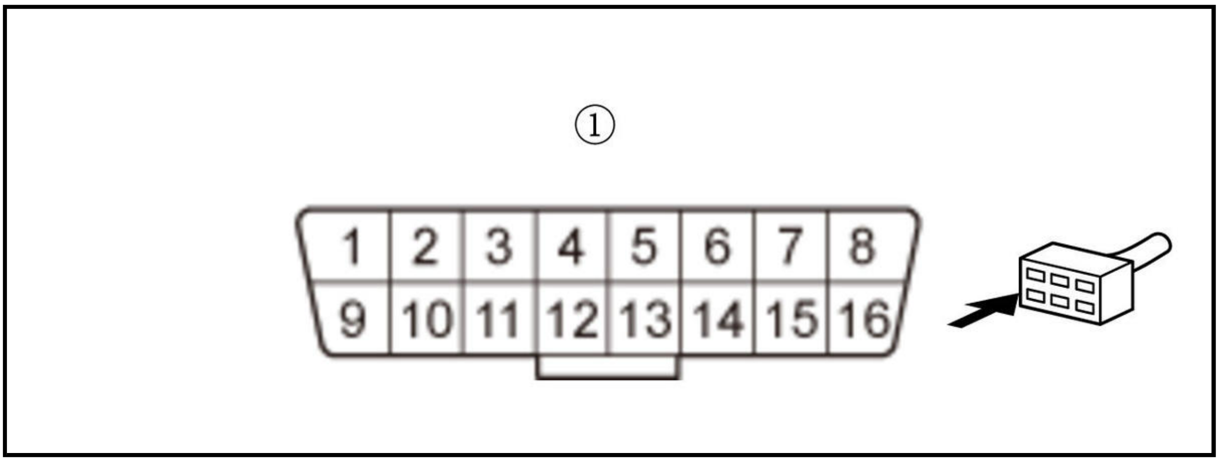
NO

Repair an open in the DIAG-CAN_L wire between the CAN gateway and the DLC (16P) No. 14.

22. Shorted wire check (DIAG-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The DIAG-CAN_H wire is not shorted to ground. Go to step 23.

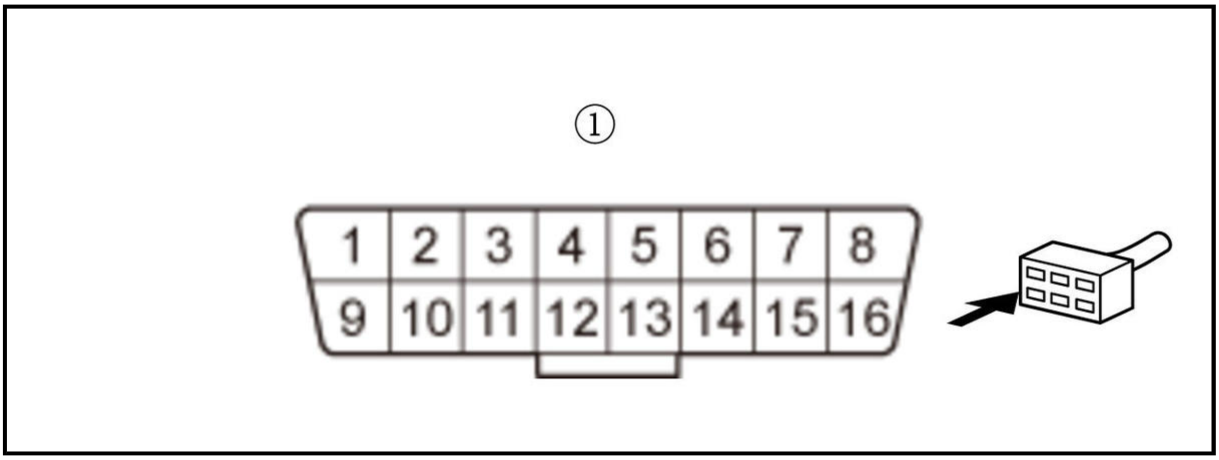
NO

Repair a short in the DIAG-CAN_H wire between the CAN gateway and the DLC (16P) No. 6.

23. Shorted wire check (DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The DIAG-CAN_L wire is not shorted to ground. Go to step 24.

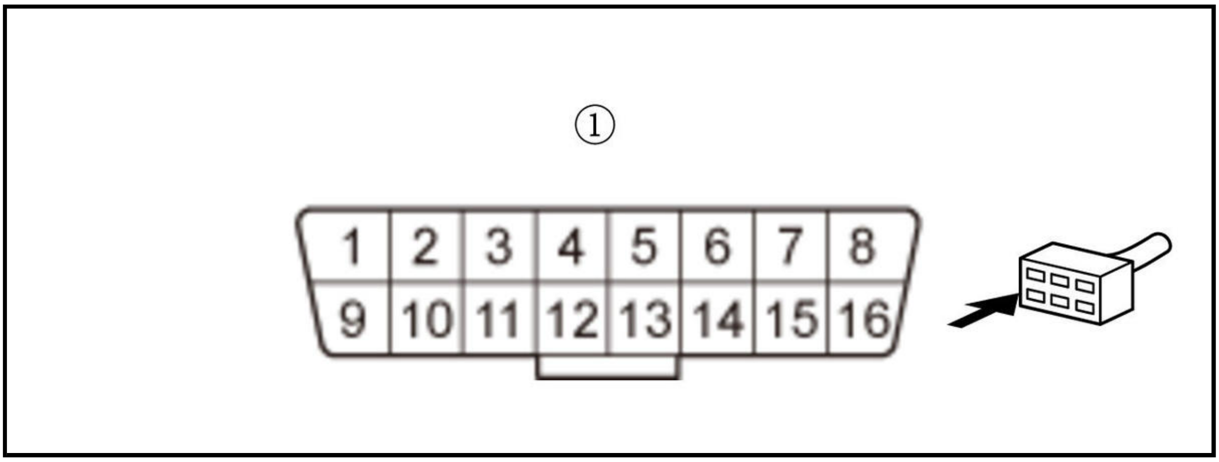
NO

Repair a short in the DIAG-CAN_L wire between the CAN gateway and the DLC (16P) No. 14.

24. Shorted wire check (DIAG-CAN_H line to DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 6: ①
Test point 2	DLC (16P) (female terminals) No. 14: ①



Is there 1 MΩ or more?

YES

The DIAG-CAN_H wire and the DIAG-CAN_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good CAN gateway** .

NO

Repair a short in the DIAG-CAN_H wire to the DIAG-CAN_L wire between DLC (16P) No. 6 and No. 14.

DTC TROUBLESHOOTING

DTC B2601

DTC B2601 : Parking Sensor CPU Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B2601 Parking Sensor CPU Error	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B2601 Parking Sensor CPU Error	B

   Is DTC B2601 indicated?

   YES

   Replace the parking and back-up sensor control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2602

DTC B2602 : Parking Sensor EEPROM Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B2602 Parking Sensor EEPROM Error	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B2602 Parking Sensor EEPROM Error	B

Is DTC B2602 indicated?

YES

Replace the parking and back-up sensor control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2610, B2611, B2612, B2613

DTC B2610 : Front 1st sensor failure

DTC B2611 : Front 2nd sensor failure

DTC B2612 : Front 3rd sensor failure

DTC B2613 : Front 4th sensor failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2610 Front 1st sensor failure	B
B2611 Front 2nd sensor failure	B
B2612 Front 3rd sensor failure	B
B2613 Front 4th sensor failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2610 Front 1st sensor failure	B
B2611 Front 2nd sensor failure	B
B2612 Front 3rd sensor failure	B
B2613 Front 4th sensor failure	B

Are any DTCs indicated?

YES

Refer to the DTC shown on the display, then replace the sensor based on the instructions (see table).

DTC	Operation for transmitting control unit
B2610	Left front corner sensor
B2611	Left front center sensor
B2612	Right front center sensor

DTC	Operation for transmitting control unit
B2613	Right front corner sensor

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2614, B2615, B2616, B2617

DTC B2614 : Rear 1st sensor failure

DTC B2615 : Rear 2nd sensor failure

DTC B2616 : Rear 3rd sensor failure

DTC B2617 : Rear 4th sensor failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2614 Rear 1st sensor failure	B
B2615 Rear 2nd sensor failure	B
B2616 Rear 3rd sensor failure	B
B2617 Rear 4th sensor failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2614 Rear 1st sensor failure	B
B2615 Rear 2nd sensor failure	B
B2616 Rear 3rd sensor failure	B
B2617 Rear 4th sensor failure	B

Are any DTCs indicated?

YES

Refer to the DTC shown on the display, then replace the sensor based on the instructions (see table).

DTC	Operation for transmitting control unit
B2614	Left rear corner sensor
B2615	Left rear center sensor
B2616	Right rear center sensor

DTC	Operation for transmitting control unit
B2617	Right rear corner sensor

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2618, B2619, B261A, B261B

DTC B2618 : Front 1st sensor data failure

DTC B2619 : Front 2nd sensor data failure

DTC B261A : Front 3rd sensor data failure

DTC B261B : Front 4th sensor data failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before you troubleshoot, resetting the parking and back-up sensor control unit .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2618 Front 1st sensor data failure	B
B2619 Front 2nd sensor data failure	B
B261A Front 3rd sensor data failure	B
B261B Front 4th sensor data failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2618 Front 1st sensor data failure	B
B2619 Front 2nd sensor data failure	B
B261A Front 3rd sensor data failure	B
B261B Front 4th sensor data failure	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B2618 Front 1st sensor data failure	B
B2619 Front 2nd sensor data failure	B
B261A Front 3rd sensor data failure	B
B261B Front 4th sensor data failure	B
B2646 Front sensor power failure	B
B2648 Front sensor signal short to ground	B

Are any DTCs indicated?

YES

Go to step 3.

YES

Go to step 4.

YES

Go to step 5.

YES

Go to step 6.

YES

Go to parking and back-up sensor system DTC B2646 troubleshooting.

YES

Go to parking and back-up sensor system DTC B2648 troubleshooting.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

3. Open wire check (BOF_SIDE_L, SOF_SIDE_L, E1_SIDE_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

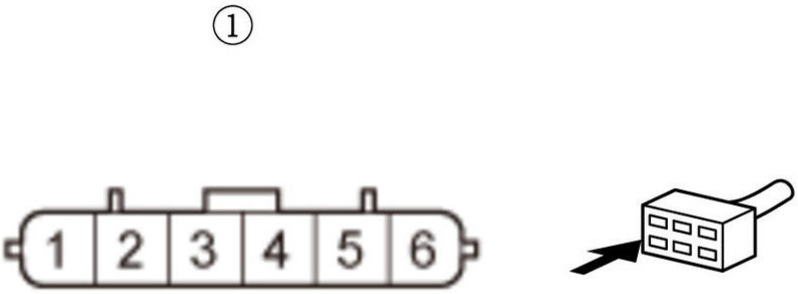
Parking and back-up sensor control unit 16P connector
Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 7**
Test point 2	Left front corner sensor 6P connector (female terminals) No. 6: ①

Test point 1	**Parking and back-up sensor control unit 16P connector No. 6**
Test point 2	Left front corner sensor 6P connector (female terminals) No. 4: ①

Test point 1	**Parking and back-up sensor control unit 16P connector No. 13**
Test point 2	Left front corner sensor 6P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the left front corner sensor .

NO

Repair an open or high resistance in BOF_SIDE_L, SOF_SIDE_L, or E1_SIDE_L wire.

4. Open wire check (BOF_CTR_L, SOF_CTR_L, E1_CTR_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

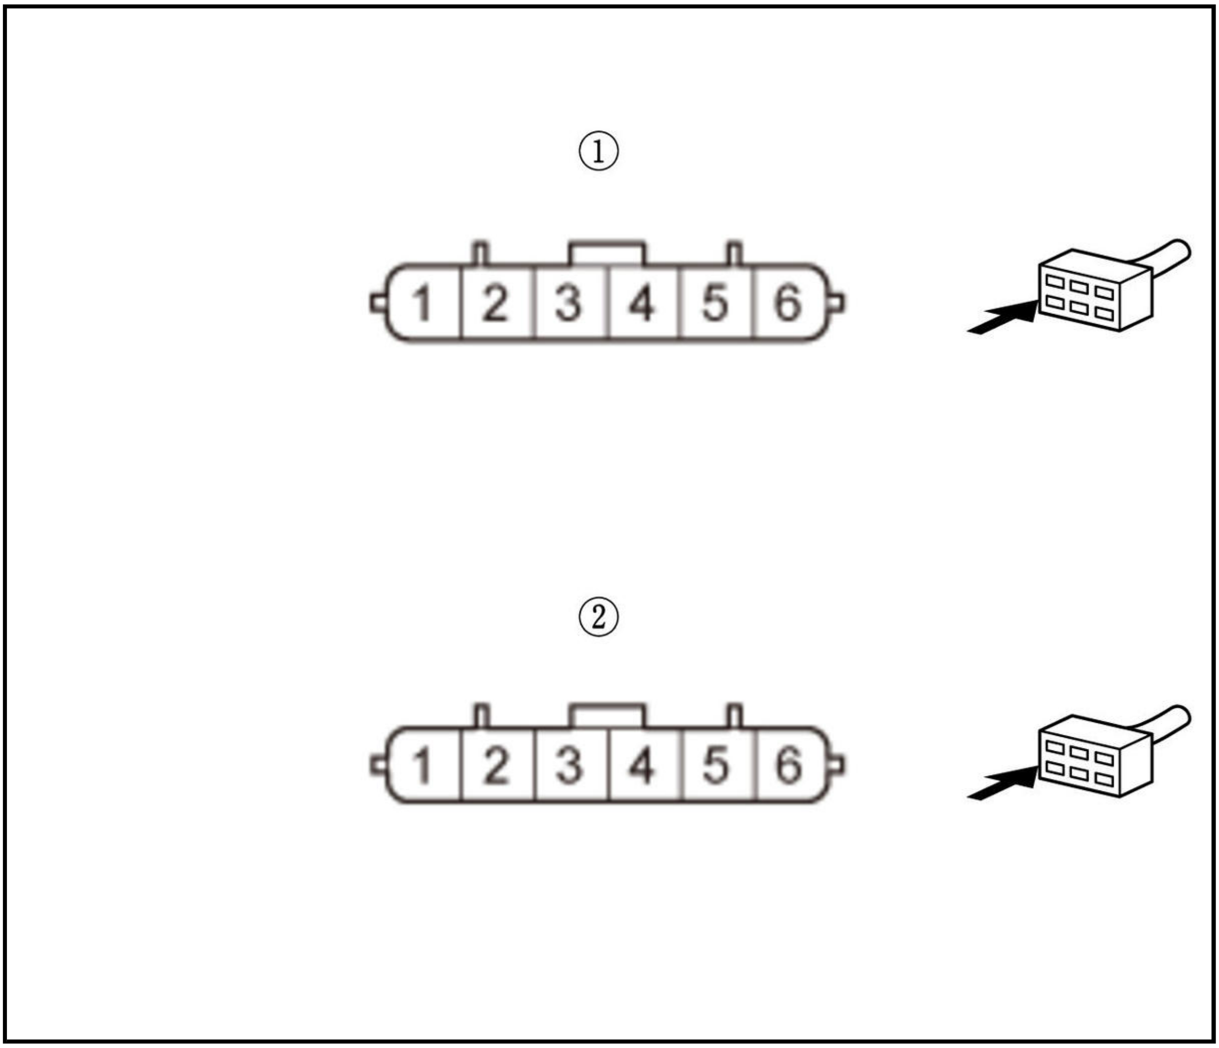
Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left front corner sensor 6P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left front corner sensor 6P connector (female terminals) No. 1: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the left front center sensor .

NO

Repair an open or high resistance in BOF_CTR_L, SOF_CTR_L, or E1_CTR_L wire.

5. Open wire check (BOF_CTR_R, SOF_CTR_R, E1_CTR_R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

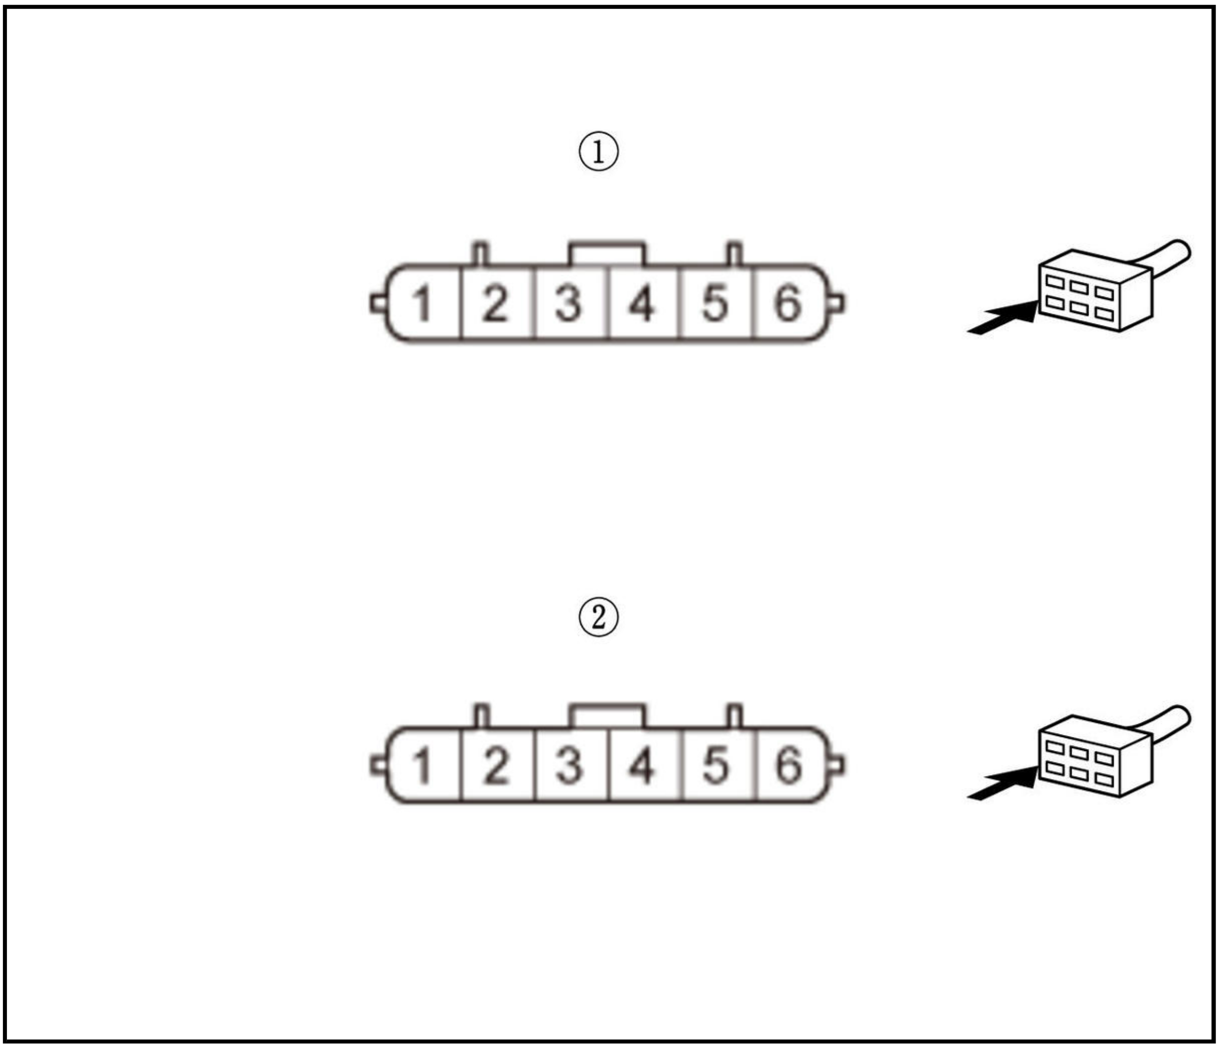
Left front center sensor 6P connector
Right front center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode front center sensor 6P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left front center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right front center sensor .

NO

Repair an open or high resistance in BOF_CTR_R, SOF_CTR_R, or E1_CTR_R wire.

6. Open wire check (BOF_SIDE_R, SOF_SIDE_R, E1_SIDE_R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Right front center sensor 6P connector
Right front corner sensor 6P connector

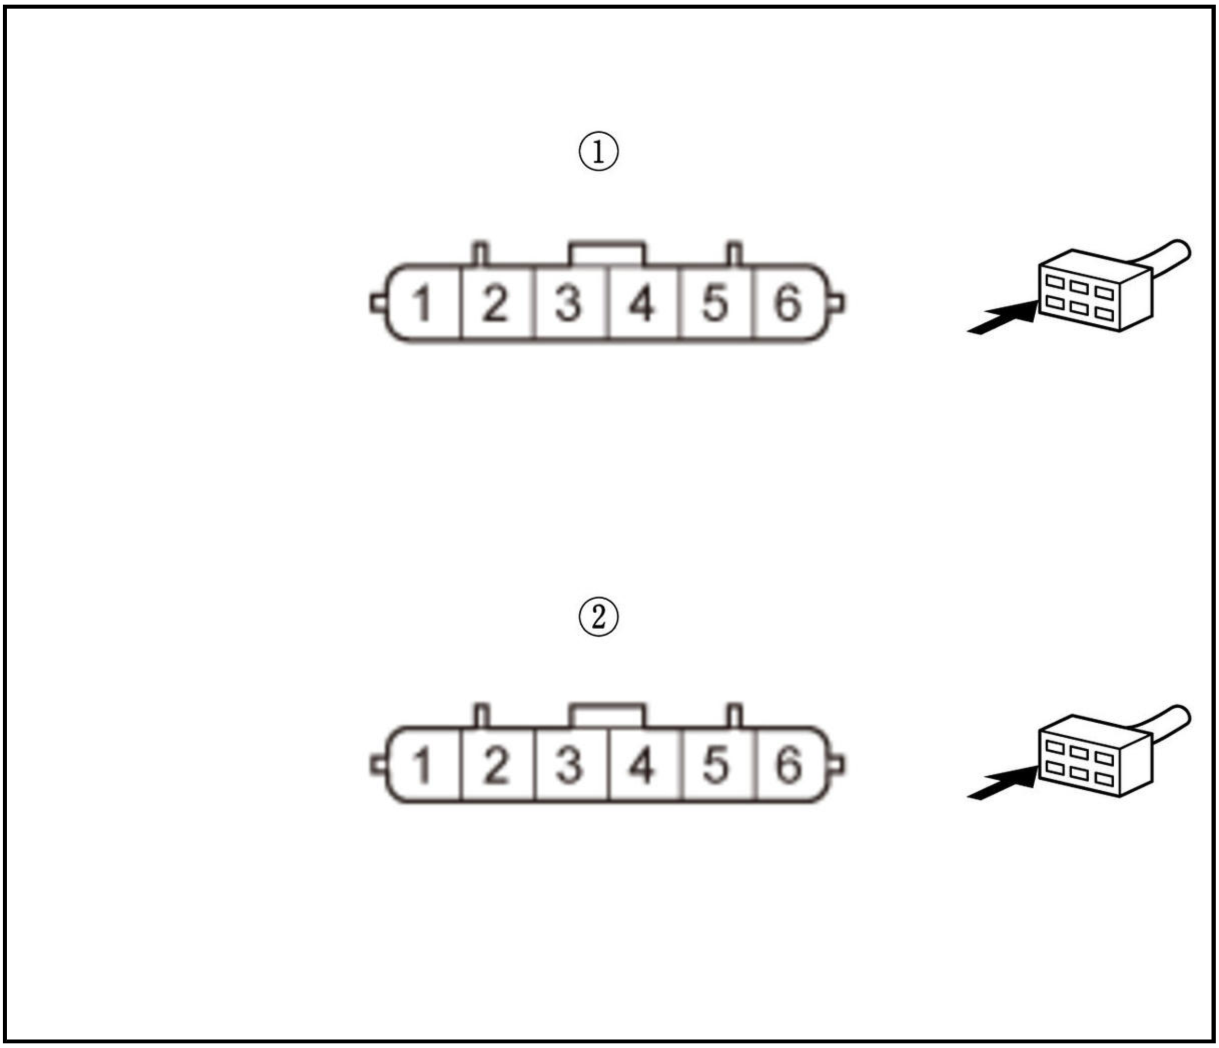
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Right front center sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 5: ①

Test point 2	Right front corner sensor 6P connector (female terminals) No. 6: ②

Test point 1	Right front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 4: ②

Test point 1	Right front center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right front corner sensor .

NO

Repair an open or high resistance in BOF_SIDE_R, SOF_SIDE_R, or E1_SIDE_R wire.

DTC B261C, B261D, B261E, B261F

DTC B261C : Rear 1st sensor data failure

DTC B261D : Rear 2nd sensor data failure

DTC B261E : Rear 3rd sensor data failure

DTC B261F : Rear 4th sensor data failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before you troubleshoot, **resetting the parking and back-up sensor control unit** .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B261C Rear 1st sensor data failure	B
B261D Rear 2nd sensor data failure	B
B261E Rear 3rd sensor data failure	B
B261F Rear 4th sensor data failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B261C Rear 1st sensor data failure	B
B261D Rear 2nd sensor data failure	B
B261E Rear 3rd sensor data failure	B
B261F Rear 4th sensor data failure	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B261C Rear 1st sensor data failure	B
B261D Rear 2nd sensor data failure	B
B261E Rear 3rd sensor data failure	B
B261F Rear 4th sensor data failure	B
B2647 Rear sensor power failure	B
B2649 Rear sensor signal short to ground	B

Are any DTCs indicated?

YES

Go to step 3.

YES

Go to step 4.

YES

Go to step 5.

YES

Go to step 6.

YES

Go to parking and back-up sensor system DTC B2647 troubleshooting.

YES

Go to parking and back-up sensor system DTC B2649 troubleshooting.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

3. Open wire check (BOR_SIDE_L, SOR_SIDE_L, E2_SIDE_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

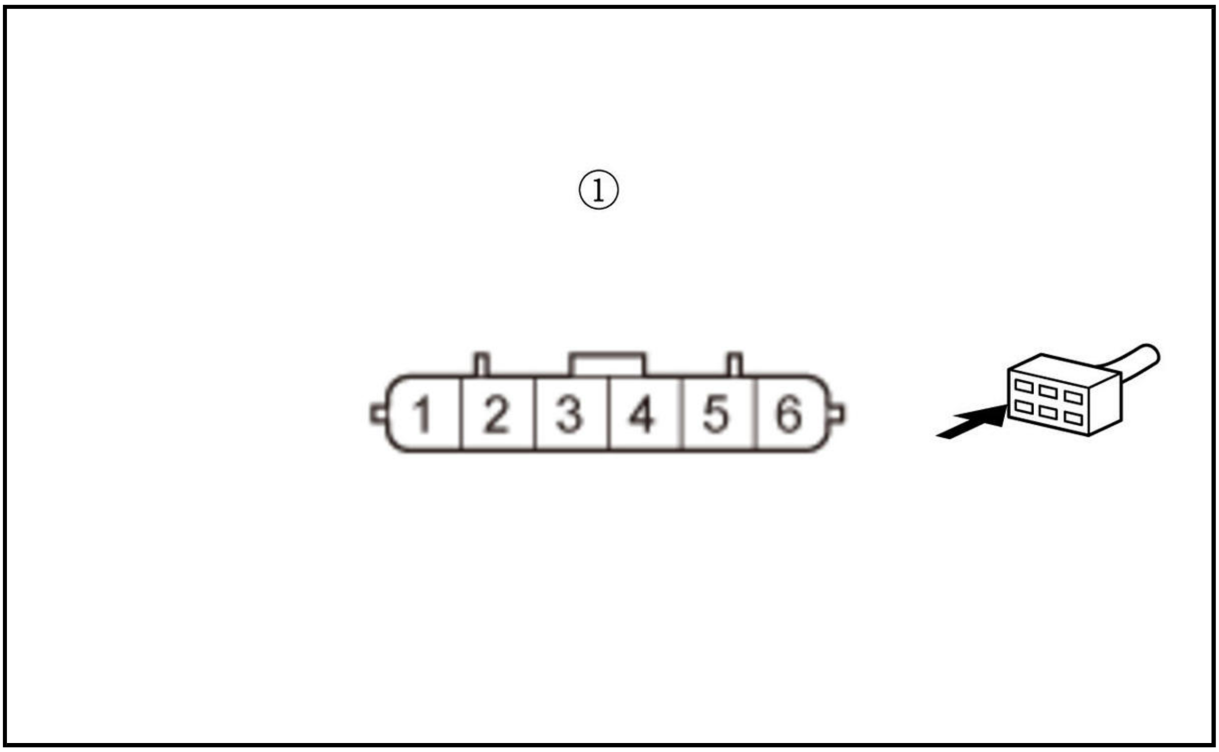
Parking and back-up sensor control unit 16P connector Left rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 16
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 6: ①

Test point 1	Parking and back-up sensor control unit 16P connector No. 14
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 4: ①

Test point 1	Parking and back-up sensor control unit 16P connector No. 12
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the left rear corner sensor .

NO

Repair an open or high resistance in BOR_SIDE_L, SOR_SIDE_L, or E2_SIDE_L wire.

4. Open wire check (BOR_CTR_L, SOR_CTR_L, E2_CTR_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

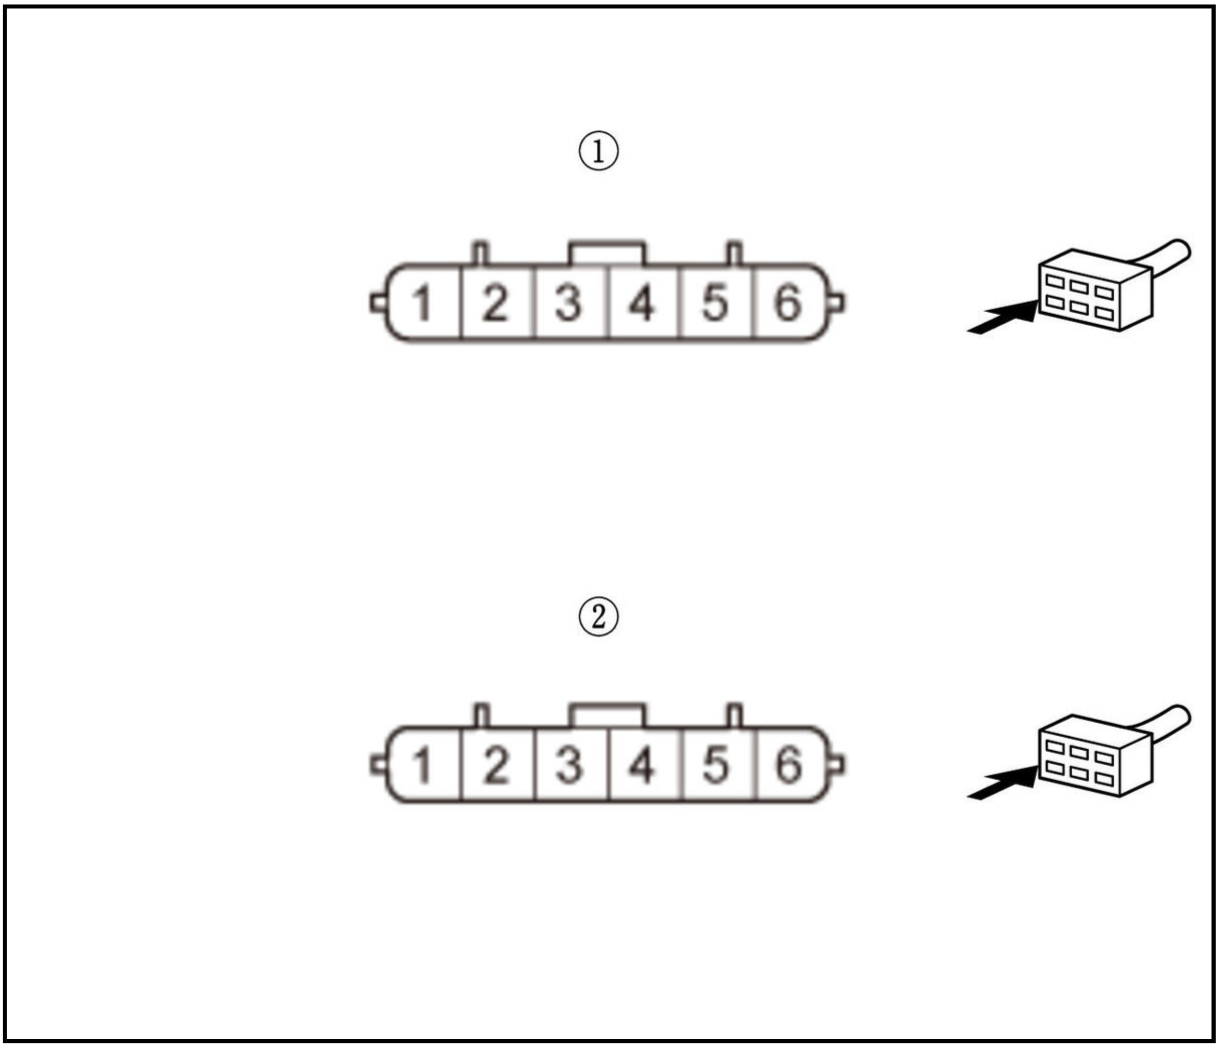
Left rear corner sensor 6P connector Left rear center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear corner sensor 6P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left rear corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left rear corner sensor 6P connector (female terminals) No. 1: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the left rear center sensor .

NO

Repair an open or high resistance in BOR_CTR_L, SOR_CTR_L, or E2_CTR_L wire.

5. Open wire check (BOR_CTR_R, SOR_CTR_R, E2_CTR_R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Left rear center sensor 6P connector Right rear center sensor 6P connector

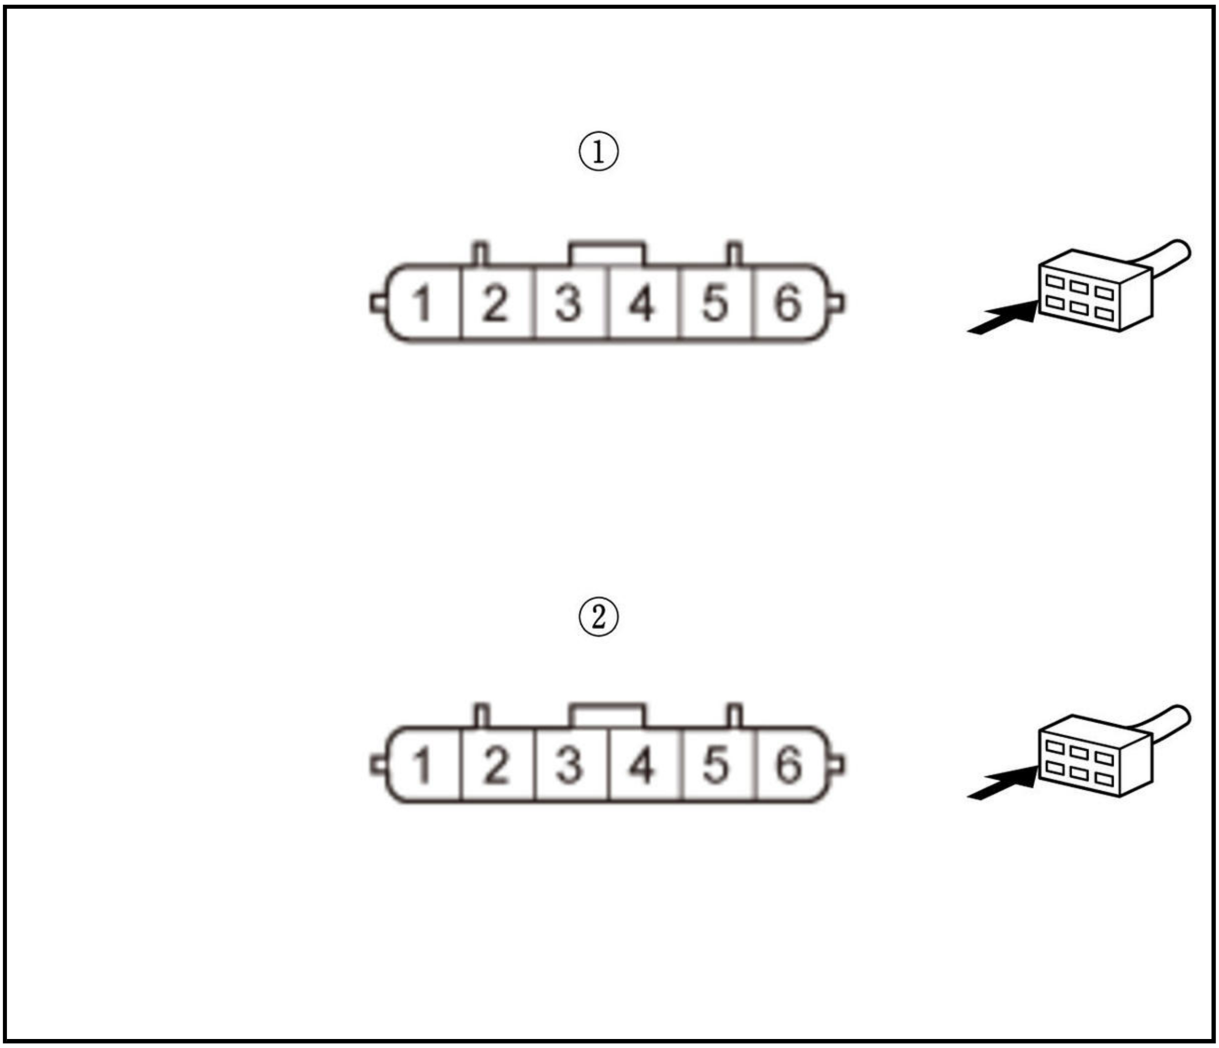
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear center sensor 6P connector: disconnected Right rear center sensor 6P connector: disconnected

B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left rear center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right rear center sensor .

NO

Repair an open or high resistance in BOR_CTR_R, SOR_CTR_R, or E2_CTR_R wire.

6. Open wire check (BOR_SIDE_R, SOR_SIDE_R, E2_SIDE_R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

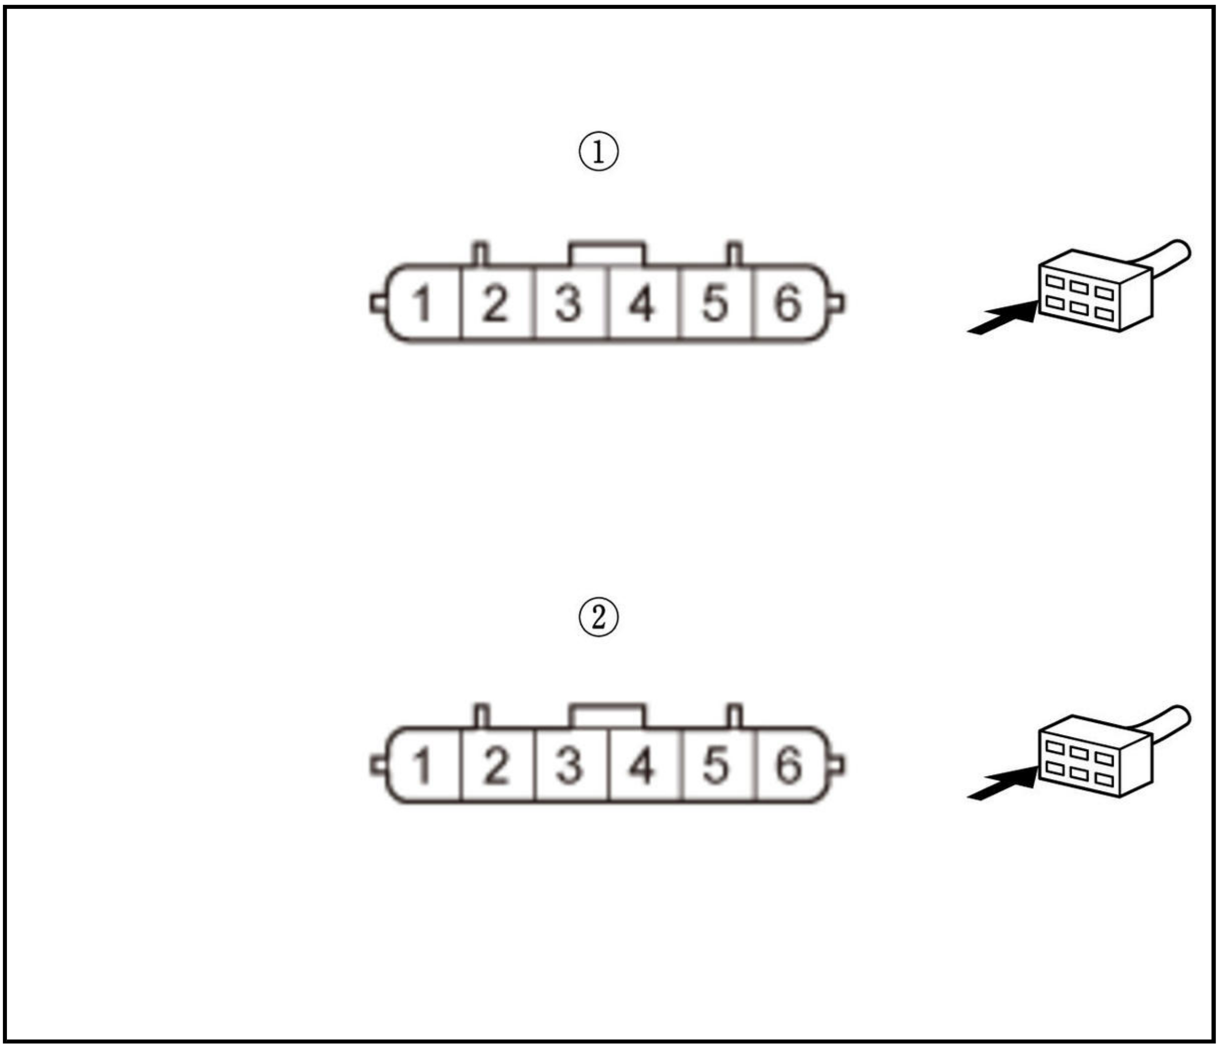
Right rear center sensor 6P connector Right rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Right rear center sensor 6P connector: disconnected Right rear corner sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear corner sensor 6P connector (female terminals) No. 6: ②

Test point 1	Right rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear corner sensor 6P connector (female terminals) No. 4: ②

Test point 1	Right rear center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right rear corner sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right rear corner sensor .

NO

Repair an open or high resistance in BOR_SIDE_R, SOR_SIDE_R, or E2_SIDE_R wire.

DTC B2646

DTC B2646 : Front sensor power failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2646 Front sensor power failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

    -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2646 Front sensor power failure	B

Is DTC B2646 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (BOF_SIDE_L, E1_SIDE_L lines) 1

-1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 7**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Go to step 10.

NO

Go to step 3.

3. Shorted wire check (BOF_SIDE_R, E1_SIDE_R lines) 1

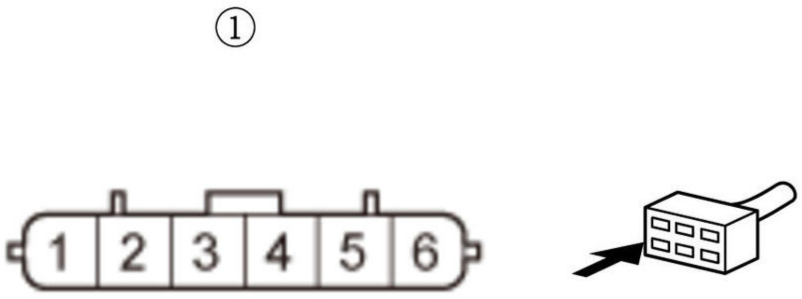
-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 5: ①

Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

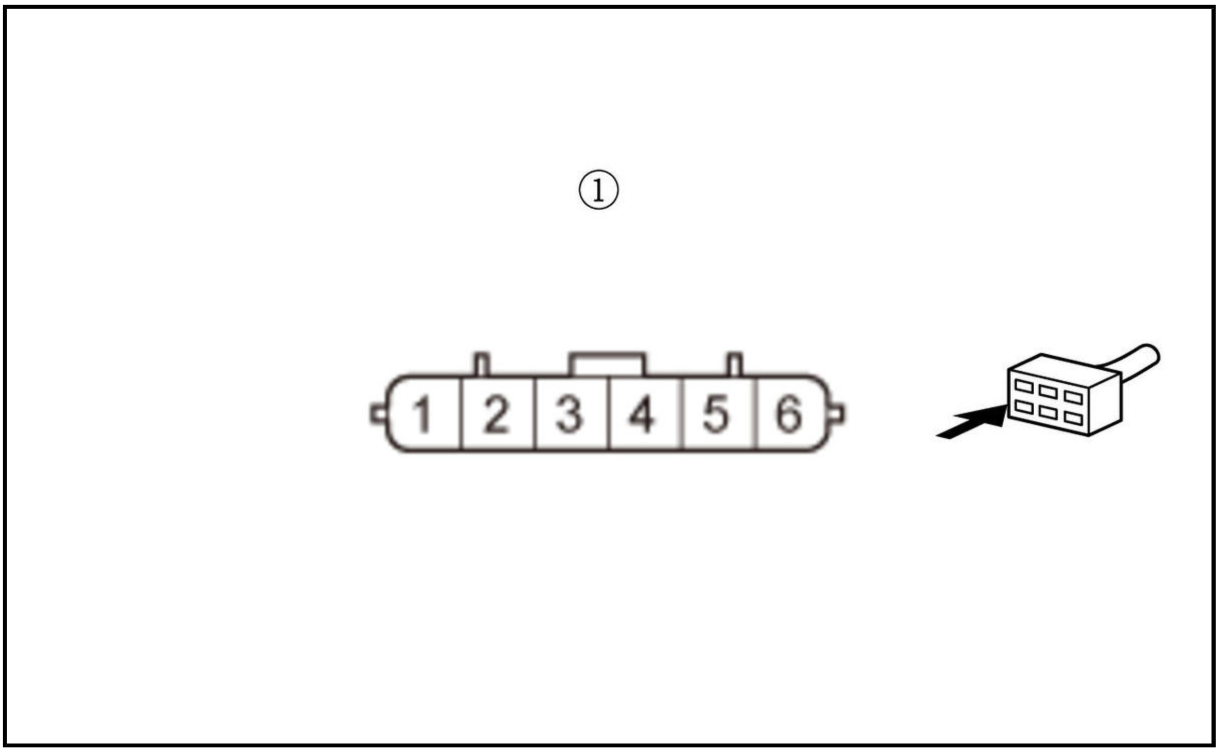
4. Shorted wire check (BOF_SIDE_R, E1_SIDE_R lines) 2

-1. Disconnect the following connector.

Right front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front corner sensor .

NO

Repair a short in the BOF_SIDE_R and E1_SIDE_R wires.

5. Shorted wire check (BOF_CTR_R, E1_CTR_R lines) 1

-1. Reconnect the following connector.

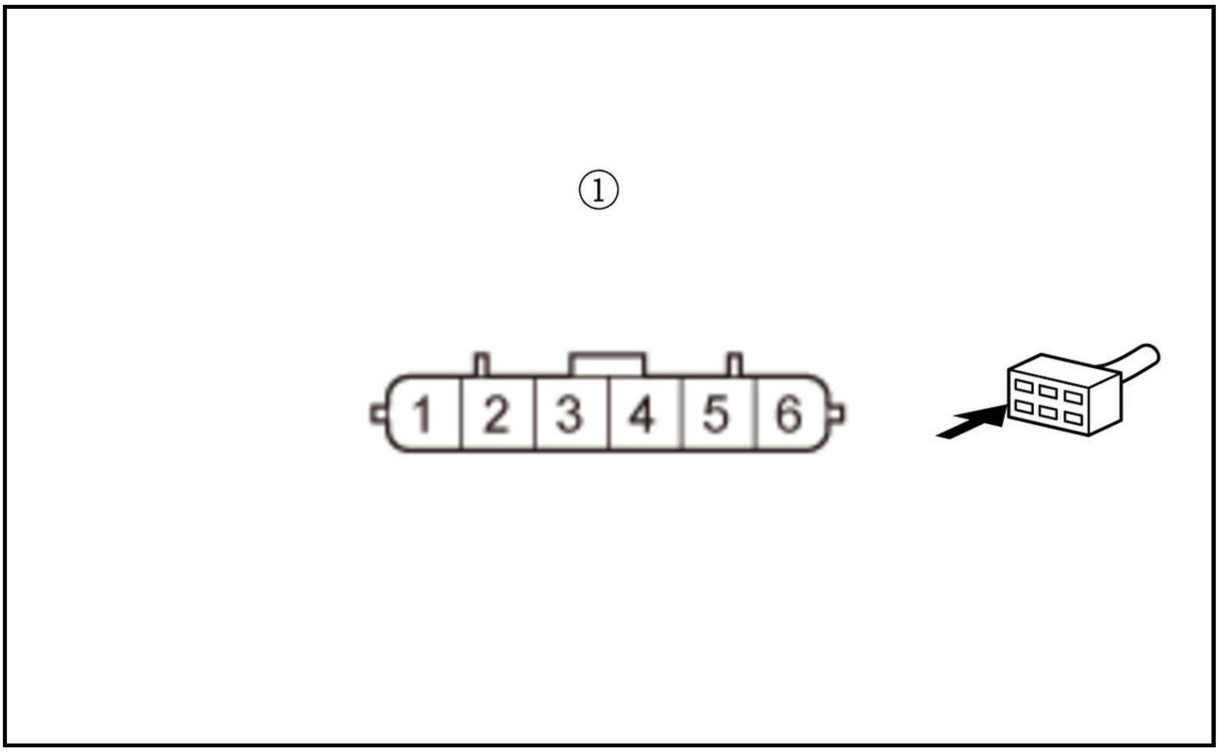
Right front center sensor 6P connector

-2. Disconnect the following connector.

Left front center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

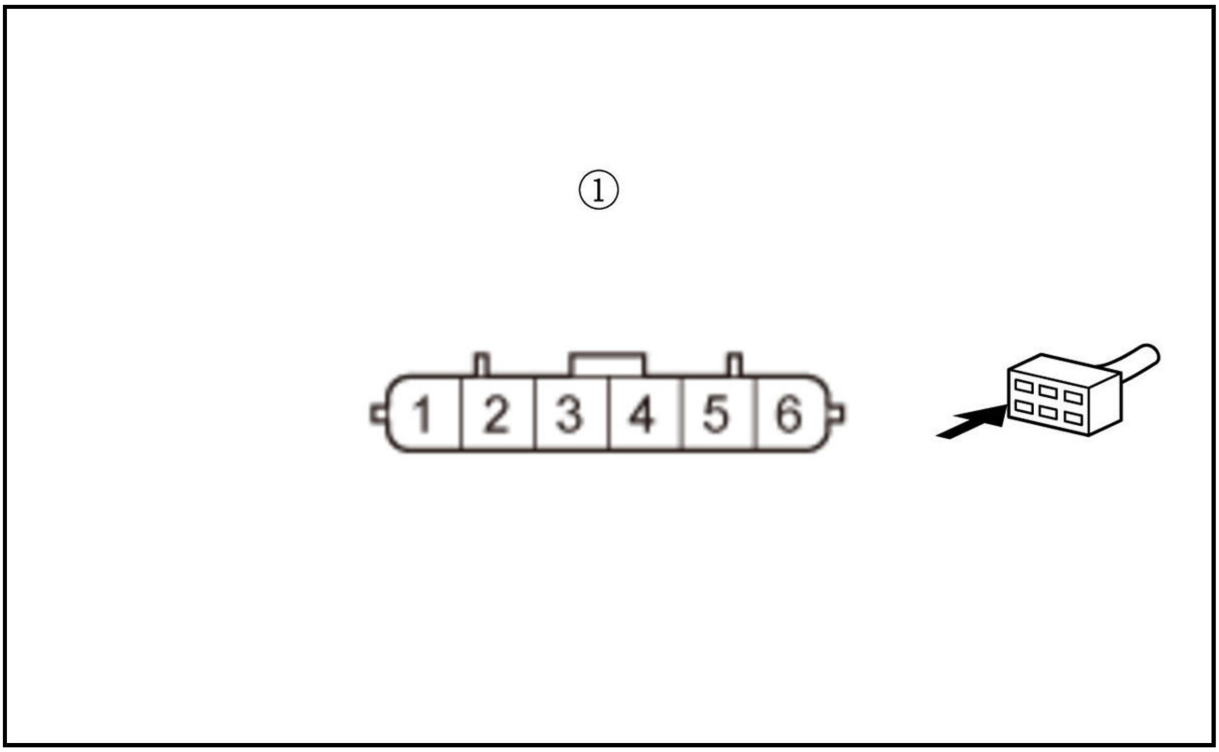
6. Shorted wire check (BOF_CTR_R, E1_CTR_R lines) 2

-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front center sensor .

NO

Repair a short in the BOF_CTR_R and E1_CTR_R wires.

7. Shorted wire check (BOF_CTR_L, E1_CTR_L lines) 1

-1. Reconnect the following connector.

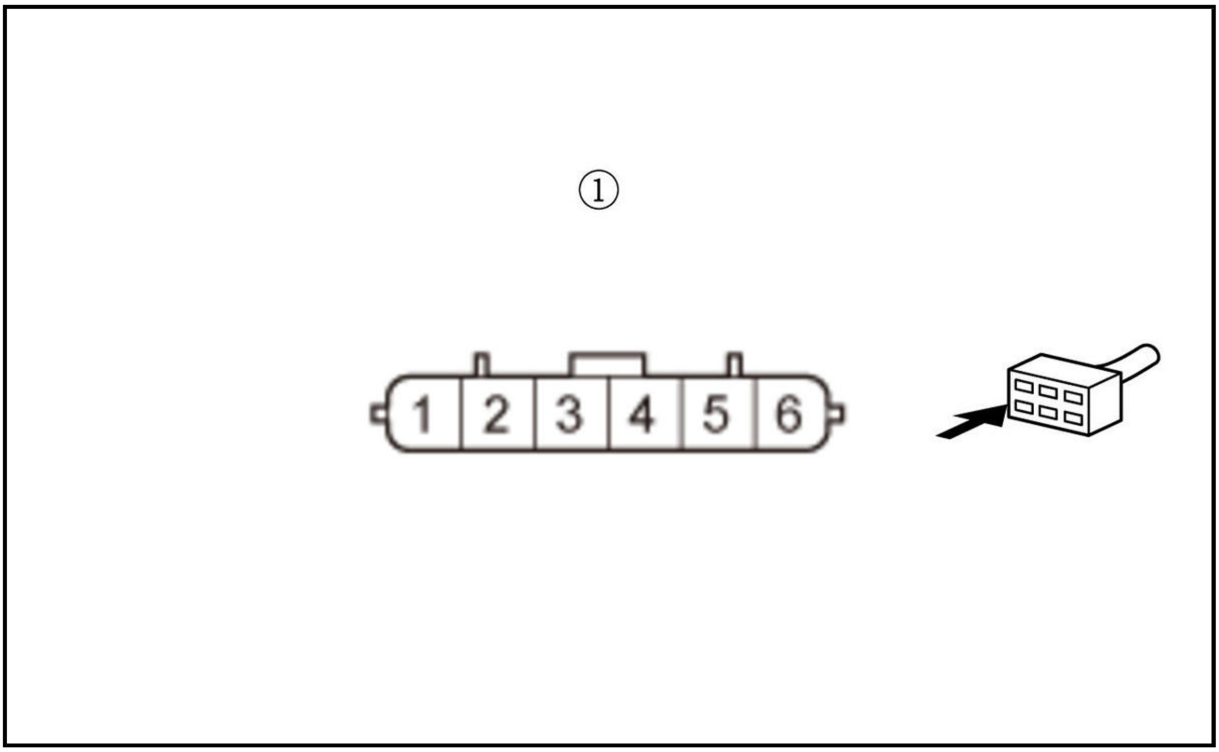
Left front center sensor 6P connector

-2. Disconnect the following connector.

Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

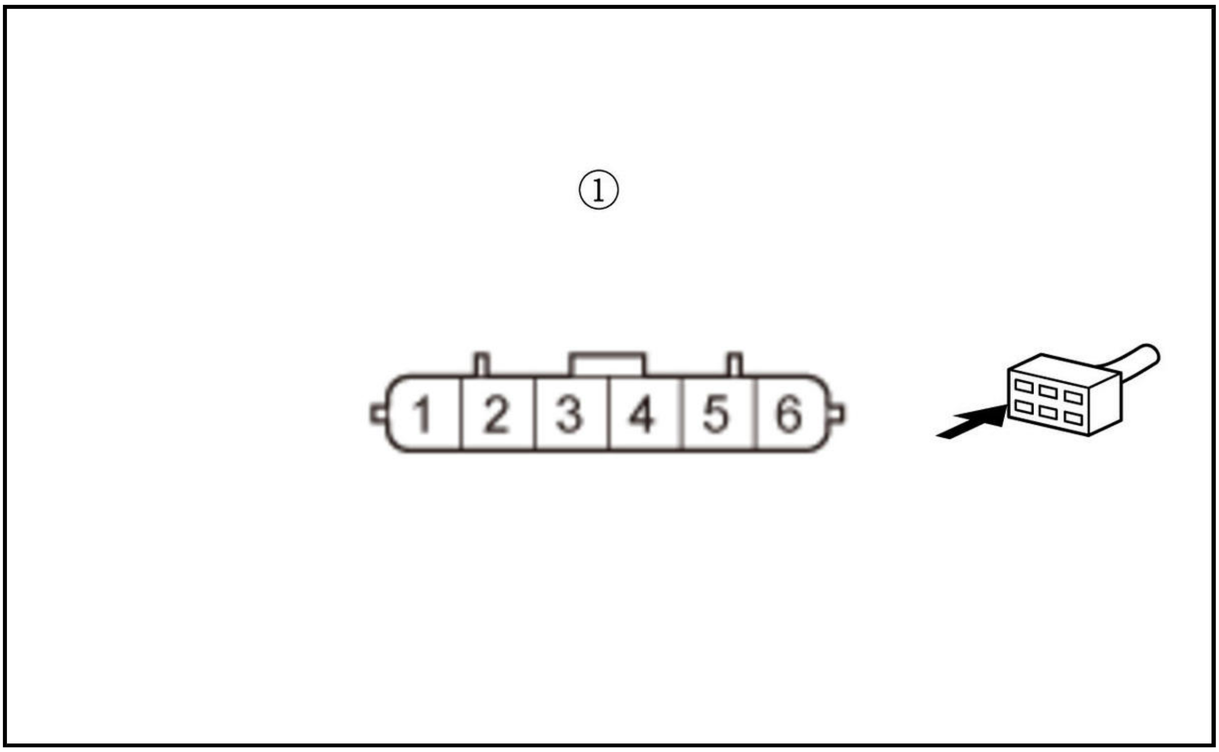
8. Shorted wire check (BOF_CTR_L, E1_CTR_L lines) 2

-1. Disconnect the following connector.

Left front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left front center sensor .

NO

Repair a short in the BOF_CTR_L and E1_CTR_L wires.

9. Shorted wire check (BOF_SIDE_L, E1_SIDE_L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 7**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Replace the left front corner sensor .

NO

Repair a short in the BOF_SIDE_L and E1_SIDE_L wires.

10. Shorted wire check (BOF_SIDE_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected

B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 7
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the BOF_SIDE_L wire.

DTC B2647

DTC B2647 : Rear sensor power failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2647 Rear sensor power failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2647 Rear sensor power failure	B

   Is DTC B2647 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (BOR_SIDE_L, E2_SIDE_L lines) 1

   -1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 16**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Go to step 10.

NO

Go to step 3.

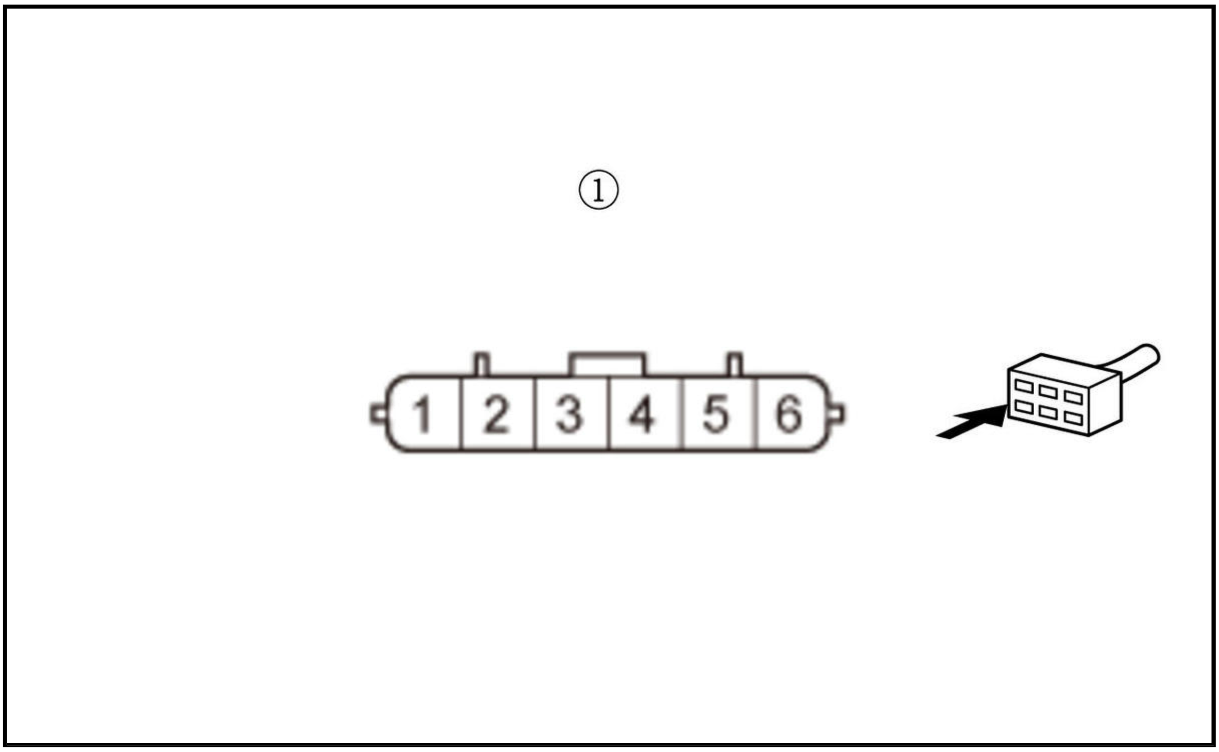
3. Shorted wire check (BOR_SIDE_R, E2_SIDE_R lines) 1

-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

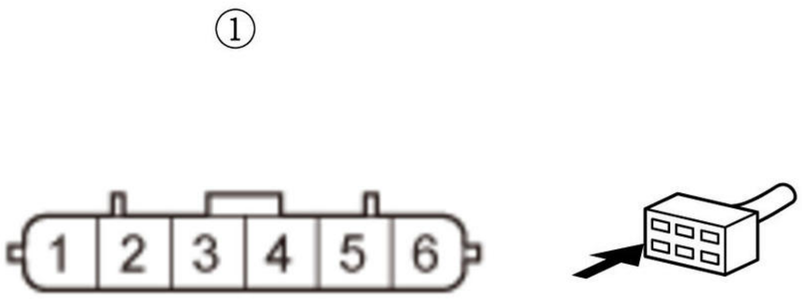
4. Shorted wire check (BOR_SIDE_R, E2_SIDE_R lines) 2

-1. Disconnect the following connector.

Right rear corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected Right rear corner sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear corner sensor .

NO

Repair a short in the BOR_SIDE_R and E2_SIDE_R wires.

5. Shorted wire check (BOR_CTR_R, E2_CTR_R lines) 1

-1. Reconnect the following connector.

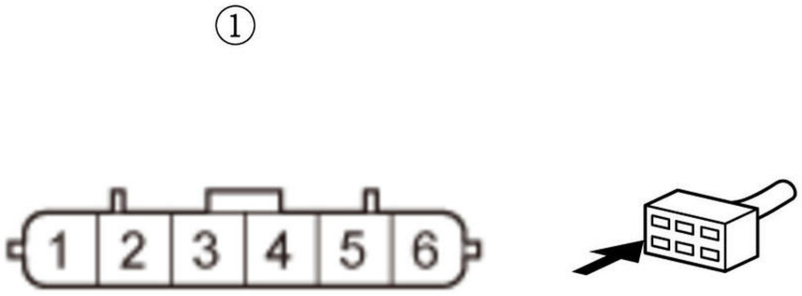
Right rear center sensor 6P connector

-2. Disconnect the following connector.

Left rear center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

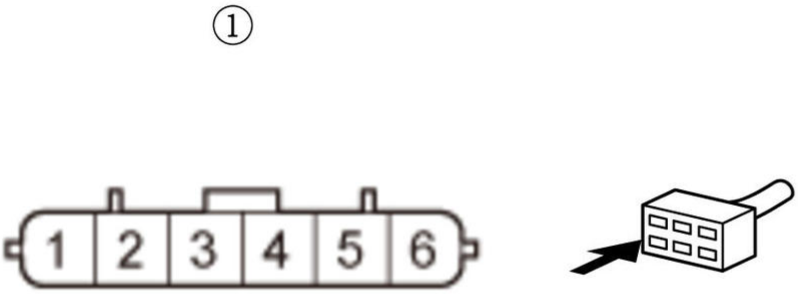
6. Shorted wire check (BOR_CTR_R, E2_CTR_R lines) 2

-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear center sensor .

NO

Repair a short in the BOR_CTR_R and E2_CTR_R wires.

7. Shorted wire check (BOR_CTR_L, E2_CTR_L lines) 1

-1. Reconnect the following connector.

Left rear center sensor 6P connector

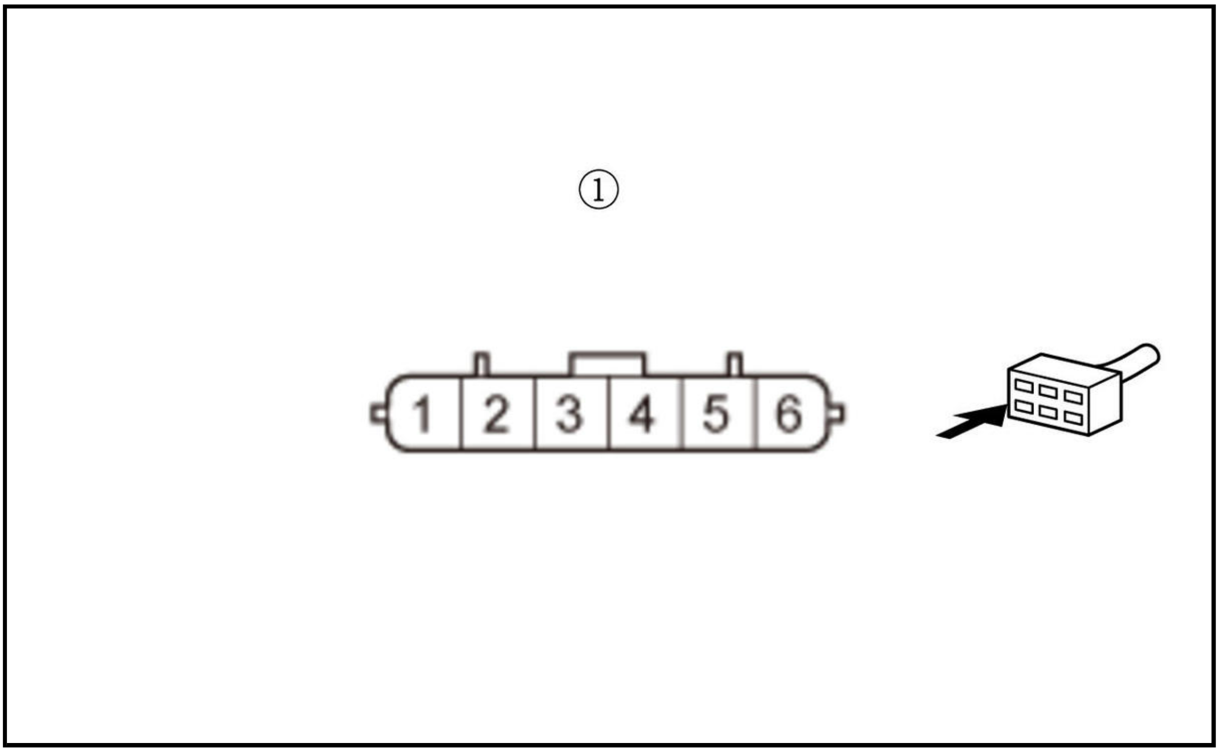
-2. Disconnect the following connector.

Left rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B

Test point 1	Left rear corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

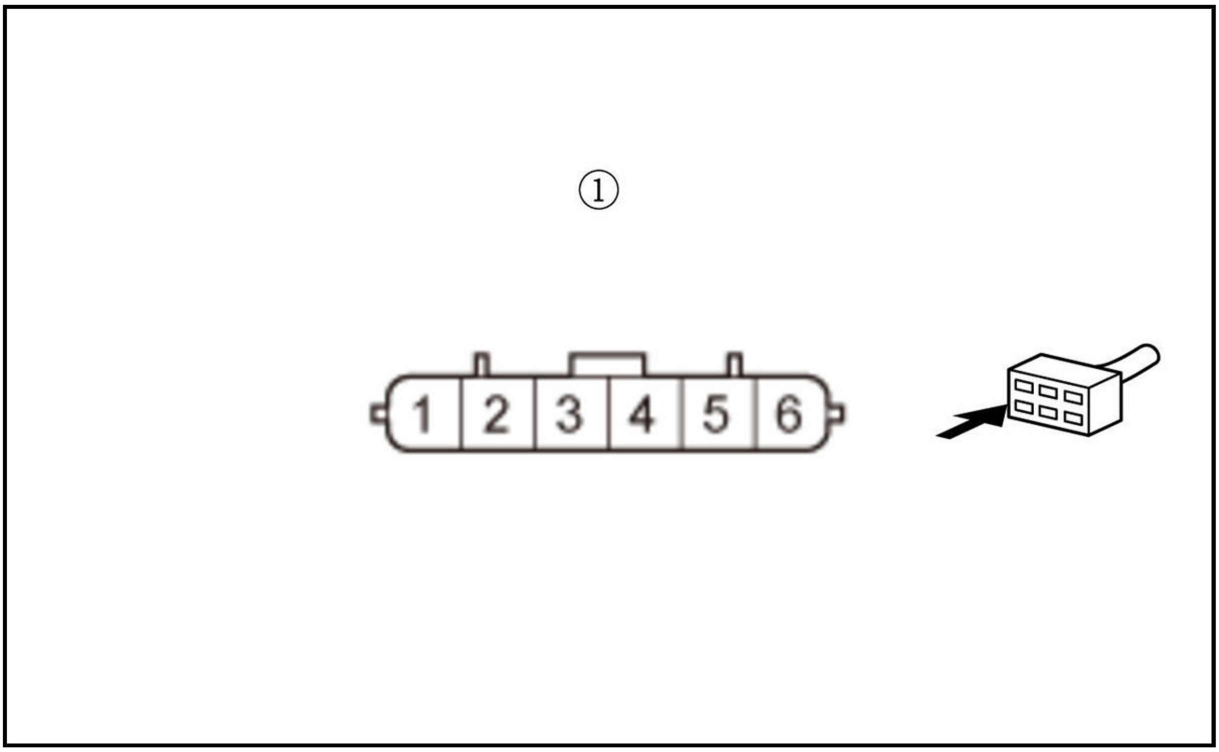
8. Shorted wire check (BOR_CTR_L, E2_CTR_L lines) 2

-1. Disconnect the following connector.

Left rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left rear center sensor .

NO

Repair a short in the BOR_CTR_L and E2_CTR_L wires.

9. Shorted wire check (BOR_SIDE_L, E2_SIDE_L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 16**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Replace the left rear corner sensor .

NO

Repair a short in the BOR_SIDE_L and E2_SIDE_L wires.

10. Shorted wire check (BOR_SIDE_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected

B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 16
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the BOR_SIDE_L wire.

DTC B2648

DTC B2648 : Front sensor signal short to ground

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2648 Front sensor signal short to ground	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2648 Front sensor signal short to ground	B

   Is DTC B2648 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (SOF_SIDE_L, E1_SIDE_L lines) 1

   -1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 6**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Go to step 10.

NO

Go to step 3.

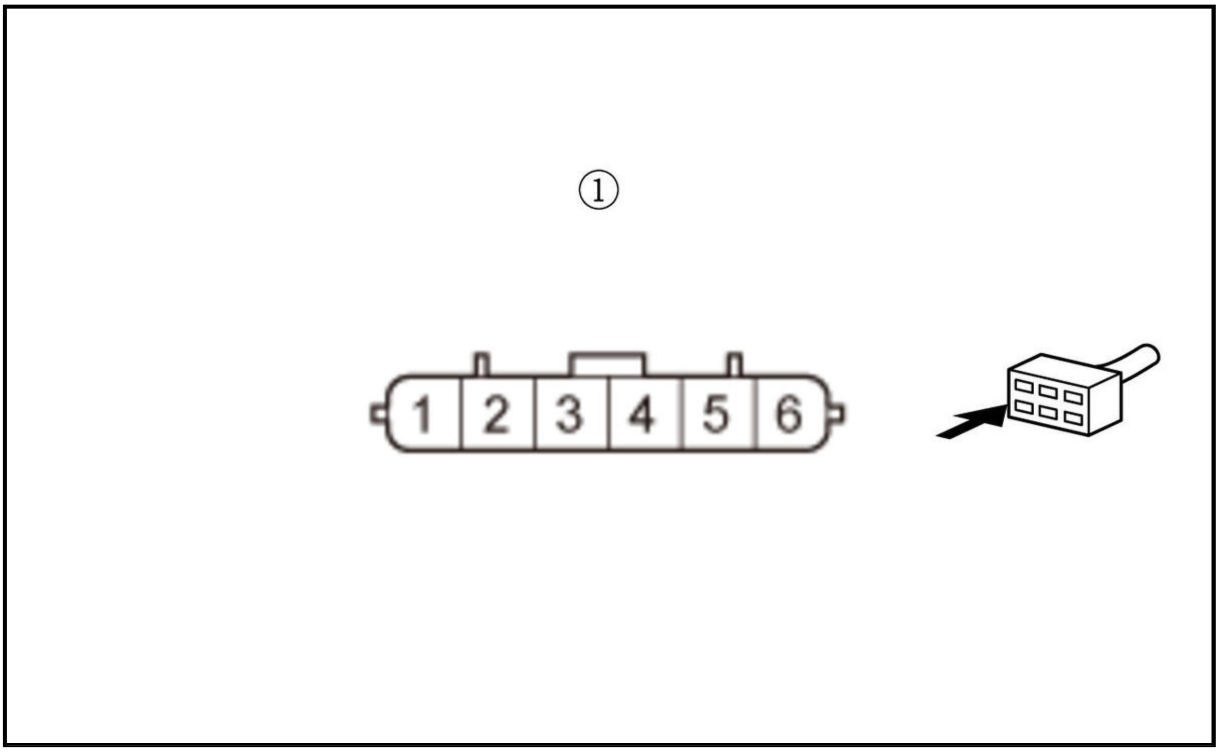
3. Shorted wire check (SOF_SIDE_R, E1_SIDE_R lines) 1

-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeted Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

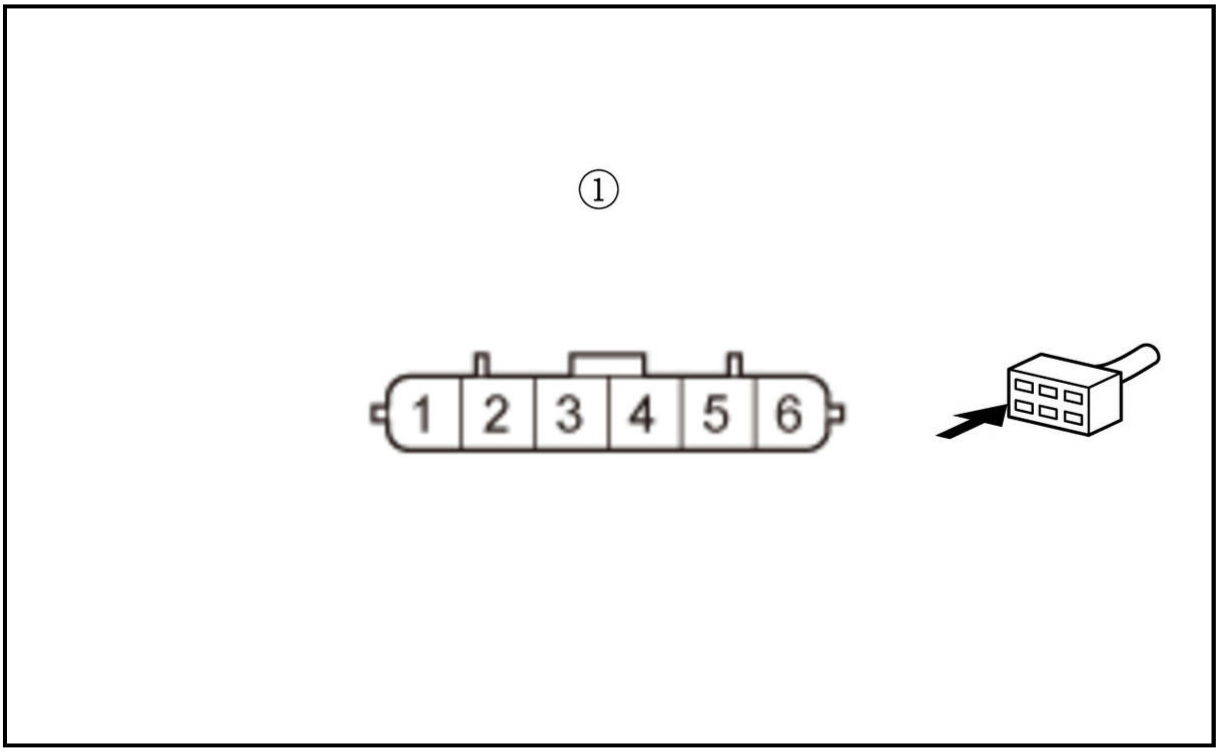
4. Shorted wire check (SOF_SIDE_R, E1_SIDE_R lines) 2

-1. Disconnect the following connector.

Right front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front corner sensor .

NO

Repair a short in the SOF_SIDE_R and E1_SIDE_R wires.

5. Shorted wire check (SOF_CTR_R, E1_CTR_R lines) 1

-1. Reconnect the following connector.

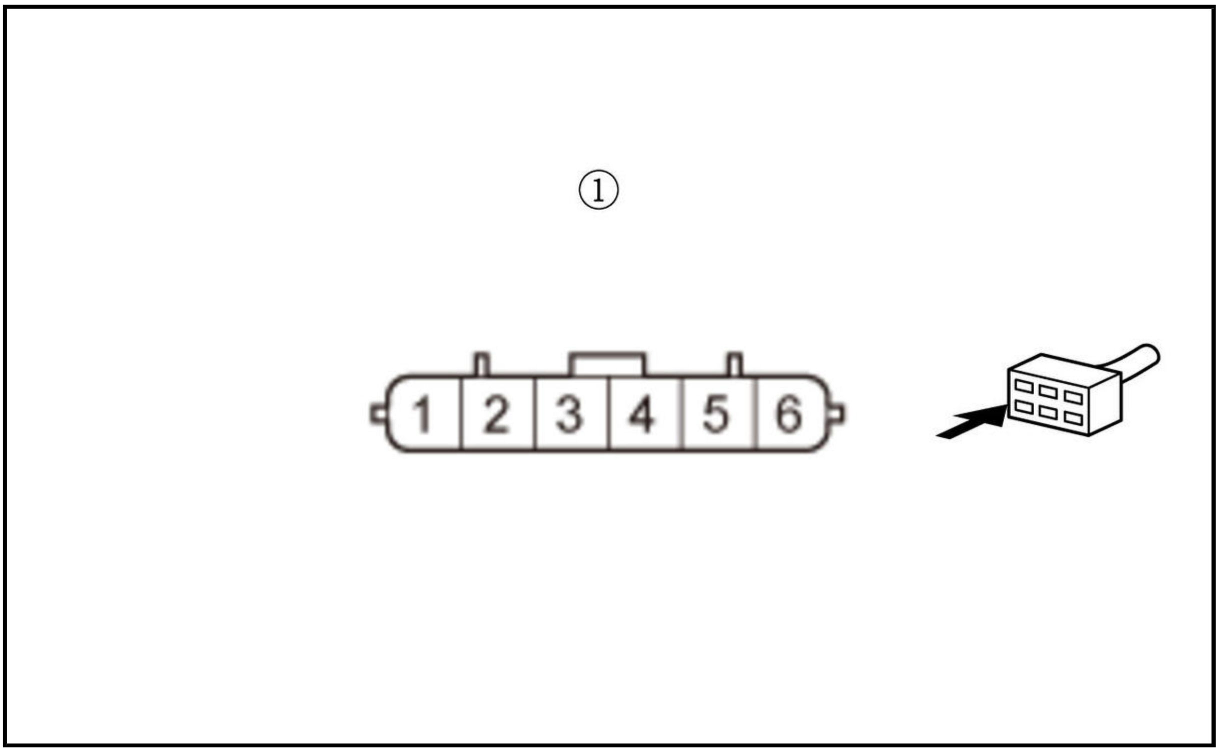
Right front center sensor 6P connector

-2. Disconnect the following connector.

Left front center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

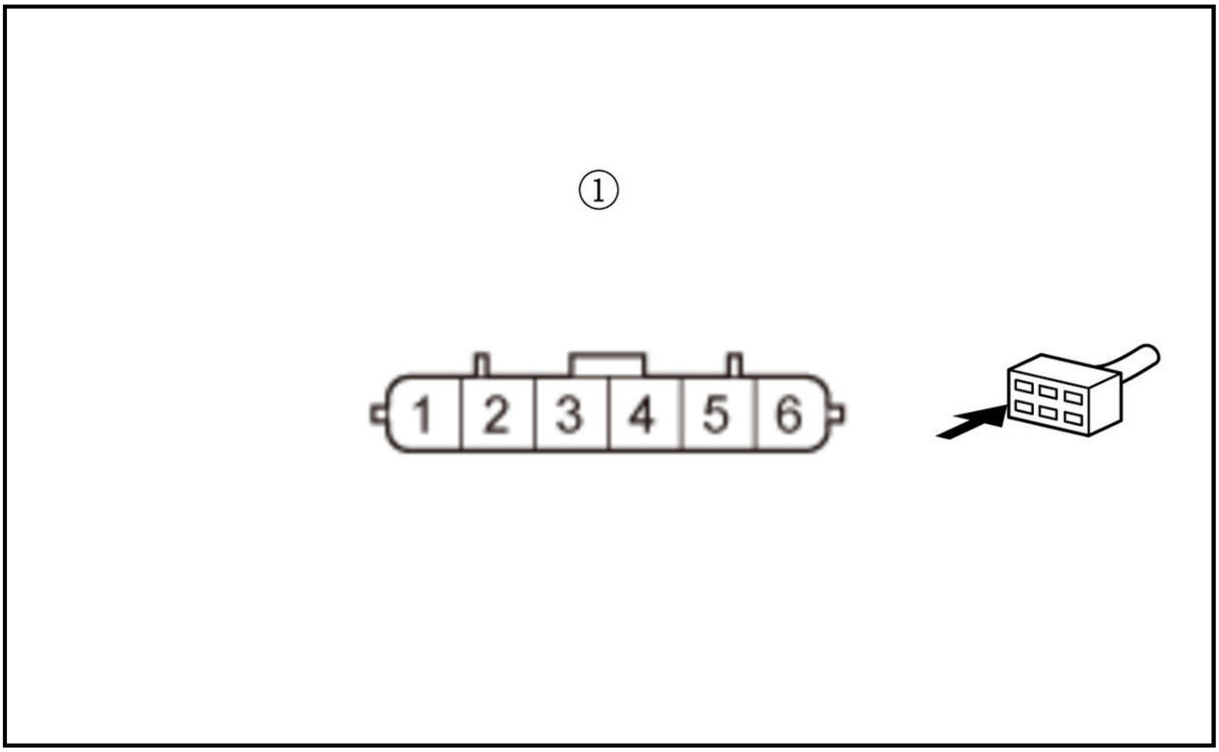
6. Shorted wire check (SOF_CTR_R, E1_CTR_R lines) 2

-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front center sensor .

NO

Repair a short in the SOF_CTR_R and E1_CTR_R wires.

7. Shorted wire check (SOF_CTR_L, E1_CTR_L lines) 1

-1. Reconnect the following connector.

Left front center sensor 6P connector

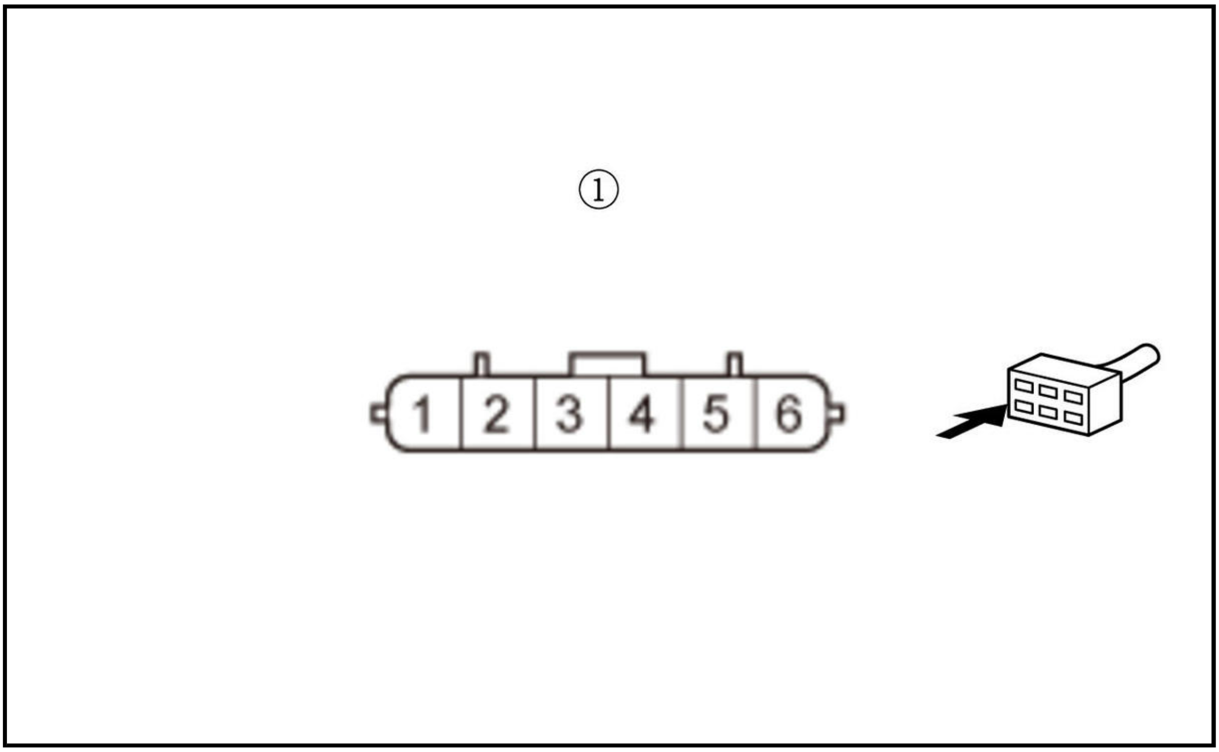
-2. Disconnect the following connector.

Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B

Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

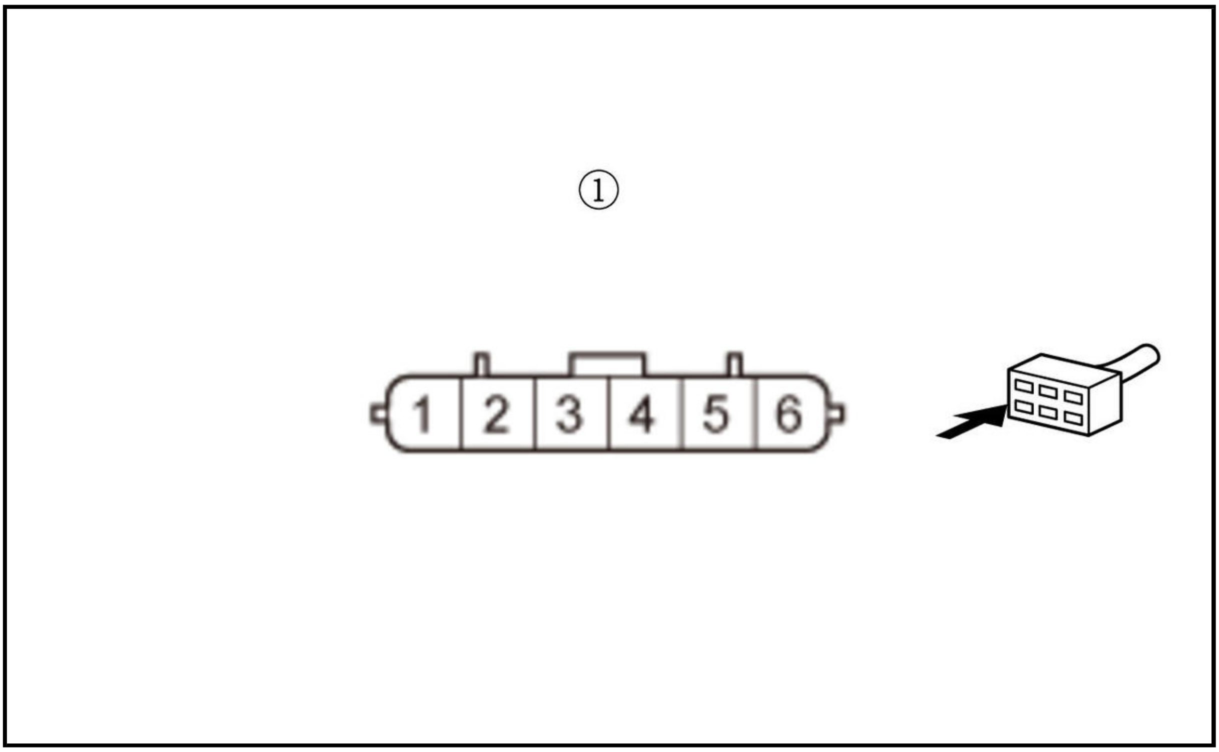
8. Shorted wire check (SOF_CTR_L, E1_CTR_L lines) 2

-1. Disconnect the following connector.

Left front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left front center sensor .

NO

Repair a short in the SOF_CTR_L and E1_CTR_L wires.

9. Shorted wire check (SOF_SIDE_L, E1_SIDE_L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 6**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Replace the left front corner sensor .

NO

Repair a short in the SOF_SIDE_L and E1_SIDE_L wires.

10. Shorted wire check (SOF_SIDE_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected

B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 6
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the SOF_SIDE_L wire.

DTC B2649

DTC B2649 : Rear sensor signal short to ground

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2649 Rear sensor signal short to ground	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2649 Rear sensor signal short to ground	B

   Is DTC B2649 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (SOR_SIDE_L, E2_SIDE_L lines) 1

   -1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 14
Test point 2	Parking and back-up sensor control unit 16P connector No. 12

Is there 1.0 MΩ or more?

YES

Go to step 10.

NO

Go to step 3.

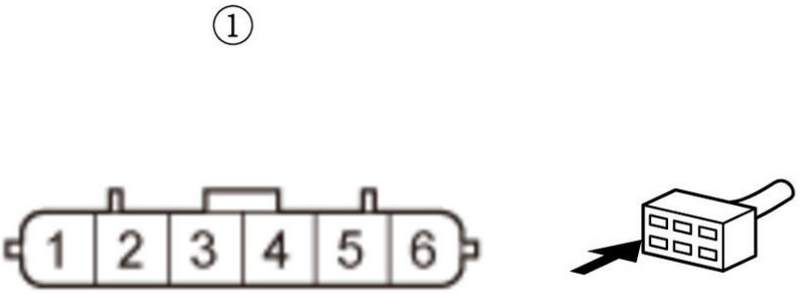
3. Shorted wire check (SOR_SIDE_R, E2_SIDE_R lines) 1

-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

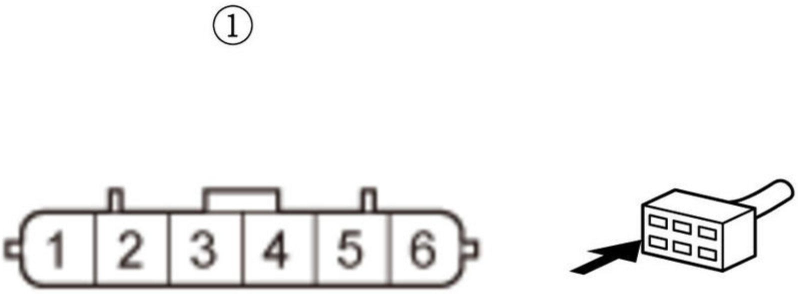
4. Shorted wire check (SOR_SIDE_R, E2_SIDE_R lines) 2

-1. Disconnect the following connector.

Right rear corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected Right rear corner sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear corner sensor .

NO

Repair a short in the SOR_SIDE_R and E2_SIDE_R wires.

5. Shorted wire check (SOR_CTR_R, E2_CTR_R lines) 1

-1. Reconnect the following connector.

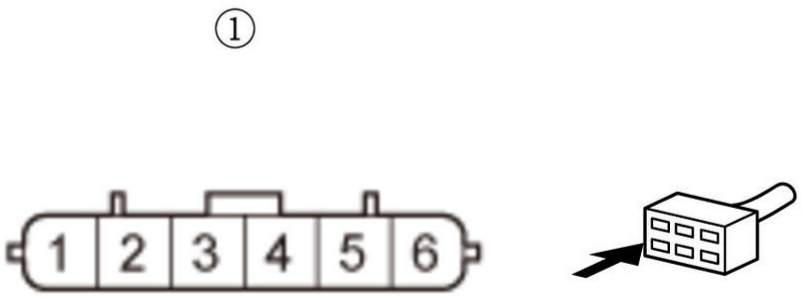
Right rear center sensor 6P connector

-2. Disconnect the following connector.

Left rear center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

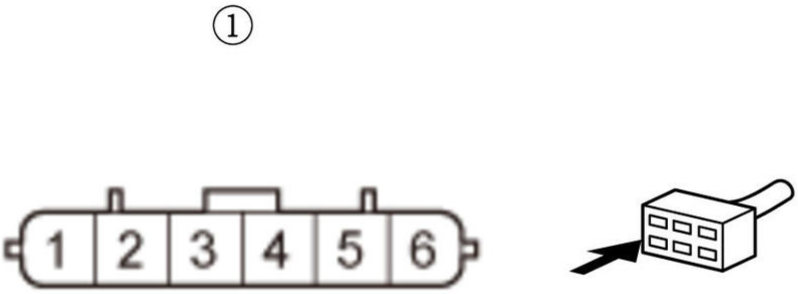
6. Shorted wire check (SOR_CTR_R, E2_CTR_R lines) 2

-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear center sensor .

NO

Repair a short in the SOR_CTR_R and E2_CTR_R wires.

7. Shorted wire check (SOR_CTR_L, E2_CTR_L lines) 1

-1. Reconnect the following connector.

Left rear center sensor 6P connector

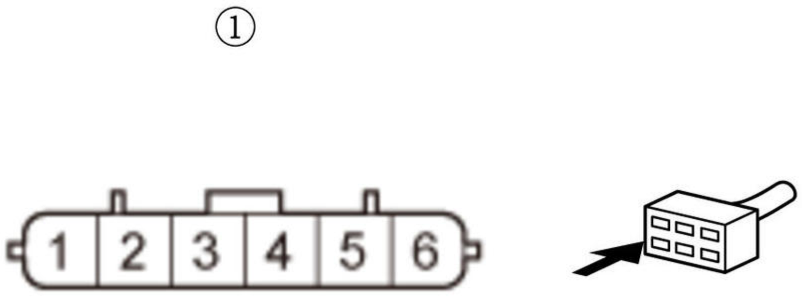
-2. Disconnect the following connector.

Left rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B

Test point 1	Left rear corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

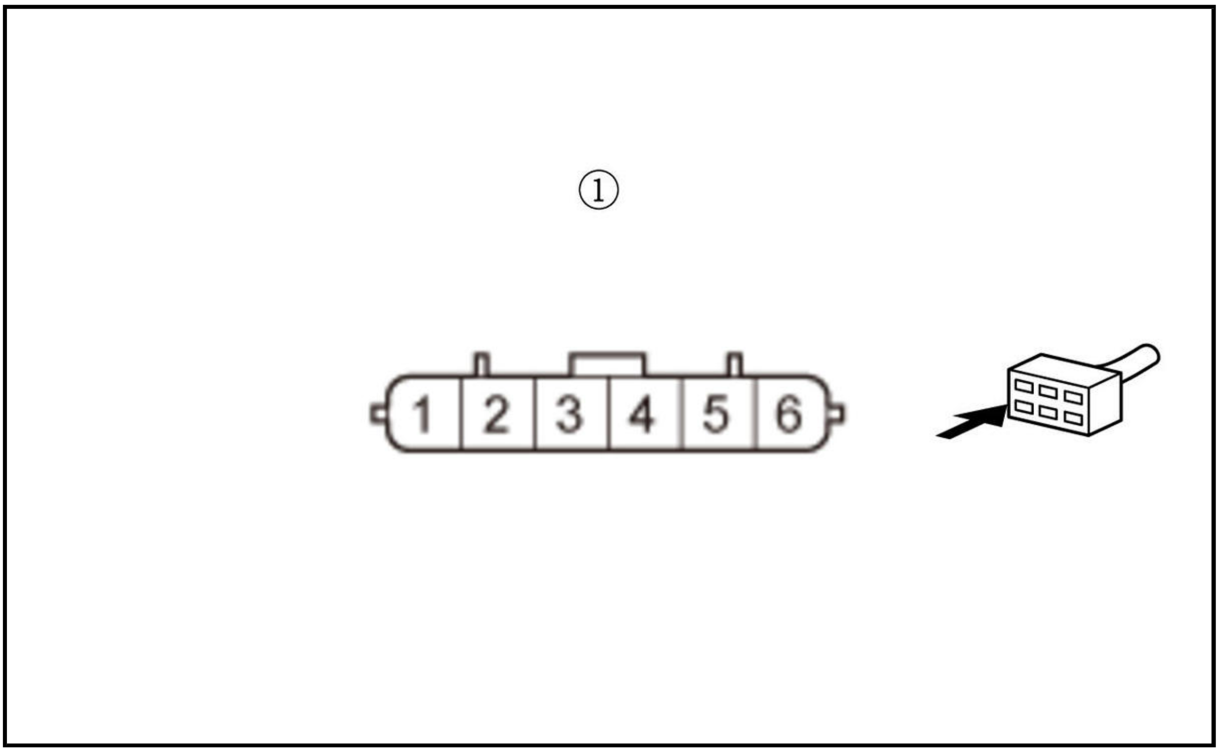
8. Shorted wire check (SOR_CTR_L, E2_CTR_L lines) 2

-1. Disconnect the following connector.

Left rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left rear center sensor .

NO

Repair a short in the SOR_CTR_L and E2_CTR_L wires.

9. Shorted wire check (SOR_SIDE_L, E2_SIDE_L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear corner sensor 6P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 14**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Replace the left rear corner sensor .

NO

Repair a short in the SOR_SIDE_L and E2_SIDE_L wires.

10. Shorted wire check (SOR_SIDE_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected

B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 14
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the SOR_SIDE_L wire.

DTC B264A

DTC B264A : Indicator circuit short to power

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B264A Indicator circuit short to power	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B264A Indicator circuit short to power	B

   Is DTC B264A indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Parking and back-up sensor switch check

   -1. Do the parking and back-up sensor switch test .

   Is the parking and back-up sensor switch OK?

   YES

   Go to step 3.

NO

Replace the parking and back-up sensor switch .

3. Shorted wire check (C/SNSR_IND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 5
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the C/SNSR_IND wire.

NO

Replace the parking and back-up sensor control unit .

DTC B264B

DTC B264B : Indicator circuit short to ground

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B264B Indicator circuit short to ground	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B264B Indicator circuit short to ground	B

Is DTC B264B indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Parking and back-up sensor switch check

-1. **Do the parking and back-up sensor switch test** .

Is the parking and back-up sensor switch OK?

YES

Go to step 3.

NO

Replace the parking and back-up sensor switch .

3. Shorted wire check (C/SNSR_IND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 5**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the C/SNSR_IND wire.

DTC B264D

DTC B264D : Front sensor combination error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B264D Front sensor combination error	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B264D Front sensor combination error	B

Is DTC B264D indicated?

YES

Replace the parking and back-up sensor control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0155, U1281 (PARKING/BACK-UP SENSOR CONTROL UNIT)

DTC U0155 : Lost communication with Gauge Control Module

DTC U1281 : Lost communication with MICU

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0155 Lost communication with Gauge Control Module	B
U1281 Lost communication with MICU	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0155 Lost communication with Gauge Control Module	B
U1281 Lost communication with MICU	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Parking and back-up sensor control unit 16P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0155	Gauge control module connector A (32P)
U1281	Body control module connector B (36P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0155	B-CAN_H	**Parking and back-up sensor control unit 16P connector**	No. 9	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 2		No. 31
U1281	B-CAN_H	**Parking and back-up sensor control unit 16P connector**	No. 9	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 2		No. 21

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0155	**Gauge control module**
U1281	**Body control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (PARKING/BACK-UP SENSOR CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

   Is DTC U1280 indicated?

   YES

   Go to body control module DTC U1280 troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC TROUBLESHOOTING

DTC B2601 (2020 2021)

DTC B2601 : Parking Sensor CPU Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B2601 Parking Sensor CPU Error	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2601 Parking Sensor CPU Error	B

Is DTC B2601 indicated?

YES

Replace the parking and back-up sensor control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2602 (2020 2021)

DTC B2602 : Parking Sensor EEPROM Error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B2602 Parking Sensor EEPROM Error	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2602 Parking Sensor EEPROM Error	B

Is DTC B2602 indicated?

YES

Replace the parking and back-up sensor control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2610, B2611, B2612, B2613 (2020 2021)

DTC B2610 : Front 1st sensor failure

DTC B2611 : Front 2nd sensor failure

DTC B2612 : Front 3rd sensor failure

DTC B2613 : Front 4th sensor failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2610 Front 1st sensor failure	B
B2611 Front 2nd sensor failure	B
B2612 Front 3rd sensor failure	B
B2613 Front 4th sensor failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2610 Front 1st sensor failure	B
B2611 Front 2nd sensor failure	B
B2612 Front 3rd sensor failure	B
B2613 Front 4th sensor failure	B

Are any DTCs indicated?

YES

Refer to the DTC shown on the display, then replace the sensor based on the instructions (see table).

DTC	Operation for transmitting control unit
B2610	Left front corner sensor
B2611	Left front center sensor
B2612	Right front center sensor

DTC	Operation for transmitting control unit
B2613	Right front corner sensor

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2614, B2615, B2616, B2617 (2020 2021)

DTC B2614 : Rear 1st sensor failure

DTC B2615 : Rear 2nd sensor failure

DTC B2616 : Rear 3rd sensor failure

DTC B2617 : Rear 4th sensor failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2614 Rear 1st sensor failure	B
B2615 Rear 2nd sensor failure	B
B2616 Rear 3rd sensor failure	B
B2617 Rear 4th sensor failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2614 Rear 1st sensor failure	B
B2615 Rear 2nd sensor failure	B
B2616 Rear 3rd sensor failure	B
B2617 Rear 4th sensor failure	B

Are any DTCs indicated?

YES

Refer to the DTC shown on the display, then replace the sensor based on the instructions (see table).

DTC	Operation for transmitting control unit
B2614	Left rear corner sensor
B2615	Left rear center sensor
B2616	Right rear center sensor

DTC	Operation for transmitting control unit
B2617	Right rear corner sensor

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2618, B2619, B261A, B261B (2020 2021)

DTC B2618 : Front 1st sensor data failure

DTC B2619 : Front 2nd sensor data failure

DTC B261A : Front 3rd sensor data failure

DTC B261B : Front 4th sensor data failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before you troubleshoot, resetting the parking and back-up sensor control unit .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2618 Front 1st sensor data failure	B
B2619 Front 2nd sensor data failure	B
B261A Front 3rd sensor data failure	B
B261B Front 4th sensor data failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2618 Front 1st sensor data failure	B
B2619 Front 2nd sensor data failure	B
B261A Front 3rd sensor data failure	B
B261B Front 4th sensor data failure	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	**DTC**
B2618 Front 1st sensor data failure	B
B2619 Front 2nd sensor data failure	B
B261A Front 3rd sensor data failure	B
B261B Front 4th sensor data failure	B
B2646 Front sensor power failure	B
B2648 Front sensor signal short to ground	B

Are any DTCs indicated?

YES: with front center sensor

Go to step 3.

YES: without front center sensor

Go to step 3.

YES: with front center sensor

Go to step 4.

YES: with front center sensor

Go to step 5.

YES: with front center sensor

Go to step 6.

YES: without front center sensor

Go to step 7.

YES

Go to parking and back-up sensor system DTC B2646 troubleshooting.

YES

Go to parking and back-up sensor system DTC B2648 troubleshooting.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

3. Open wire check (BOF SIDE L, SOF SIDE L, E1 SIDE L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

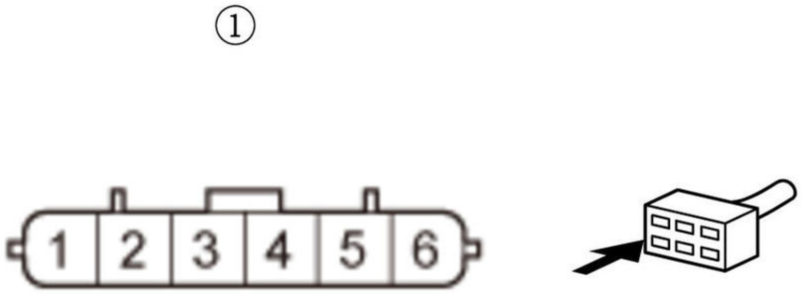
Parking and back-up sensor control unit 16P connector Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 7
Test point 2	Left front corner sensor 6P connector (female terminals) No. 6: ①

Test point 1	Parking and back-up sensor control unit 16P connector No. 6
Test point 2	Left front corner sensor 6P connector (female terminals) No. 4: ①

Test point 1	Parking and back-up sensor control unit 16P connector No. 13
Test point 2	Left front corner sensor 6P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the left front corner sensor .

NO

Repair an open or high resistance in BOF SIDE L, SOF SIDE L, or E1 SIDE L wire.

4. Open wire check (BOF CTR L, SOF CTR L, E1 CTR L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Left front corner sensor 6P connector Left front center sensor 6P connector

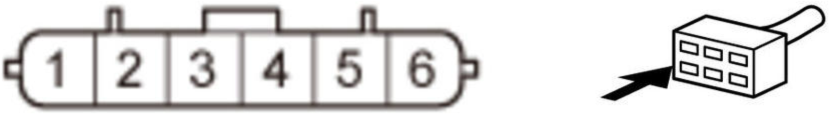
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left front corner sensor 6P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 6: ②

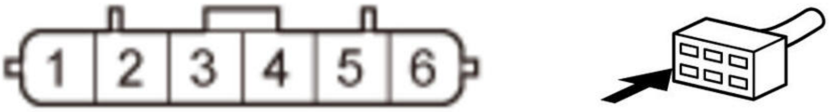
Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left front corner sensor 6P connector (female terminals) No. 1: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 2: ②

①



②



Is there 1.0 Ω or less?

YES

Replace the left front center sensor .

NO

Repair an open or high resistance in BOF CTR L, SOF CTR L, or E1 CTR L wire.

5. Open wire check (BOF CTR R, SOF CTR R, E1 CTR R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

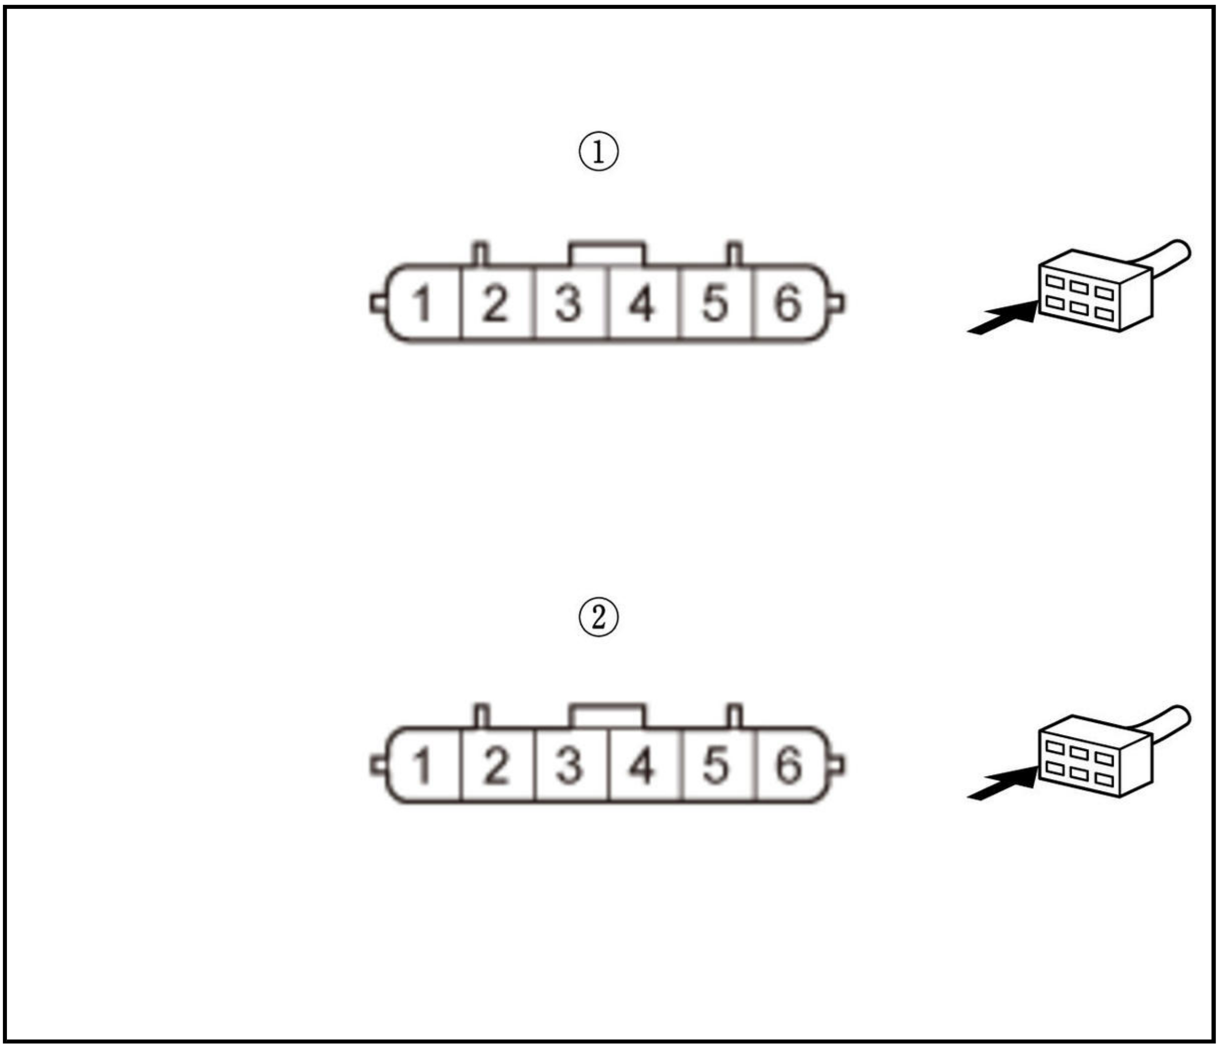
Left front center sensor 6P connector Right front center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left front center sensor 6P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left front center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right front center sensor .

NO

Repair an open or high resistance in BOF CTR R, SOF CTR R, or E1 CTR R wire.

6. Open wire check (BOF SIDE R, SOF SIDE R, E1 SIDE R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

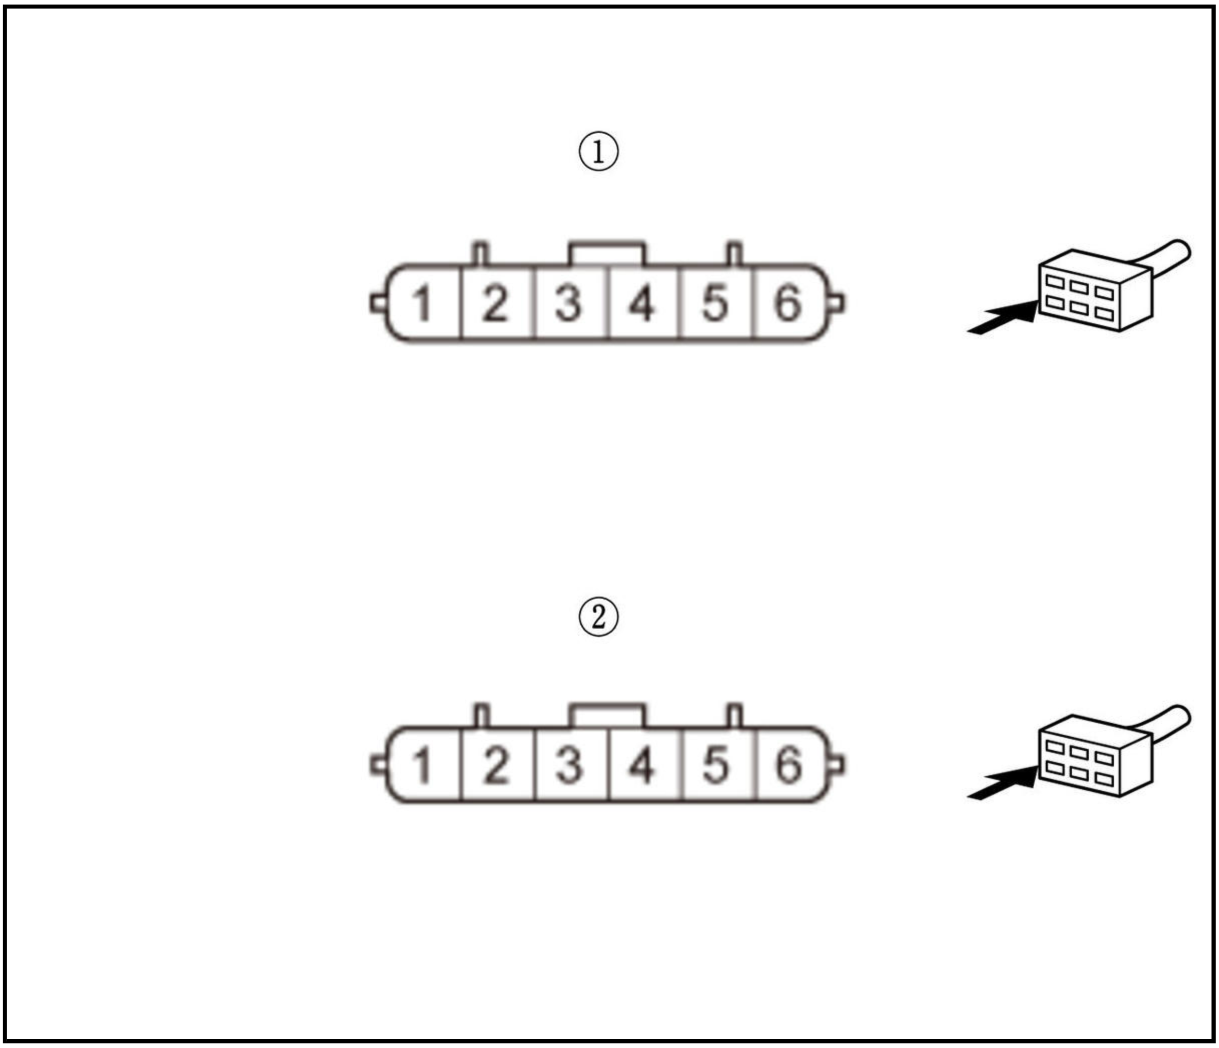
Right front center sensor 6P connector Right front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Right front center sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 6: ②

Test point 1	Right front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 4: ②

Test point 1	Right front center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right front corner sensor .

NO

Repair an open or high resistance in BOF SIDE R, SOF SIDE R, or E1 SIDE R wire.

7. Open wire check (BOF CTR L, SOF CTR L, E1 CTR L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

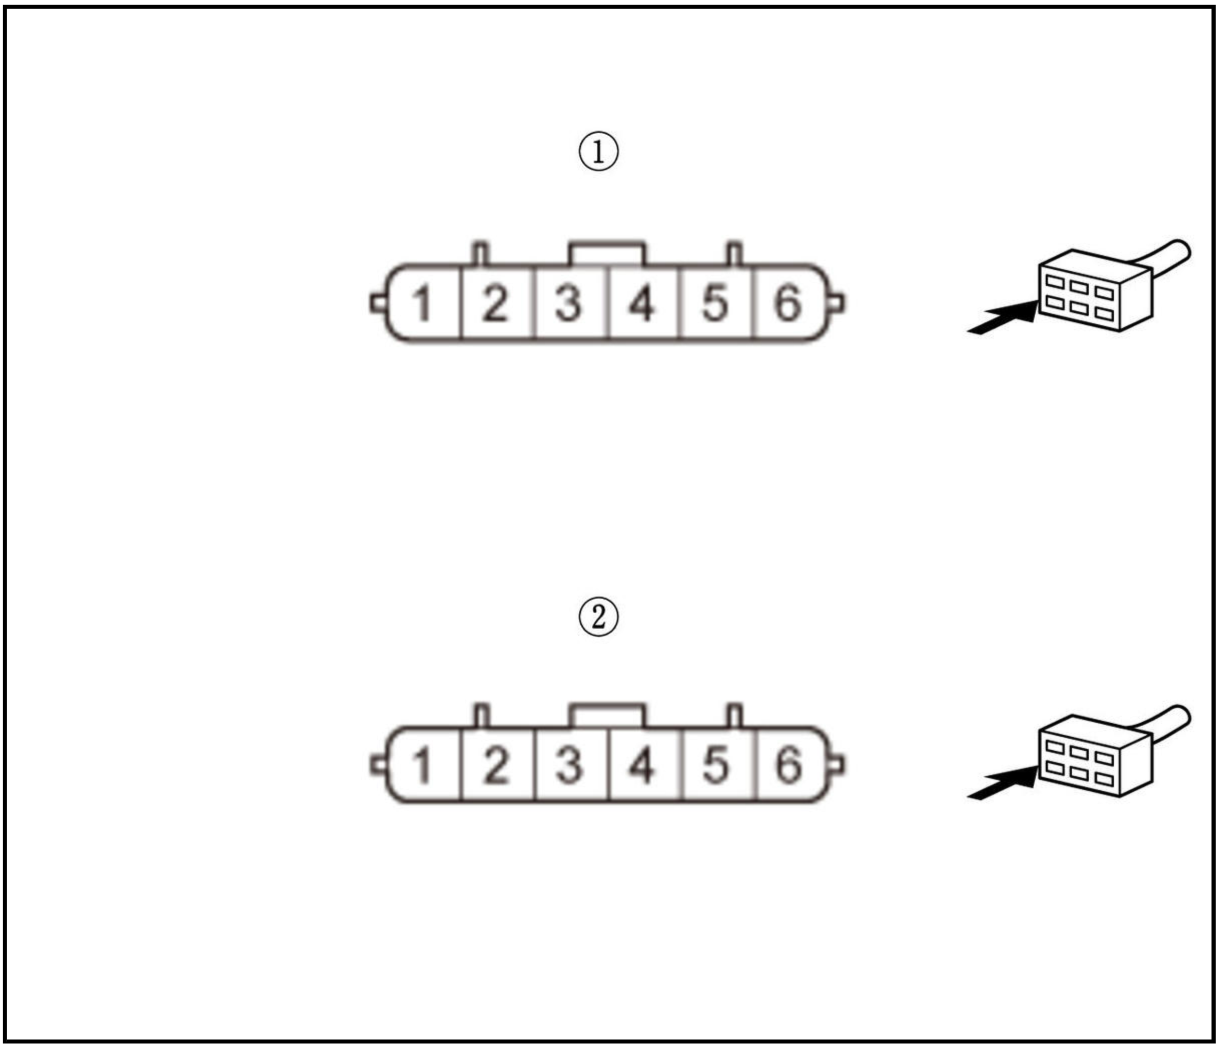
Left front corner sensor 6P connector Right front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left front corner sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left front corner sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right front corner sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right front corner sensor .

NO

Repair an open or high resistance in BOF CTR L, SOF CTR L, or E1 CTR L wire.

DTC B261C, B261D, B261E, B261F (2020 2021)

DTC B261C : Rear 1st sensor data failure

DTC B261D : Rear 2nd sensor data failure

DTC B261E : Rear 3rd sensor data failure

DTC B261F : Rear 4th sensor data failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before you troubleshoot, **resetting the parking and back-up sensor control unit** .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B261C Rear 1st sensor data failure	B
B261D Rear 2nd sensor data failure	B
B261E Rear 3rd sensor data failure	B
B261F Rear 4th sensor data failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B261C Rear 1st sensor data failure	B
B261D Rear 2nd sensor data failure	B
B261E Rear 3rd sensor data failure	B
B261F Rear 4th sensor data failure	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B261C Rear 1st sensor data failure	B
B261D Rear 2nd sensor data failure	B
B261E Rear 3rd sensor data failure	B
B261F Rear 4th sensor data failure	B
B2647 Rear sensor power failure	B
B2649 Rear sensor signal short to ground	B

Are any DTCs indicated?

YES

Go to step 3.

YES

Go to step 4.

YES

Go to step 5.

YES

Go to step 6.

YES

Go to parking and back-up sensor system DTC B2647 troubleshooting.

YES

Go to parking and back-up sensor system DTC B2649 troubleshooting.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

3. Open wire check (BOR SIDE L, SOR SIDE L, E2 SIDE L lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

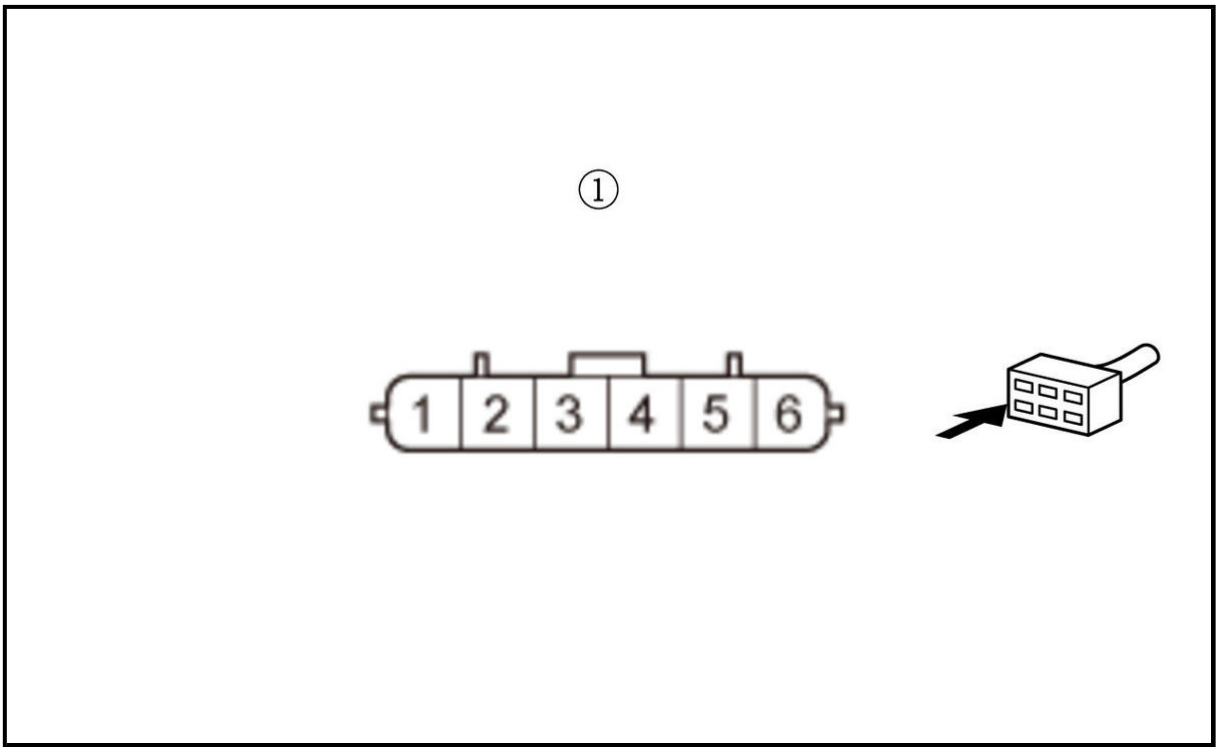
Parking and back-up sensor control unit 16P connector Left rear corner sensor 6P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 16
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 6: ①

Test point 1	Parking and back-up sensor control unit 16P connector No. 14
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 4: ①

Test point 1	**Parking and back-up sensor control unit 16P connector No. 12**
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the left rear corner sensor .

NO

Repair an open or high resistance in BOR SIDE L, SOR SIDE L, or E2 SIDE L wire.

4. Open wire check (BOR CTR L, SOR CTR L, E2 CTR L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

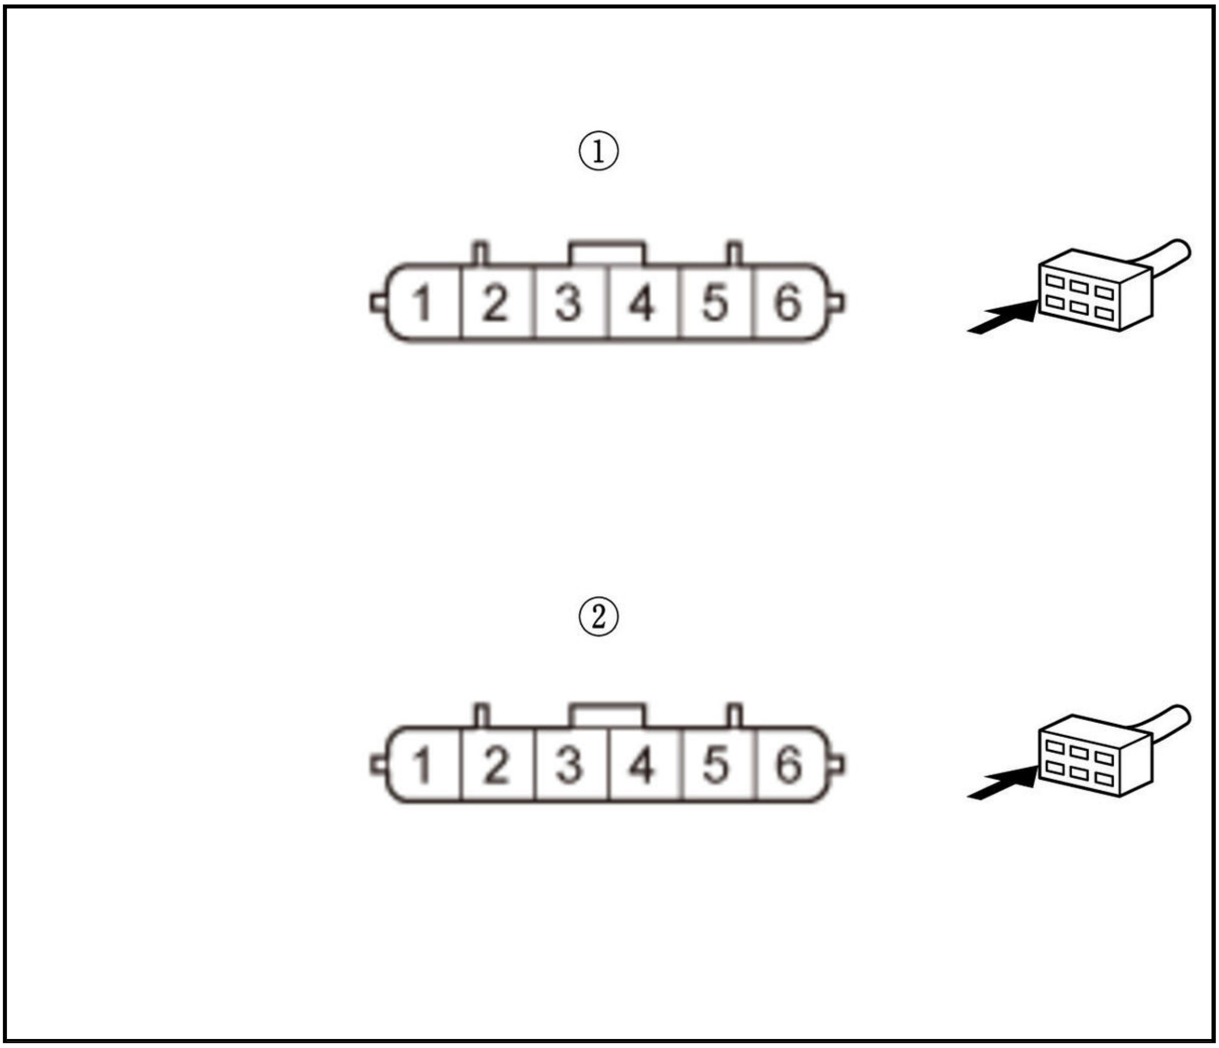
Left rear corner sensor 6P connector Left rear center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear corner sensor 6P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left rear corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left rear corner sensor 6P connector (female terminals) No. 1: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the left rear center sensor .

NO

Repair an open or high resistance in BOR CTR L, SOR CTR L, or E2 CTR L wire.

5. Open wire check (BOR CTR R, SOR CTR R, E2 CTR R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Left rear center sensor 6P connector Right rear center sensor 6P connector

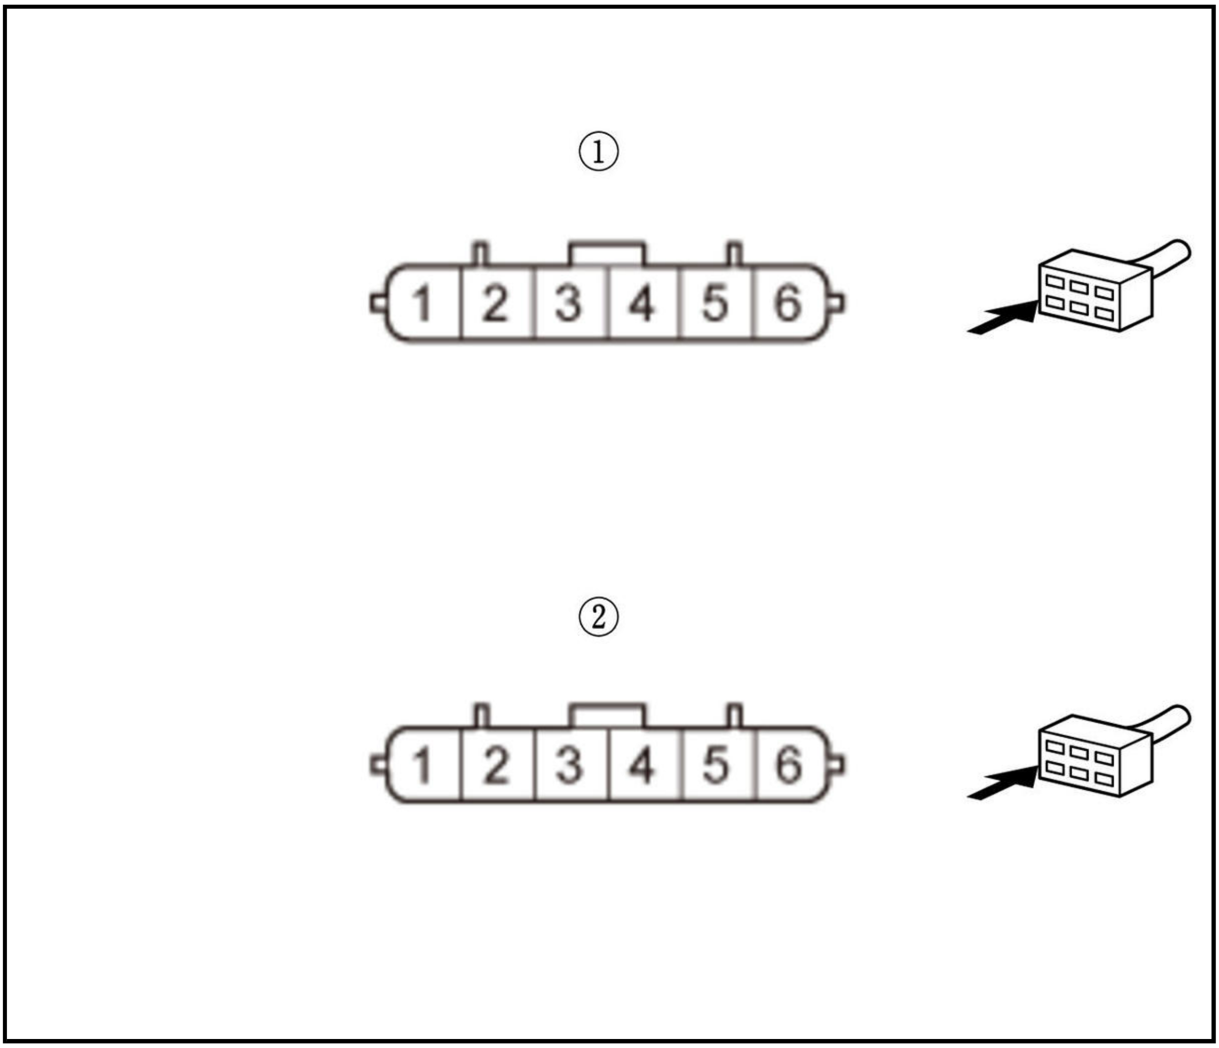
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear center sensor 6P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B

Test point 1	Left rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 6: ②

Test point 1	Left rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 4: ②

Test point 1	Left rear center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right rear center sensor .

NO

Repair an open or high resistance in BOR CTR R, SOR CTR R, or E2 CTR R wire.

6. Open wire check (BOR SIDE R, SOR SIDE R, E2 SIDE R lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

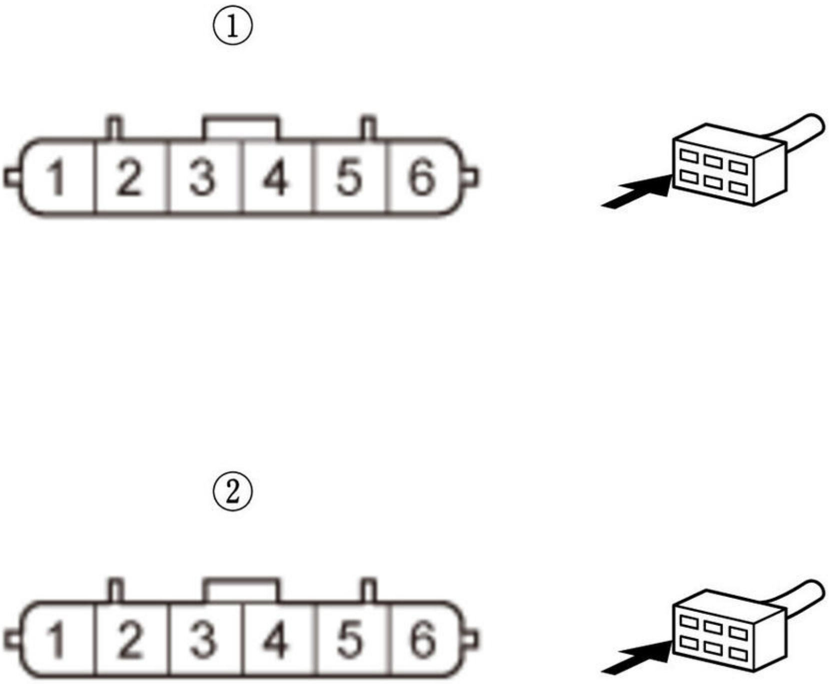
Right rear center sensor 6P connector Right rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Right rear center sensor 6P connector: disconnected Right rear corner sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear corner sensor 6P connector (female terminals) No. 6: ②

Test point 1	Right rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear corner sensor 6P connector (female terminals) No. 4: ②

Test point 1	Right rear center sensor 6P connector (female terminals) No. 1: ①
Test point 2	Right rear corner sensor 6P connector (female terminals) No. 2: ②



Is there 1.0 Ω or less?

YES

Replace the right rear corner sensor .

NO

Repair an open or high resistance in BOR SIDE R, SOR SIDE R, or E2 SIDE R wire.

DTC B2646 (2020 2021)

DTC B2646 : Front sensor power failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2646 Front sensor power failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2646 Front sensor power failure	B

Is DTC B2646 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (BOF SIDE L, E1 SIDE L lines) 1

-1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 7
Test point 2	Parking and back-up sensor control unit 16P connector No. 13

Is there 1.0 MΩ or more?

YES

Go to step 12.

NO: with front center sensor

Go to step 3.

NO: without front center sensor

Go to step 5.

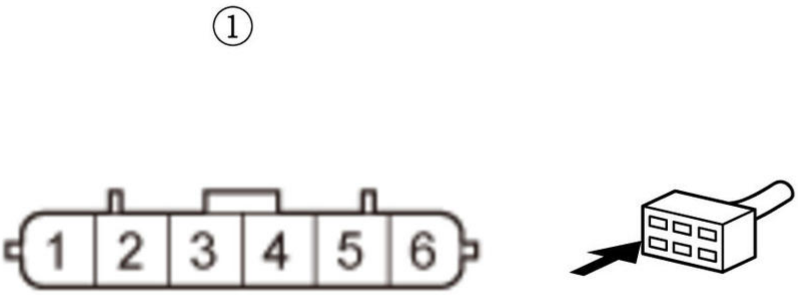
3. Shorted wire check (BOF SIDE R, E1 SIDE R lines) 1

-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 4.

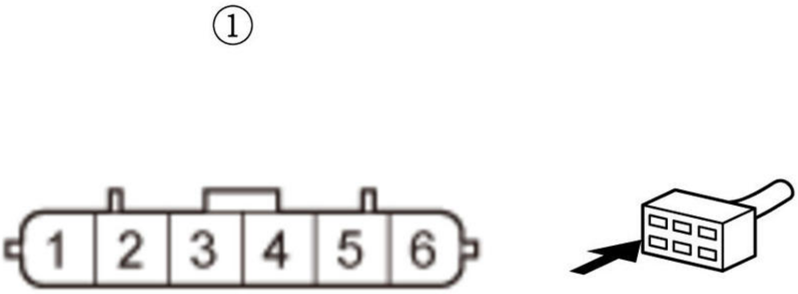
4. Shorted wire check (BOF SIDE R, E1 SIDE R lines) 2

-1. Disconnect the following connector.

Right front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front corner sensor .

NO

Repair a short in the BOF SIDE R and E1 SIDE R wires.

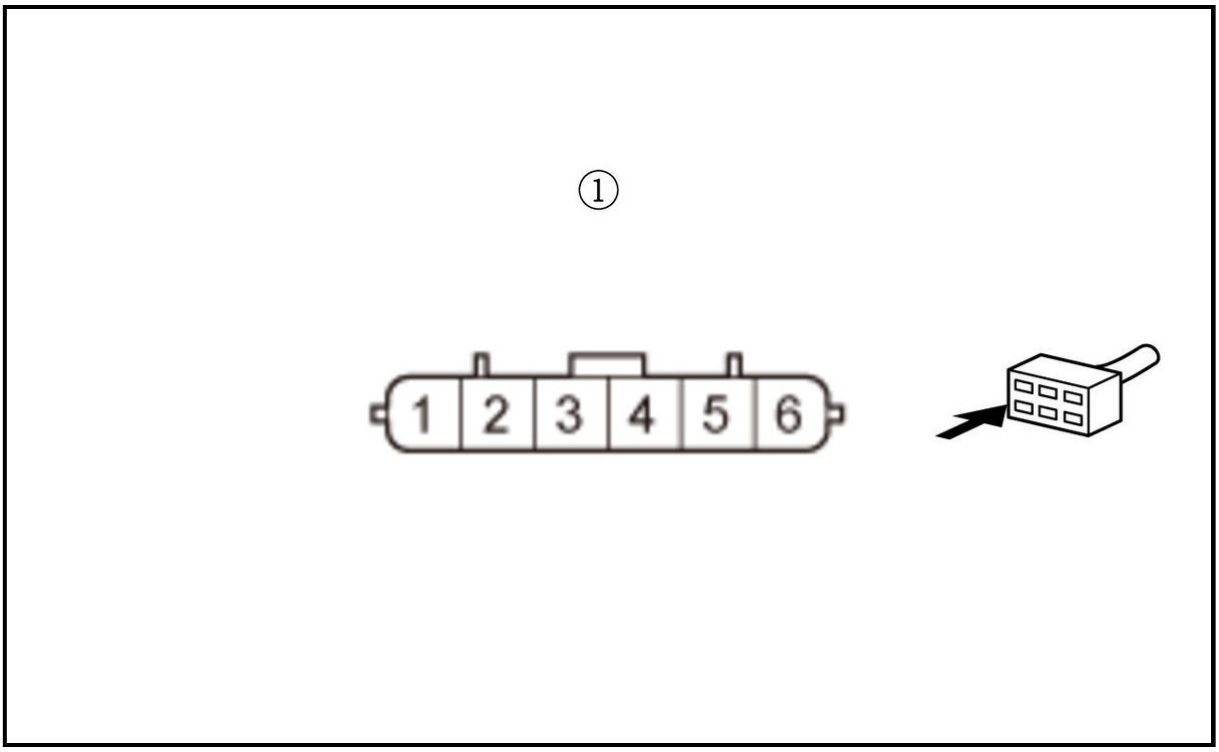
5. Shorted wire check (BOF CTR L, E1 CTR L lines) 1

-1. Disconnect the following connector.

Left front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 11.

NO

Go to step 6.

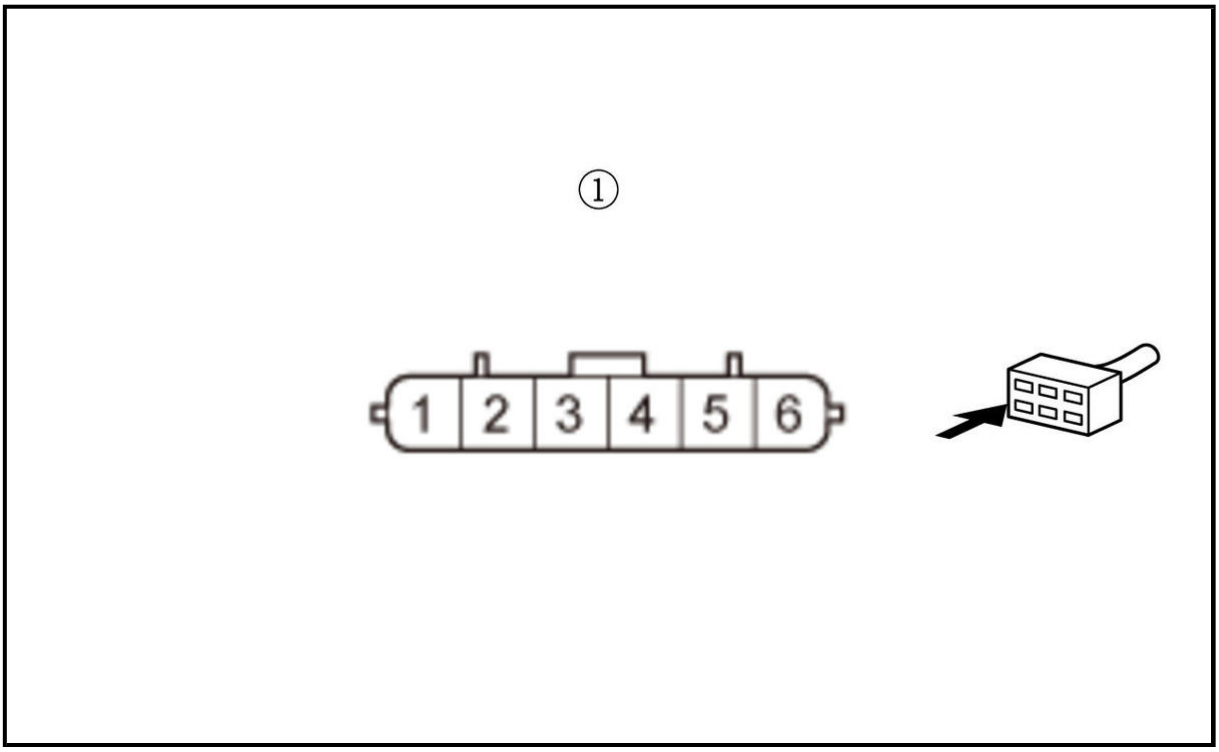
6. Shorted wire check (BOF SIDE R, E1 SIDE R lines) 2

-1. Disconnect the following connector.

Right front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front corner sensor .

NO

Repair a short in the BOF SIDE R and E1 SIDE R wires.

7. Shorted wire check (BOF CTR R, E1 CTR R lines) 1

-1. Reconnect the following connector.

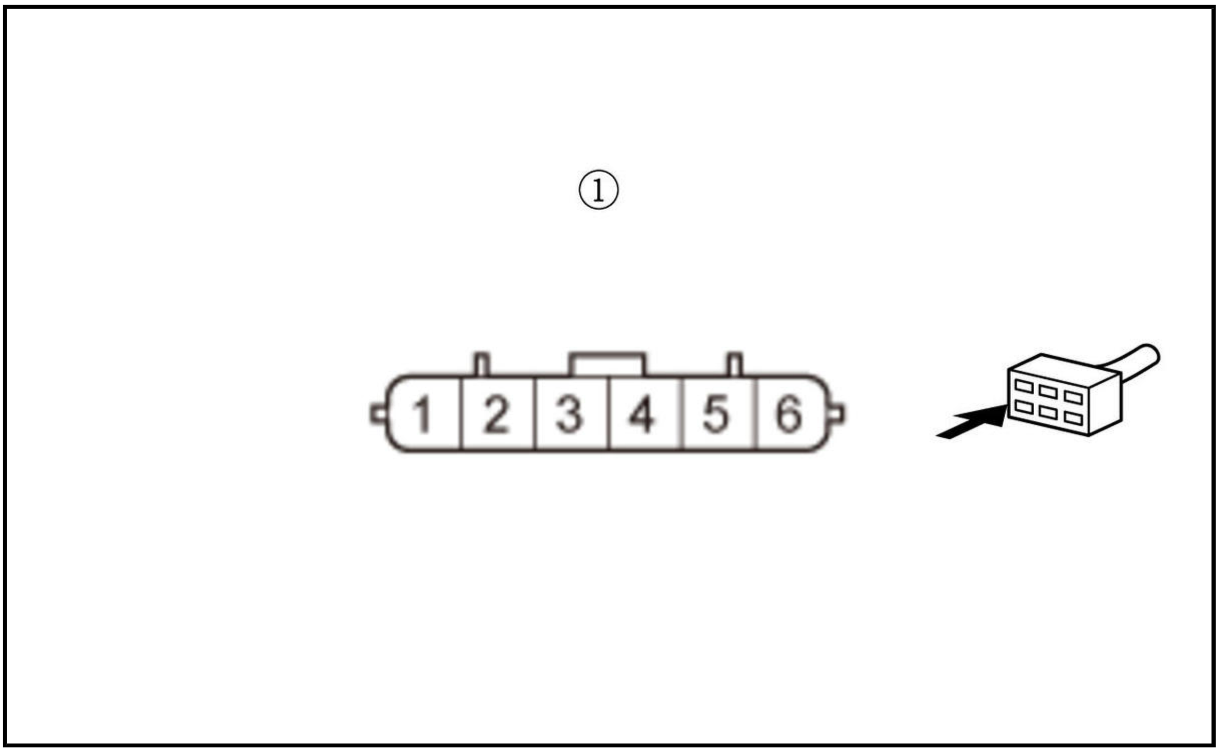
Right front center sensor 6P connector

-2. Disconnect the following connector.

Left front center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

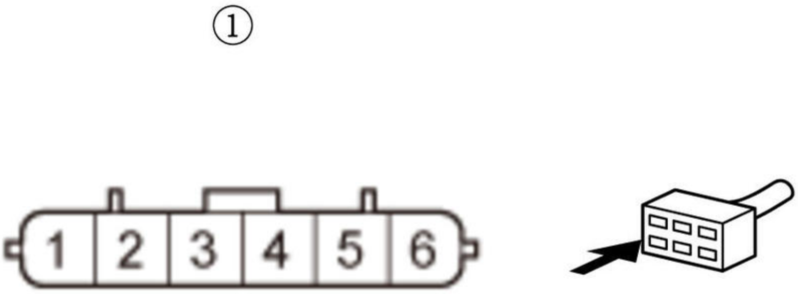
8. Shorted wire check (BOF CTR R, E1 CTR R lines) 2

   -1. Disconnect the following connector.

Right front center sensor 6P connector

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front center sensor .

NO

Repair a short in the BOF CTR R and E1 CTR R wires.

9. Shorted wire check (BOF CTR L, E1 CTR L lines) 1

-1. Reconnect the following connector.

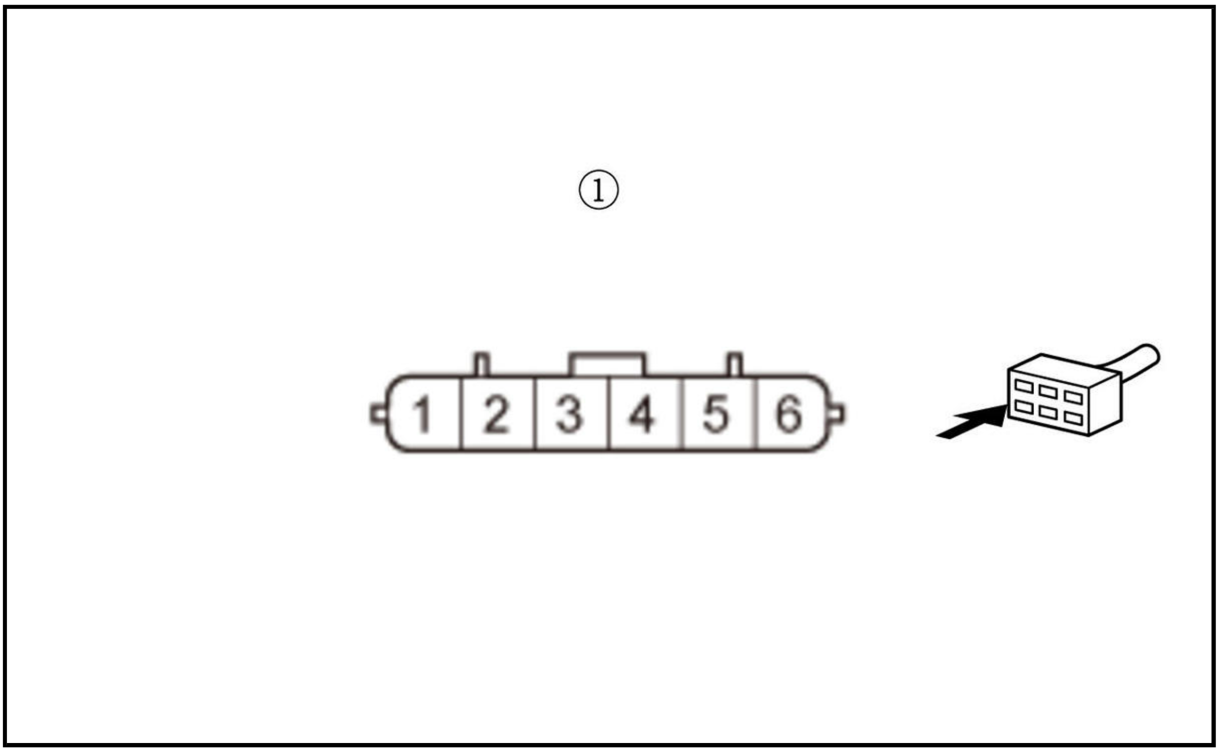
Left front center sensor 6P connector

-2. Disconnect the following connector.

Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 11.

NO

Go to step 10.

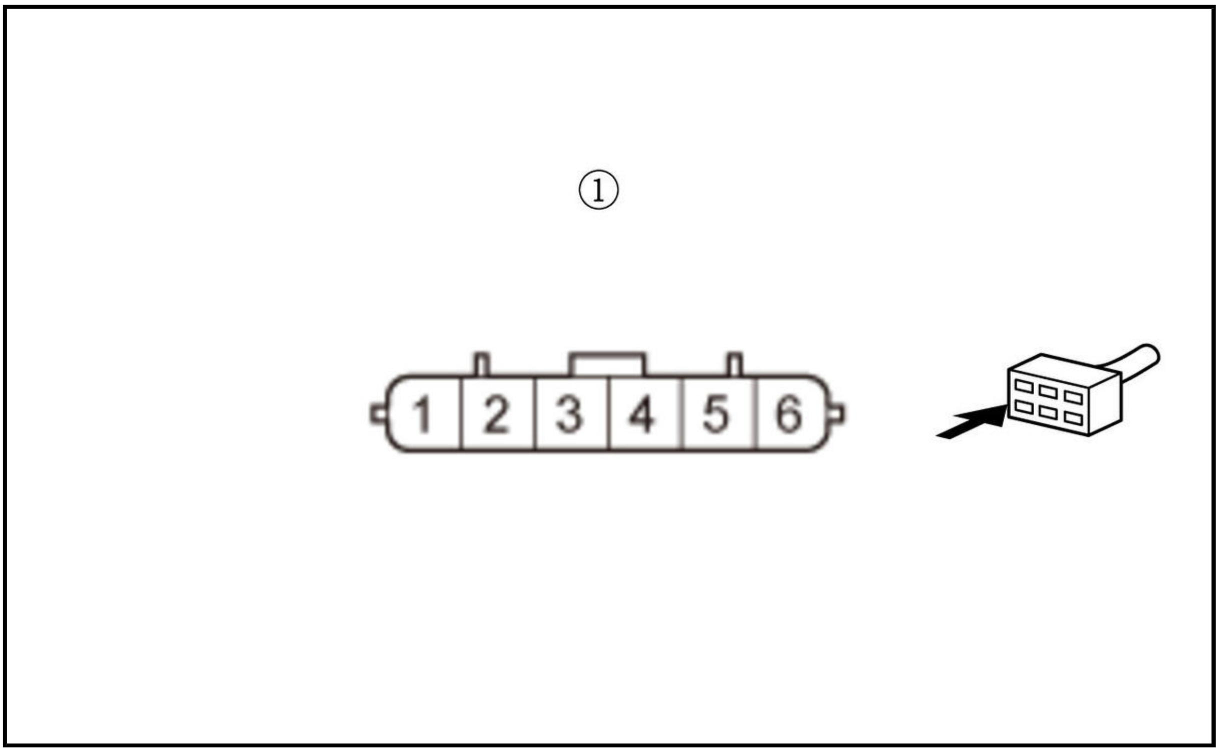
10. Shorted wire check (BOF CTR L, E1 CTR L lines) 2

-1. Disconnect the following connector.

Left front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left front center sensor .

NO

Repair a short in the BOF CTR L and E1 CTR L wires.

11. Shorted wire check (BOF SIDE L, E1 SIDE L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 7**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Replace the left front corner sensor .

NO

Repair a short in the BOF SIDE L and E1 SIDE L wires.

12. Shorted wire check (BOF SIDE L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B

Test point 1	Parking and back-up sensor control unit 16P connector No. 7
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the BOF SIDE L wire.

DTC B2647 (2020 2021)

DTC B2647 : Rear sensor power failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2647 Rear sensor power failure	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2647 Rear sensor power failure	B

   Is DTC B2647 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (BOR SIDE L, E2 SIDE L lines) 1

   -1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 16**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Go to step 10.

NO

Go to step 3.

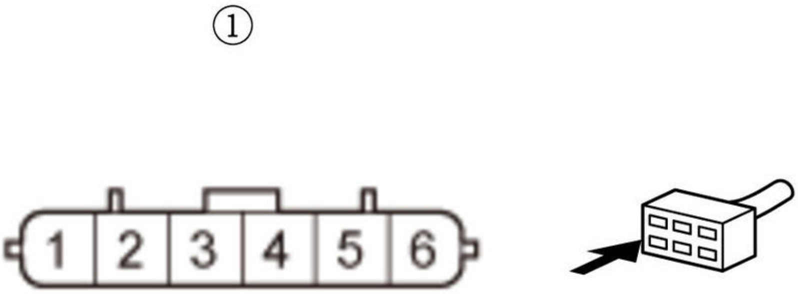
3. Shorted wire check (BOR SIDE R, E2 SIDE R lines) 1

-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

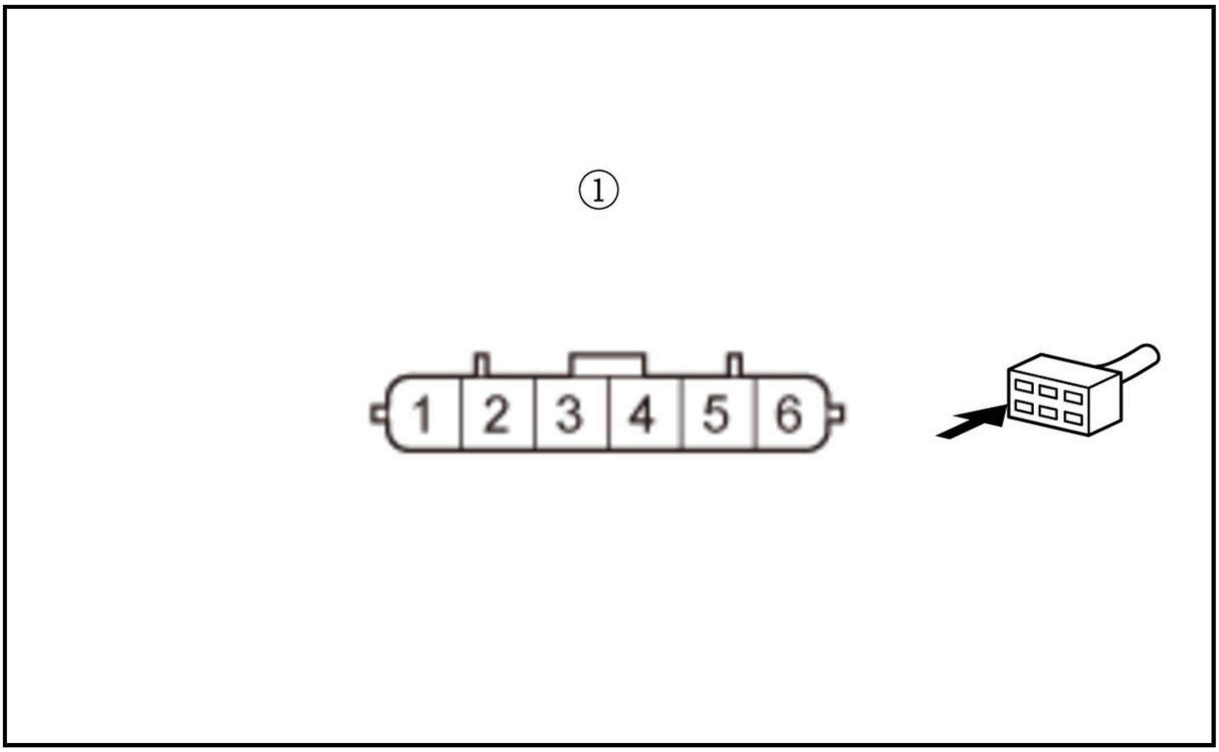
4. Shorted wire check (BOR SIDE R, E2 SIDE R lines) 2

-1. Disconnect the following connector.

Right rear corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected Right rear corner sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear corner sensor .

NO

Repair a short in the BOR SIDE R and E2 SIDE R wires.

5. Shorted wire check (BOR CTR R, E2 CTR R lines) 1

-1. Reconnect the following connector.

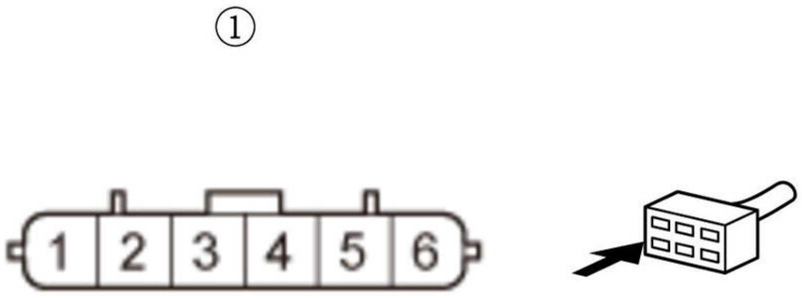
Right rear center sensor 6P connector

-2. Disconnect the following connector.

Left rear center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (BOR CTR R, E2 CTR R lines) 2

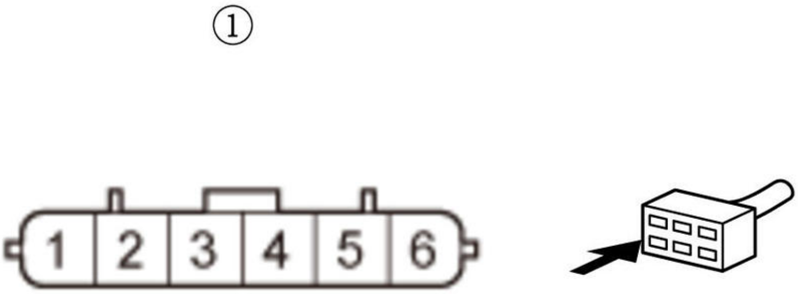
-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected Right rear center

	sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear center sensor .

NO

Repair a short in the BOR CTR R and E2 CTR R wires.

7. Shorted wire check (BOR CTR L, E2 CTR L lines) 1

-1. Reconnect the following connector.

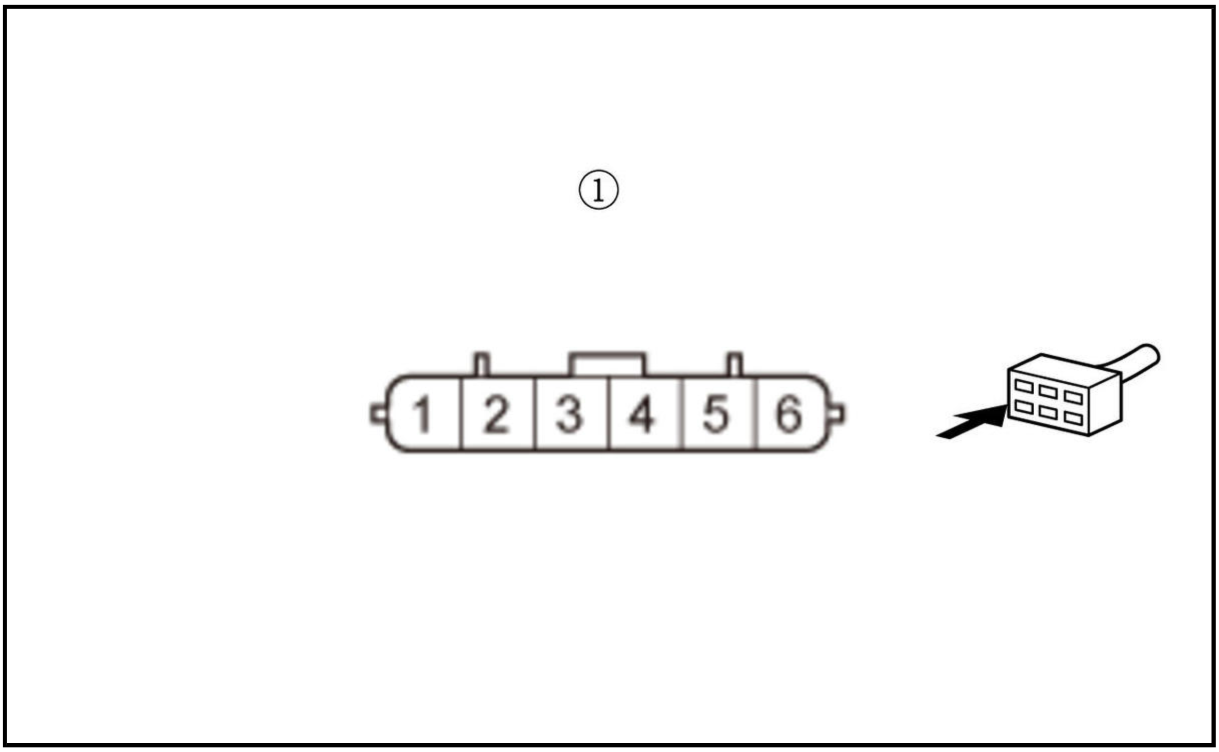
Left rear center sensor 6P connector

-2. Disconnect the following connector.

Left rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

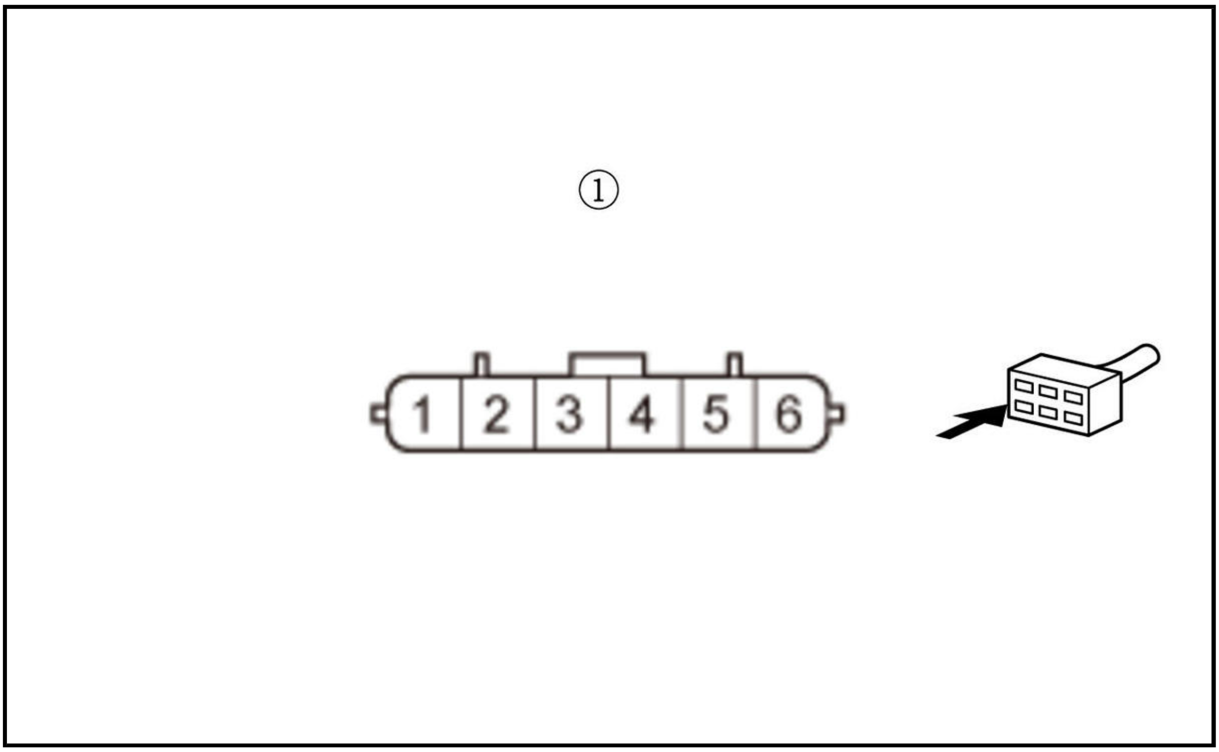
8. Shorted wire check (BOR CTR L, E2 CTR L lines) 2

-1. Disconnect the following connector.

Left rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 5: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left rear center sensor .

NO

Repair a short in the BOR CTR L and E2 CTR L wires.

9. Shorted wire check (BOR SIDE L, E2 SIDE L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 16**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Replace the left rear corner sensor .

NO

Repair a short in the BOR SIDE L and E2 SIDE L wires.

10. Shorted wire check (BOR SIDE L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B

Test point 1	Parking and back-up sensor control unit 16P connector No. 16
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the BOR SIDE L wire.

DTC B2648 (2020 2021)

DTC B2648 : Front sensor signal short to ground

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2648 Front sensor signal short to ground	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2648 Front sensor signal short to ground	B

   Is DTC B2648 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (SOF SIDE L, E1 SIDE L lines) 1

   -1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 6**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Go to step 12.

NO: with front center sensor

Go to step 3.

NO: without front center sensor

Go to step 5.

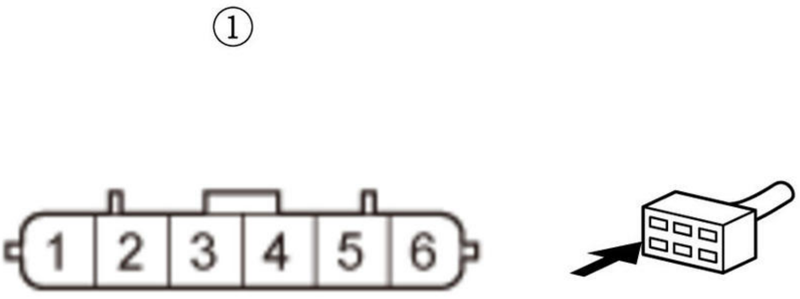
3. Shorted wire check (SOF SIDE R, E1 SIDE R lines) 1

-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 4.

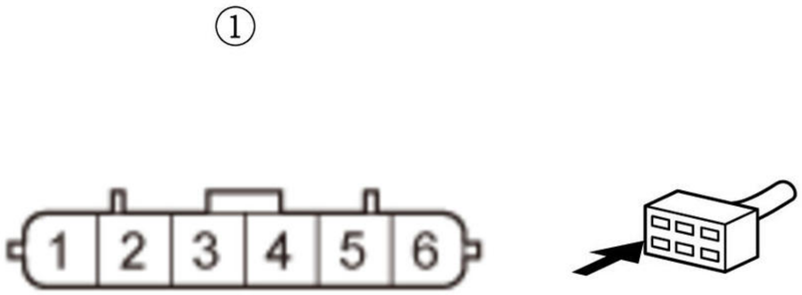
4. Shorted wire check (SOF SIDE R, E1 SIDE R lines) 2

-1. Disconnect the following connector.

Right front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right front center sensor 6P connector: disconnected Right front corner sensor 6P connector: disconnected
B	B
Test point 1	Right front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front corner sensor .

NO

Repair a short in the SOF SIDE R and E1 SIDE R wires.

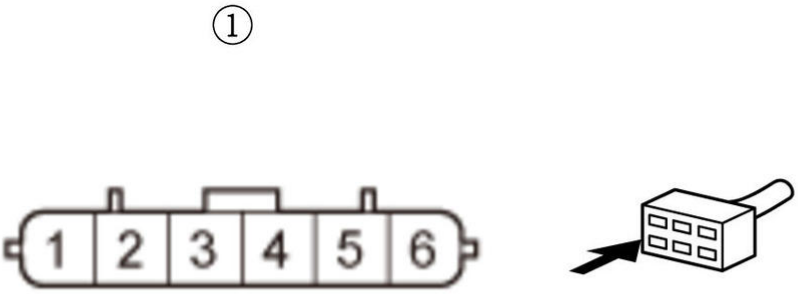
5. Shorted wire check (SOF CTR L, E1 CTR L lines) 1

-1. Disconnect the following connector.

Left front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 11.

NO

Go to step 6.

6. Shorted wire check (SOF SIDE R, E1 SIDE R lines) 2

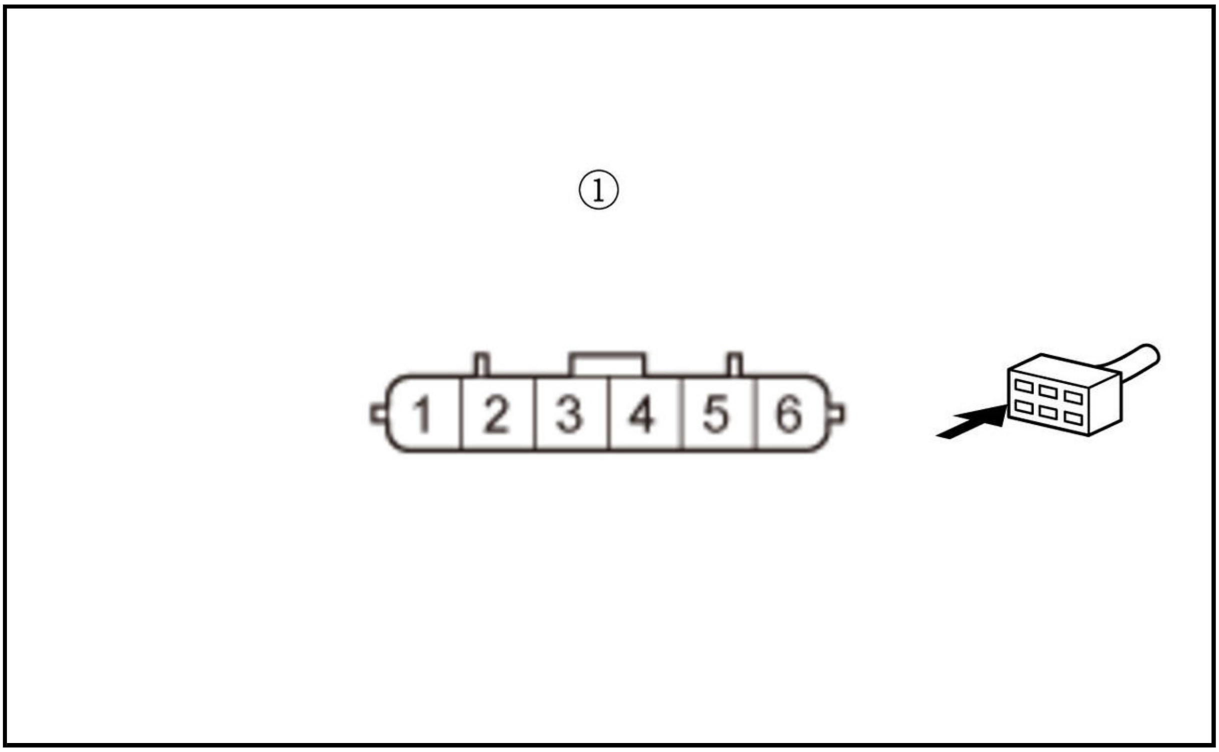
-1. Disconnect the following connector.

Right front corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected Right front corner

	sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front corner sensor .

NO

Repair a short in the SOF SIDE R and E1 SIDE R wires.

7. Shorted wire check (SOF CTR R, E1 CTR R lines) 1

-1. Reconnect the following connector.

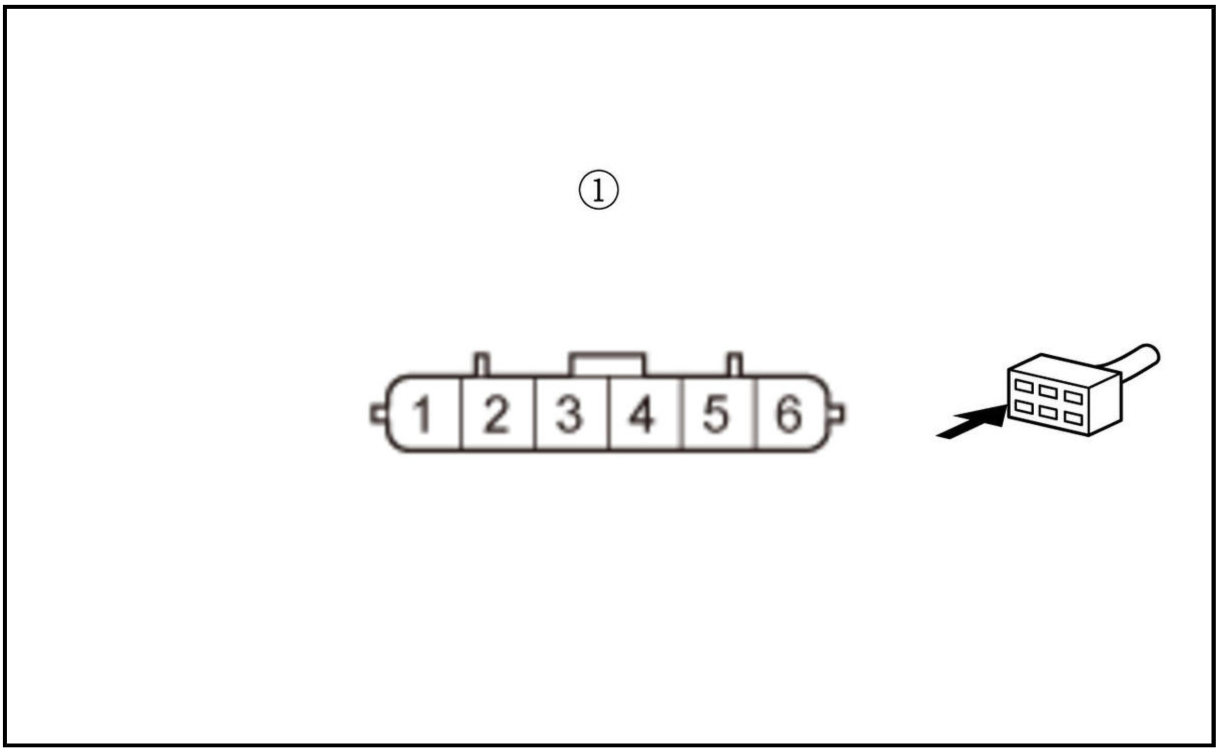
Right front center sensor 6P connector

-2. Disconnect the following connector.

Left front center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

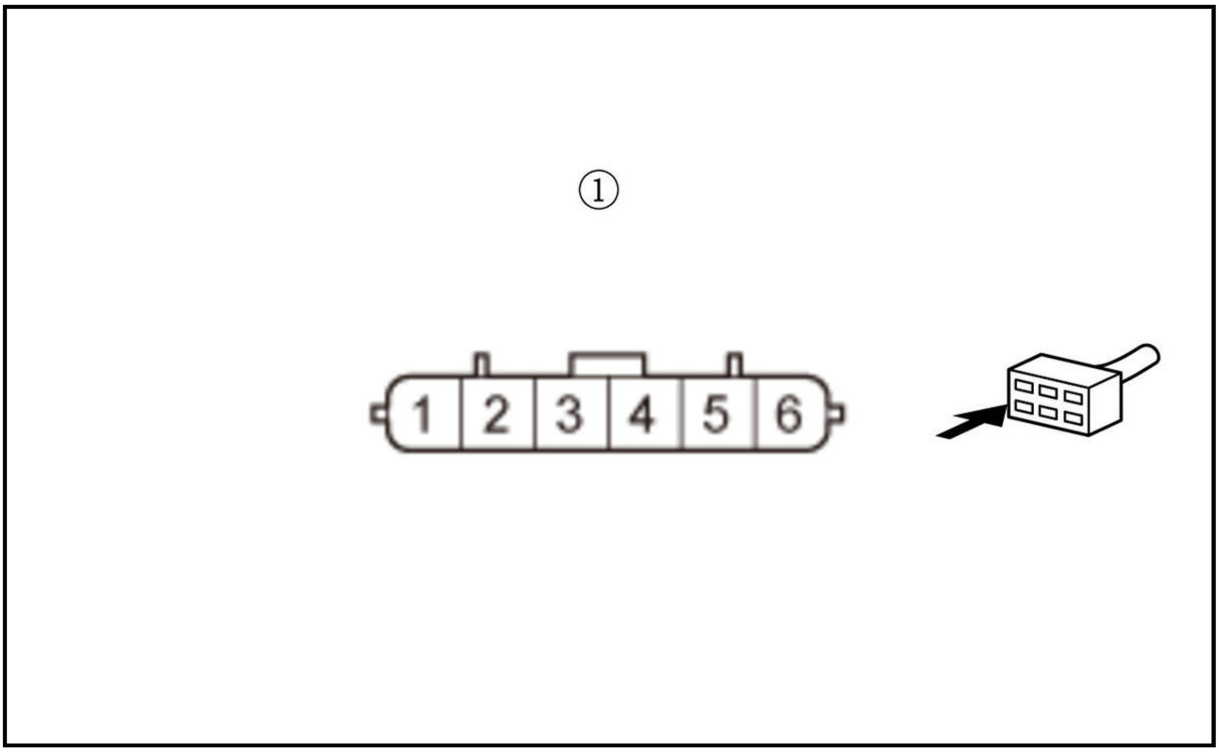
8. Shorted wire check (SOF CTR R, E1 CTR R lines) 2

-1. Disconnect the following connector.

Right front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front center sensor 6P connector: disconnected Right front center sensor 6P connector: disconnected
B	B
Test point 1	Left front center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right front center sensor .

NO

Repair a short in the SOF CTR R and E1 CTR R wires.

9. Shorted wire check (SOF CTR L, E1 CTR L lines) 1

-1. Reconnect the following connector.

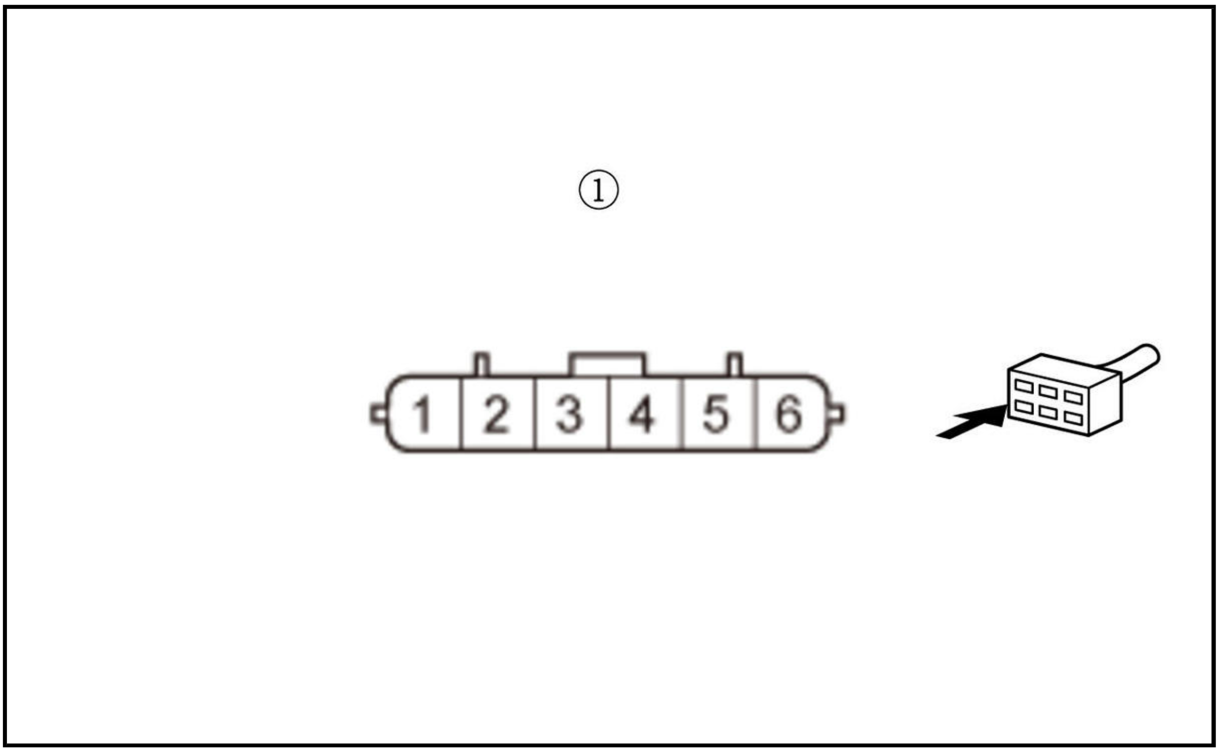
Left front center sensor 6P connector

-2. Disconnect the following connector.

Left front corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 11.

NO

Go to step 10.

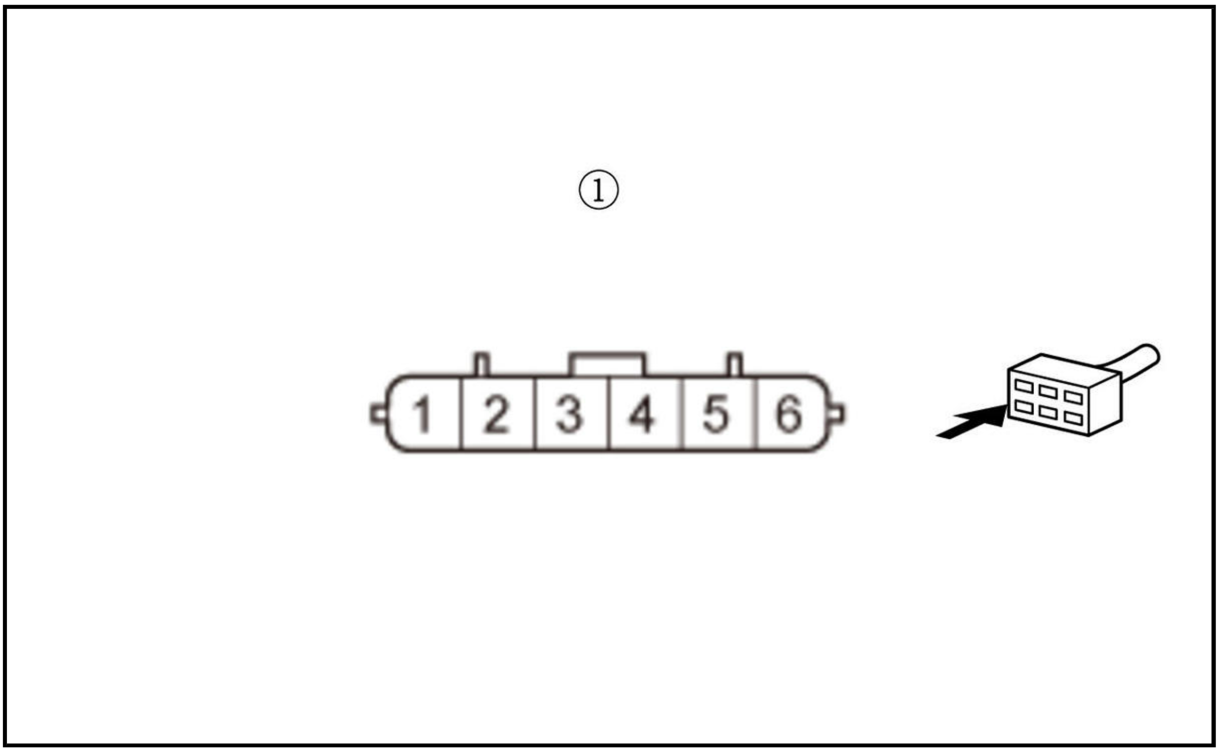
10. Shorted wire check (SOF CTR L, E1 CTR L lines) 2

-1. Disconnect the following connector.

Left front center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected Left front center sensor 6P connector: disconnected
B	B
Test point 1	Left front corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left front corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left front center sensor .

NO

Repair a short in the SOF CTR L and E1 CTR L wires.

11. Shorted wire check (SOF SIDE L, E1 SIDE L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left front corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 6**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 13**

Is there 1.0 MΩ or more?

YES

Replace the left front corner sensor .

NO

Repair a short in the SOF SIDE L and E1 SIDE L wires.

12. Shorted wire check (SOF SIDE L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B

Test point 1	Parking and back-up sensor control unit 16P connector No. 6
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the SOF SIDE L wire.

DTC B2649 (2020 2021)

DTC B2649 : Rear sensor signal short to ground

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The connection order of the sensor is 1st -> 2nd -> 3rd -> 4th from the side near the control unit.

DTC Description	DTC
B2649 Rear sensor signal short to ground	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2649 Rear sensor signal short to ground	B

   Is DTC B2649 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (SOR SIDE L, E2 SIDE L lines) 1

   -1. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 14**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Go to step 10.

NO

Go to step 3.

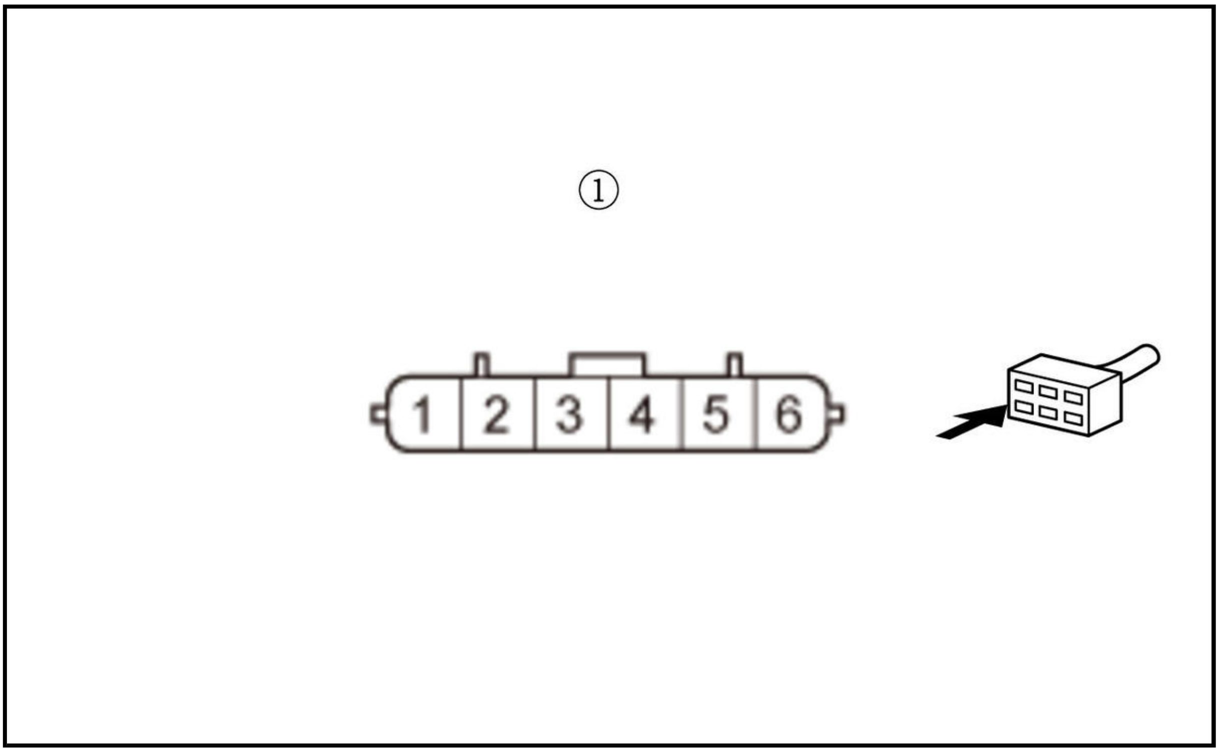
3. Shorted wire check (SOR SIDE R, E2 SIDE R lines) 1

-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

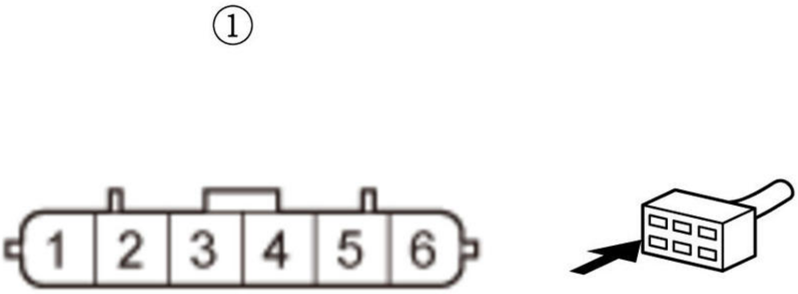
4. Shorted wire check (SOR SIDE R, E2 SIDE R lines) 2

-1. Disconnect the following connector.

Right rear corner sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Right rear center sensor 6P connector: disconnected Right rear corner sensor 6P connector: disconnected
B	B
Test point 1	Right rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Right rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear corner sensor .

NO

Repair a short in the SOR SIDE R and E2 SIDE R wires.

5. Shorted wire check (SOR CTR R, E2 CTR R lines) 1

-1. Reconnect the following connector.

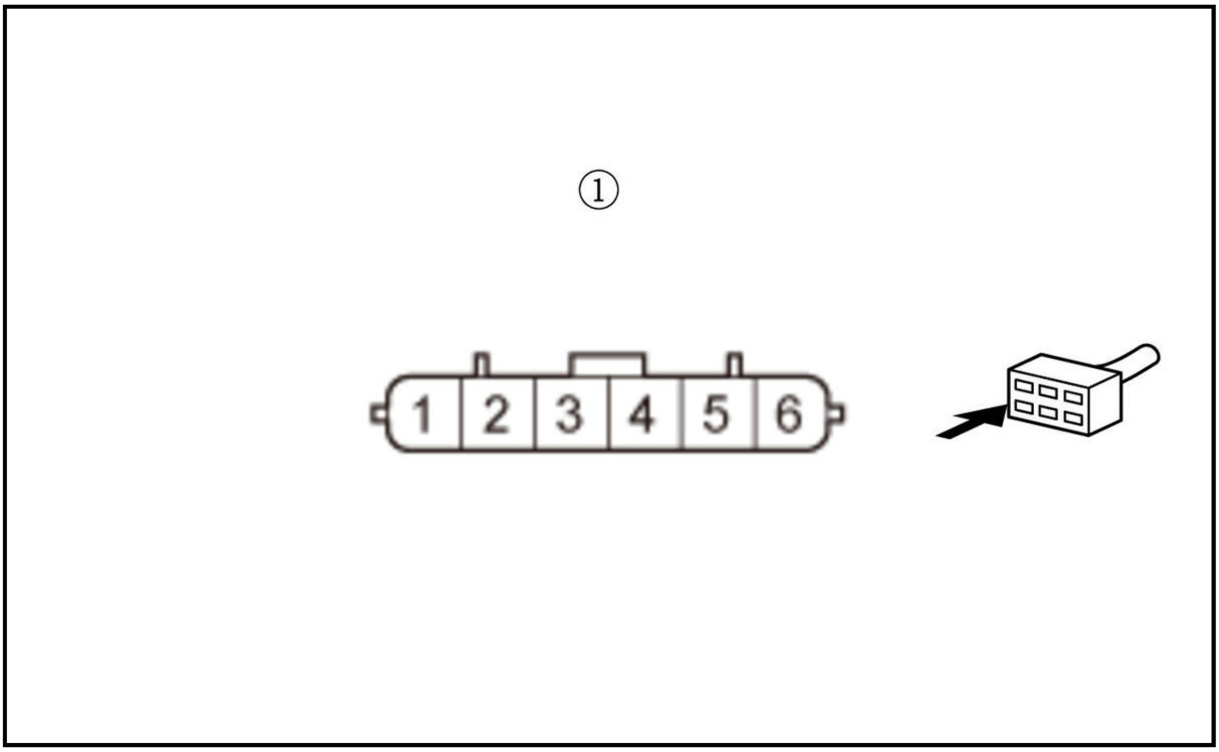
Right rear center sensor 6P connector

-2. Disconnect the following connector.

Left rear center sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 7.

NO

Go to step 6.

6. Shorted wire check (SOR CTR R, E2 CTR R lines) 2

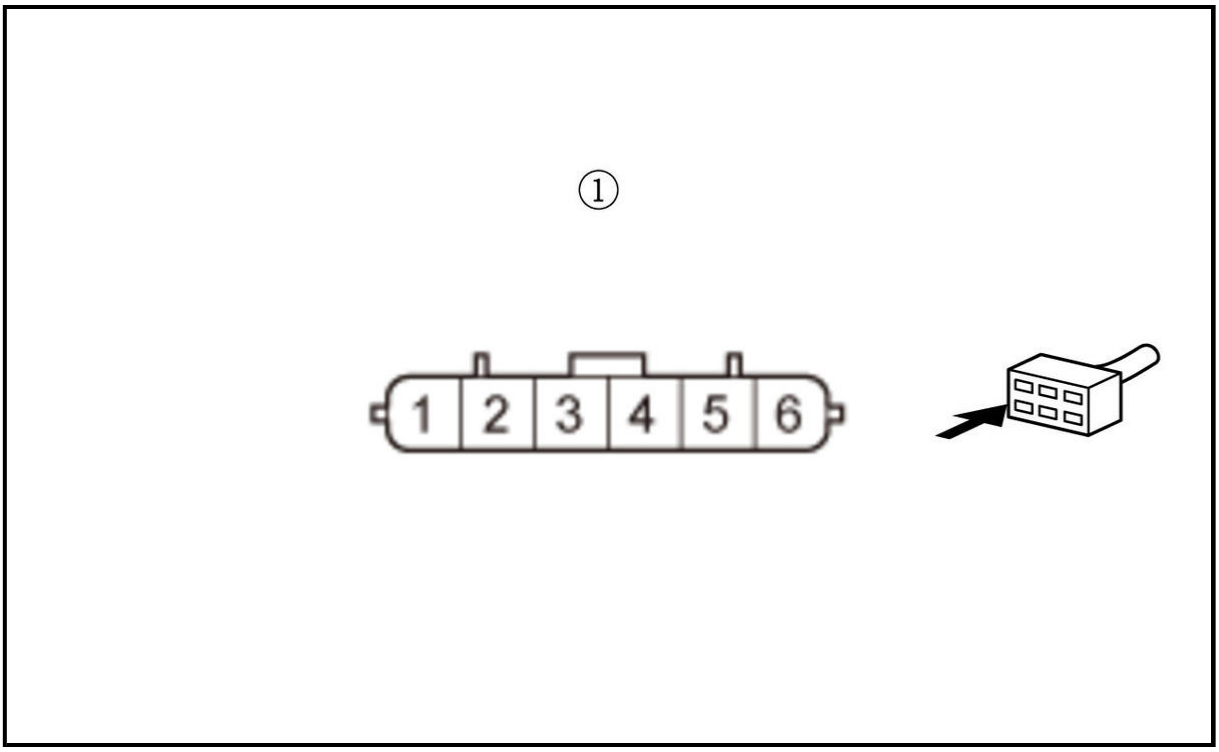
-1. Disconnect the following connector.

Right rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear center sensor 6P connector: disconnected Right rear center

	sensor 6P connector: disconnected
B	B
Test point 1	Left rear center sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear center sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the right rear center sensor .

NO

Repair a short in the SOR CTR R and E2 CTR R wires.

7. Shorted wire check (SOR CTR L, E2 CTR L lines) 1

-1. Reconnect the following connector.

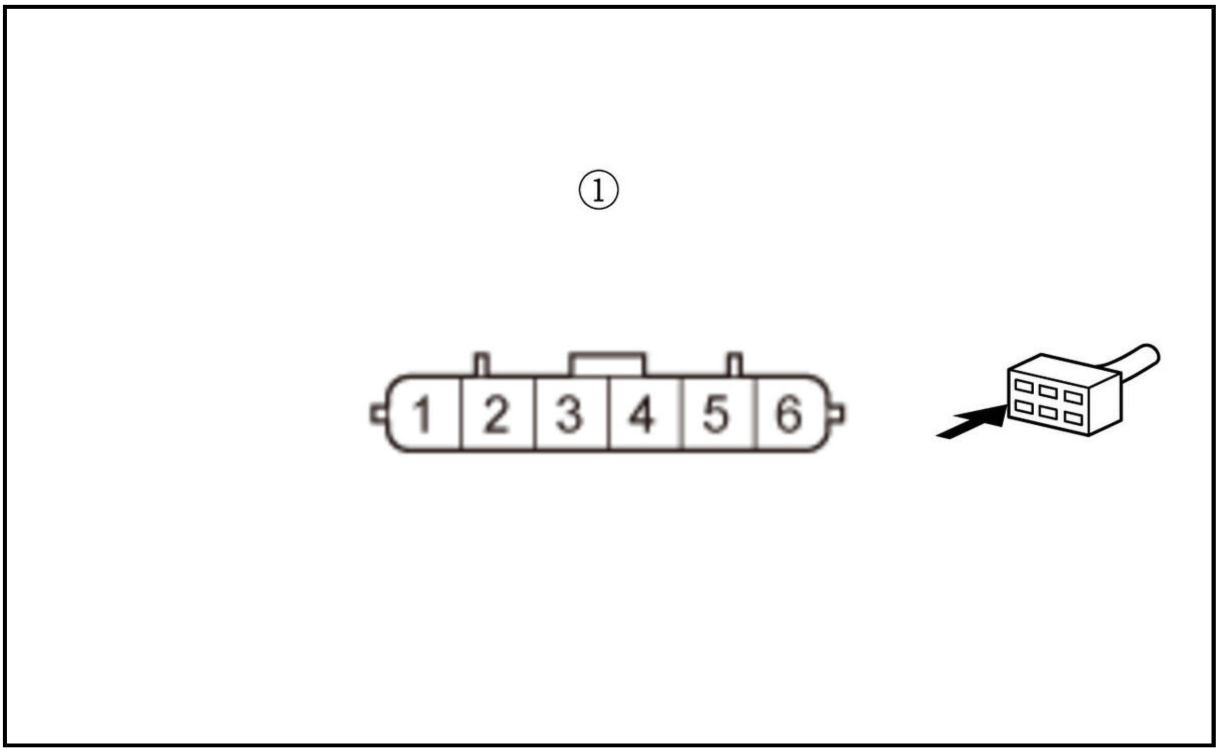
Left rear center sensor 6P connector

-2. Disconnect the following connector.

Left rear corner sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Go to step 9.

NO

Go to step 8.

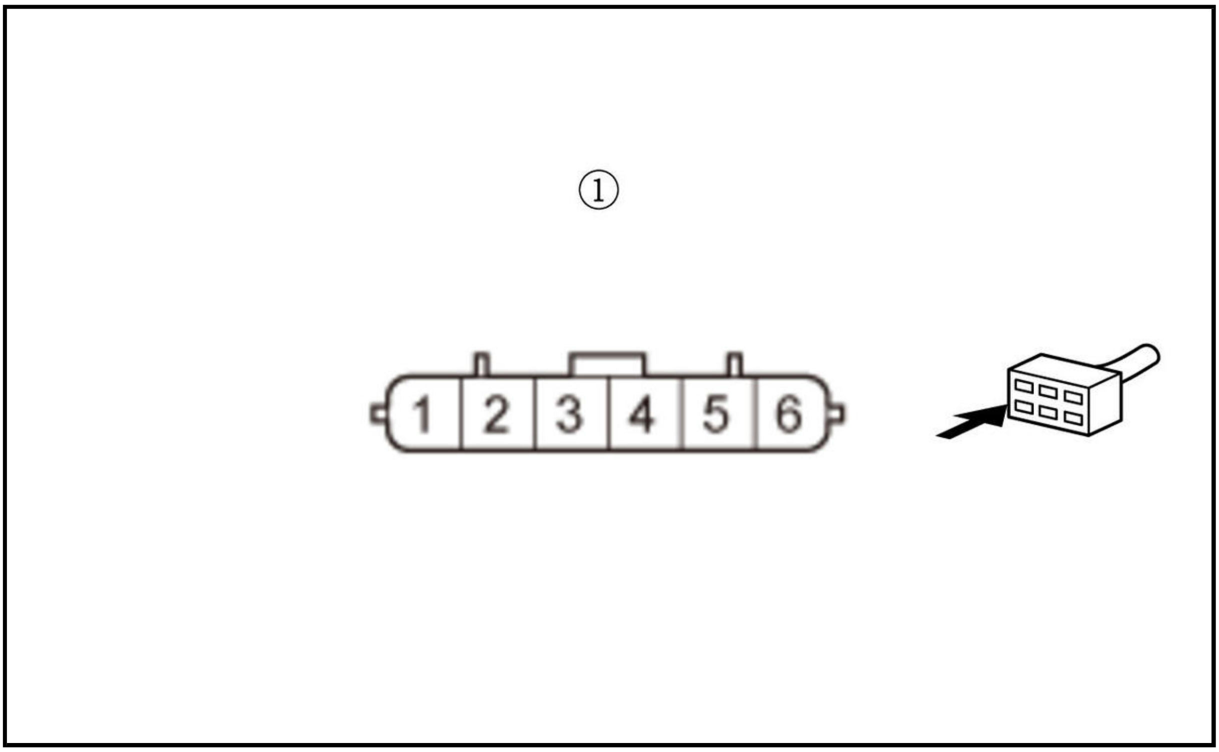
8. Shorted wire check (SOR CTR L, E2 CTR L lines) 2

-1. Disconnect the following connector.

Left rear center sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected Left rear center sensor 6P connector: disconnected
B	B
Test point 1	Left rear corner sensor 6P connector (female terminals) No. 3: ①
Test point 2	Left rear corner sensor 6P connector (female terminals) No. 1: ①



Is there 1.0 MΩ or more?

YES

Replace the left rear center sensor .

NO

Repair a short in the SOR CTR L and E2 CTR L wires.

9. Shorted wire check (SOR SIDE L, E2 SIDE L lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Left rear corner sensor 6P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 14**
Test point 2	**Parking and back-up sensor control unit 16P connector No. 12**

Is there 1.0 MΩ or more?

YES

Replace the left rear corner sensor .

NO

Repair a short in the SOR SIDE L and E2 SIDE L wires.

10. Shorted wire check (SOR SIDE L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B

Test point 1	Parking and back-up sensor control unit 16P connector No. 14
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the SOR SIDE L wire.

DTC B264A (2020 2021)

DTC B264A : Indicator circuit short to power

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B264A Indicator circuit short to power	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B264A Indicator circuit short to power	B

   Is DTC B264A indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Parking and back-up sensor switch check

   -1. Do the parking and back-up sensor switch test .

   Is the parking and back-up sensor switch OK?

   YES

   Go to step 3.

   NO

Replace the parking and back-up sensor switch .

3. Shorted wire check (C/SNSR IND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	Parking and back-up sensor control unit 16P connector No. 5
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the C/SNSR IND wire.

NO

Replace the parking and back-up sensor control unit .

DTC B264B (2020 2021)

DTC B264B : Indicator circuit short to ground

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B264B Indicator circuit short to ground	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B264B Indicator circuit short to ground	B

Is DTC B264B indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Parking and back-up sensor switch check

-1. **Do the parking and back-up sensor switch test** .

Is the parking and back-up sensor switch OK?

YES

Go to step 3.

NO

Replace the parking and back-up sensor switch .

3. Shorted wire check (C/SNSR IND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Parking and back-up sensor control unit 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected
B	B
Test point 1	**Parking and back-up sensor control unit 16P connector No. 5**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the parking and back-up sensor control unit .

NO

Repair a short to ground in the C/SNSR IND wire.

DTC B264D (2020 2021)

DTC B264D : Front sensor combination error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B264D Front sensor combination error	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B264D Front sensor combination error	B

Is DTC B264D indicated?

YES

Replace the parking and back-up sensor control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0155, U1281(PARKING/BACK-UP SENSOR CONTROL UNIT) (2020 2021)

DTC U0155 : Lost communication with Gauge Control Module

DTC U1281 : Lost communication with MICU

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0155 Lost communication with Gauge Control Module	B
U1281 Lost communication with MICU	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0155 Lost communication with Gauge Control Module	B
U1281 Lost communication with MICU	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Parking and back-up sensor control unit 16P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0155	Gauge control module connector A (32P)
U1281	Body control module connector B (36P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Parking and back-up sensor control unit 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0155	B-CAN_H	**Parking and back-up sensor control unit 16P connector**	No. 9	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 2		No. 31
U1281	B-CAN_H	**Parking and back-up sensor control unit 16P connector**	No. 9	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 2		No. 21

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0155	**Gauge control module**
U1281	**Body control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (PARKING/BACK-UP SENSOR CONTROL UNIT) (2020 2021)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Parking and Back-Up Sensor Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

   Is DTC U1280 indicated?

   YES

   Go to body control module DTC U1280 troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC TROUBLESHOOTING

DTC B1802

DTC B1802 : Power seat control unit internal (EEPROM) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1802 Power seat control unit internal (EEPROM) error	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1802 Power seat control unit internal (EEPROM) error	B

   Is DTC B1802 indicated?

   YES

   Replace the power seat control unit .

   NO

   Intermittent failure, the system is OK at this time.

DTC B1825

DTC B1825 : Slide pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before troubleshooting, make sure the fuses and relays associated with the system is OK.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the power switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1825 is stored when the slide switch is operated more than 1 second after the seat moves to the most forward or backward position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B

Is DTC B1825 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Driver seat recline motor pulse error	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1825?

DTC B1825 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1826, B1827, and/or B1828 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the slide switch for 2 seconds, and check the slide motor operation.

Does the slide motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (SLSE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

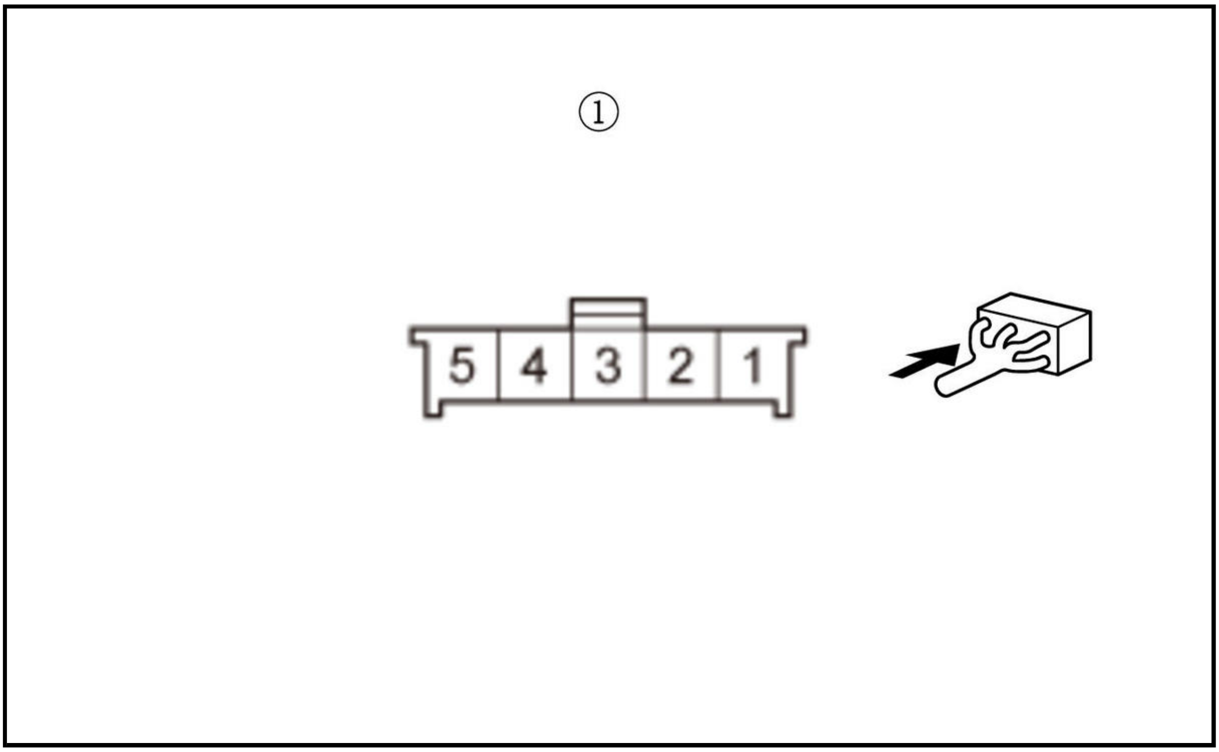
-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector
Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 8**

Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there 1.0 Ω or less?

YES

The SLSE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (SLSE line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 8**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The SLSE wire is not shorted. Go to step 6.

NO

Repair a short to ground in the wire.

6. Determine possible failure area (Power seat control unit, slide position sensor, SLSE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 8**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there voltage?

About 5 V

Faulty slide position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire.

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector

Recline motor/position sensor 6P connector
Power seat control unit connector A (20P)

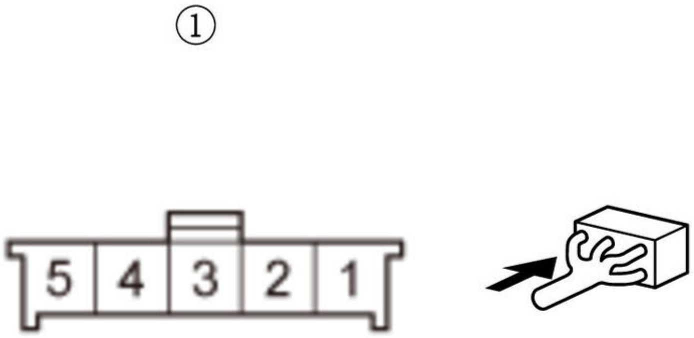
-3. Measure the resistance between test points 1 and 2.

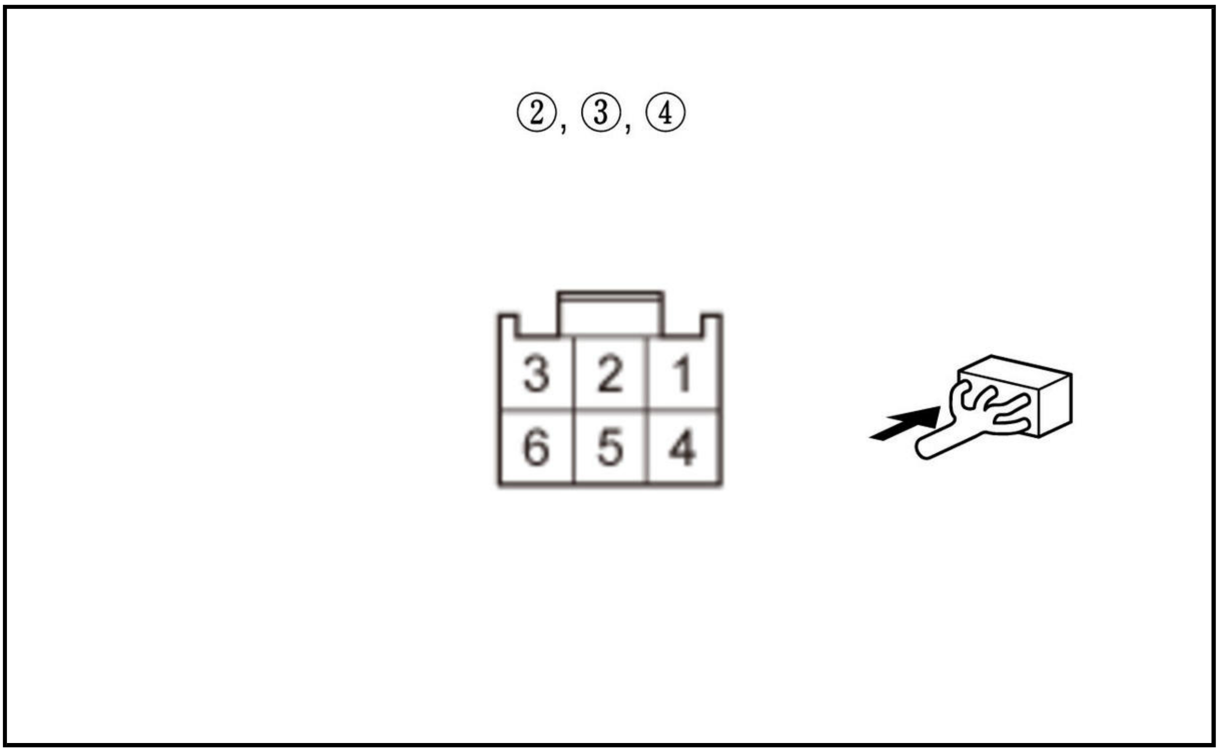
Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**





Is there 1.0 Ω or less?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The VCC wire is not shorted. Go to step 9.

NO

Repair a short to ground in the wire.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the slide switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT1 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wires are not open. Go to step 12.

NO

Repair an open or high resistance in the wire or poor ground (G501).

12. Open wire check (SLIDE FR, SLIDE RR lines)

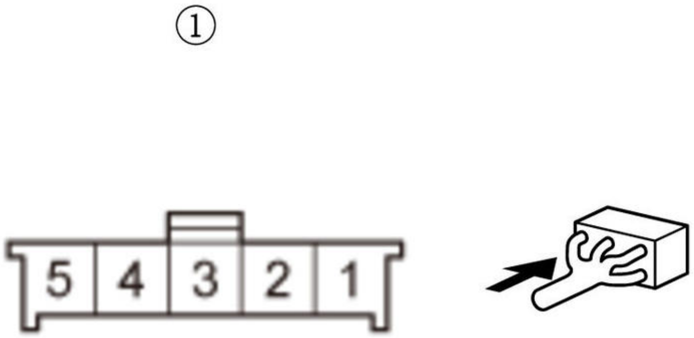
-1. Disconnect the following connectors.

Slide motor/position sensor 5P connector
Power seat control unit connector B (12P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 5: ①
Test point 2	**Power seat control unit connector B (12P) No. 3**

Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector B (12P) No. 1**



Is there 1.0 Ω or less?

YES

The SLIDE FR and SLIDE RR wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (SLIDE FR, SLIDE RR lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 3**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The SLIDE FR, SLIDE RR wires are OK. Go to step 14.

NO

Repair a short to ground in the wire.

14. Slide motor check

-1. **Test the slide motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty slide motor/position sensor; **replace the seat frame assembly** .

DTC B1826

DTC B1826 : Front height pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B1826 Front height pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the power switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1826 is stored when the front up-down switch is operated more than 1 second after the seat moves to the most up or down position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1826 Front height pulse error (no change in pulse for 1 second)	B

Is DTC B1826 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Driver seat recline motor pulse error	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1826?

DTC B1826 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1825, B1827, and/or B1828 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the front up-down switch for 2 seconds, and check the front up-down motor operation.

Does the front up-down motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (TISE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

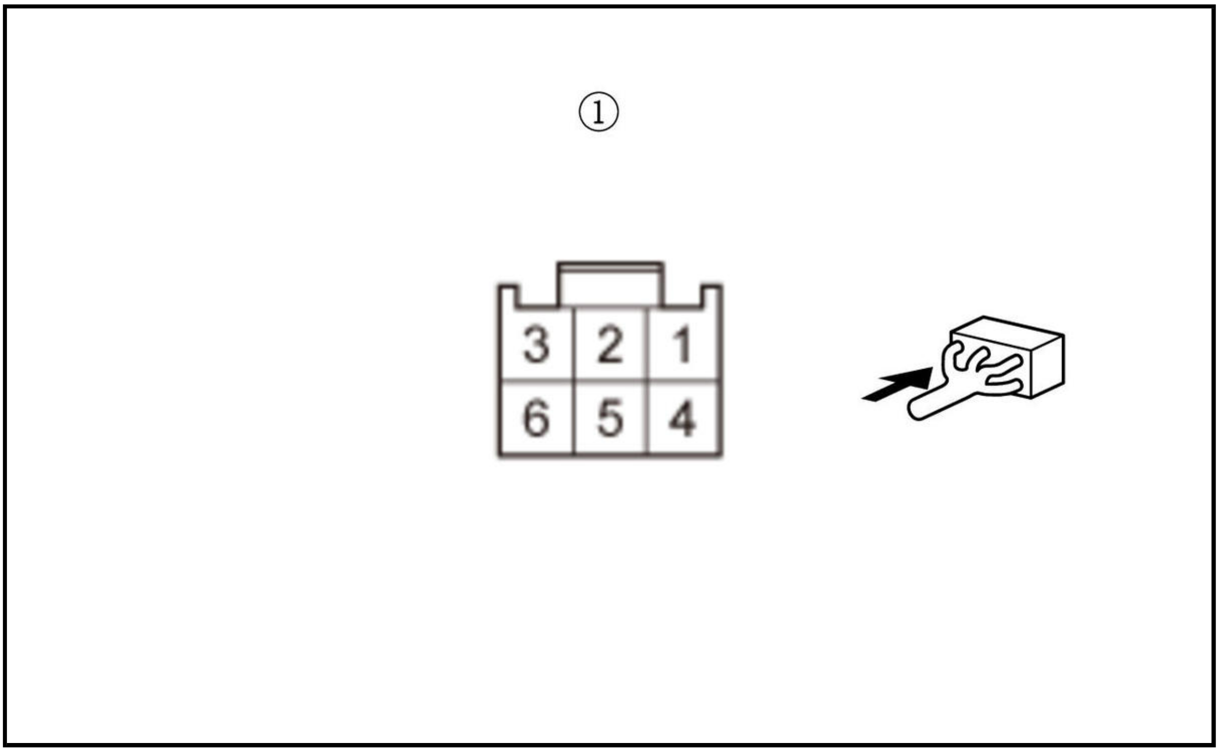
-2. Disconnect the following connectors.

Front up-down motor/position sensor 6P connector
Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector A (20P) No. 7**

Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there 1.0 Ω or less?

YES

The TISE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (TISE line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 7**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The TISE wire is not shorted. Go to step 6.

NO

Repair a short to ground in the wire.

6. Determine possible failure area (Power seat control unit, front up-down position sensor, TISE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front up-down motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 7**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there voltage?

About 5 V

Faulty front up-down position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire.

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

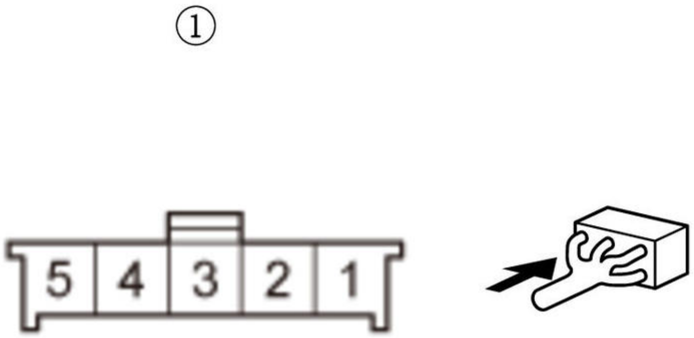
Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

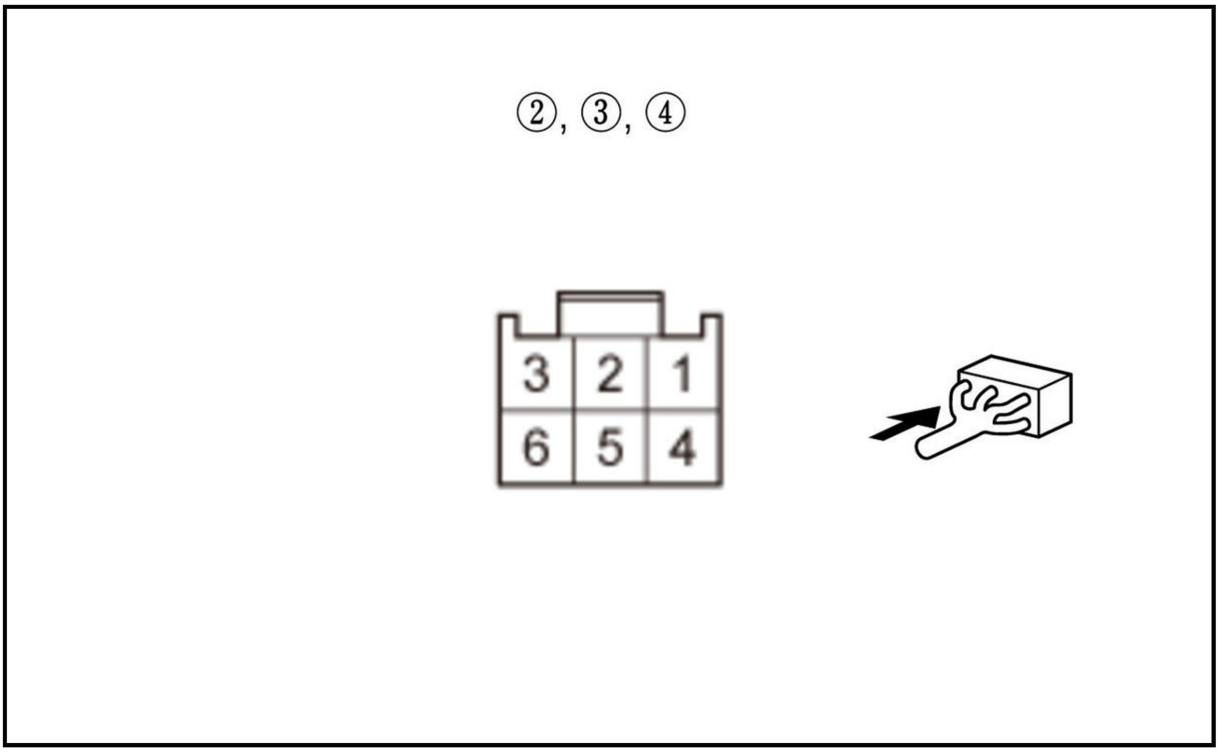
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③

Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**





Is there 1.0 Ω or less?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The VCC wire is not shorted. Go to step 9.

NO

Repair a short to ground in the wire.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the front up-down switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT1 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wires are not open. Go to step 12.

NO

Repair an open or high resistance in the wire or poor ground (G501).

12. Open wire check (TILT UP, TILT DOWN lines)

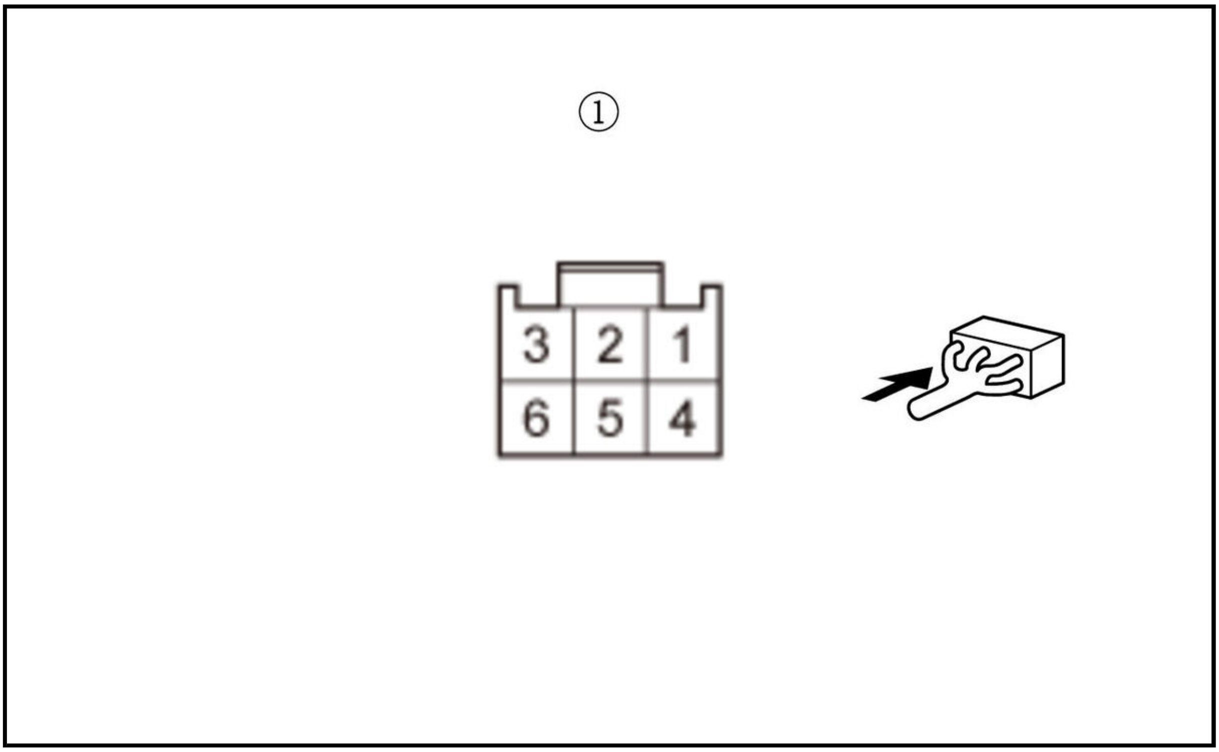
-1. Disconnect the following connectors.

Front up-down motor/position sensor 6P connector
Power seat control unit connector B (12P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 6: ①
Test point 2	**Power seat control unit connector B (12P) No. 10**

Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 4: ①
Test point 2	**Power seat control unit connector B (12P) No. 7**



Is there 1.0 Ω or less?

YES

The TILT UP and TILT DOWN wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (TILT UP, TILT DOWN lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 10**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 7**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The TILT UP and TILT DOWN wires are OK. Go to step 14.

NO

Repair a short to ground in the wire.

14. Front up-down motor check

-1. **Test the front up-down motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty front up-down motor/position sensor; **replace the seat frame assembly** .

DTC B1827

DTC B1827 : Rear height pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B1827 Rear height pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the power switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1827 is stored when the rear up-down switch is operated more than 1 second after the seat moves to the most up or down position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1827 Rear height pulse error (no change in pulse for 1 second)	B

Is DTC B1827 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Driver seat recline motor pulse error	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1827?

DTC B1827 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1825, B1826, and/or B1828 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the rear up-down switch for 2 seconds, and check the rear up-down motor operation.

Does the rear up-down motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (HESE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

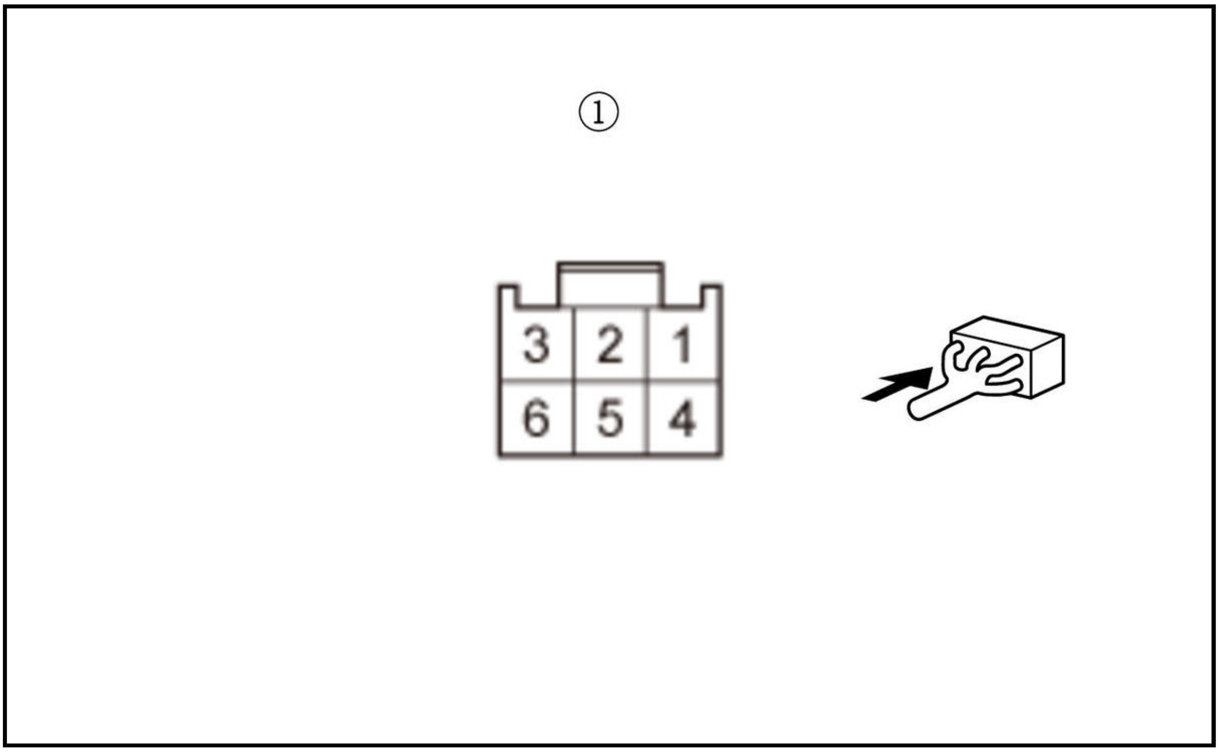
-2. Disconnect the following connectors.

Rear up-down motor/position sensor 6P connector
Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector A (20P) No. 9**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there 1.0 Ω or less?

YES

The HESE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (HESE line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 9**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The HESE wire is not shorted. Go to step 6.

NO

Repair a short to ground in the wire.

6. Determine possible failure area (Power seat control unit, rear up-down position sensor, HESE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear up-down motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 9**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there voltage?

About 5 V

Faulty rear up-down position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire (sensor line).

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

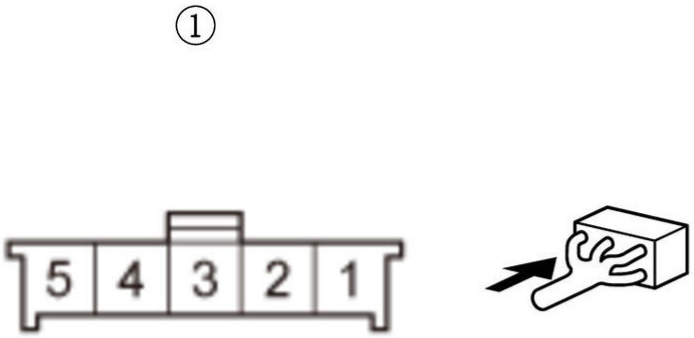
Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

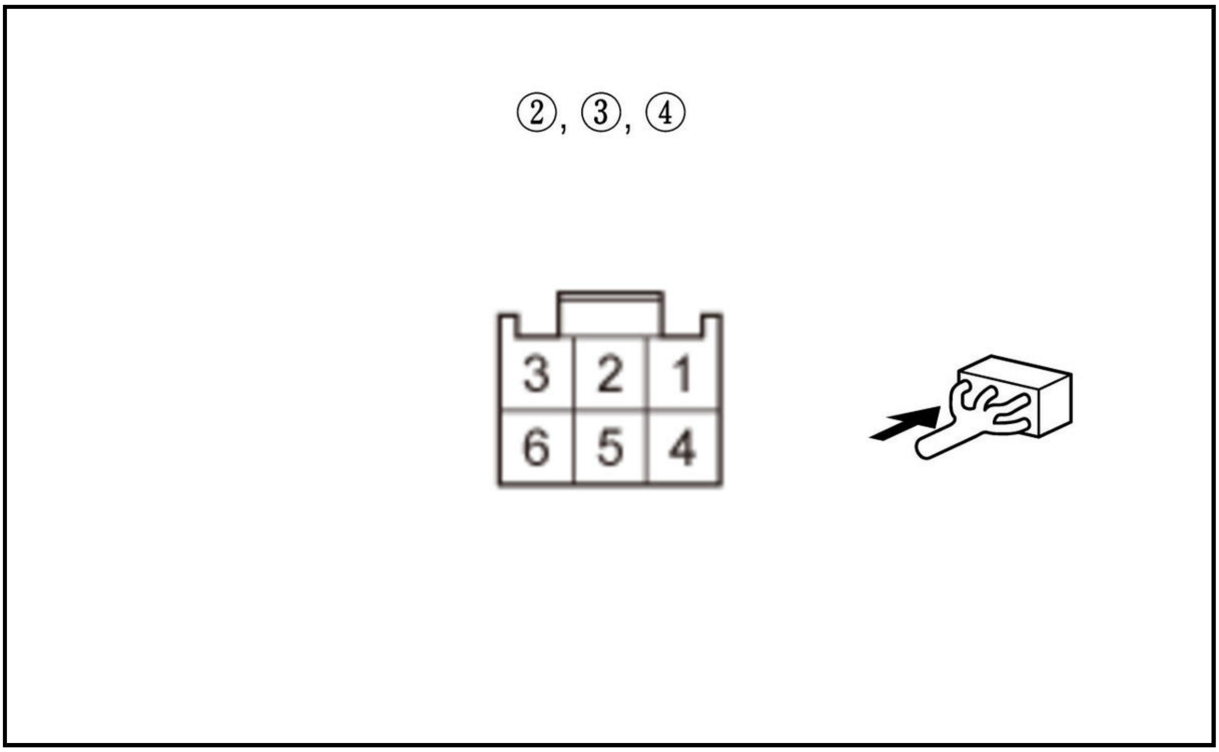
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③

Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**





Is there 1.0 Ω or less?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The VCC wire is not shorted. Go to step 9.

NO

Repair a short to ground in the wire.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the rear up-down switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT2 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wires are not open. Go to step 12.

NO

Repair an open or high resistance in the wire or poor ground (G501).

12. Open wire check (HEIGHT UP, HEIGHT DOWN lines)

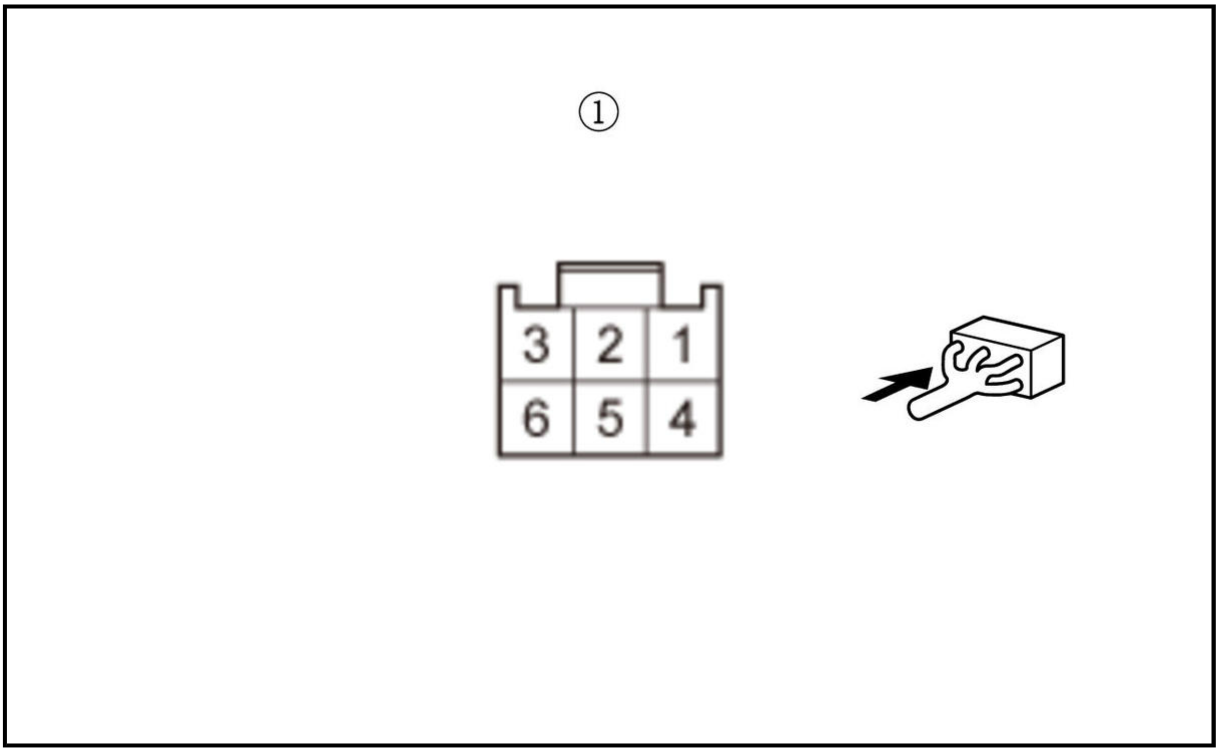
-1. Disconnect the following connectors.

Rear up-down motor/position sensor 6P connector
Power seat control unit connector B (12P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 4: ①
Test point 2	**Power seat control unit connector B (12P) No. 9**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 6: ①
Test point 2	**Power seat control unit connector B (12P) No. 4**



Is there 1.0 Ω or less?

YES

The HEIGHT UP and HEIGHT DOWN wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (HEIGHT UP, HEIGHT DOWN lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 9**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 4**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The HEIGHT UP and HEIGHT DOWN wires are OK. Go to step 14.

NO

Repair a short to ground in the wire.

14. Rear up-down motor check

-1. **Test the rear up-down motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty rear up-down motor/position sensor; **replace the seat frame assembly** .

DTC B1828

DTC B1828 : Driver seat recline motor pulse error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- When check the REC FR line circuit, do not operate the rear seat access lever, because limit switch is located in the circuit.
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B1828 Driver seat recline motor pulse error	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the power switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1828 is stored when the recline switch is operated more than 1 second after the seat moves to the most forward or backward position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1828 Driver seat recline motor pulse error	B

Is DTC B1828 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Driver seat recline motor pulse error	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1828?

DTC B1828 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1825, B1826, and/or B1827 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the recline switch for 2 seconds, and check the recline motor operation.

Does the recline motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (RESE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

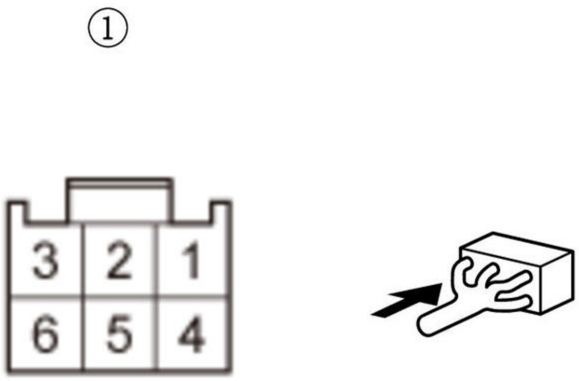
-2. Disconnect the following connectors.

Recline motor/position sensor 6P connector
Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector A (20P) No. 10**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there 1.0 Ω or less?

YES

The RESE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (RESE line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 10**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RESE wire is not shorted. Go to step 6.

NO

Repair a short to ground in the wire.

6. Determine possible failure area (Power seat control unit, recline position sensor, RESE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 10**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there about 5 V?

About 5 V

Faulty recline motor/position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire (sensor line).

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

-3. Measure the resistance between test points 1 and 2.

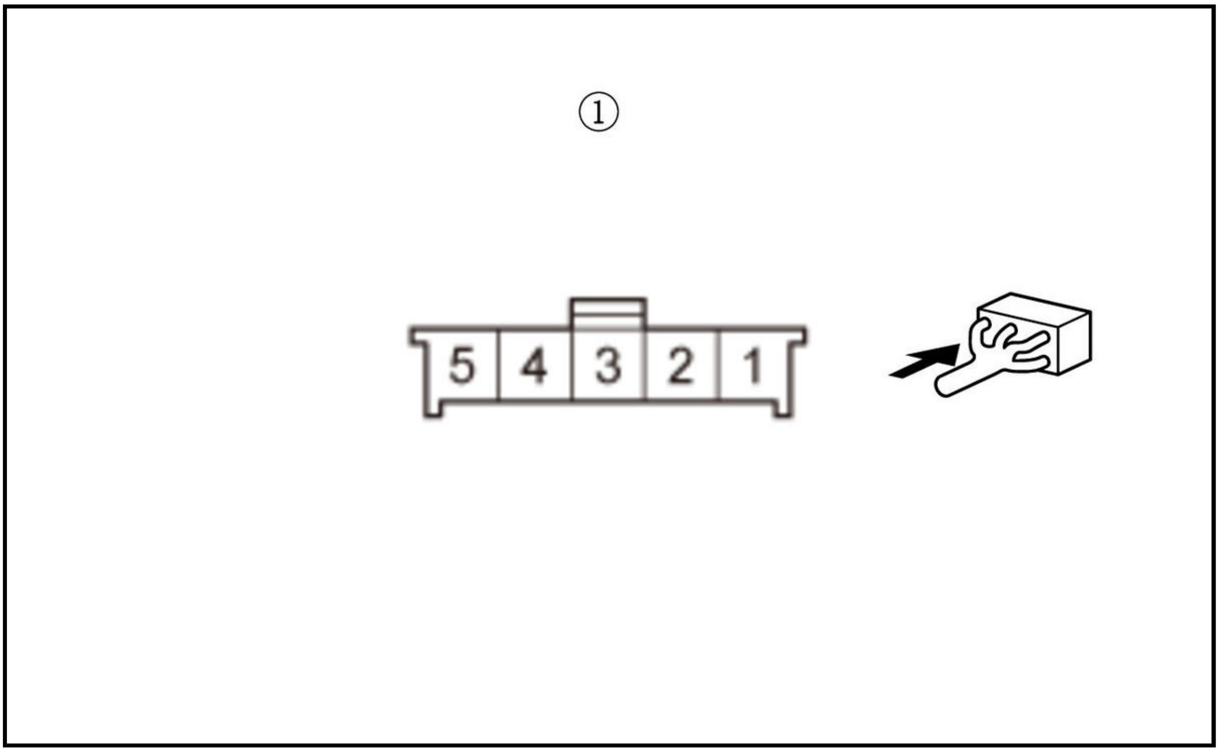
Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

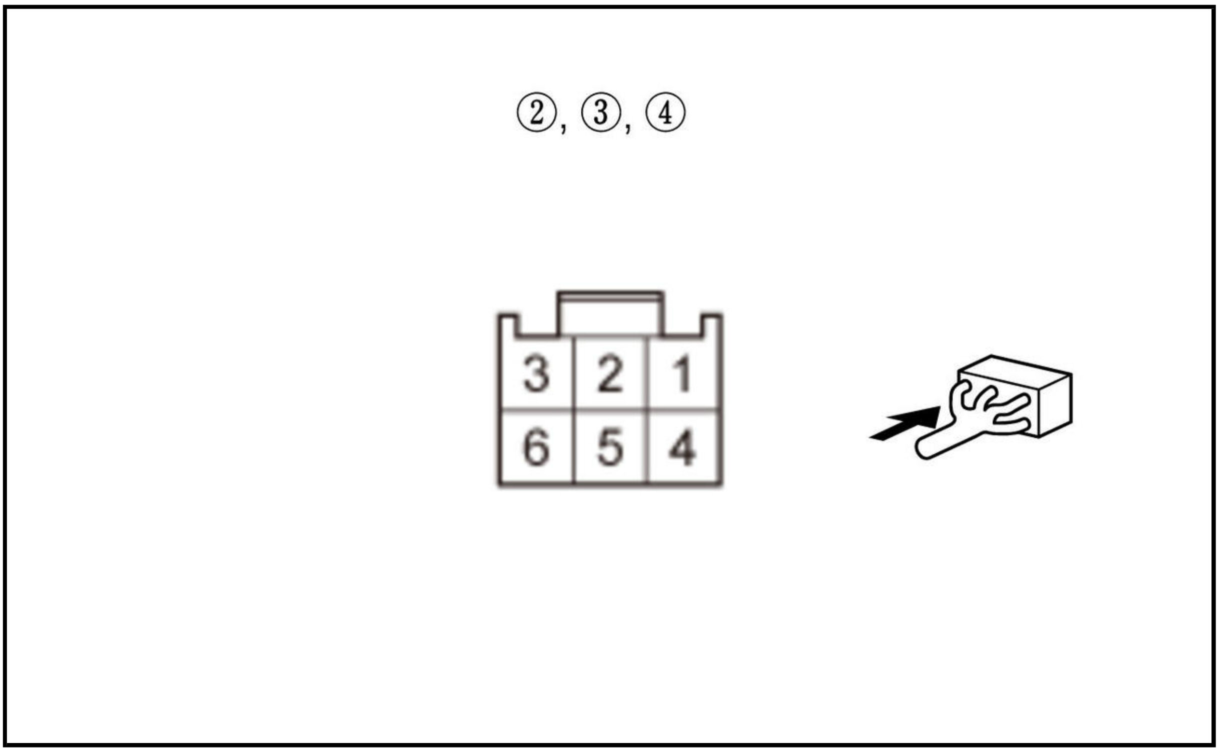
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③

Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**





Is there 1.0 Ω or less?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The VCC wire is not shorted. Go to step 9.

NO

Repair a short to ground in the wire.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the recline switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT2 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wires are not open. Go to step 12.

NO

Repair an open or high resistance in the wire or poor ground (G501).

12. Open wire check (REC FR, REC RR lines)

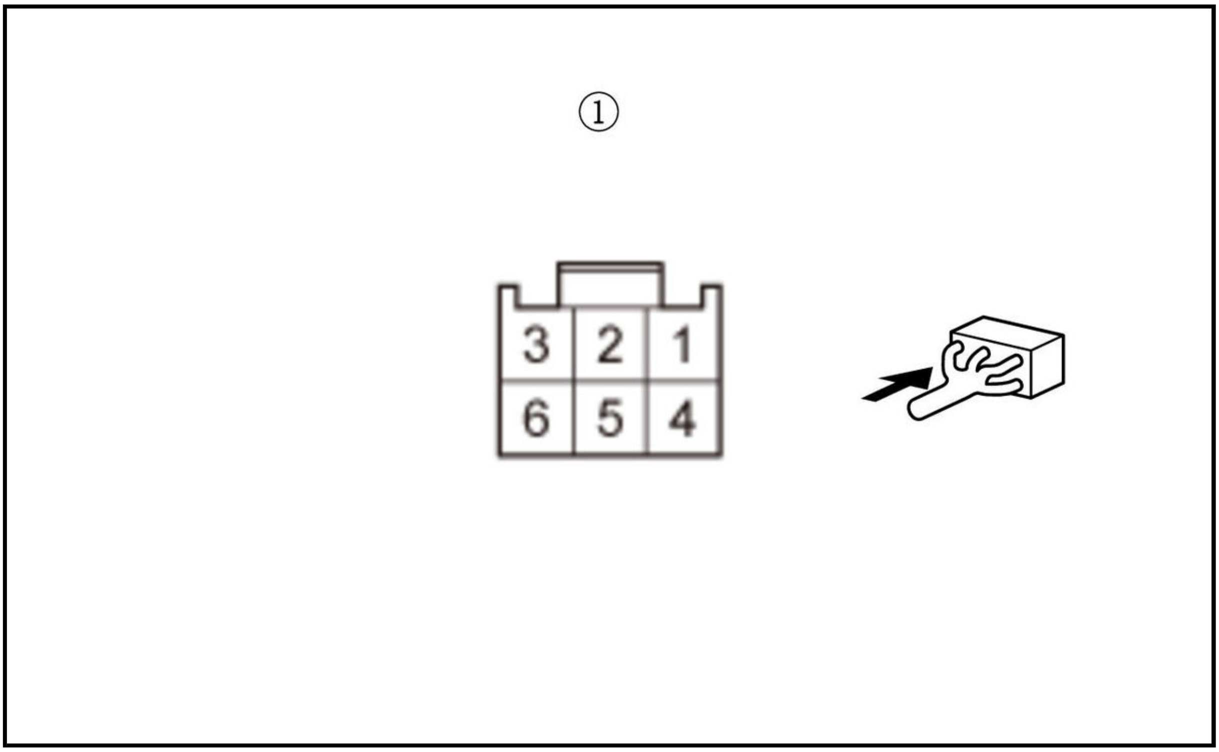
-1. Disconnect the following connectors.

Recline motor/position sensor 6P connector
Power seat control unit connector B (12P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 4: ①
Test point 2	**Power seat control unit connector B (12P) No. 8**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 6: ①
Test point 2	**Power seat control unit connector B (12P) No. 11**



Is there 1.0 Ω or less?

YES

The REC FR and REC RR wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (REC FR, REC RR lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 8**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 11**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The REC FR and REC RR wires are OK. Go to step 14.

NO

Repair a short to ground in the wire.

14. Recline motor check

-1. **Test the recline motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty recline motor/position sensor; **replace the seat frame assembly** .

DTC B1829

DTC B1829 : AT-P signal and VSP or ESL_WHEEL signal mismatch

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1829 AT-P signal and VSP or ESL_WHEEL signal mismatch	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Start the engine.

-3. Test drive at 6 mph (10 km/h) for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1829 AT-P signal and VSP or ESL_WHEEL signal mismatch	B

Is DTC B1829 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for gauge control module DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 3.

3. Open wire check (ATP-PBK / ATP-P line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power seat control unit connector A (20P) SBW shifter control module 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected SBW shifter control module 20P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 1**
Test point 2	**SBW shifter control module 20P connector No. 14**

Is there 1.0 Ω or less?

YES

Go to step 4.

NO

Repair an open or high resistance in the wire.

4. Shorted wire check (ATP-PBK / ATP-P line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected SBW shifter control module 20P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The ATP-PBK / ATP-P wire is OK. **Replace the power seat control unit** .

NO

Repair a short to ground in the wire.

DTC B1836

DTC B1836 : Power Seat Position Sensor circuit short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1836 Power Seat Position Sensor circuit short	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the power switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch in all directions for more than 1 second each.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1836 Power Seat Position Sensor circuit short	B

Is DTC B1836 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (VCC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power seat control unit connector A (20P) Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The VCC wire is not shorted. Go to step 3.

NO

Repair a short to ground in the wire.

3. Motor check (Slide, Front up-down, Rear up-down, Recline)

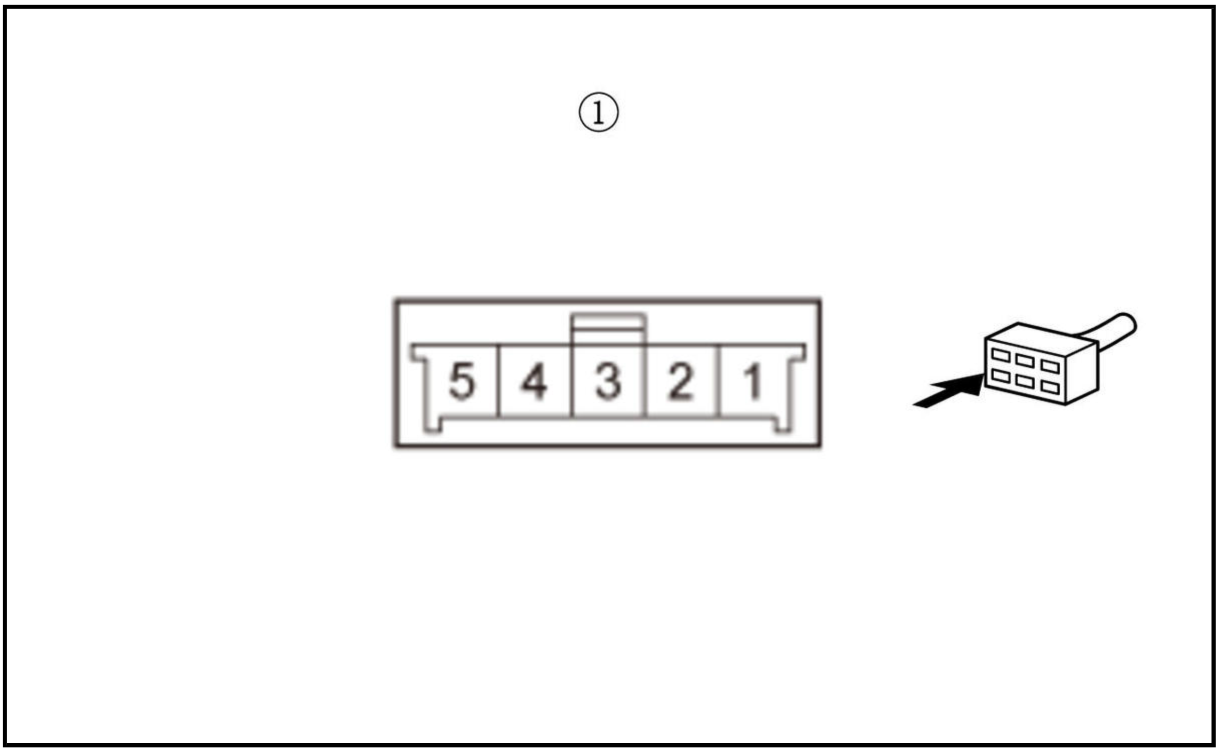
-1. Measure the resistance between test points 1 and 2.

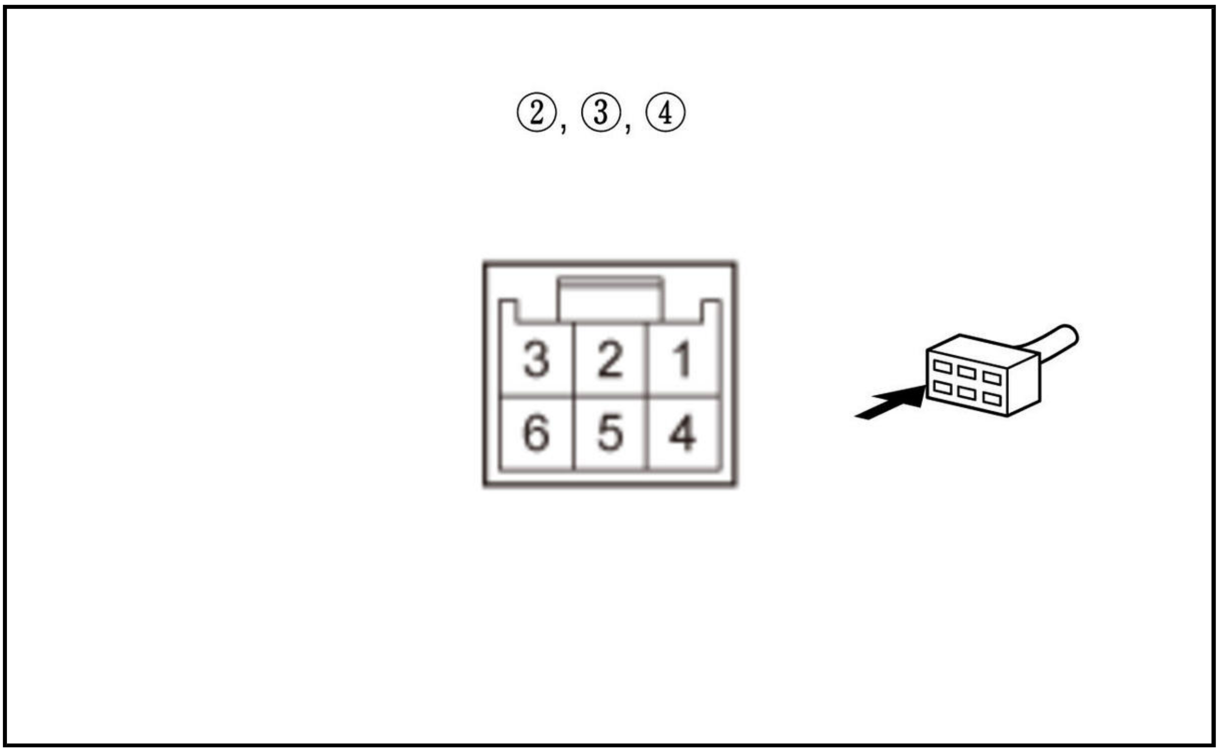
Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	Slide motor/position sensor 5P connector (male terminals) No. 2: ①
Test point 2	Body ground (motor body)

Test point 1	Front up-down motor/position sensor 6P connector (male terminals) No. 1: ②
Test point 2	Body ground (motor body)

Test point 1	Rear up-down motor/position sensor 6P connector (male terminals) No. 1: ③
Test point 2	Body ground (motor body)

Test point 1	Recline motor/position sensor 6P connector (male terminals) No. 1: ④
Test point 2	Body ground (motor body)





Is there 1.0 Ω or less?

Slide motor/position sensor is shorted

Faulty slide motor/position sensor; **replace the seat frame assembly** .

Front up-down motor/position sensor is shorted

Faulty front up-down motor/position sensor; **replace the seat frame assembly** .

Rear up-down motor/position sensor is shorted

Faulty rear up-down motor/position sensor; **replace the seat frame assembly** .

Recline motor/position sensor is shorted

Faulty recline motor/position sensor; **replace the seat frame assembly** .

NO

Replace the power seat control unit .

DTC B1837

DTC B1837 : Memory position calling timeout

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1837 Memory position calling timeout	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Move the power seat to the full front up and full rear up positions, then slide the seat all the way back and completely recline the seat-back backward with the power seat adjustment switch.

   -4. Set the seating position into memory by pressing either the driving position memory switch POSITION 1 or POSITION 2 button.

   -5. Using the power seat switches, move the seat away from the position just memorized.

   -6. Recall the memory position with the driving position memory switch.

   -7. Wait for 2 minutes.

   -8. Check for DTCs with the HDS.

DTC Description	DTC
B1837 Memory position calling timeout	B

   Is DTC B1837 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Any of DTC are indicated at the same time with DTC B1837?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 3.

3. Motor operation check

-1. Clear the DTCs with the HDS.

-2. Wait for 6 seconds.

-3. Move the motors (power seat slide forward/backward, recline forward/backward, front up-down, and rear up-down) shown one at a time, and check the operation time.

Does any motor fail to run smoothly?

Motor fails to run smoothly

Go to the failed motor test .

Motor is OK, but fails to run smoothly

Check the engagement of the motor gear.

NO

Do the teat of terminals for power seat control unit .

DTC B1844

DTC B1844 : Power Seat Slide switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1844 Power Seat Slide switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Operate the slide switch in each direction for more than 3 seconds.

-3. Wait for at least 3 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1844 Power Seat Slide switch circuit malfunction	B

Is DTC B1844 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1845

DTC B1845 : Power Seat Recline switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1845 Power Seat Recline switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Operate the recline switch in each direction for more than 3 seconds.

   -3. Wait for at least 3 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1845 Power Seat Recline switch circuit malfunction	B

Is DTC B1845 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1846

DTC B1846 : Power Seat Front Up-Down switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1846 Power Seat Front Up-Down switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Operate the front up-down switch in each direction for more than 3 seconds.

-3. Wait for at least 3 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1846 Power Seat Front Up-Down switch circuit malfunction	B

Is DTC B1846 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1847

DTC B1847 : Power Seat Rear Up-Down switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1847 Power Seat Rear Up-Down switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Operate the rear up-down switch in each direction for more than 1 second.

-3. Wait for at least 3 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1847 Power Seat Rear Up-Down switch circuit malfunction	B

Is DTC B1847 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0199, U1281, U128D (POWER SEAT CONTROL UNIT)

DTC U0199 : Power seat control unit lost communication with PW master SW

DTC U1281 : Power seat control unit lost communication with MICU (body control module) (MICU frame)

DTC U128D : Lost Communication With Gauge Control Module (VSP/NE or ESL_WHEEL frame)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0199 Power seat control unit lost communication with PW master SW	B
U1281 Power seat control unit lost communication with MICU (body control module) (MICU frame)	B
U128D Lost Communication With Gauge Control Module (VSP/NE or ESL_WHEEL frame)	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0199 Power seat control unit lost communication with PW master SW	B
U1281 Power seat control unit lost communication with MICU (body control module) (MICU frame)	B
U128D Lost Communication With Gauge Control Module (VSP/NE or ESL_WHEEL frame)	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the receiving control unit connector.

Power seat control unit connector A (20P)

   -3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0199	Power window master switch 37P connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0199	B-CAN_H	Power seat control unit connector A (20P)	No. 16	Power window master switch 37P connector	No. 32
	B-CAN_L		No. 17		No. 31
U1281	B-CAN_H	Power seat control unit connector A (20P)	No. 16	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 17		No. 21
U128D	B-CAN_H	Power seat control unit connector A (20P)	No. 16	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 17		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.

Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0199	Power window master switch
U1281	Body control module

DTC	Operation for transmitting control unit
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (POWER SEAT CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC TROUBLESHOOTING

DTC B1802

DTC B1802 : Power seat control unit internal (EEPROM) error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1802 Power seat control unit internal (EEPROM) error	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1802 Power seat control unit internal (EEPROM) error	B

Is DTC B1802 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time.

DTC B1825

DTC B1825 : Slide pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the engine start/stop switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1825 is stored when the slide switch is operated more than 1 second after the seat moves to the most forward or backward position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B

Is DTC B1825 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Recline pulse error (no change in pulse for 1 second)	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1825?

DTC B1825 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1826, B1827, and/or B1828 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the slide switch for 2 seconds, and check the slide motor operation.

Does the slide motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (SLSE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

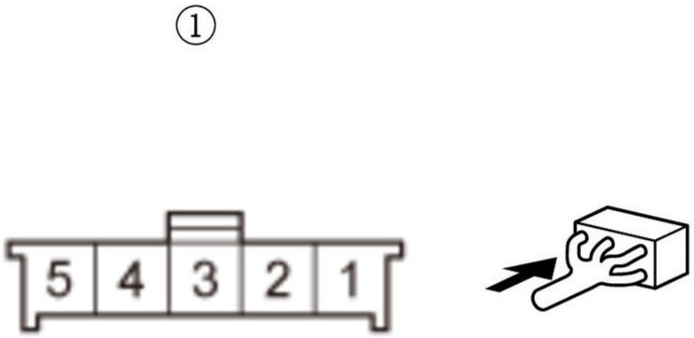
-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector
Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 8**

Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there continuity?

YES

The SLSE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (SLSE line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 8**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The SLSE wire is not shorted. Go to step 6.

6. Determine possible failure area (Power seat control unit, slide position sensor, SLSE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 8**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there voltage?

About 5 V

Faulty slide position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire.

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector

Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

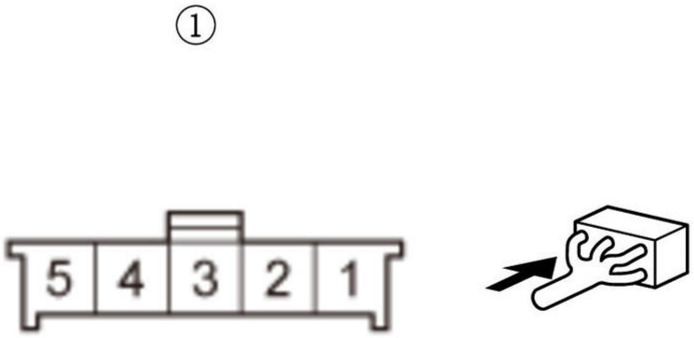
-3. Check for continuity between test points 1 and 2.

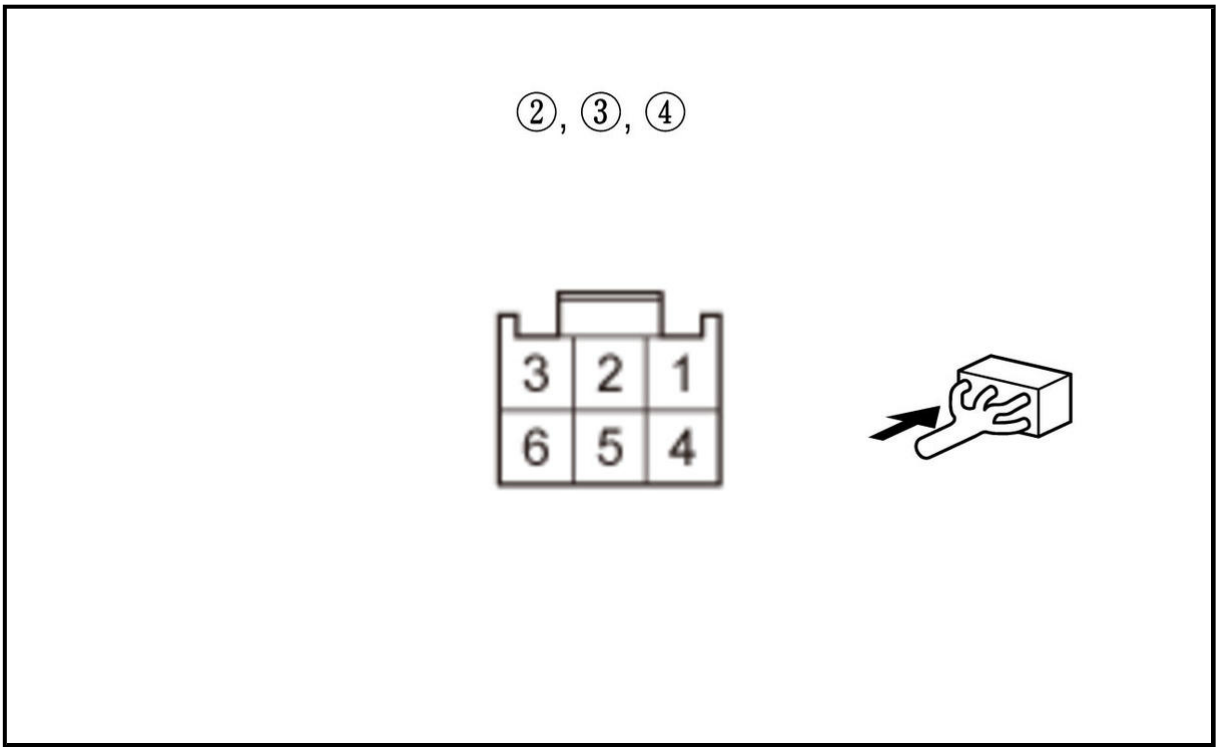
Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**





Is there continuity?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The VCC wire is not shorted. Go to step 9.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the slide switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT1 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 0.2 V or more?

YES

Repair an open or high resistance in the wire or poor ground (G501).

NO

The GND wires are not open. Go to step 12.

12. Open wire check (SLIDE FR, SLIDE RR lines)

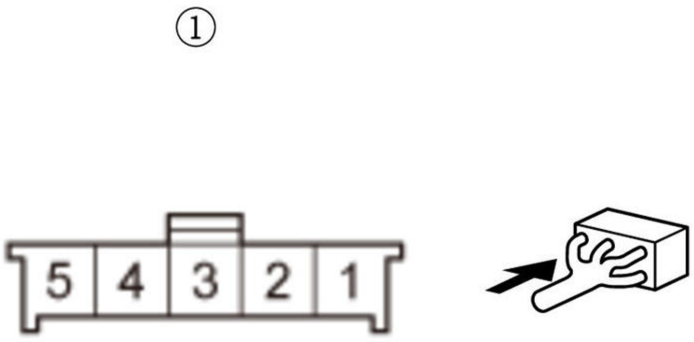
-1. Disconnect the following connectors.

Slide motor/position sensor 5P connector
Power seat control unit connector B (12P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 5: ①
Test point 2	**Power seat control unit connector B (12P) No. 3**

Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector B (12P) No. 1**



Is there continuity?

YES

The SLIDE FR and SLIDE RR wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (SLIDE FR, SLIDE RR lines)

    -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 3**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 1**
Test point 2	Body ground

    Is there continuity?

    YES

    Repair a short to ground in the wire.

    NO

    The SLIDE FR, SLIDE RR wires are OK. Go to step 14.

14. Slide motor check

    -1. **Test the slide motor** .

    Is the motor OK?

    YES

    Replace the power seat control unit .

    NO

    Faulty slide motor/position sensor; **replace the seat frame assembly** .

DTC B1826

DTC B1826 : Front height pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B1826 Front height pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

    -1. Clear the DTCs with the HDS.

    -2. Press the engine start/stop switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1826 is stored when the front up-down switch is operated more than 1 second after the seat moves to the most up or down position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1826 Front height pulse error (no change in pulse for 1 second)	B

Is DTC B1826 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Recline pulse error (no change in pulse for 1 second)	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1826?

DTC B1826 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1825, B1827, and/or B1828 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the front up-down switch for 2 seconds, and check the front up-down motor operation.

Does the front up-down motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (TISE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

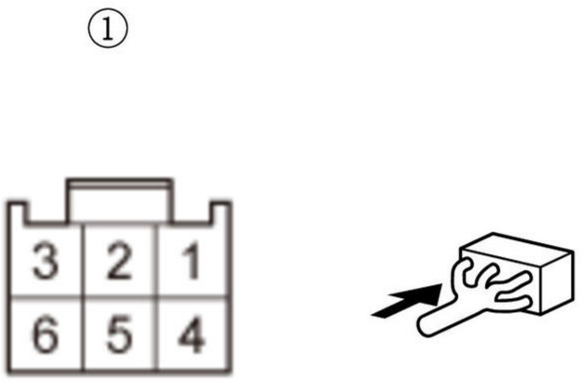
-2. Disconnect the following connectors.

Front up-down motor/position sensor 6P connector
Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector A (20P) No. 7**

Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there continuity?

YES

The TISE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (TISE line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The TISE wire is not shorted. Go to step 6.

6. Determine possible failure area (Power seat control unit, front up-down position sensor, TISE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front up-down motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 7**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there voltage?

About 5 V

Faulty front up-down position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire.

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

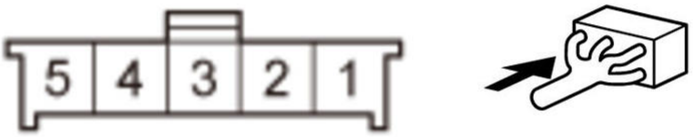
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

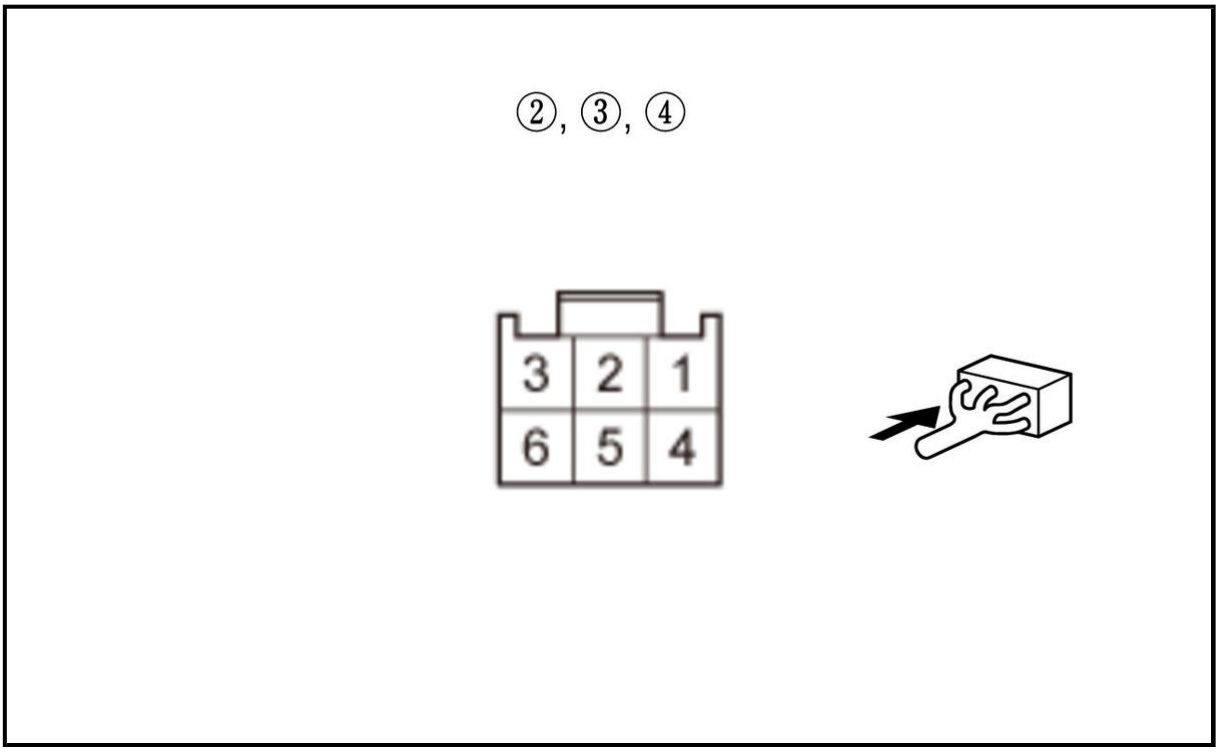
Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③

Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**

①





Is there continuity?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The VCC wire is not shorted. Go to step 9.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the front up-down switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT1 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 0.2 V or more?

YES

Repair an open or high resistance in the wire or poor ground (G501).

NO

The GND wires are not open. Go to step 12.

12. Open wire check (TILT UP, TILT DOWN lines)

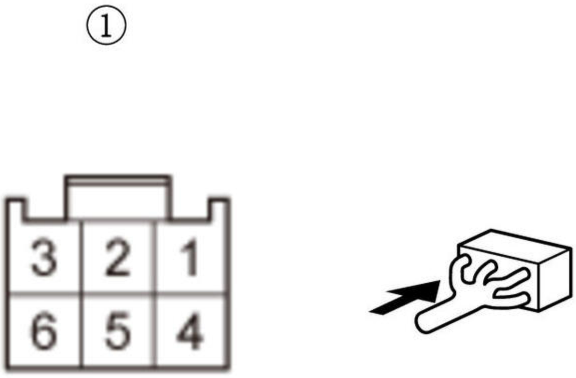
-1. Disconnect the following connectors.

Front up-down motor/position sensor 6P connector
Power seat control unit connector B (12P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 6: ①
Test point 2	**Power seat control unit connector B (12P) No. 10**

Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 4: ①
Test point 2	**Power seat control unit connector B (12P) No. 7**



Is there continuity?

YES

The TILT UP and TILT DOWN wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (TILT UP, TILT DOWN lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 10**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The TILT UP and TILT DOWN wires are OK. Go to step 14.

14. Front up-down motor check

-1. **Test the front up-down motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty front up-down motor/position sensor; **replace the seat frame assembly** .

DTC B1827

DTC B1827 : Rear height pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B1827 Rear height pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the engine start/stop switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1827 is stored when the rear up-down switch is operated more than 1 second after the seat moves to the most up or down position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1827 Rear height pulse error (no change in pulse for 1 second)	B

Is DTC B1827 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Recline pulse error (no change in pulse for 1 second)	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1827?

DTC B1827 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1825, B1826, and/or B1828 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the rear up-down switch for 2 seconds, and check the rear up-down motor operation.

Does the rear up-down motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (HESE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

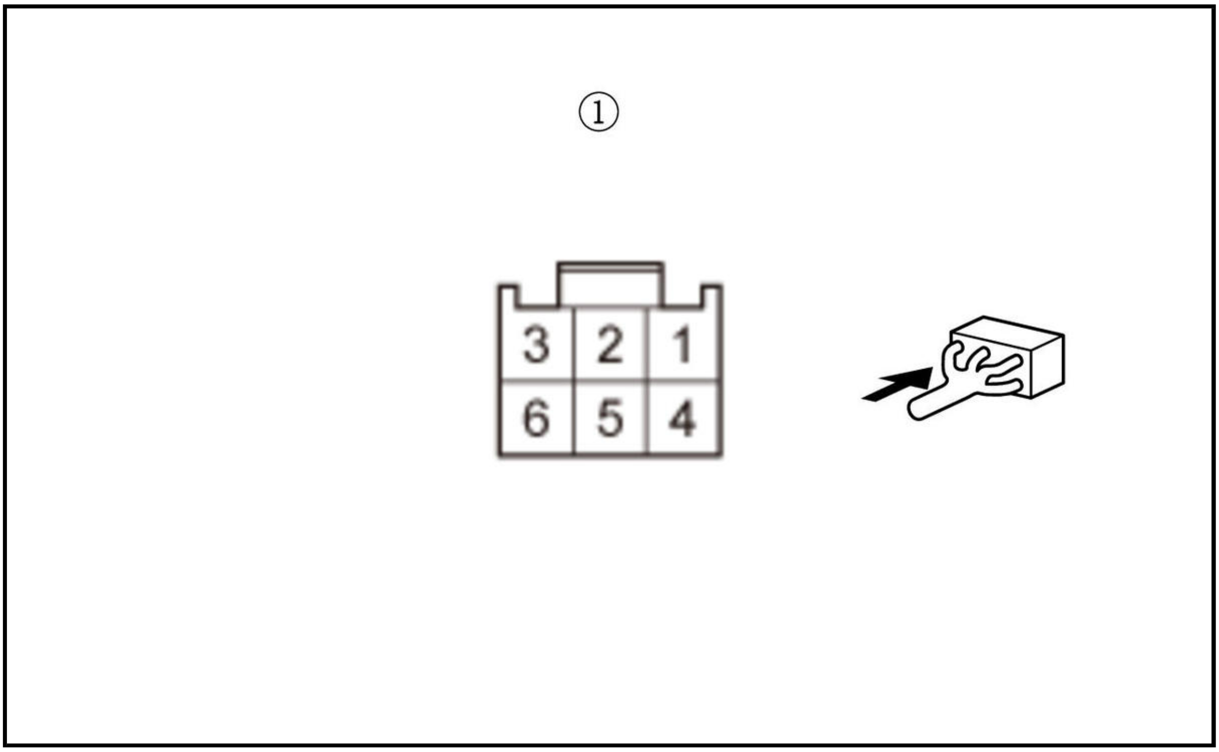
-2. Disconnect the following connectors.

Rear up-down motor/position sensor 6P connector
Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector A (20P) No. 9**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there continuity?

YES

The HESE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (HESE line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 9**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The HESE wire is not shorted. Go to step 6.

6. Determine possible failure area (Power seat control unit, rear up-down position sensor, HESE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear up-down motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 9**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there voltage?

About 5 V

Faulty rear up-down position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire (sensor line).

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

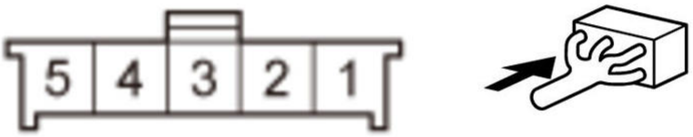
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

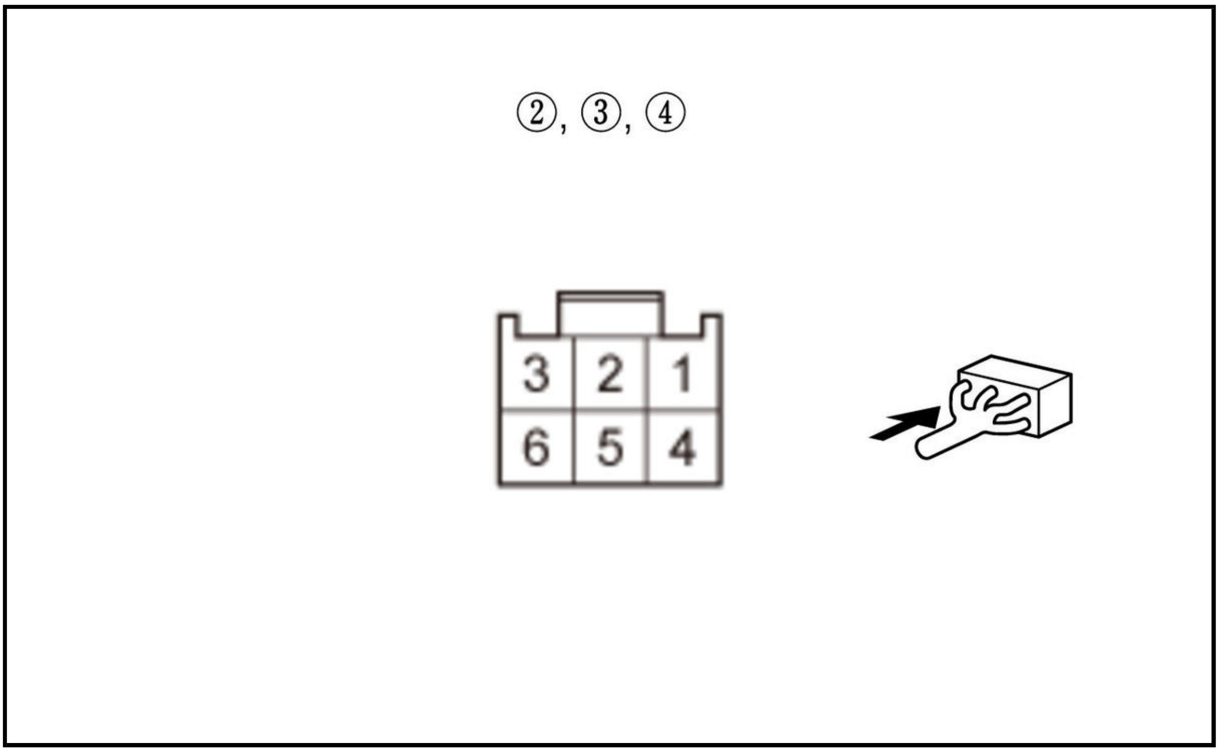
Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③

Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**

①





Is there continuity?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The VCC wire is not shorted. Go to step 9.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the rear up-down switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT2 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 0.2 V or more?

YES

Repair an open or high resistance in the wire or poor ground (G501).

NO

The GND wires are not open. Go to step 12.

12. Open wire check (HEIGHT UP, HEIGHT DOWN lines)

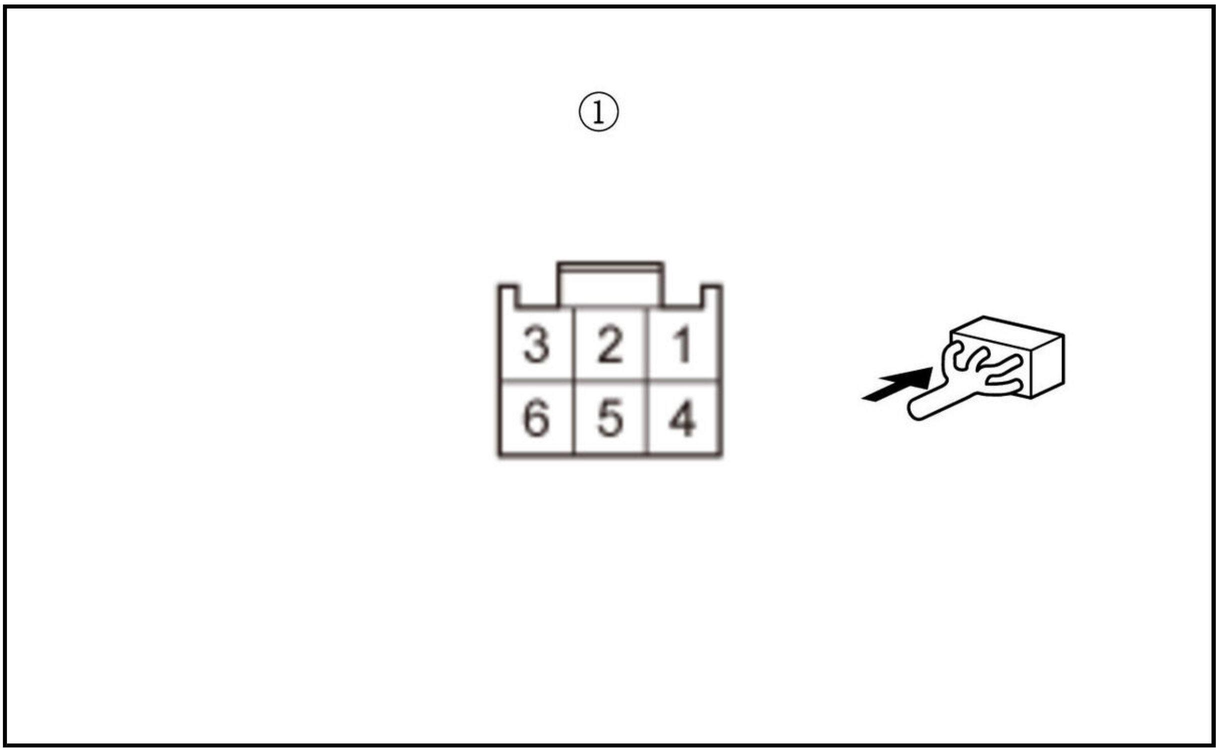
-1. Disconnect the following connectors.

Rear up-down motor/position sensor 6P connector
Power seat control unit connector B (12P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 4: ①
Test point 2	**Power seat control unit connector B (12P) No. 9**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 6: ①
Test point 2	**Power seat control unit connector B (12P) No. 4**



Is there continuity?

YES

The HEIGHT UP and HEIGHT DOWN wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (HEIGHT UP, HEIGHT DOWN lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear up-down motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 9**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The HEIGHT UP and HEIGHT DOWN wires are OK. Go to step 14.

14. Rear up-down motor check

-1. **Test the rear up-down motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty rear up-down motor/position sensor; **replace the seat frame assembly** .

DTC B1828

DTC B1828 : Recline pulse error (no change in pulse for 1 second)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- When check the REC FR line circuit, do not operate the rear seat access lever, because limit switch is located in the circuit.
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B1828 Recline pulse error (no change in pulse for 1 second)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the engine start/stop switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1828 is stored when the recline switch is operated more than 1 second after the seat moves to the most forward or backward position, even when the system is OK.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1828 Recline pulse error (no change in pulse for 1 second)	B

Is DTC B1828 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1825 Slide pulse error (no change in pulse for 1 second)	B
B1826 Front height pulse error (no change in pulse for 1 second)	B
B1827 Rear height pulse error (no change in pulse for 1 second)	B
B1828 Recline pulse error (no change in pulse for 1 second)	B
B1836 Power Seat Position Sensor circuit short	B

Any of DTC are indicated at the same time with DTC B1828?

DTC B1828 is indicated only

Go to step 3.

DTC B1836 is also indicated

Go to the DTC B1836 troubleshooting.

DTC B1825, B1826, and/or B1827 are also indicated

Go to step 7.

3. Determine possible failure area (motor operation, motor sensor)

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Operate the recline switch for 2 seconds, and check the recline motor operation.

Does the recline motor run smoothly?

YES

Go to step 4.

NO

Go to step 10.

4. Open wire check (RESE, SEG lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

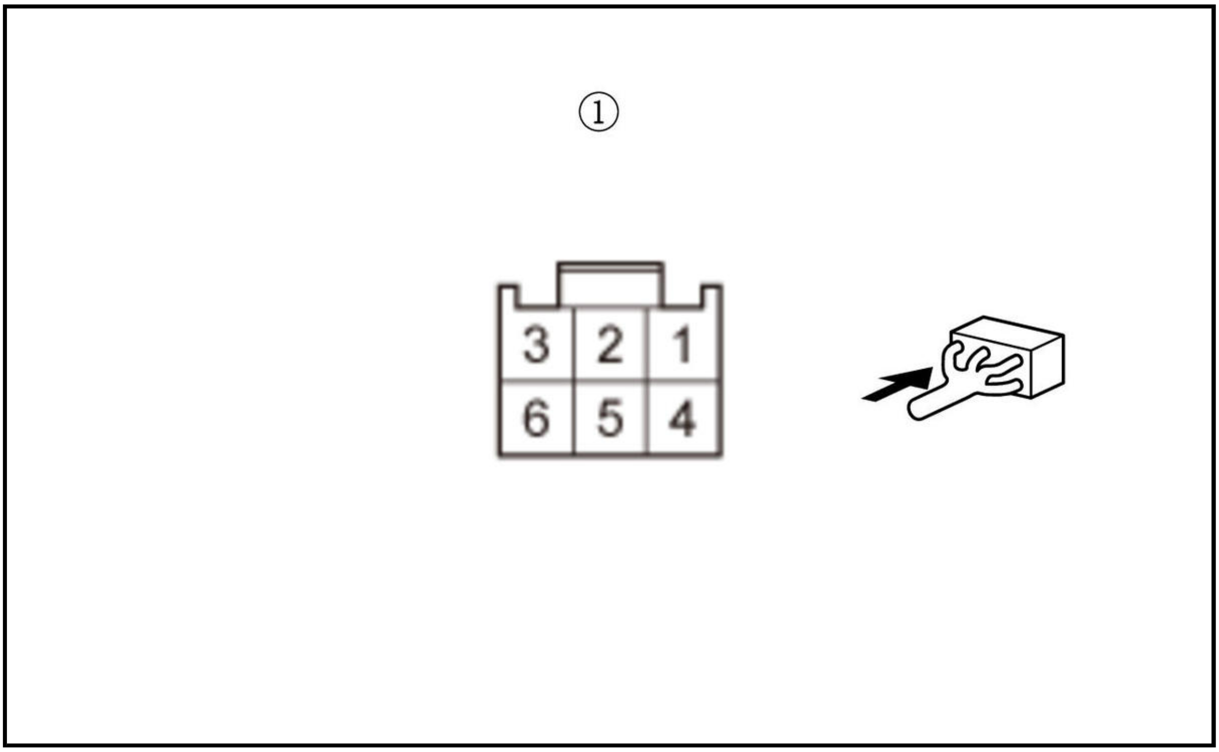
-2. Disconnect the following connectors.

Recline motor/position sensor 6P connector
Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 1: ①
Test point 2	**Power seat control unit connector A (20P) No. 10**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**



Is there continuity?

YES

The RESE, SEG wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (RESE line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 10**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The RESE wire is not shorted. Go to step 6.

6. Determine possible failure area (Power seat control unit, recline position sensor, RESE line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 10**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there about 5 V?

About 5 V

Faulty recline motor/position sensor; **replace the seat frame assembly** .

No voltage

Replace the power seat control unit .

Battery voltage

Repair a short to power in the wire (sensor line).

7. Open wire check (SEG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector Power seat control unit connector A (20P)

-3. Check for continuity between test points 1 and 2.

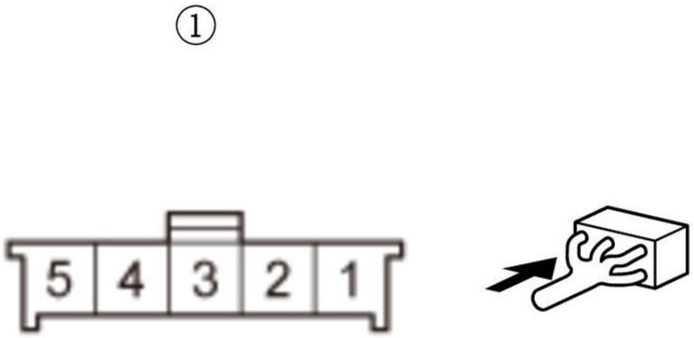
Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	Slide motor/position sensor 5P connector (female terminals) No. 3: ①
Test point 2	**Power seat control unit connector A (20P) No. 19**

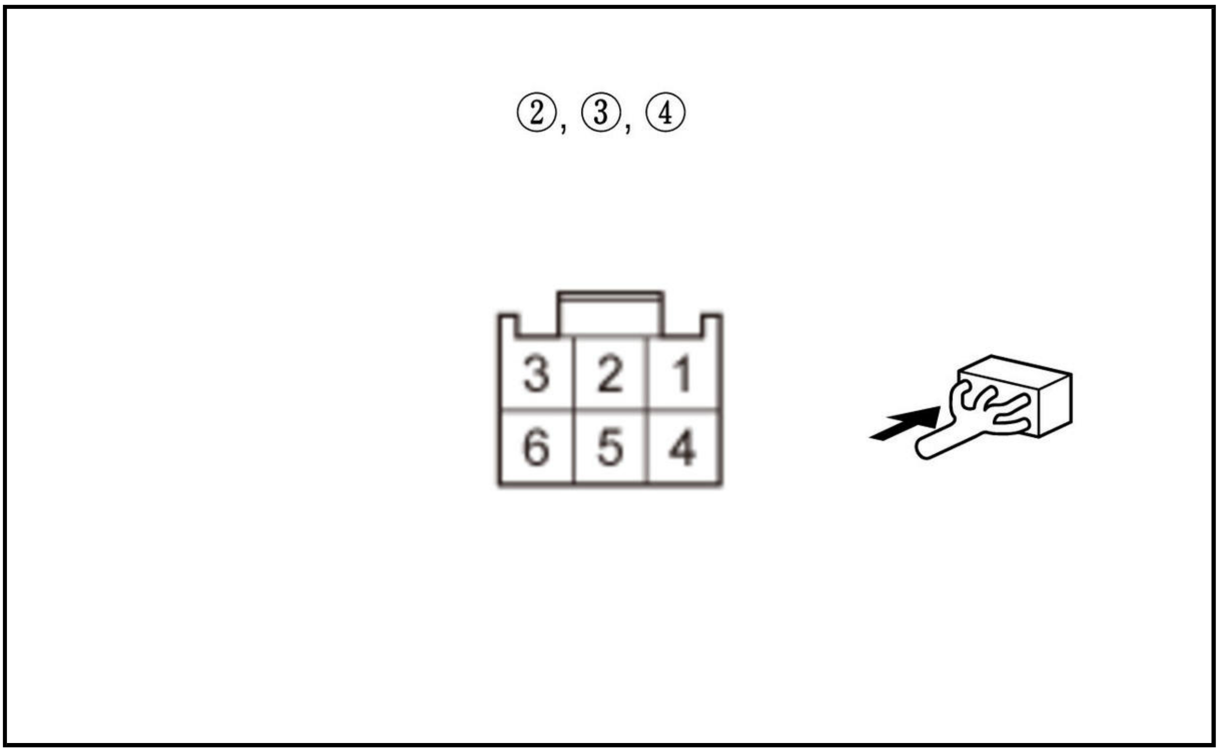
Test point 1	Front up-down motor/position sensor 6P connector (female terminals) No. 2: ②
Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Rear up-down motor/position sensor 6P connector (female terminals) No. 2: ③

Test point 2	**Power seat control unit connector A (20P) No. 19**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 2: ④
Test point 2	**Power seat control unit connector A (20P) No. 19**





Is there continuity?

YES

The SEG wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Shorted wire check (VCC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected Power seat control unit connector A (20P): disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The VCC wire is not shorted. Go to step 9.

9. Determine possible failure area (Power seat control unit, VCC line)

-1. Reconnect the following connector.

Power seat control unit connector A (20P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	**Power seat control unit connector A (20P) No. 19**

Is there battery voltage when the recline switch is operated?

YES

Repair an open or high resistance in the wire.

NO

Replace the power seat control unit .

10. Open wire check (+B/P-SEAT2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The +B/P-SEAT2 wire is not open. Go to step 11.

NO

Repair an open or high resistance in the wire.

11. Open wire check (GND lines)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	**Power seat control unit connector B (12P) No. 2**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 5**
Test point 2	Body ground

Test point 1	**Power seat control unit connector A (20P) No. 20**
Test point 2	Body ground

Is there 0.2 V or more?

YES

Repair an open or high resistance in the wire or poor ground (G501).

NO

The GND wires are not open. Go to step 12.

12. Open wire check (REC FR, REC RR lines)

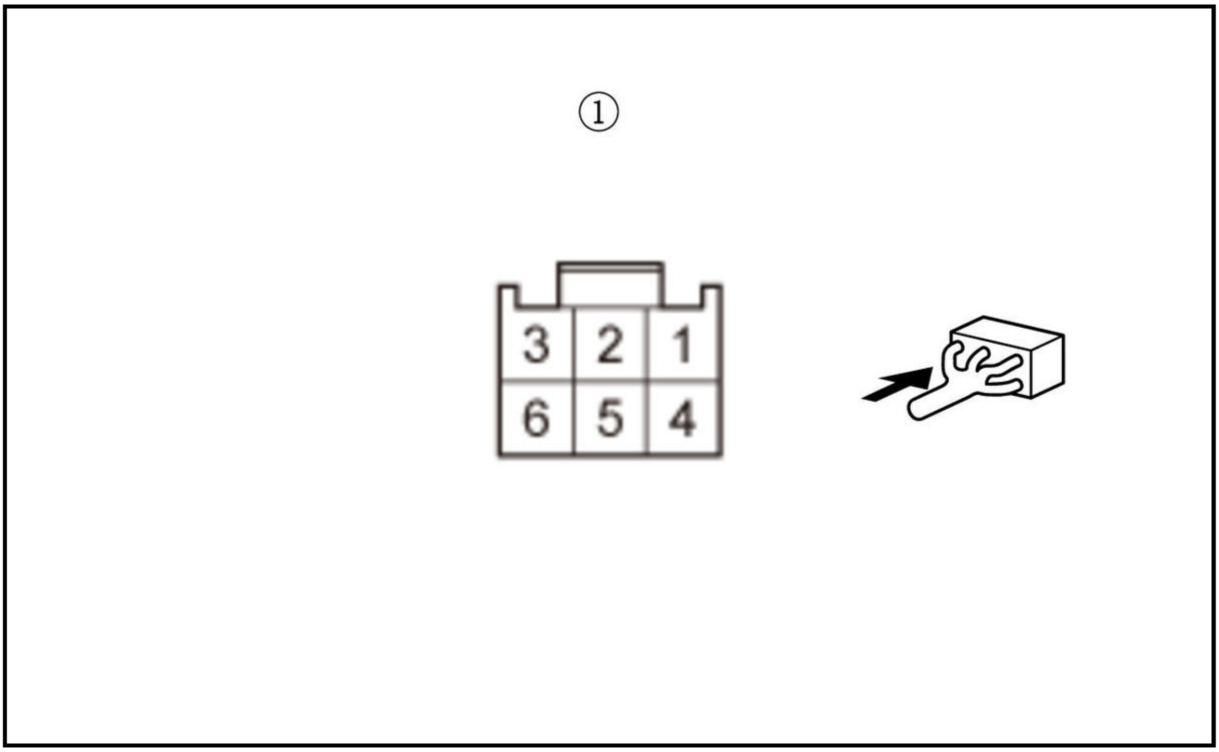
-1. Disconnect the following connectors.

Recline motor/position sensor 6P connector
Power seat control unit connector B (12P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 4: ①
Test point 2	**Power seat control unit connector B (12P) No. 8**

Test point 1	Recline motor/position sensor 6P connector (female terminals) No. 6: ①
Test point 2	**Power seat control unit connector B (12P) No. 11**



Is there continuity?

YES

The REC FR and REC RR wires are not open. Go to step 13.

NO

Repair an open or high resistance in the wire.

13. Shorted wire check (REC FR, REC RR lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Recline motor/position sensor 6P connector: disconnected Power seat control unit connector B (12P): disconnected
Test point 1	**Power seat control unit connector B (12P) No. 8**
Test point 2	Body ground

Test point 1	**Power seat control unit connector B (12P) No. 11**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The REC FR and REC RR wires are OK. Go to step 14.

14. Recline motor check

-1. **Test the recline motor** .

Is the motor OK?

YES

Replace the power seat control unit .

NO

Faulty recline motor/position sensor; **replace the seat frame assembly** .

DTC B1829

DTC B1829 : AT-P signal and VSP signal mismatch

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1829 AT-P signal and VSP signal mismatch	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Start the engine.

-3. Test drive at 6 mph (10 km/h) for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1829 AT-P signal and VSP signal mismatch	B

Is DTC B1829 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. A/T system check

-1. Check the P indicator of the shift position/mode indicator and the MIL.

Do the P indicator and MIL come on?

YES

Troubleshoot the A/T system.

NO

Go to step 3.

3. DTC check

-1. Check for gauge control module DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Replace the power seat control unit .

DTC B1836

DTC B1836 : Power Seat Position Sensor circuit short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1836 Power Seat Position Sensor circuit short	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Press the engine start/stop switch at least twenty times, then wait for at least 20 seconds.

-3. Operate the power seat adjustment switch in all directions for more than 1 second each.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1836 Power Seat Position Sensor circuit short	B

Is DTC B1836 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (VCC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power seat control unit connector A (20P) Slide motor/position sensor 5P connector Front up-down motor/position sensor 6P connector Rear up-down motor/position sensor 6P connector Recline motor/position sensor 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected Slide motor/position sensor 5P connector: disconnected Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	**Power seat control unit connector A (20P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The VCC wire is not shorted. Go to step 3.

3. Motor check (Slide, Front up-down, Rear up-down, Recline)

-1. Check for continuity between test points 1 and 2.

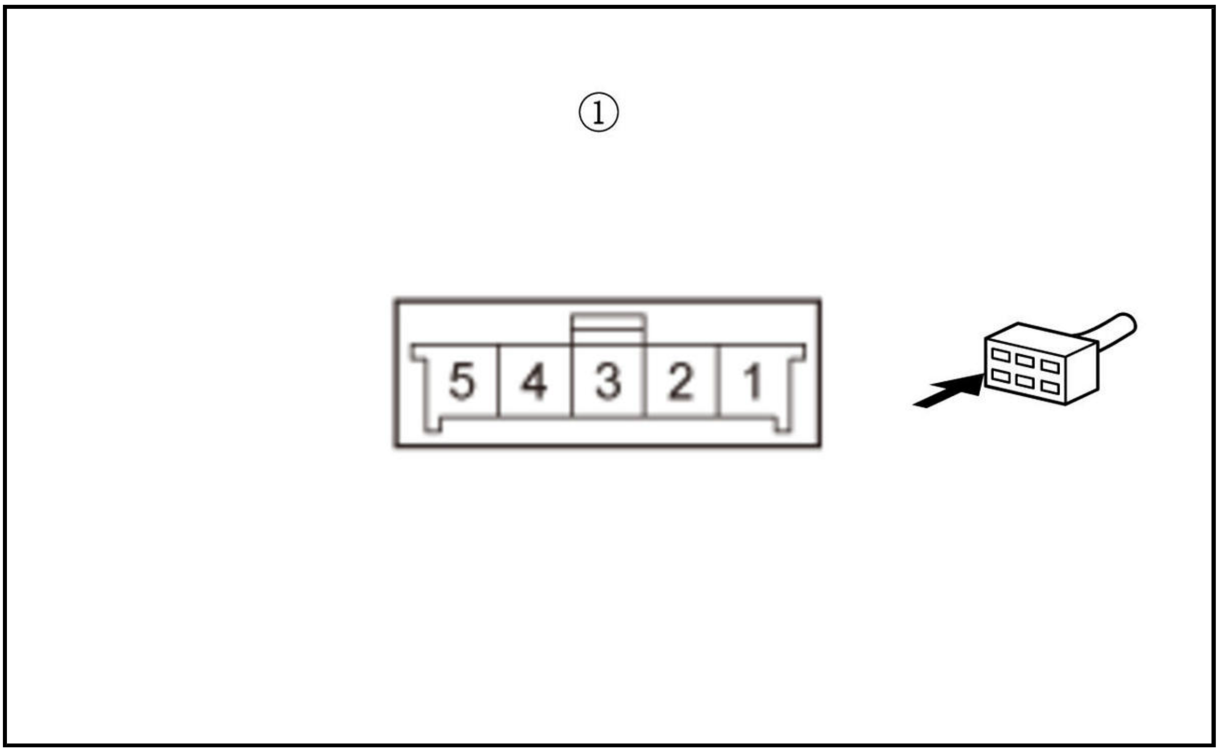
Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected Slide motor/position sensor 5P connector: disconnected

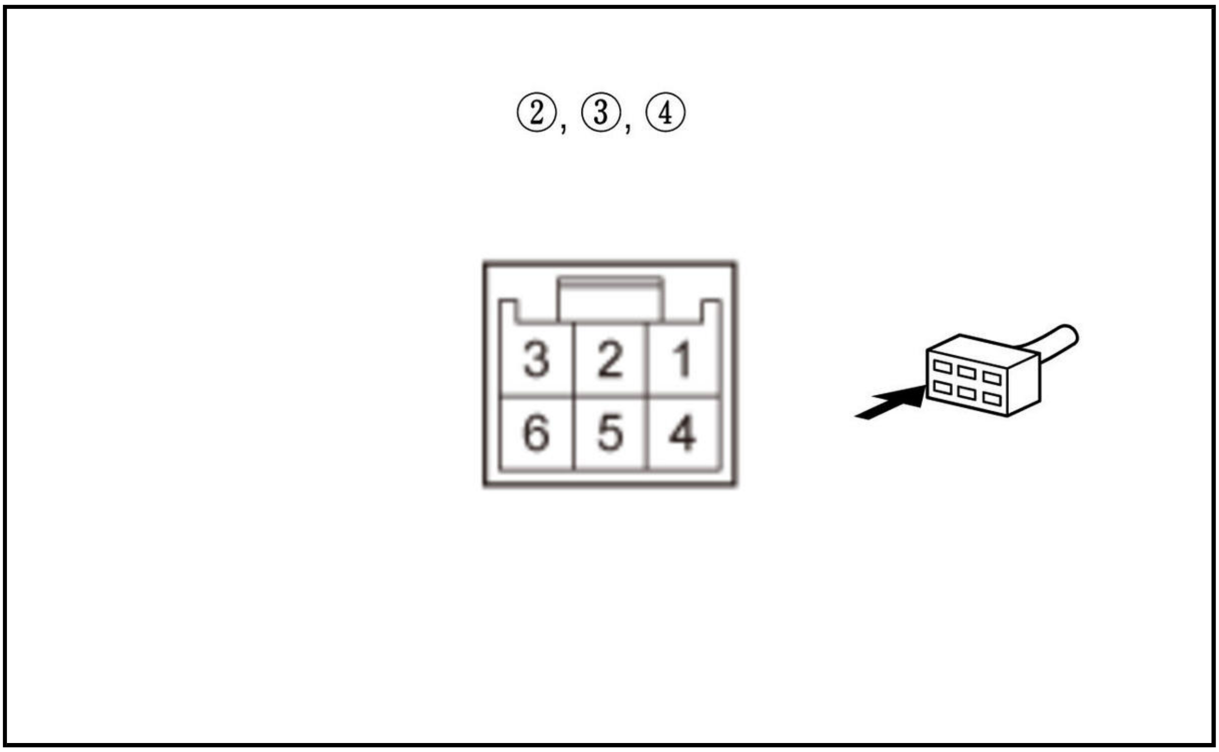
	Front up-down motor/position sensor 6P connector: disconnected Rear up-down motor/position sensor 6P connector: disconnected Recline motor/position sensor 6P connector: disconnected
Test point 1	Slide motor/position sensor 5P connector (male terminals) No. 2: ①
Test point 2	Body ground (motor body)

Test point 1	Front up-down motor/position sensor 6P connector (male terminals) No. 1: ②
Test point 2	Body ground (motor body)

Test point 1	Rear up-down motor/position sensor 6P connector (male terminals) No. 1: ③
Test point 2	Body ground (motor body)

Test point 1	Recline motor/position sensor 6P connector (male terminals) No. 1: ④
Test point 2	Body ground (motor body)





Is there continuity?

Slide motor/position sensor is shorted

Faulty slide motor/position sensor; **replace the seat frame assembly** .

Front up-down motor/position sensor is shorted

Faulty front up-down motor/position sensor; **replace the seat frame assembly** .

Rear up-down motor/position sensor is shorted

Faulty rear up-down motor/position sensor; **replace the seat frame assembly** .

Recline motor/position sensor is shorted

Faulty recline motor/position sensor; **replace the seat frame assembly** .

NO

Replace the power seat control unit .

DTC B1837

DTC B1837 : Memory position calling timeout

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1837 Memory position calling timeout	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Move the power seat to the full front up and full rear up positions, then slide the seat all the way back and completely recline the seat-back backward with the power seat adjustment switch.

-4. Set the seating position into memory by pressing either the driving position memory switch POSITION 1 or POSITION 2 button.

-5. Using the power seat switches, move the seat away from the position just memorized.

-6. Recall the memory position with the driving position memory switch.

-7. Wait for 2 minutes.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B1837 Memory position calling timeout	B

Is DTC B1837 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Any of DTC are indicated at the same time with DTC B1837?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 3.

3. Motor operation check

-1. Clear the DTCs with the HDS.

-2. Wait for 6 seconds.

-3. Move the motors (power seat slide forward/backward, recline forward/backward, front up-down, and rear up-down) shown one at a time, and check the operation time.

Does any motor fail to run smoothly?

Motor fails to run smoothly

Go to the failed motor test .

Motor is OK, but fails to run smoothly

Check the engagement of the motor gear.

NO

Do the teat of terminals for power seat control unit .

DTC B1844

DTC B1844 : Power Seat Slide switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1844 Power Seat Slide switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Operate the slide switch in each direction for more than 3 seconds.

   -3. Wait for at least 3 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1844 Power Seat Slide switch circuit malfunction	B

Is DTC B1844 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1845

DTC B1845 : Power Seat Recline switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1845 Power Seat Recline switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Operate the recline switch in each direction for more than 3 seconds.

-3. Wait for at least 3 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1845 Power Seat Recline switch circuit malfunction	B

Is DTC B1845 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1846

DTC B1846 : Power Seat Front Up-Down switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1846 Power Seat Front Up-Down switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Operate the front up-down switch in each direction for more than 3 seconds.

-3. Wait for at least 3 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1846 Power Seat Front Up-Down switch circuit malfunction	B

Is DTC B1846 indicated?

YES

Replace the power seat control unit .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1847

DTC B1847 : Power Seat Rear Up-Down switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1847 Power Seat Rear Up-Down switch circuit malfunction	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Operate the rear up-down switch in each direction for more than 1 second.

   -3. Wait for at least 3 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1847 Power Seat Rear Up-Down switch circuit malfunction	B

   Is DTC B1847 indicated?

   YES

   Replace the power seat control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0199, U1281, U128D (POWER SEAT CONTROL UNIT)

DTC U0199 : Power seat control unit lost communication with door multiplex control unit (DRLockSW frame)**DTC U1281** : Power seat control unit lost communication with MICU (MICU frame)**DTC U128D** : Lost Communication With Gauge Control Module (VSP/NE frame)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0199 Power seat control unit lost communication with door multiplex control unit (DRLockSW frame)	B
U1281 Power seat control unit lost communication with MICU (MICU frame)	B
U128D Lost Communication With Gauge Control Module (VSP/NE frame)	B

DTC (Power Seat Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0199 Power seat control unit lost communication with door multiplex control unit (DRLockSW frame)	B
U1281 Power seat control unit lost communication with MICU (MICU frame)	B
U128D Lost Communication With Gauge Control Module (VSP/NE frame)	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN H line, B-CAN L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Power seat control unit connector A (20P)

-3. Disconnect the transmitting control unit connector (s).

Refer to the DTC shown on the display, then disconnect the connector (s) based on the instructions (see table).

DTC	Connector
U0199	Power window master switch 37P connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN H circuit and the B-CAN L circuit.

Test condition	Vehicle OFF (LOCK) mode Power seat control unit connector A (20P): disconnected Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0199	B-CAN H	**Power seat control unit connector A (20P)**	No. 16	**Power window master switch 37P connector**	No. 32
	B-CAN L		No. 17		No. 31
U1281	B-CAN H	**Power seat control unit connector A (20P)**	No. 16	**Body control module connector B (36P)**	No. 20
	B-CAN L		No. 17		No. 21
U128D	B-CAN H	**Power seat control unit connector A**	No. 16	**Gauge control module connector A**	No. 30

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
	B-CAN L	(20P)	No. 17	(32P)	No. 31

Is there continuity?

YES

The B-CAN H wire and the B-CAN L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0199	Power window master switch
U1281	Body control module

DTC	Operation for transmitting control unit
U128D	Gauge control module

NO

Repair an open in the B-CAN H wire and/or the B-CAN L wire.

DTC U1280 (POWER SEAT CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Power Seat Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

TROUBLESHOOTING

DTC B1352

DTC B1352 : Power Tailgate Control Unit Internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1352 Power Tailgate Control Unit Internal error (EEPROM error)	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1352 Power Tailgate Control Unit Internal error (EEPROM error)	B

   Is DTC B1352 indicated?

   YES

   Replace the power tailgate control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections at the power tailgate control unit.

DTC B1375

DTC B1375 : Driver's side PTG switch circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1375 Driver's side PTG switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Operate the driver's power tailgate switch for more than 1 second.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1375 Driver's side PTG switch circuit malfunction	B

Is DTC B1375 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (T/G OPEN SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modePower tailgate control unit connector A (24P): disconnected
Test point 1	**Power tailgate control unit connector A (24P) No. 8**

Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the T/G OPEN SW wire.

NO

Repair a short to ground in the PTG/PTL SCOM wire.

DTC B1376

DTC B1376 : Tailgate Outer Handle switch circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1376 Tailgate Outer Handle switch circuit malfunction	B

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Press the tailgate outer handle switch for more than 1 second.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1376 Tailgate Outer Handle switch circuit malfunction	B

   Is DTC B1376 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (T/G OPEN SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected
B	B

Test point 1	**Power tailgate control unit connector A (24P) No. 23**
Test point 2	Body ground

   Is there continuity?

   YES

   Repair a short to ground in the T/G OPEN SW wire.

   NO

   Repair a short to ground in the PTG/PTL SCOM wire.

DTC B1377

DTC B1377 : Power Tailgate Inner switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1377 Power Tailgate Inner switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the keyless transmitter.

   -3. Press the power tailgate inside switch for more than 1 second.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1377 Power Tailgate Inner switch circuit malfunction	B

   Is DTC B1377 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (PTG/PTL CLOSE SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected
Test point 1	**Power tailgate control unit connector A (24P) No. 24**

Test point 2	Body ground

   Is there continuity?

   YES

   Repair a short to ground in the PTG/PTL CLOSE SW wire.

   NO

   Repair a short to ground in the PTG/PTL SCOM wire.

DTC B1378

DTC B1378 : Power Tailgate Right Touch/Pinch sensor circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate manually or with the keyless transmitter.

   -3. Close the tailgate with the keyless transmitter or driver's power tailgate switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B

   Is DTC B1378 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B
B1385 Power Tailgate temperature sensor malfunction	B

   Any of DTC are indicated at the same time with DTC B1378?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Open wire check (PTG/PTL SEG2 line)

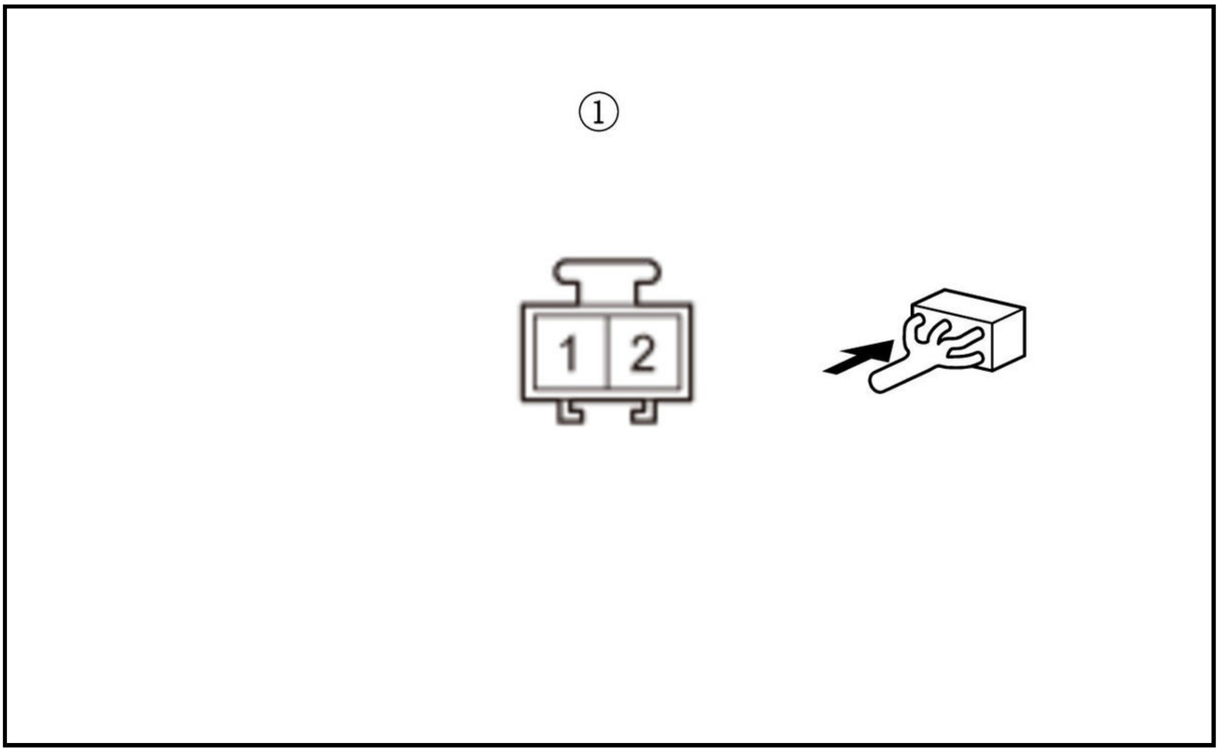
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Power tailgate control unit connector B (10P)Right power tailgate pinch sensor 2P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector B (10P): disconnected Right power tailgate pinch sensor 2P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 8**
Test point 2	Right power tailgate pinch sensor 2P connector (male terminals) No. 2: ①



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

4. Determine possible failure area (right power tailgate pinch sensor, others)

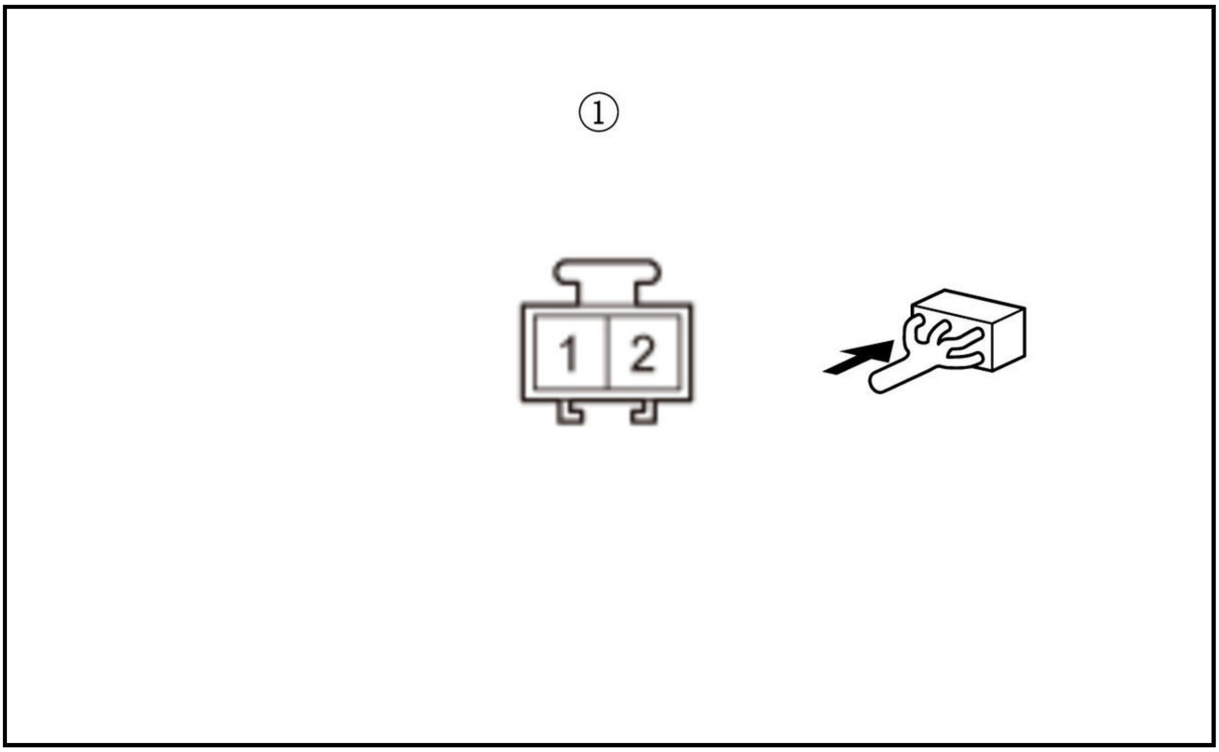
-1. Disconnect the following connector.

Right power tailgate pinch sensor 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Right power tailgate pinch sensor 2P connector: disconnected
Test point 1	Right power tailgate pinch sensor 2P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Replace the right power tailgate pinch sensor .

NO

Go to step 5.

5. Open wire check (PTG/PTL TSLA line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Right power tailgate pinch sensor 2P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 9**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

Replace the power tailgate control unit .

DTC B1379

DTC B1379 : Power Tailgate Left Touch/Pinch sensor circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate manually or with the keyless transmitter.

   -3. Close the tailgate with the keyless transmitter or driver's power tailgate switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B

   Is DTC B1379 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B
B1385 Power Tailgate temperature sensor malfunction	B

   Any of DTC are indicated at the same time with DTC B1379?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Open wire check (PTG/PTL SEG2 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

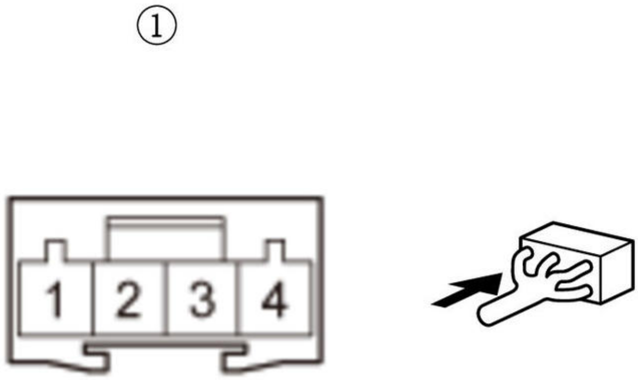
   -2. Disconnect the following connectors.

Power tailgate control unit connector B (10P) Left power tailgate pinch sensor 4P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector B (10P): disconnected Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 8**

Test point 2	Left power tailgate pinch sensor 4P connector (male terminals) No. 2: ①



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

4. Determine possible failure area (left power tailgate pinch sensor, others)

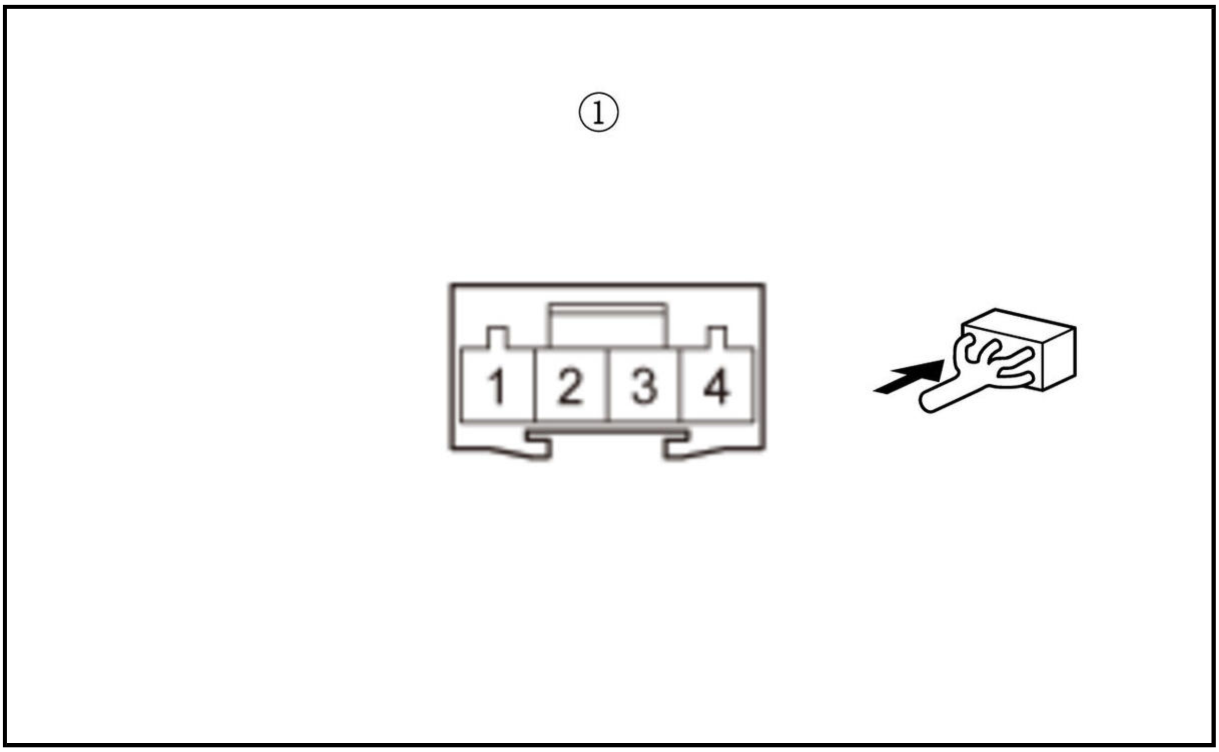
-1. Disconnect the following connector.

Left power tailgate pinch sensor 4P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON modeLeft power tailgate pinch sensor 4P connector: disconnected
Test point 1	Left power tailgate pinch sensor 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Replace the left power tailgate pinch sensor .

NO

Go to step 5.

5. Open wire check (PTG/PTL TSLL line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	Power tailgate control unit connector B (10P) No. 3
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

Replace the power tailgate control unit .

DTC B1380

DTC B1380 : Tailgate Closer Unit Neutral switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1380 Tailgate Closer Unit Neutral switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1380 Tailgate Closer Unit Neutral switch circuit malfunction	B

   Is DTC B1380 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (PTG/PTL CLCL line short, others)

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Latch Gear Position Sw. neutral	B	B

   Is data list value ON?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. Determine possible failure area (power tailgate closer unit, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Latch Gear Position Sw. neutral	B	B

Is data list value ON?

YES

Go to step 4.

NO

Faulty sector switch; **replace the tailgate latch** .

4. Shorted wire check (PTG/PTL CLCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 10**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the power tailgate control unit .

5. Determine possible failure area (power tailgate closer unit, others)

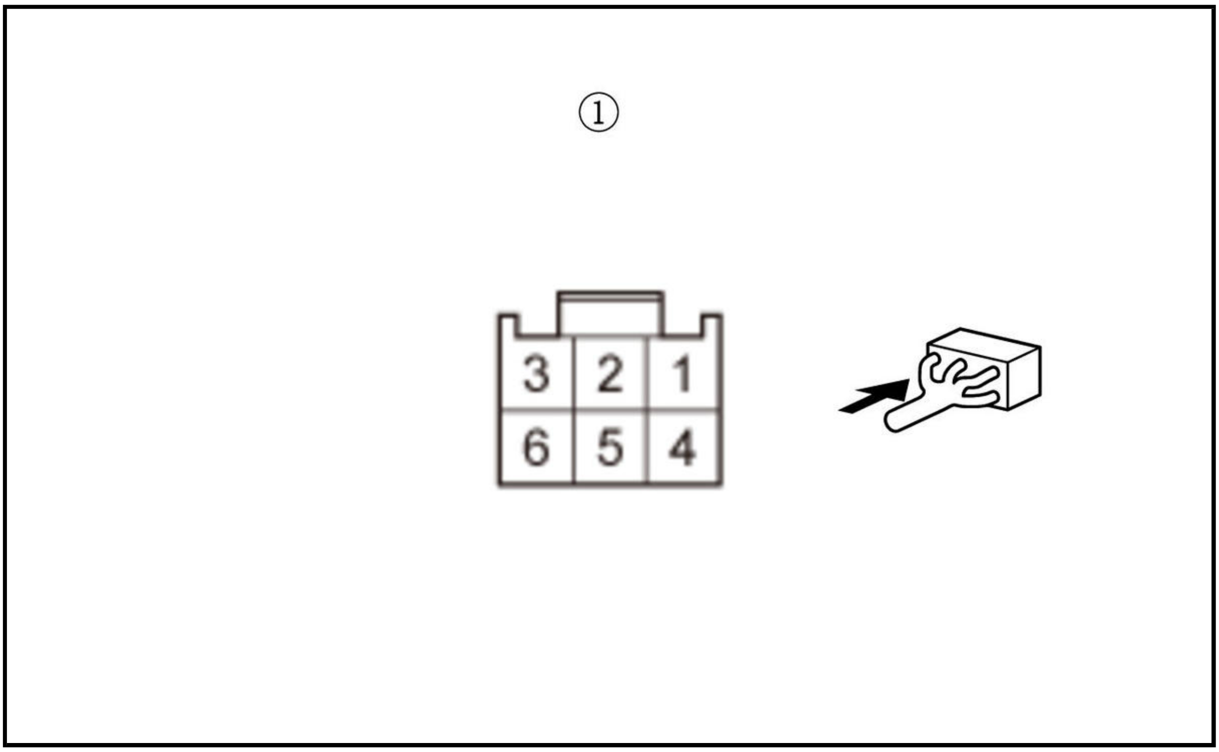
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 3: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Latch Gear Position Sw. neutral	B	B

Is data list value ON?

YES

Faulty sector switch; **replace the tailgate latch** .

NO

Go to step 6.

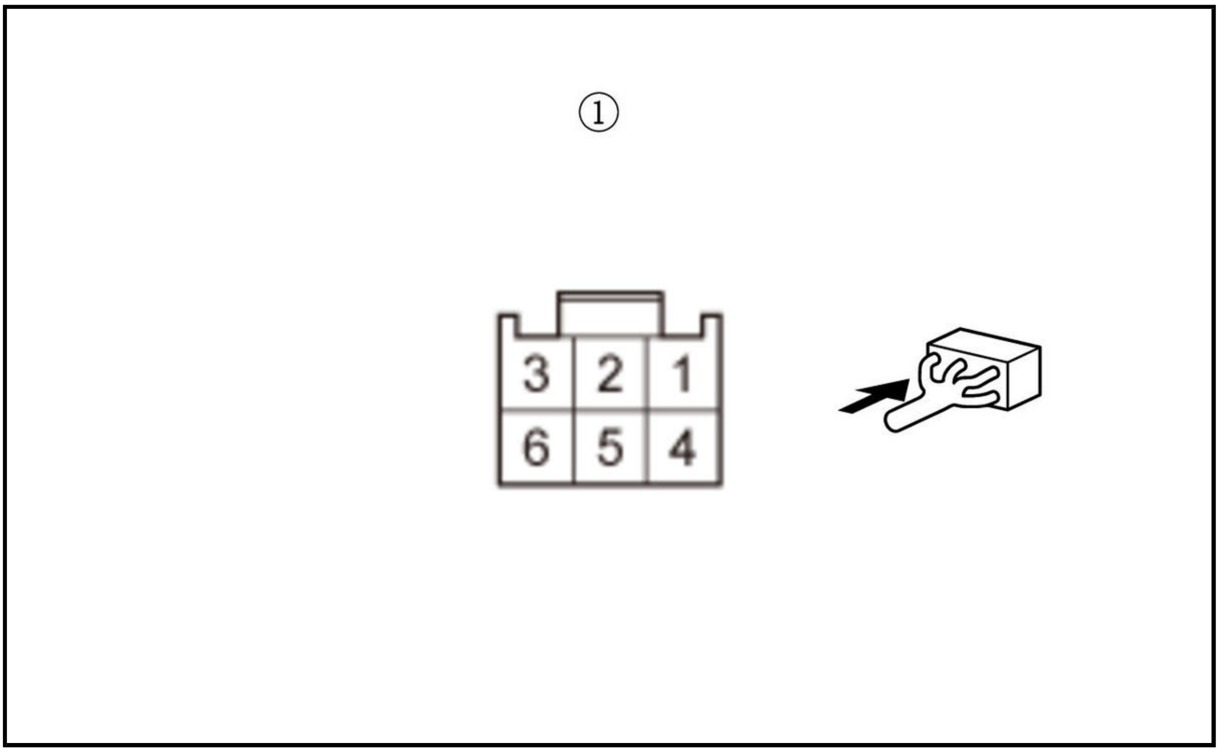
6. Determine possible failure area (PTG/PTL CLCL line, PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 3: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Latch Gear Position Sw. neutral	B	B

Is data list value ON?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

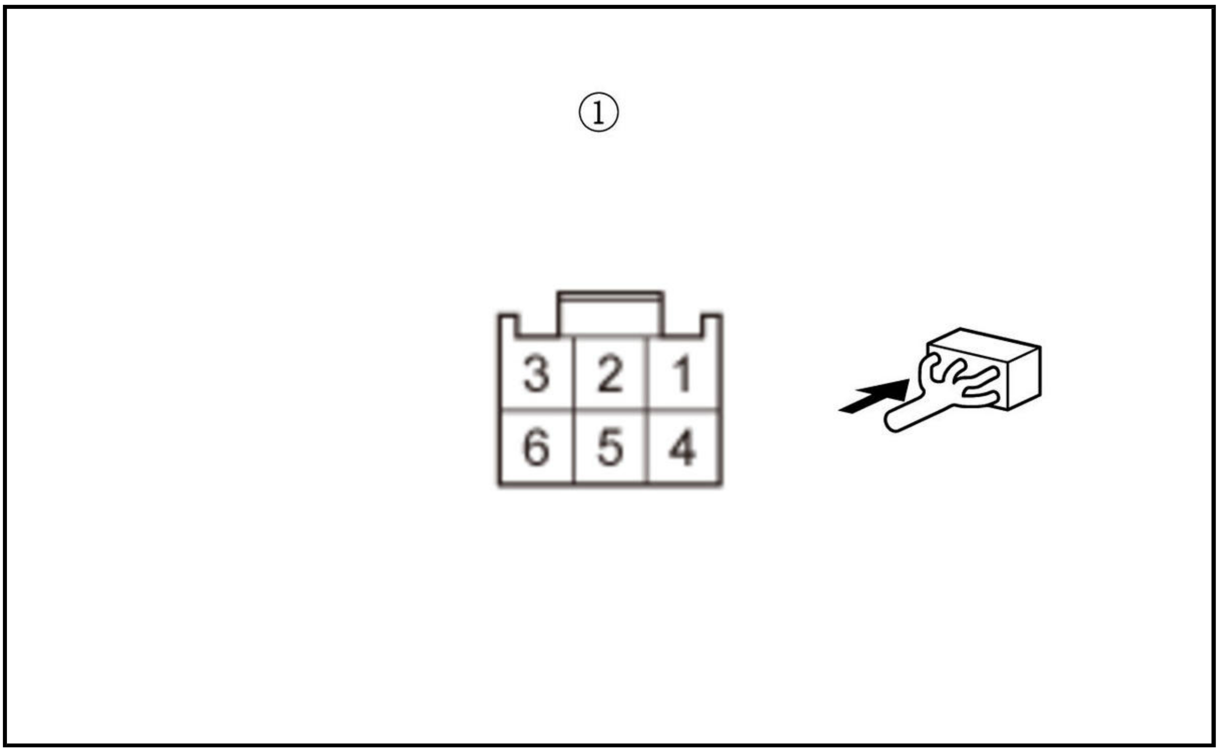
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

8. Open wire check (PTG/PTL CLCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

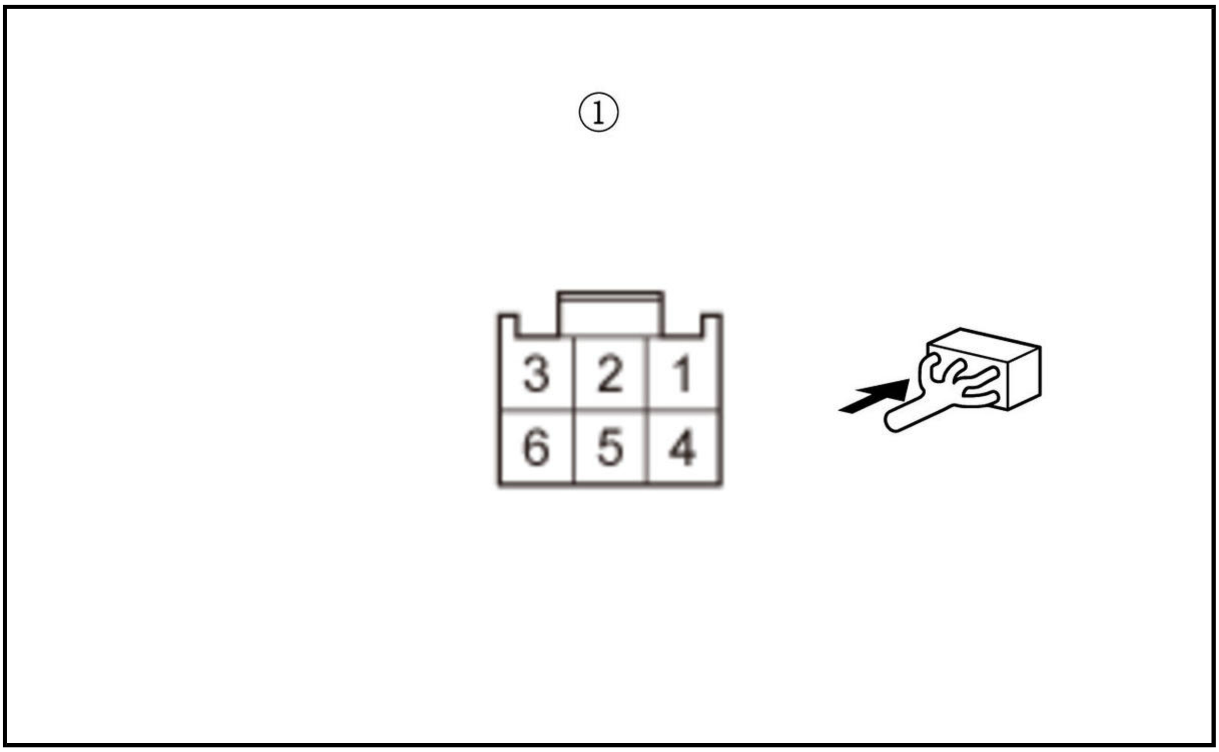
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 3: ①
Test point 2	Power tailgate control unit connector A (24P) No. 10



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1382

DTC B1382 : Tailgate Closer Unit Full Latch switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1382 Tailgate Closer Unit Full Latch switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1382 Tailgate Closer Unit Full Latch switch circuit malfunction	B

Is DTC B1382 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1384 Tailgate Closer Unit Half Latch switch circuit malfunction	B
B1390 Power Tailgate Closer Motor function error	B

Are DTC B1384 and/or B1390 indicated?

YES

Go to the indicated DTCs troubleshooting, then recheck.

NO

Go to step 3.

3. Determine possible failure area (T/G SW line short, others)

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Go to step 4.

NO

Go to step 6.

4. Determine possible failure area (power tailgate closer unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Go to step 5.

NO

Faulty full latch switch; **replace the tailgate latch** .

5. Shorted wire check (T/G SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 11**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the power tailgate control unit .

6. Determine possible failure area (power tailgate closer unit, others)

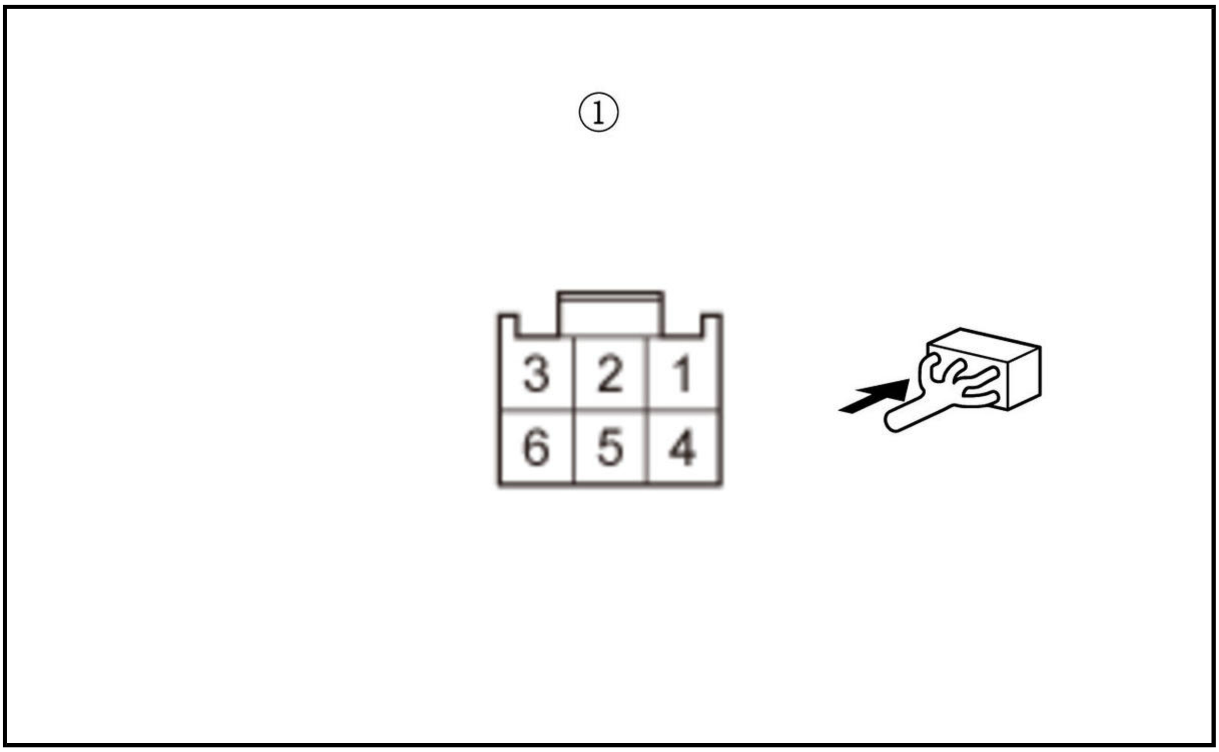
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Faulty full latch switch; **replace the tailgate latch** .

NO

Go to step 7.

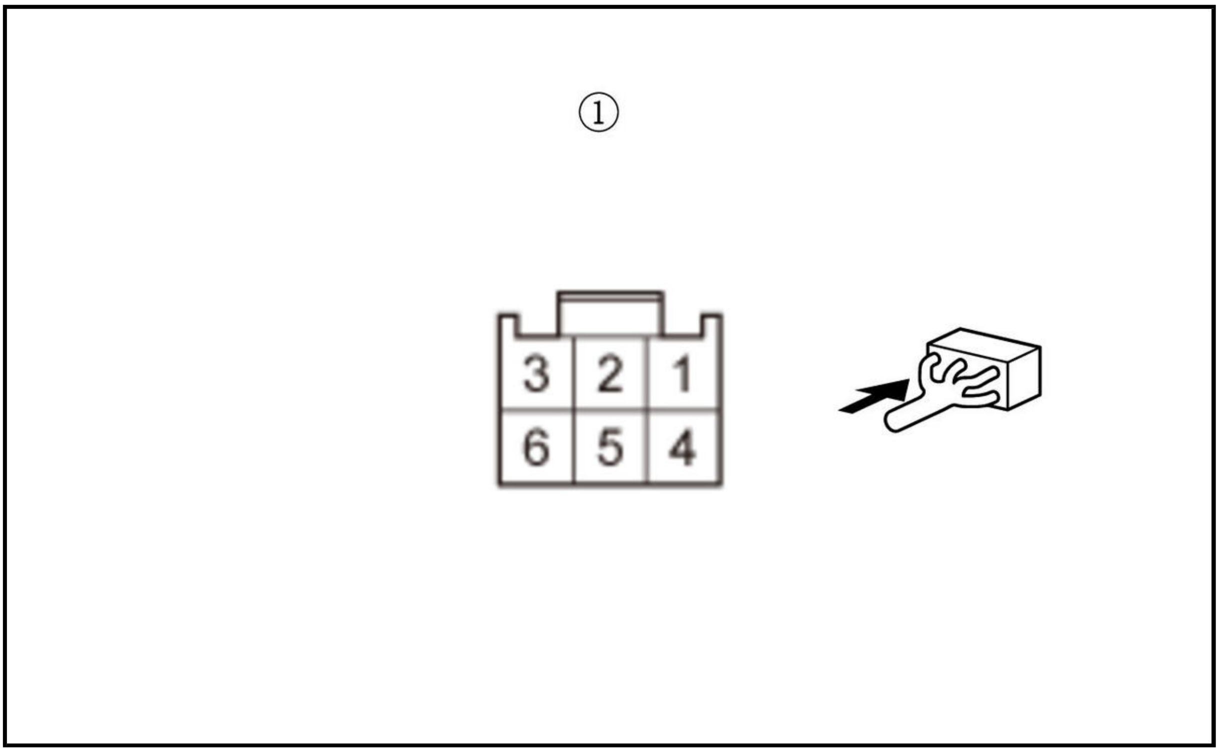
7. Determine possible failure area (T/G SW line, PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Go to step 8.

NO

Go to step 9.

8. Open wire check (PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

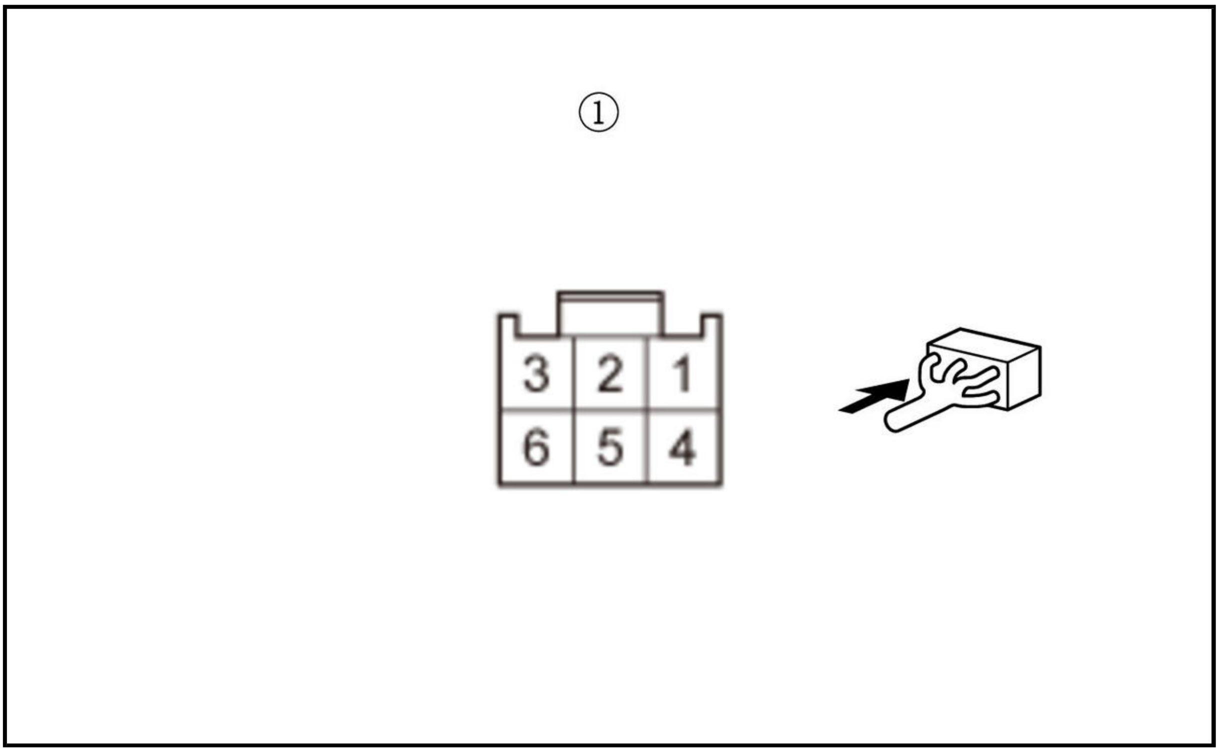
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

9. Open wire check (T/G SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

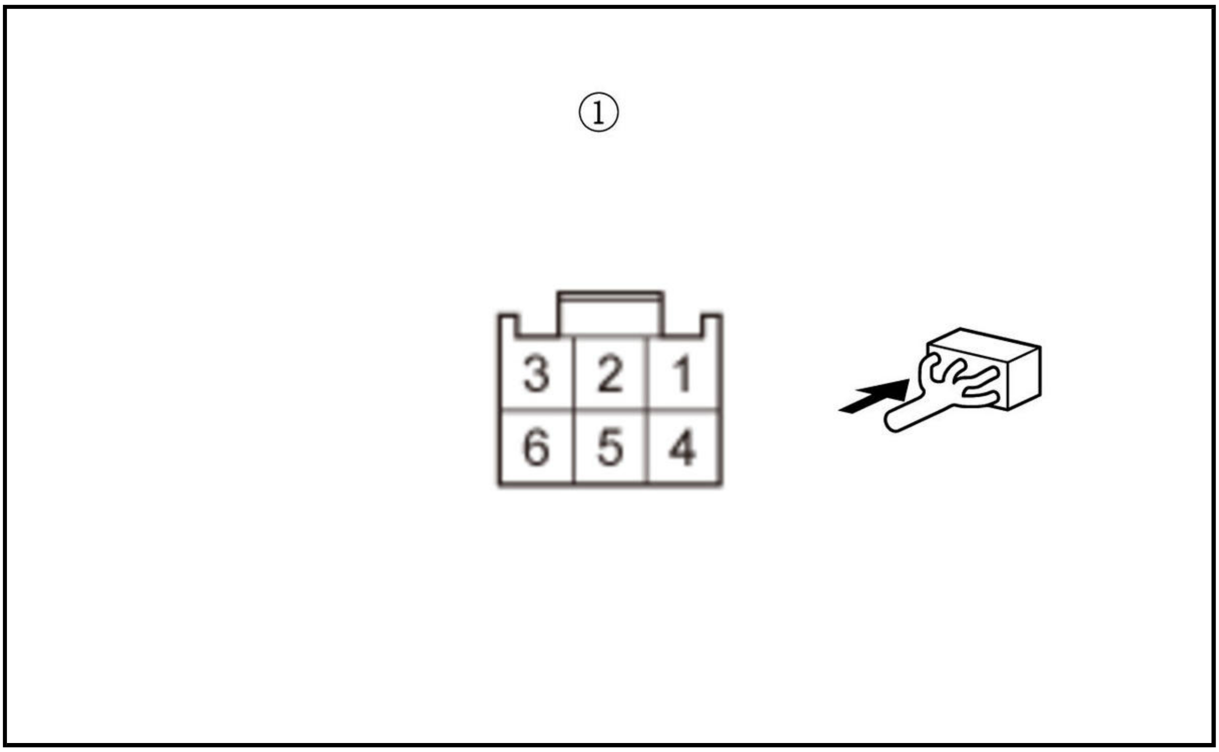
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 11**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1383

DTC B1383 : Tailgate Closer Unit Ratchet switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1383 Tailgate Closer Unit Ratchet switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Open the tailgate with the tailgate outer handle switch.

-3. Close the tailgate manually.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1383 Tailgate Closer Unit Ratchet switch circuit malfunction	B

Is DTC B1383 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (PTG/PTL RACT line short, others)

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Go to step 3.

NO

Go to step 5.

3. Determine possible failure area (power tailgate closer unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Go to step 4.

NO

Faulty ratchet switch; **replace the tailgate latch** .

4. Shorted wire check (PTG/PTL RACT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the power tailgate control unit .

5. Determine possible failure area (power tailgate closer unit, others)

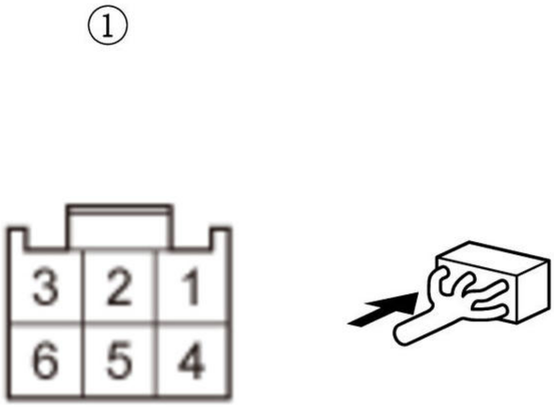
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 6: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Faulty ratchet switch; **replace the tailgate latch** .

NO

Go to step 6.

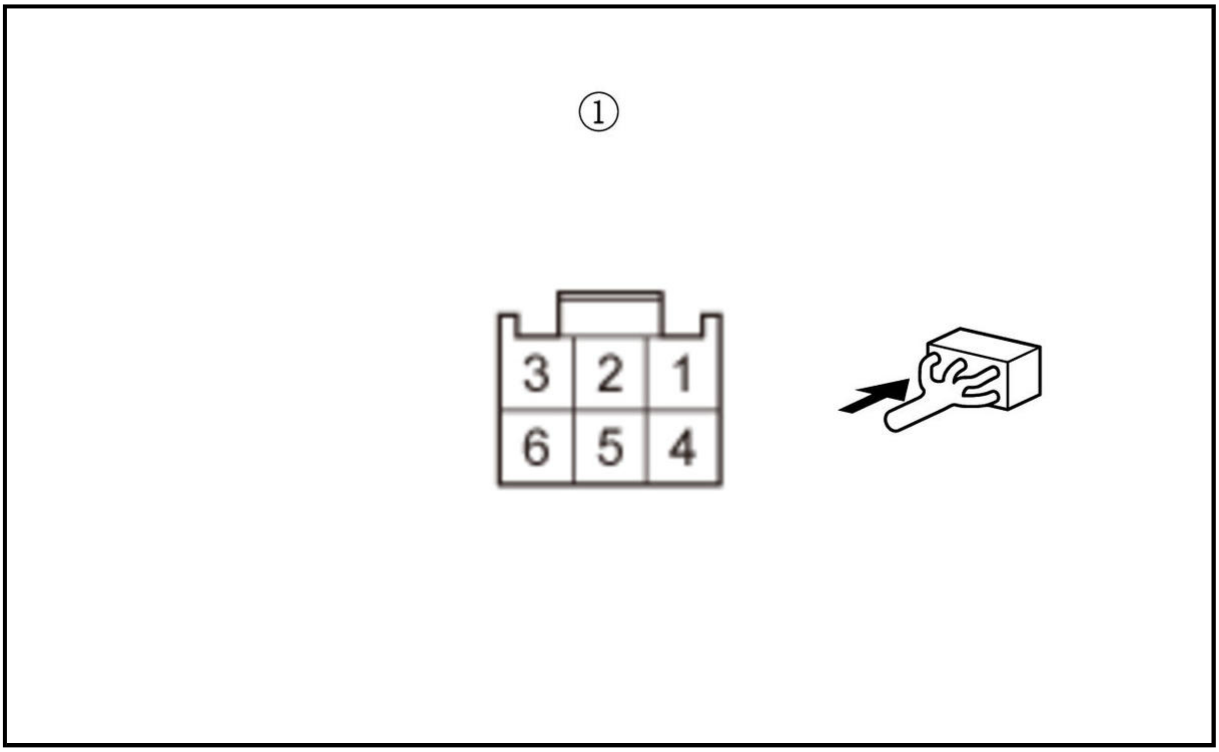
6. Determine possible failure area (PTG/PTL RACT line, PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 6: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

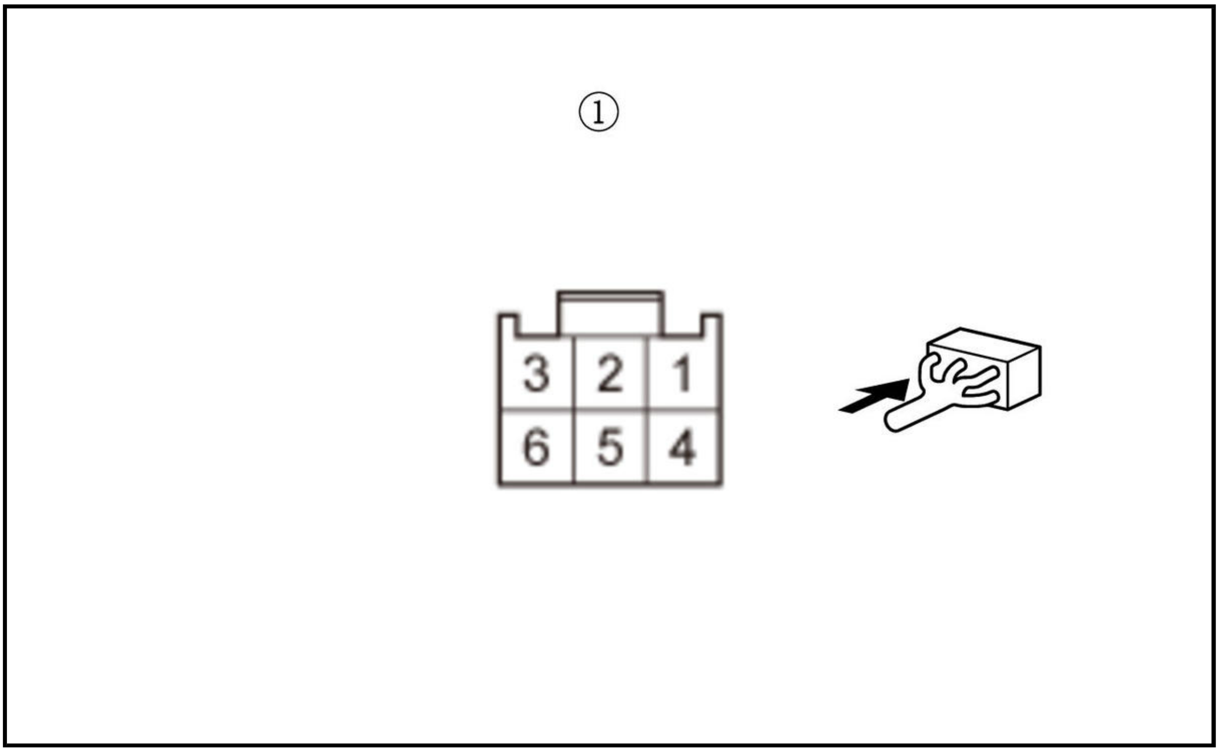
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

8. Open wire check (PTG/PTL RACT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

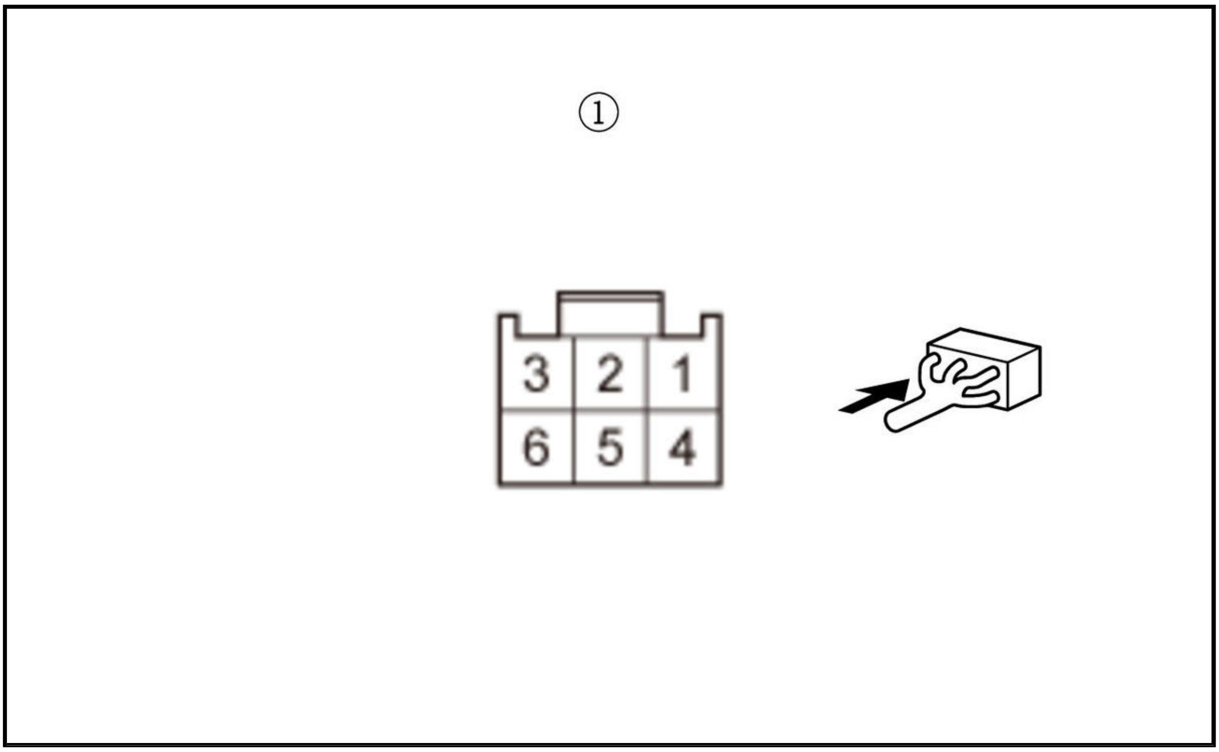
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 6: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 22**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1384

DTC B1384 : Tailgate Closer Unit Half Latch switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1384 Tailgate Closer Unit Half Latch switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1384 Tailgate Closer Unit Half Latch switch circuit malfunction	B

   Is DTC B1384 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (PTG/PTL HALF line short, others)

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

   Is data list value ON?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. Determine possible failure area (power tailgate closer unit, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

Is data list value ON?

YES

Go to step 4.

NO

Faulty half latch switch; **replace the tailgate latch** .

4. Shorted wire check (PTG/PTL HALF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 12**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the power tailgate control unit .

5. Determine possible failure area (power tailgate closer unit, others)

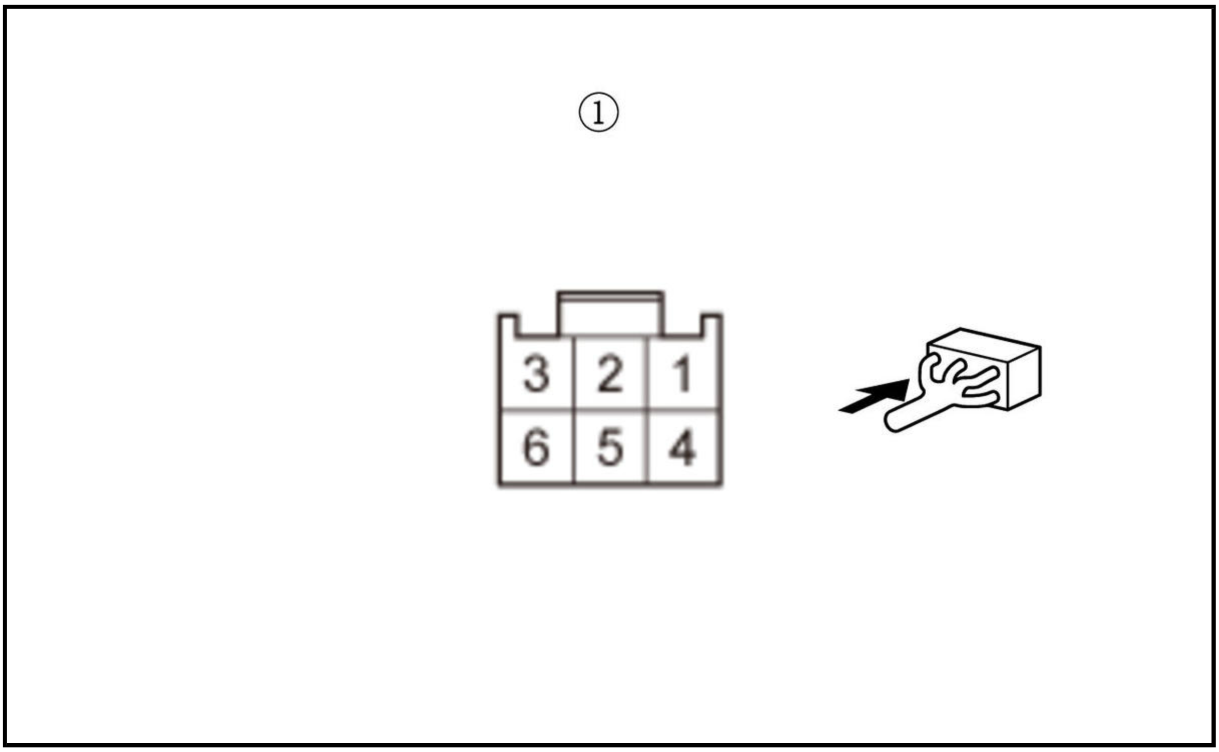
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

Is data list value ON?

YES

Faulty half latch switch; **replace the tailgate latch** .

NO

Go to step 6.

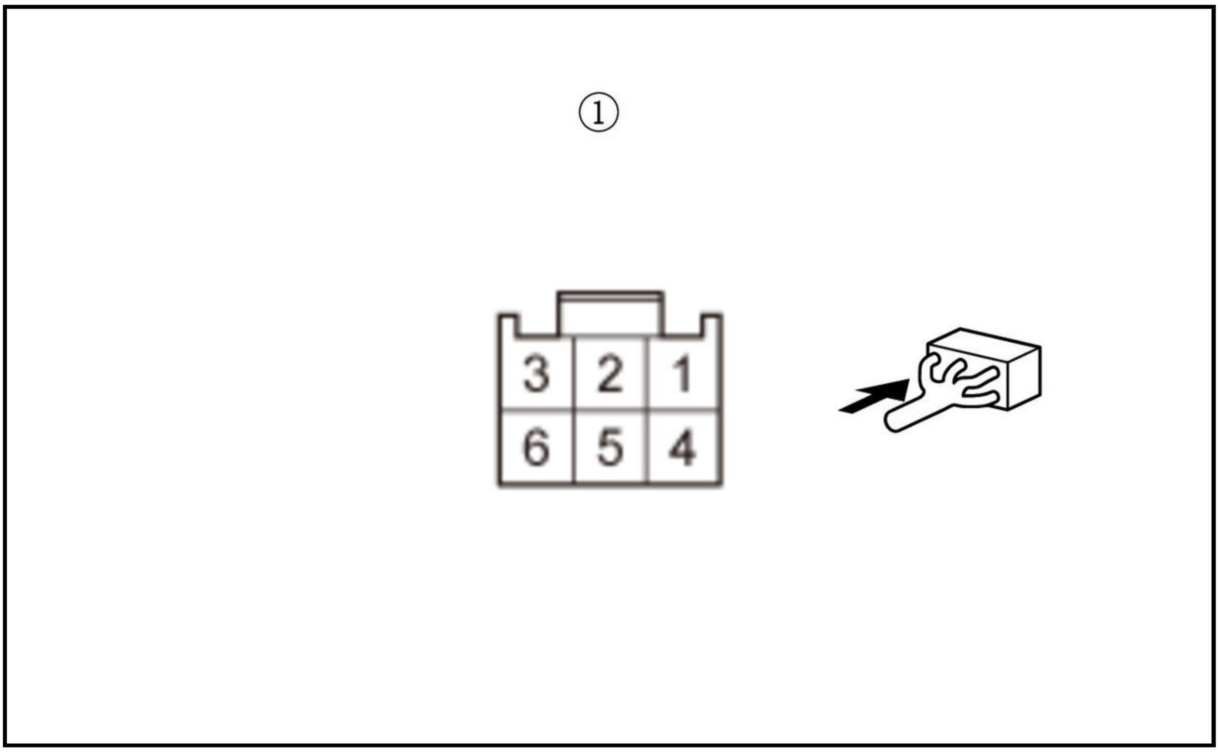
6. Determine possible failure area (PTG/PTL HALF line, PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 4: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

Is data list value ON?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

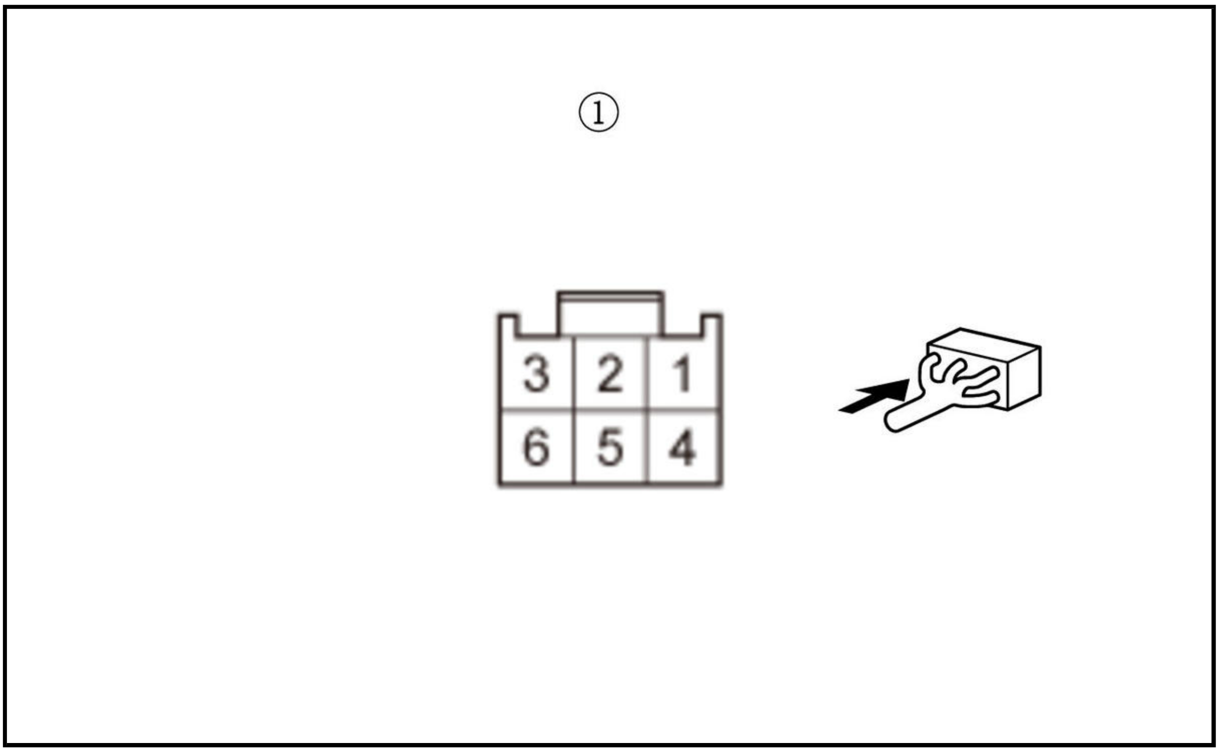
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

8. Open wire check (PTG/PTL HALF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

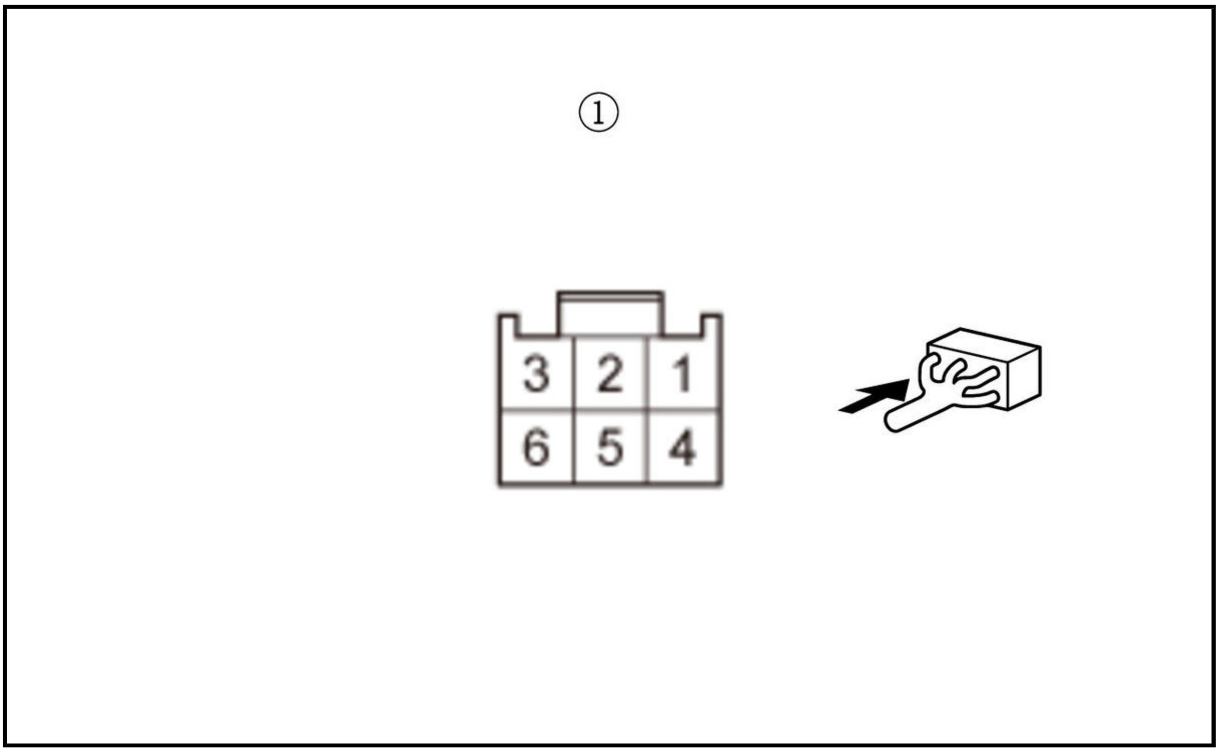
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 4: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 12**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1385

DTC B1385 : Power Tailgate temperature sensor malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1385 Power Tailgate temperature sensor malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate manually or with the keyless transmitter.

   -3. Close the tailgate with the keyless transmitter or driver's power tailgate switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1385 Power Tailgate temperature sensor malfunction	B

   Is DTC B1385 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B
B1385 Power Tailgate temperature sensor malfunction	B

Any of DTC are indicated at the same time with DTC B1385?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (PTG/PTL SEG2 line)

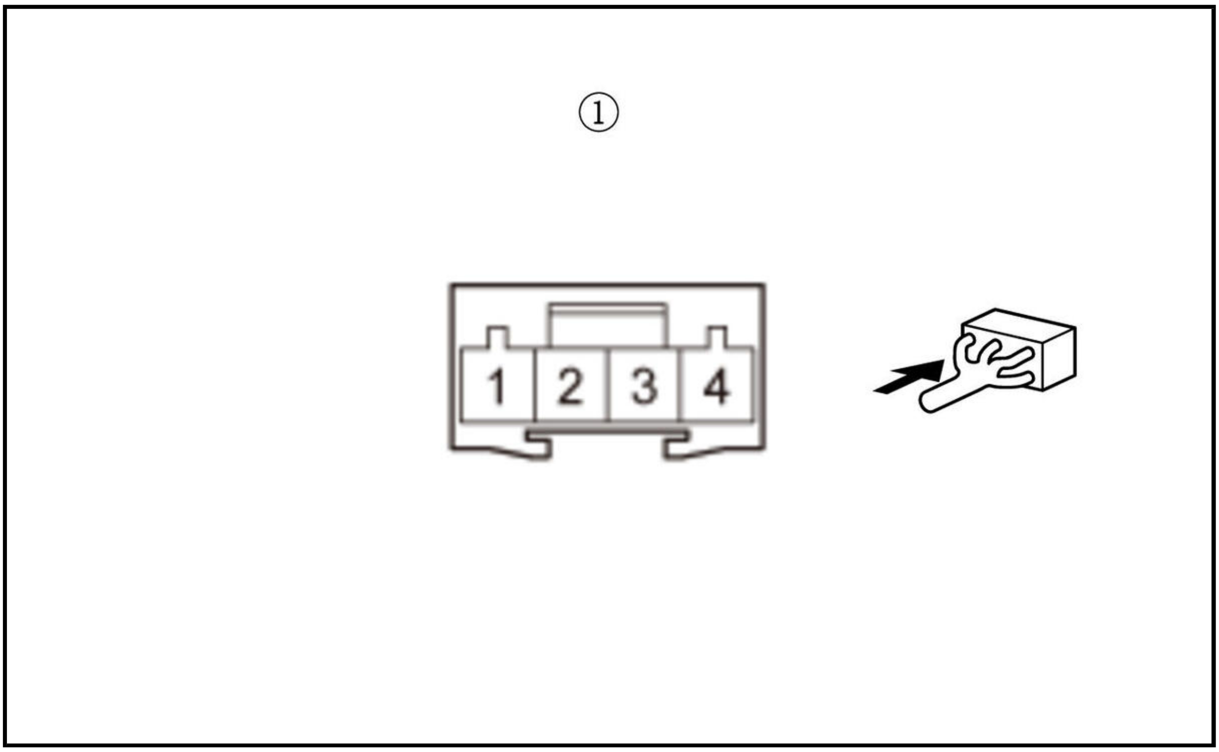
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power tailgate control unit connector B (10P) Left power tailgate pinch sensor 4P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector B (10P): disconnected Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 8**
Test point 2	Left power tailgate pinch sensor 4P connector (male terminals) No. 2: ①



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

4. Determine possible failure area (left power tailgate pinch sensor thermistor, others)

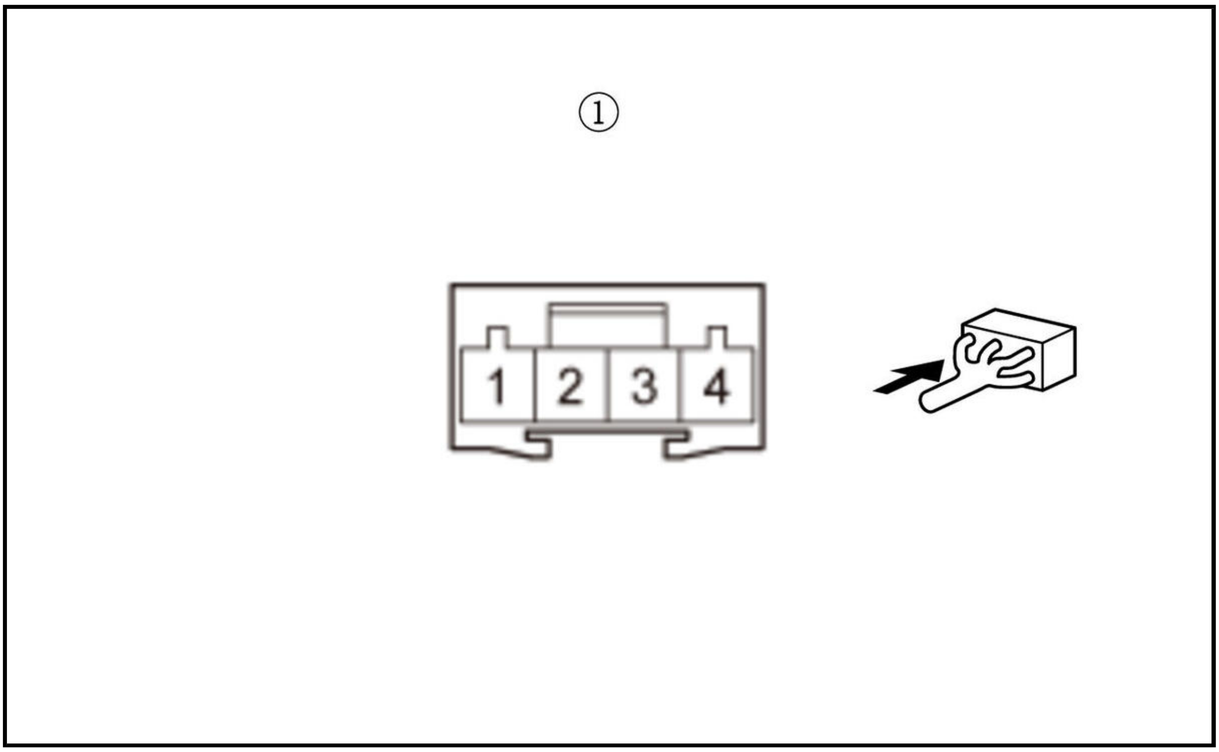
-1. Disconnect the following connector.

Left power tailgate pinch sensor 4P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	Left power tailgate pinch sensor 4P connector (male terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Replace the left power tailgate pinch sensor .

NO

Go to step 5.

5. Open wire check (PTG/PTL THERMISTOR line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

Replace the power tailgate control unit .

DTC B1386

DTC B1386 : Power Tailgate sensor Pulse A circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1386 Power Tailgate sensor Pulse A circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate automatically with the keyless transmitter or power tailgate inside switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1386 Power Tailgate sensor Pulse A circuit malfunction	B

   Is DTC B1386 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1387 Power Tailgate sensor Pulse B circuit malfunction	B

   Is DTC B1387 indicated?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Shorted wire check (PTG/PTL SVCC line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

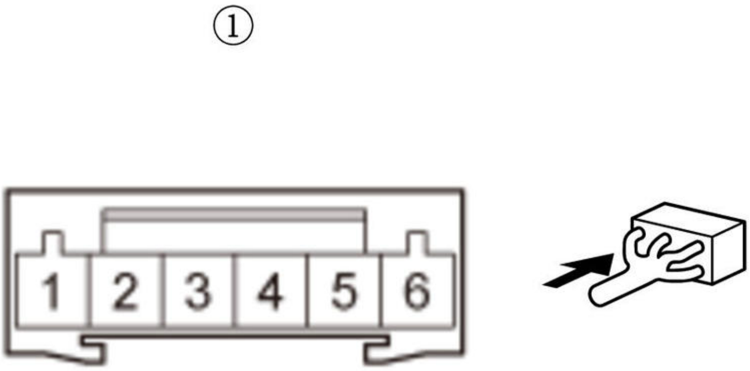
   -2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF(LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B

Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the power tailgate control unit .

4. Determine possible failure area (power tailgate sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

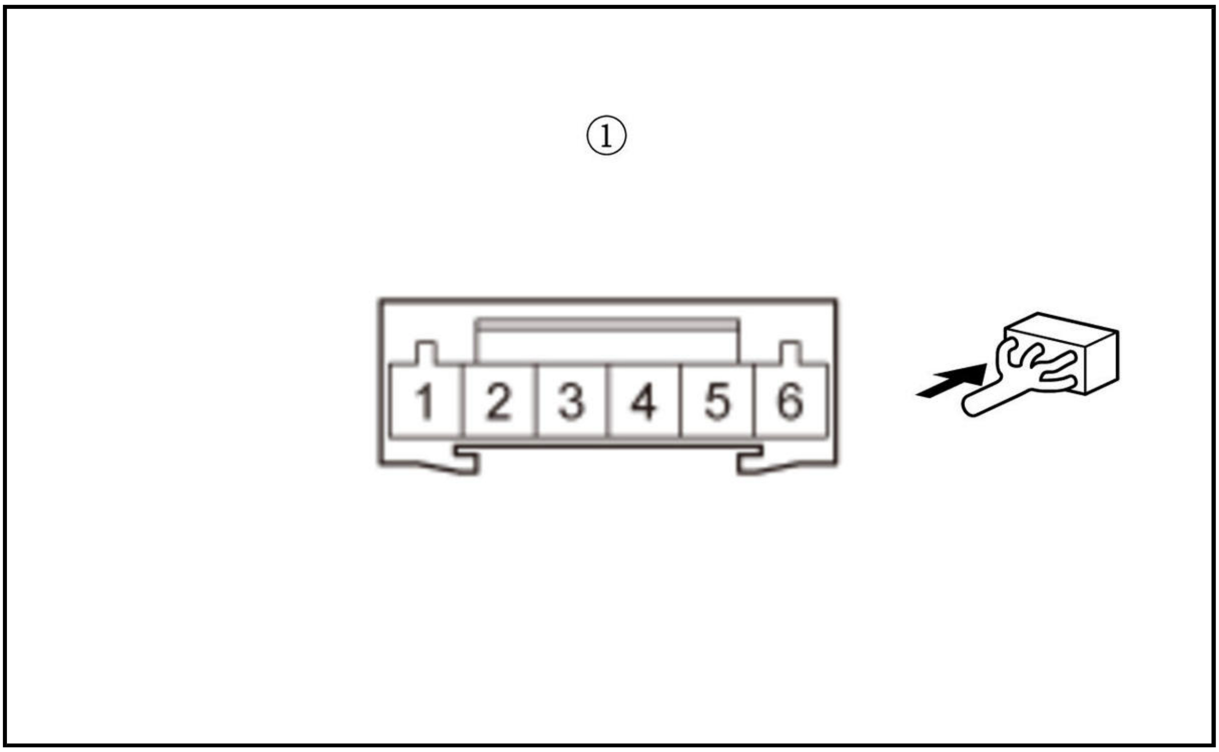
-2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 5V?

YES

Faulty power tailgate sensor; **replace the power tailgate drive unit** .

NO

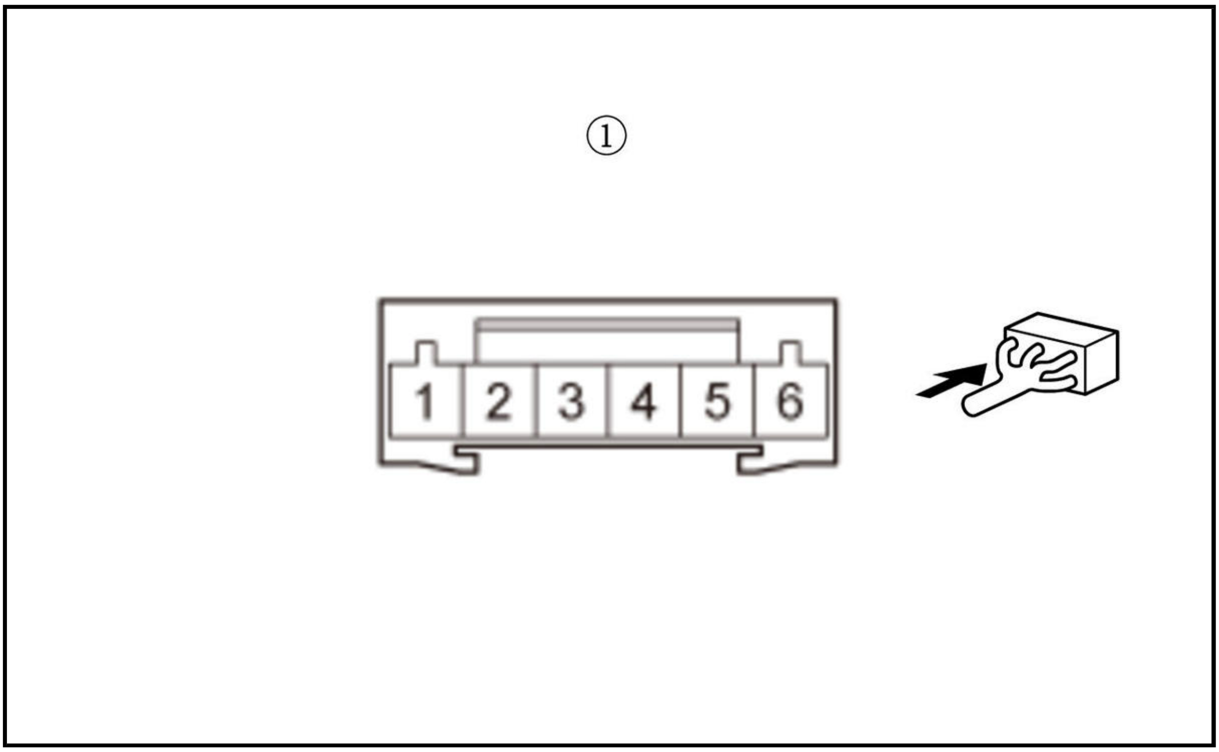
Go to step 5.

5. Shorted wire check (PTG/PTL SENA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

Go to step 6.

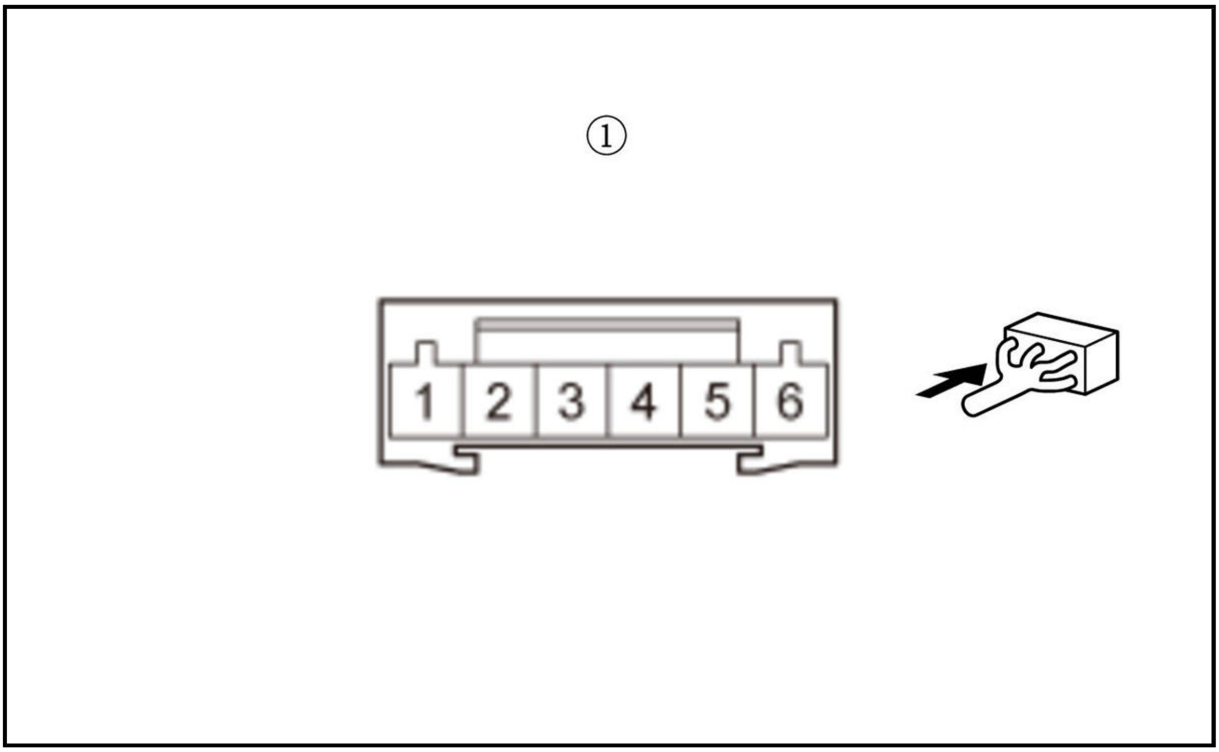
6. Open wire check (PTG/PTL SENA line)

-1. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 3**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1387

DTC B1387 : Power Tailgate sensor Pulse B circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1387 Power Tailgate sensor Pulse B circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate automatically with the keyless transmitter or power tailgate inside switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1387 Power Tailgate sensor Pulse B circuit malfunction	B

Is DTC B1387 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1386 Power Tailgate sensor Pulse A circuit malfunction	B

Is DTC B1386 indicated?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PTG/PTL SVCC line)

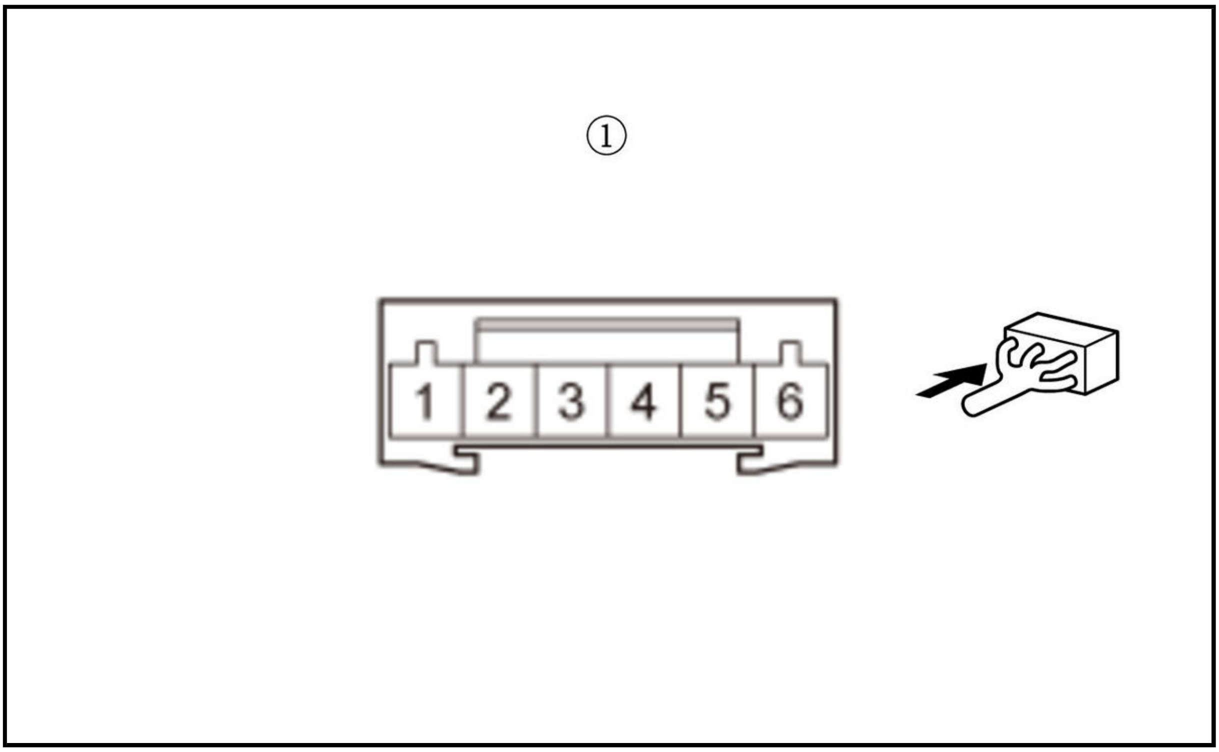
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

Replace the power tailgate control unit .

4. Determine possible failure area (power tailgate sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

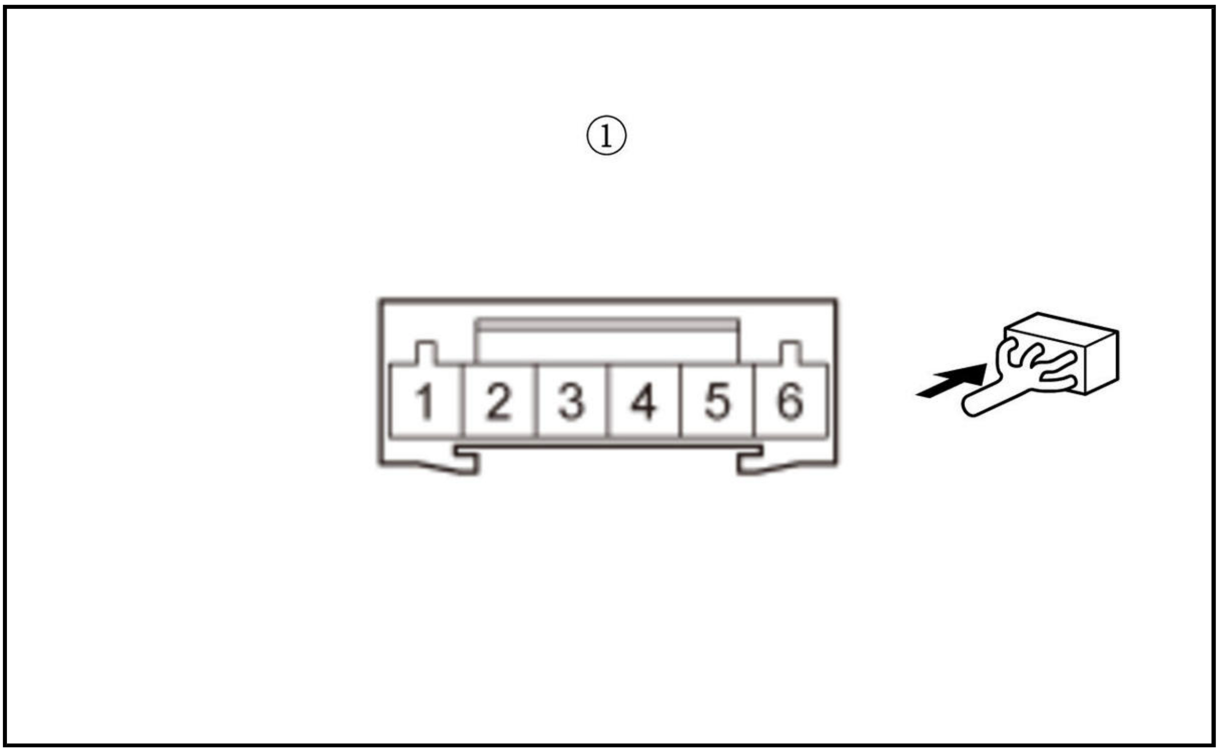
-2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 3: ①
Test point 2	Body ground



Is there about 5V?

YES

Faulty power tailgate sensor; **replace the power tailgate drive unit** .

NO

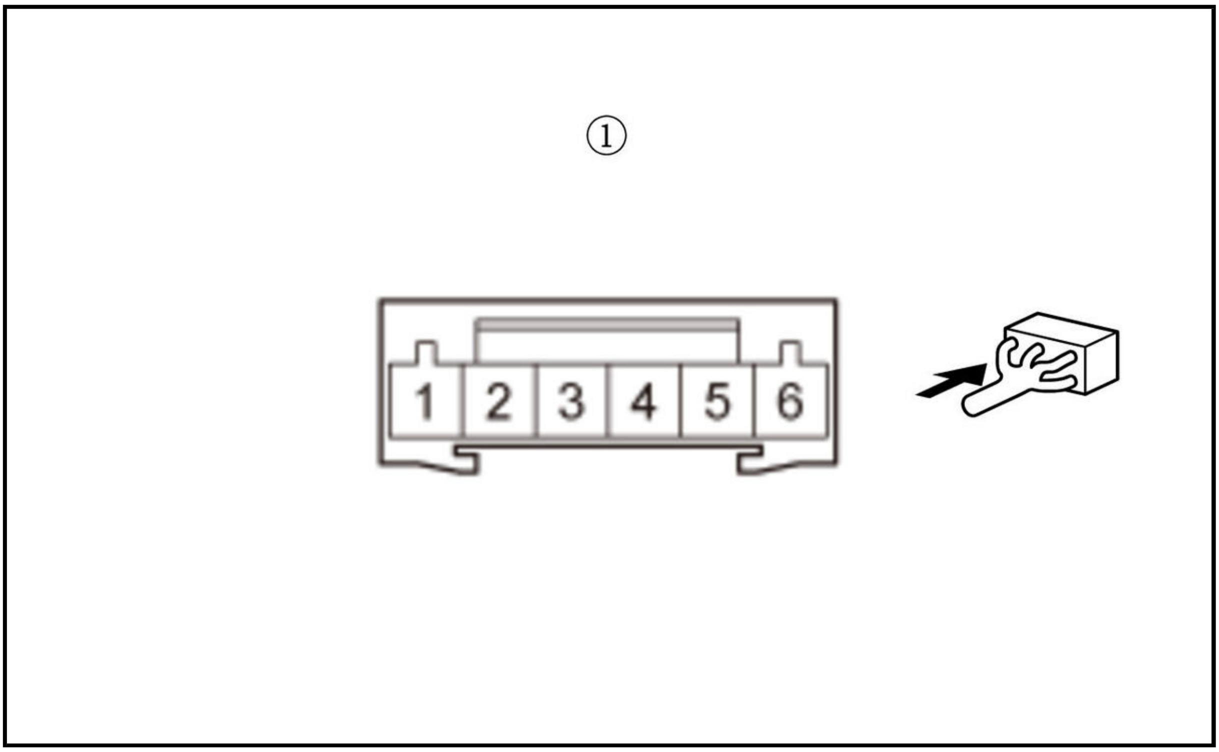
Go to step 5.

5. Shorted wire check (PTG/PTL SENB line)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

Go to step 6.

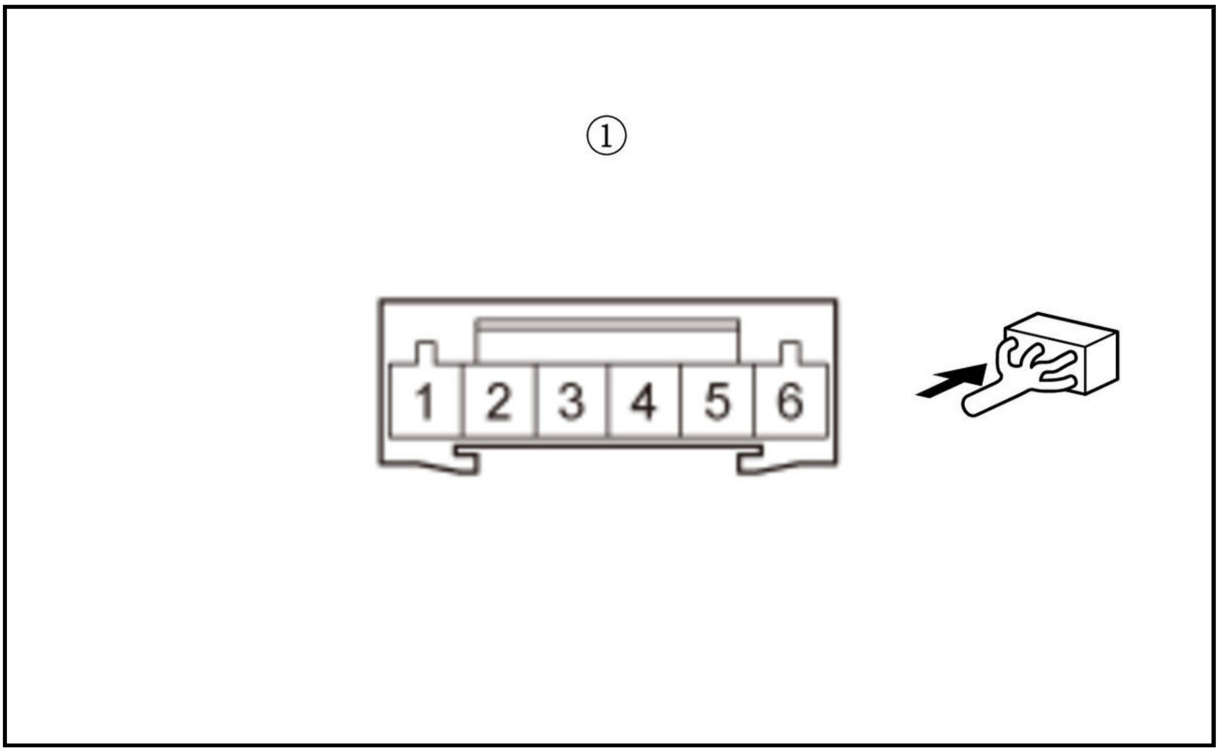
6. Open wire check (PTG/PTL SENB line)

-1. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 3: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 16**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1388

DTC B1388 : Power Tailgate Drive Motor circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B1388 Power Tailgate Drive Motor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate.

   -3. Close the tailgate automatically with the keyless transmitter or power tailgate inside switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1388 Power Tailgate Drive Motor circuit malfunction	B

Is DTC B1388 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Power tailgate motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the power tailgate motor** .

Is the motor OK?

YES

Go to step 3.

NO

Faulty power tailgate motor; **replace the power tailgate drive unit** .

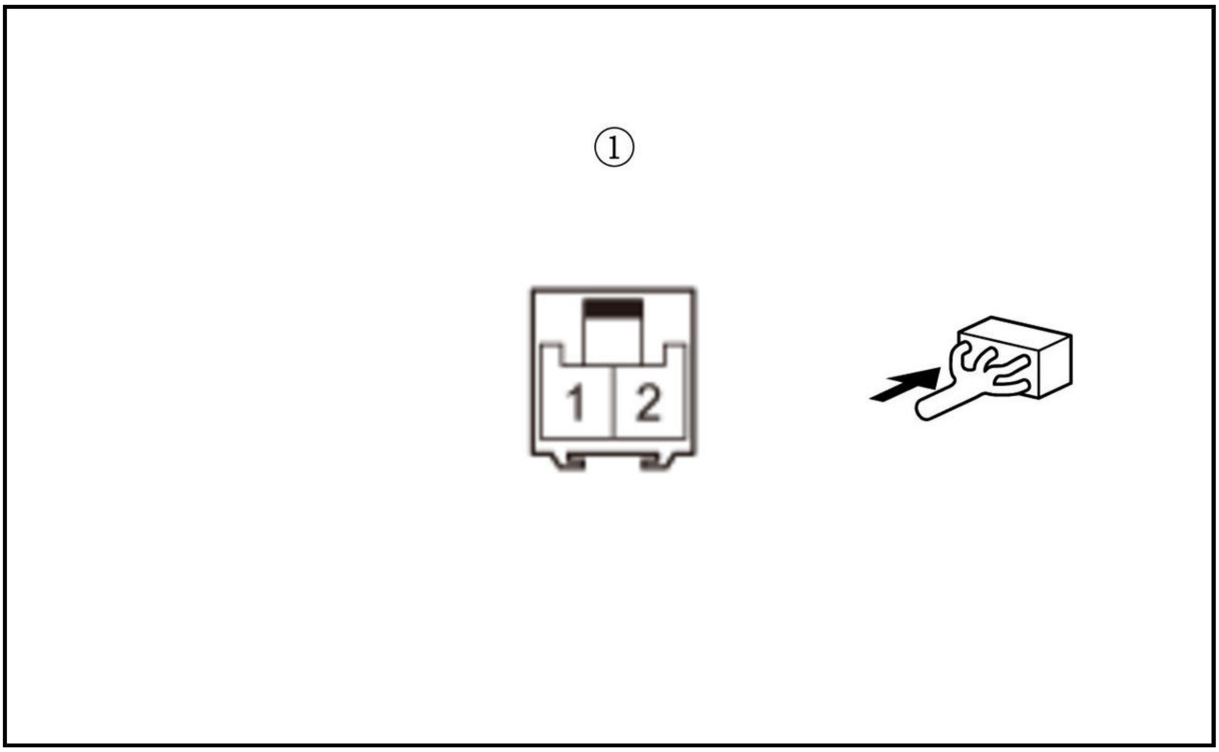
3. Shorted wire check (PTG/PTL PTM+ line)

-1. Disconnect the following connector.

Power tailgate control unit connector C (5P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

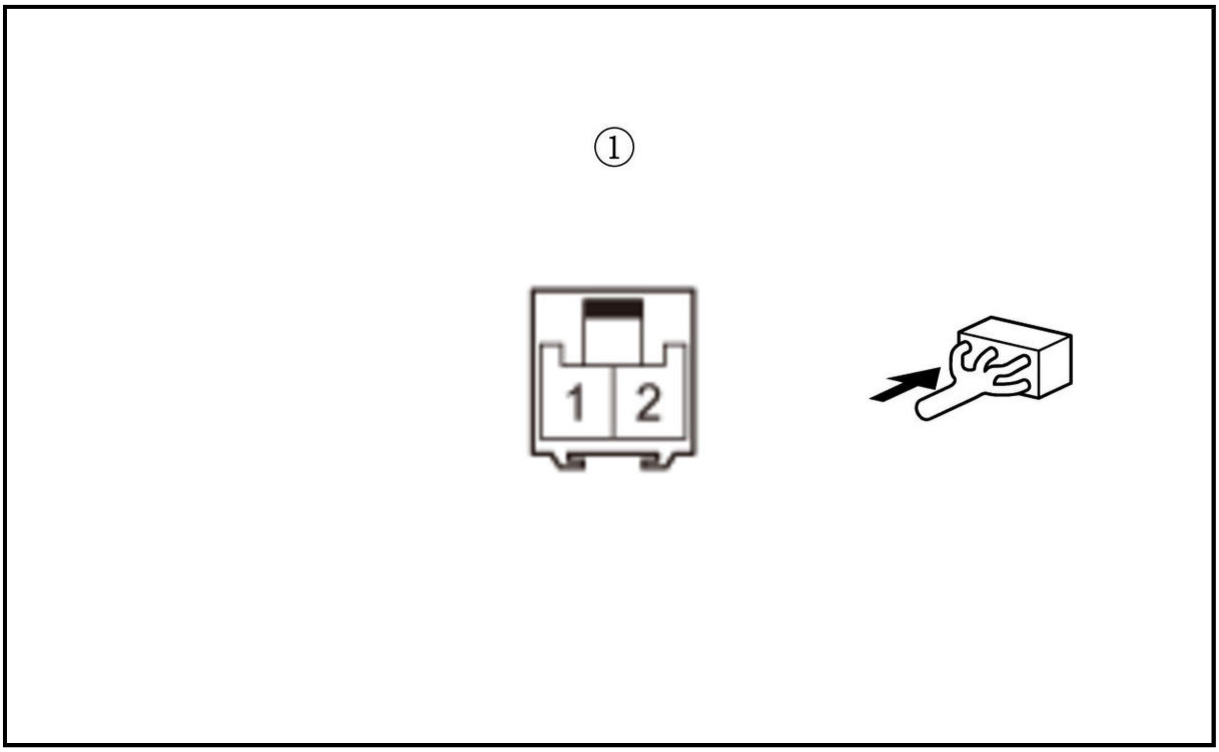
NO

The PTG/PTL PTM+ wire is not shorted. Go to step 4.

4. Shorted wire check (PTG/PTL PTM- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

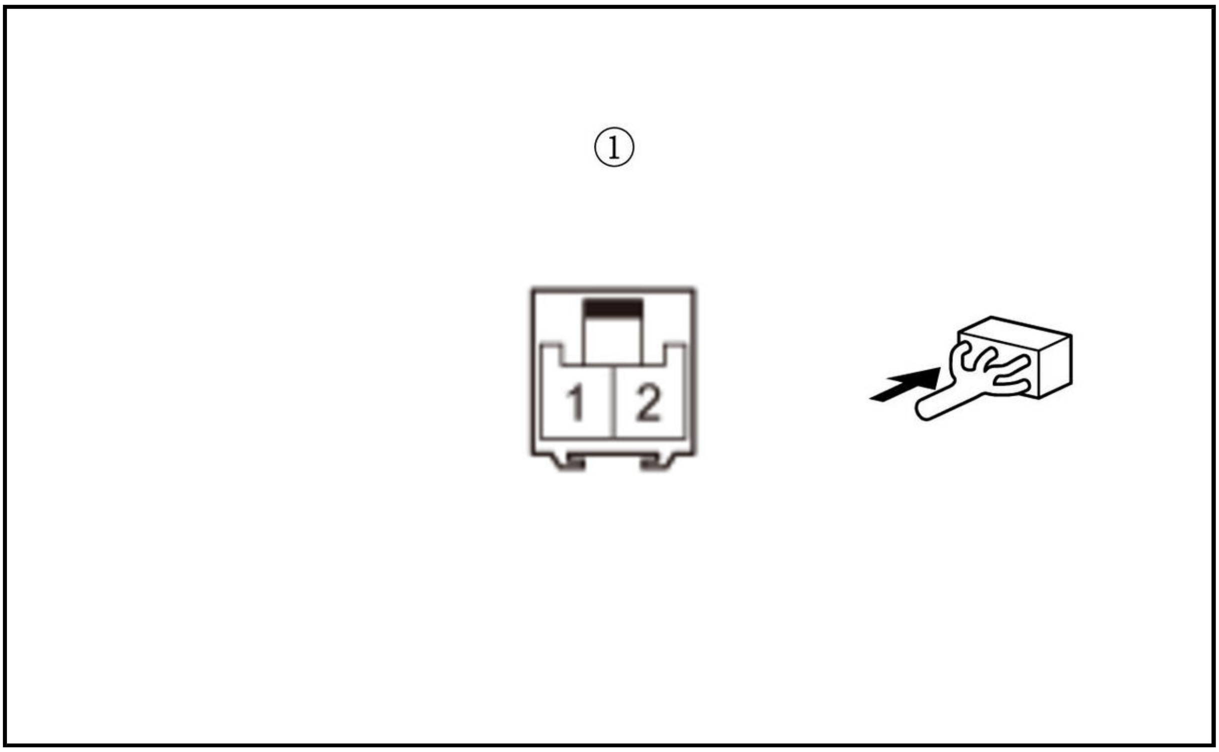
NO

The PTG/PTL PTM- wire is not shorted. Go to step 5.

5. Open wire check (PTG/PTL PTM+ line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector C (5P) No. 3**



Is there continuity?

YES

The PTG/PTL PTM+ wire is not opened. Go to step 6.

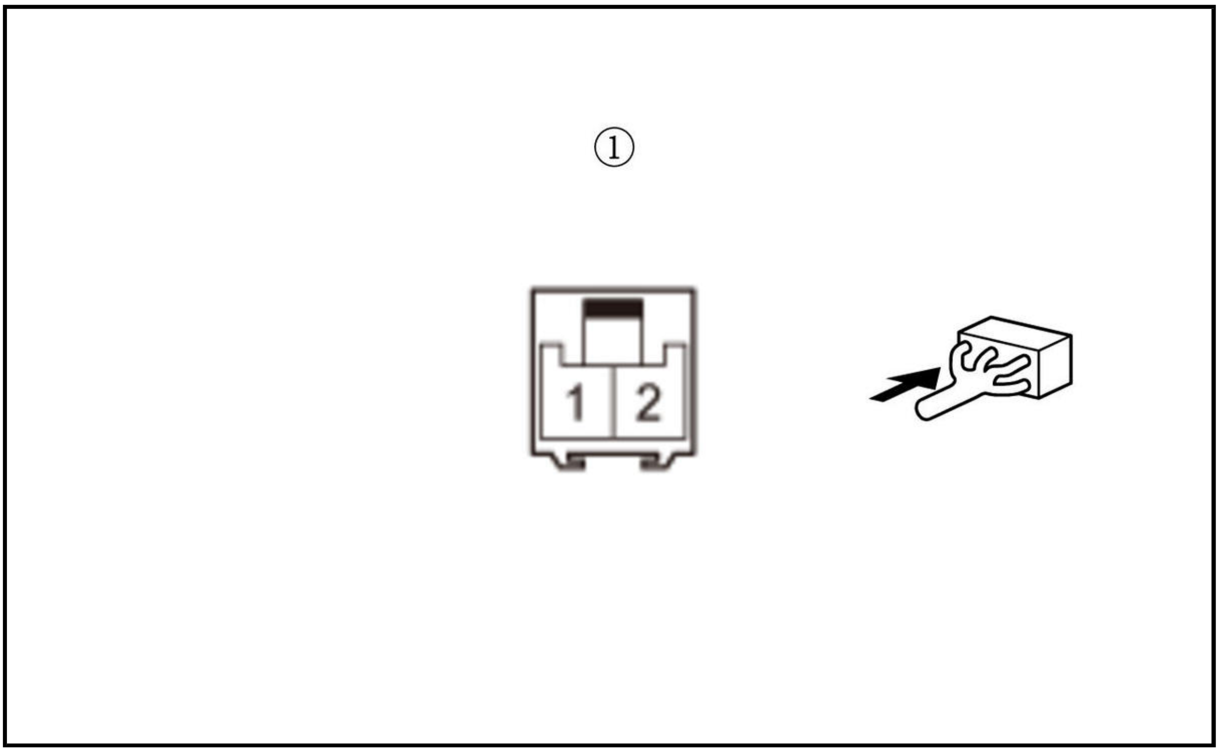
NO

Repair an open or high resistance in the wire.

6. Open wire check (PTG/PTL PTM- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector C (5P) No. 5**



Is there continuity?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1390

DTC B1390 : Power Tailgate Closer Motor function error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses associated with the system is OK.

DTC Description	DTC
B1390 Power Tailgate Closer Motor function error	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. With the tailgate closed, press the tailgate outer handle switch and wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1390 Power Tailgate Closer Motor function error	B

Is DTC B1390 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for power tailgate system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTCs troubleshooting, then recheck.

NO

Go to step 3.

3. Open wire check (PTG/PTL CLM+ line)

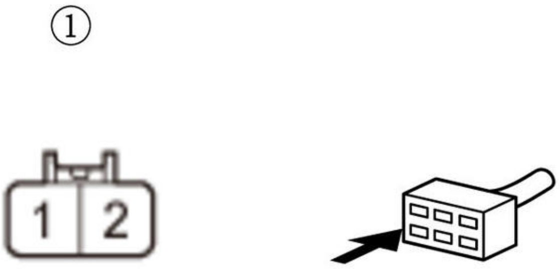
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power tailgate closer unit connector A (2P) Power tailgate control unit connector B (10P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector A (2P): disconnected Power tailgate control unit connector B (10P): disconnected
Test point 1	Power tailgate closer unit connector A (2P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector B (10P) No. 2**



Is there continuity?

YES

The PTG/PTL CLM+ wire is OK. Go to step 4.

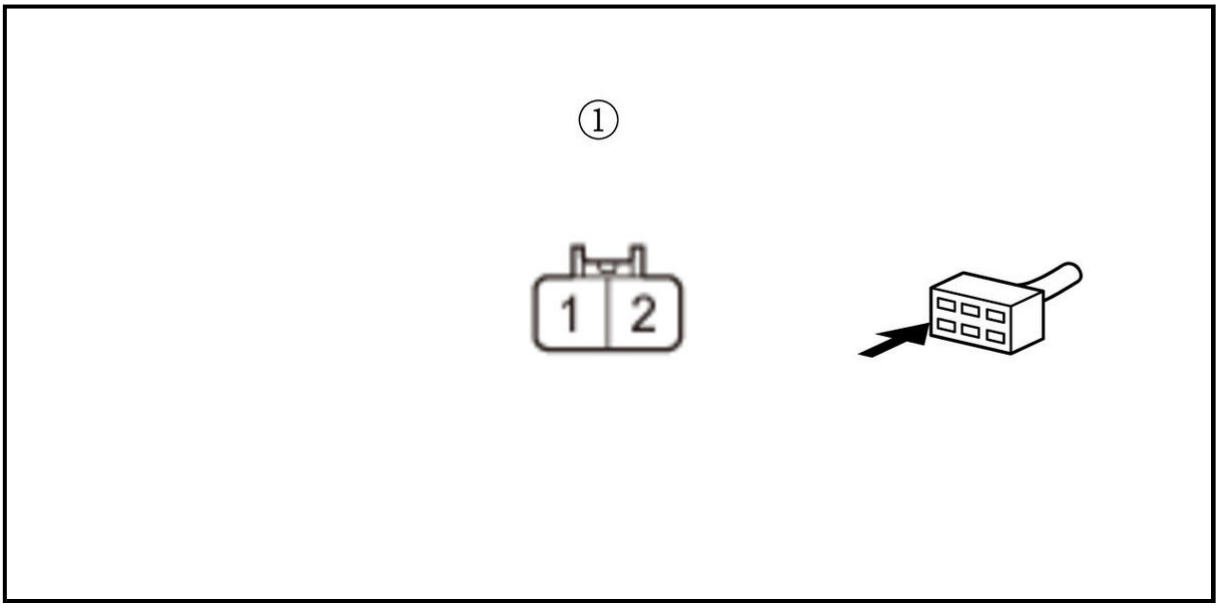
NO

Repair an open or high resistance in the wire.

4. Open wire check (PTG/PTL CLM- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector A (2P): disconnected Power tailgate control unit connector B (10P): disconnected
Test point 1	Power tailgate closer unit connector A (2P) (female terminals) No. 1: ①
Test point 2	Power tailgate control unit connector B (10P) No. 6



Is there continuity?

YES

Faulty closer motor; replace the power tailgate closer unit .

NO

Repair an open or high resistance in the wire.

DTC U0199, U1281, U128D (POWER TAILGATE CONTROL UNIT)

DTC U0199 : Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)**DTC U1281** : Lost communication with MICU (MICU frame)**DTC U128D** : Power Tailgate Control Unit lost communication with GAUGE Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the chart below.

- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0199 Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	B
U1281 Lost communication with MICU (MICU frame)	B
U128D Power Tailgate Control Unit lost communication with GAUGE Control Module	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0199 Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	B

DTC Description	DTC
U1281 Lost communication with MICU (MICU frame)	B
U128D Power Tailgate Control Unit lost communication with GAUGE Control Module	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the receiving control unit connector.

Power tailgate control unit connector A (24P)

   -3. Disconnect the transmitting control unit connector(s).

   Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see chart below).

DTC	Connector
U0199	Power window master switch 37P connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0199	B-CAN_H	Power tailgate control unit connector A (24P)	No. 6	Power window master switch 37P connector	No. 32
	B-CAN_L		No. 7		No. 31
U1281	B-CAN_H	Power tailgate control unit connector A (24P)	No. 6	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 7		No. 21
U128D	B-CAN_H	Power tailgate control unit connector A (24P)	No. 6	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 7		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.Refer to the DTC shown on the display, then replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U0199	Power window master switch
U1281	Body control module
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (POWER TAILGATE CONTROL UNIT)

DTC U1280 : Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)	B

DTC (Power Tailgate Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC TROUBLESHOOTING

DTC B1352

DTC B1352 : Power Tailgate Control Unit Internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1352 Power Tailgate Control Unit Internal error (EEPROM error)	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1352 Power Tailgate Control Unit Internal error (EEPROM error)	B

   Is DTC B1352 indicated?

   YES

   Replace the power tailgate control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections at the power tailgate control unit.

DTC B1375

DTC B1375 : Driver's side PTG switch circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1375 Driver's side PTG switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Operate the driver's power tailgate switch for more than 1 second.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1375 Driver's side PTG switch circuit malfunction	B

Is DTC B1375 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (T/G_OPEN_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected
Test point 1	**Power tailgate control unit connector A (24P) No. 8**

Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Repair a short to ground in the PTG/PTL_SCOM wire.

NO

Repair a short to ground in the T/G_OPEN_SW wire.

DTC B1376

DTC B1376 : Tailgate Outer Handle switch circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1376 Tailgate Outer Handle switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Press the tailgate outer handle switch for more than 1 second.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1376 Tailgate Outer Handle switch circuit malfunction	B

   Is DTC B1376 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (T/G_OPEN_SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected
B	B

Test point 1	**Power tailgate control unit connector A (24P) No. 23**
Test point 2	Body ground

   Is there 1.0 MΩ or more?

   YES

   Repair a short to ground in the PTG/PTL_SCOM wire.

   NO

   Repair a short to ground in the T/G_OPEN_SW wire.

DTC B1377

DTC B1377 : Power Tailgate Inside switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1377 Power Tailgate Inside switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the keyless transmitter.

   -3. Press the power tailgate inside switch for more than 1 second.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1377 Power Tailgate Inside switch circuit malfunction	B

   Is DTC B1377 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (PTG/PTL_CLOSE_SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected

Test point 1	**Power tailgate control unit connector A (24P) No. 24**
Test point 2	Body ground

   Is there 1.0 MΩ or more?

   YES

   Repair a short to ground in the PTG/PTL_SCOM wire.

   NO

   Repair a short to ground in the PTG/PTL_CLOSE_SW wire.

DTC B1378

DTC B1378 : Power Tailgate Right Touch/Pinch sensor circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate manually or with the keyless transmitter.

   -3. Close the tailgate with the keyless transmitter or driver's power tailgate switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B

   Is DTC B1378 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B
B1385 Power Tailgate temperature sensor malfunction	B

   Any of DTC are indicated at the same time with DTC B1378?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Open wire check (PTG/PTL_SEG2 line)

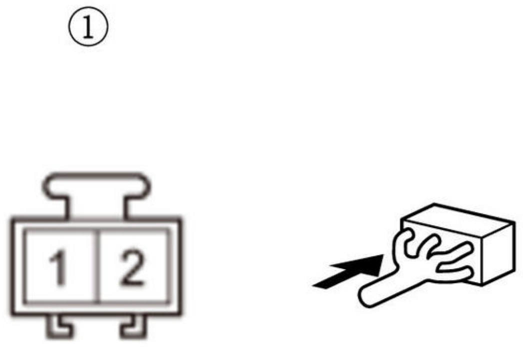
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Power tailgate control unit connector B (10P) Right power tailgate pinch sensor 2P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector B (10P): disconnected Right power tailgate pinch sensor 2P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 8**
Test point 2	Right power tailgate pinch sensor 2P connector (male terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

4. Determine possible failure area (right power tailgate pinch sensor, others)

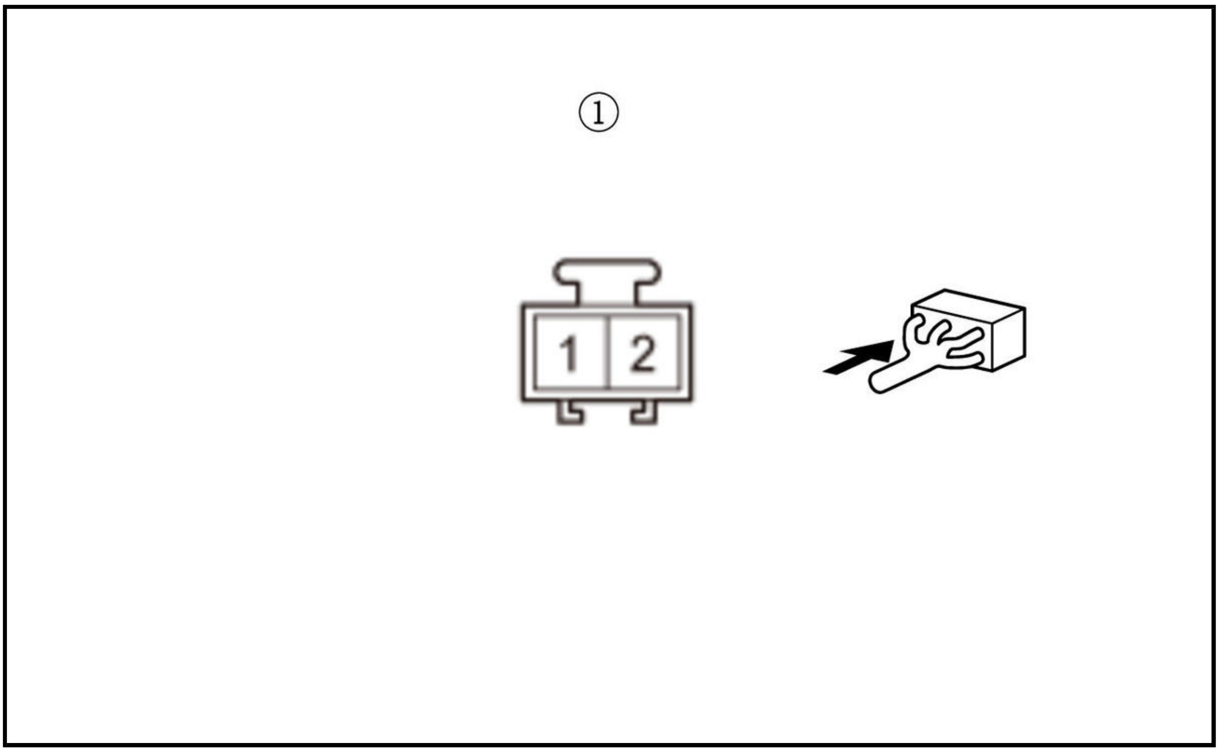
-1. Disconnect the following connector.

Right power tailgate pinch sensor 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Right power tailgate pinch sensor 2P connector: disconnected
Test point 1	Right power tailgate pinch sensor 2P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Replace the right power tailgate pinch sensor .

NO

Go to step 5.

5. Open wire check (PTG/PTL_TSLA line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Right power tailgate pinch sensor 2P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 9**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

Replace the power tailgate control unit .

DTC B1379

DTC B1379 : Power Tailgate Left Touch/Pinch sensor circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate manually or with the keyless transmitter.

   -3. Close the tailgate with the keyless transmitter or driver's power tailgate switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B

   Is DTC B1379 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B
B1385 Power Tailgate temperature sensor malfunction	B

   Any of DTC are indicated at the same time with DTC B1379?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Open wire check (PTG/PTL_SEG2 line)

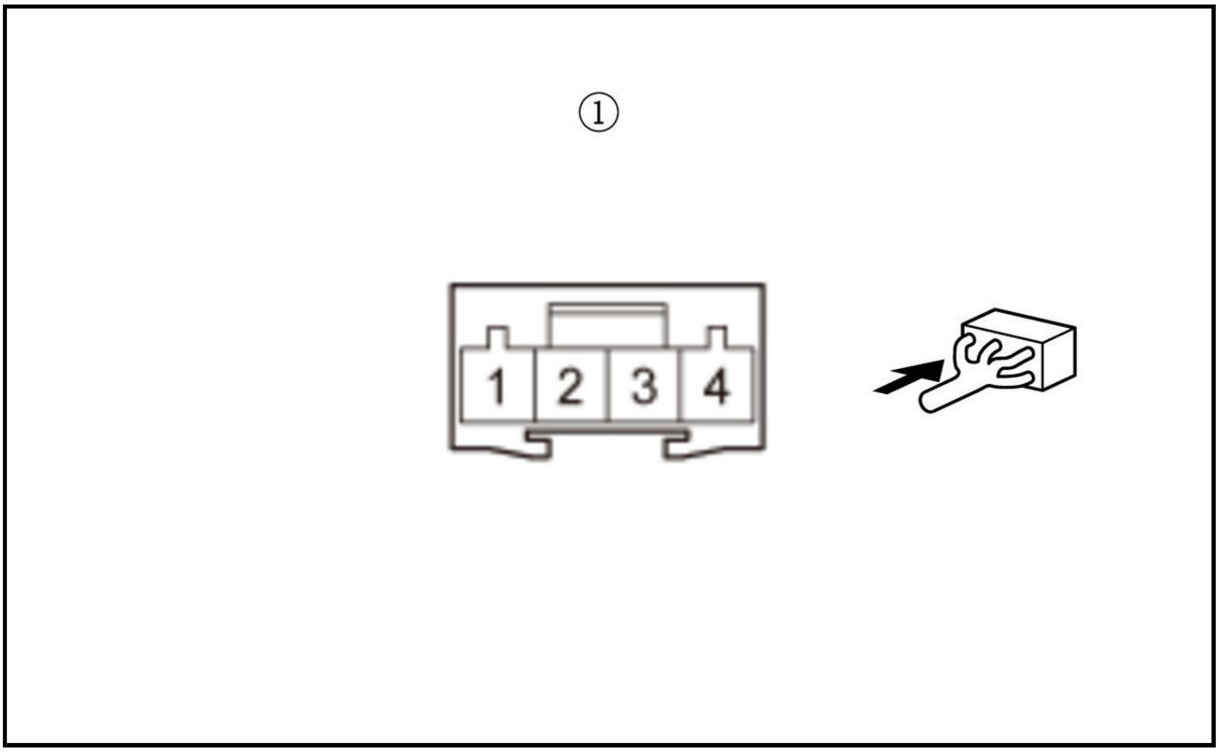
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Power tailgate control unit connector B (10P Left power tailgate pinch sensor 4P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector B (10P): disconnected Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 8**
Test point 2	Left power tailgate pinch sensor 4P connector (male terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

4. Determine possible failure area (left power tailgate pinch sensor, others)

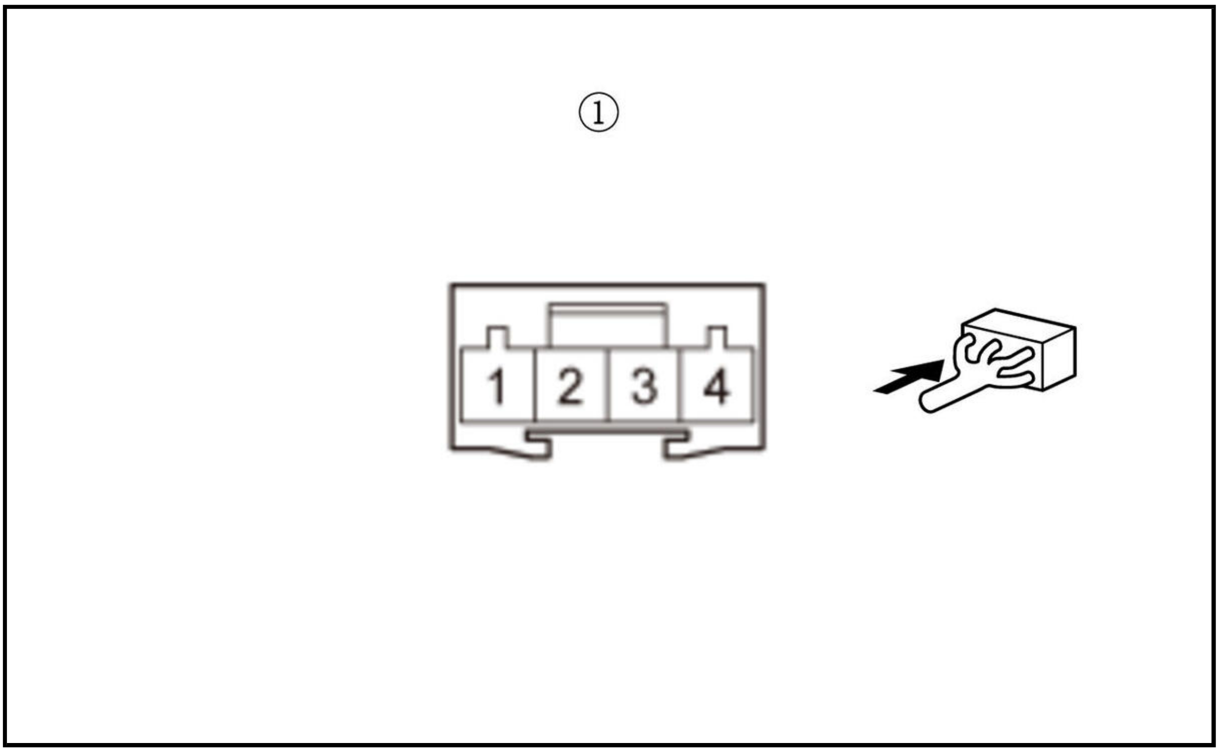
-1. Disconnect the following connector.

Left power tailgate pinch sensor 4P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	Left power tailgate pinch sensor 4P connector (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Replace the left power tailgate pinch sensor .

NO

Go to step 5.

5. Open wire check (PTG/PTL_TSLL line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

Replace the power tailgate control unit .

DTC B1380

DTC B1380 : Tailgate Closer Unit Neutral switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1380 Tailgate Closer Unit Neutral switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1380 Tailgate Closer Unit Neutral switch circuit malfunction	B

   Is DTC B1380 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (PTG/PTL_CLCL line short, others)

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Latch Gear Position Sw. neutral	B	B

   Is data list value ON?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. Determine possible failure area (power tailgate closer unit, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Latch Gear Position Sw. neutral	B	B

Is data list value ON?

YES

Go to step 4.

NO

Faulty sector switch; **replace the tailgate latch** .

4. Shorted wire check (PTG/PTL_CLCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 10**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the power tailgate control unit .

NO

Repair a short to ground in the wire.

5. Determine possible failure area (power tailgate closer unit, others)

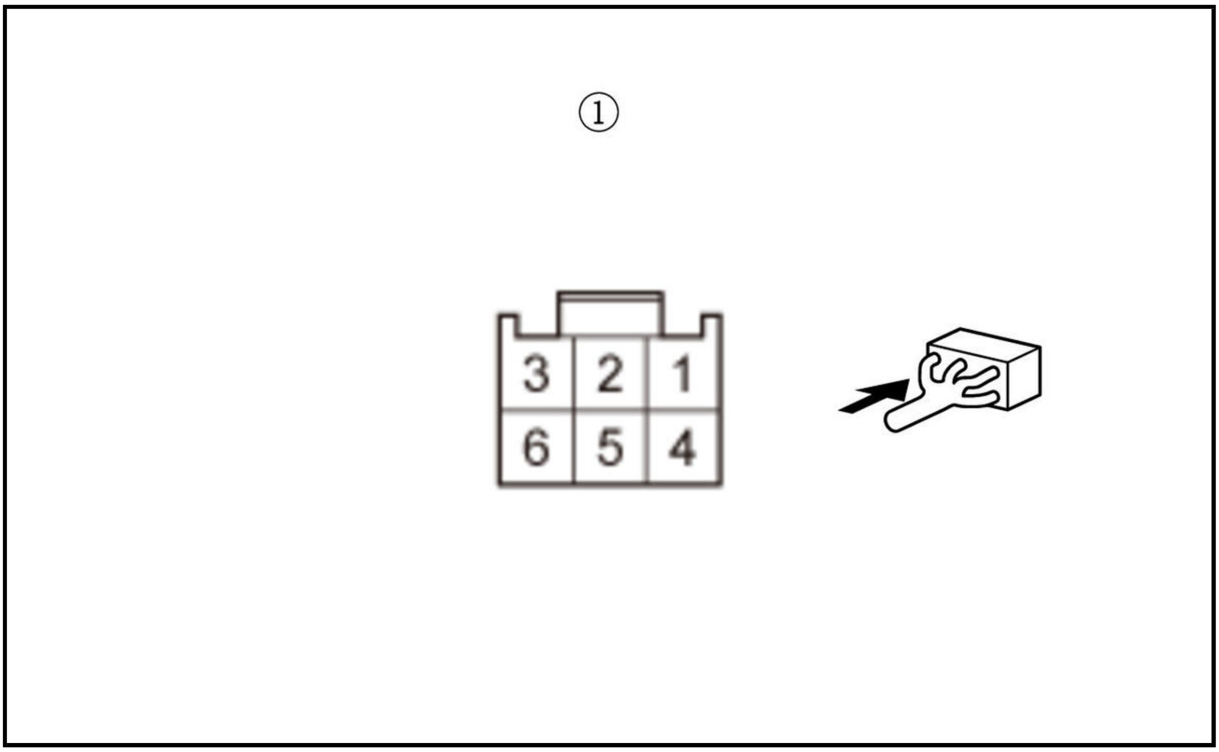
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 3: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Latch Gear Position Sw. neutral	B	B

Is data list value ON?

YES

Faulty sector switch; replace the tailgate latch .

NO

Go to step 6.

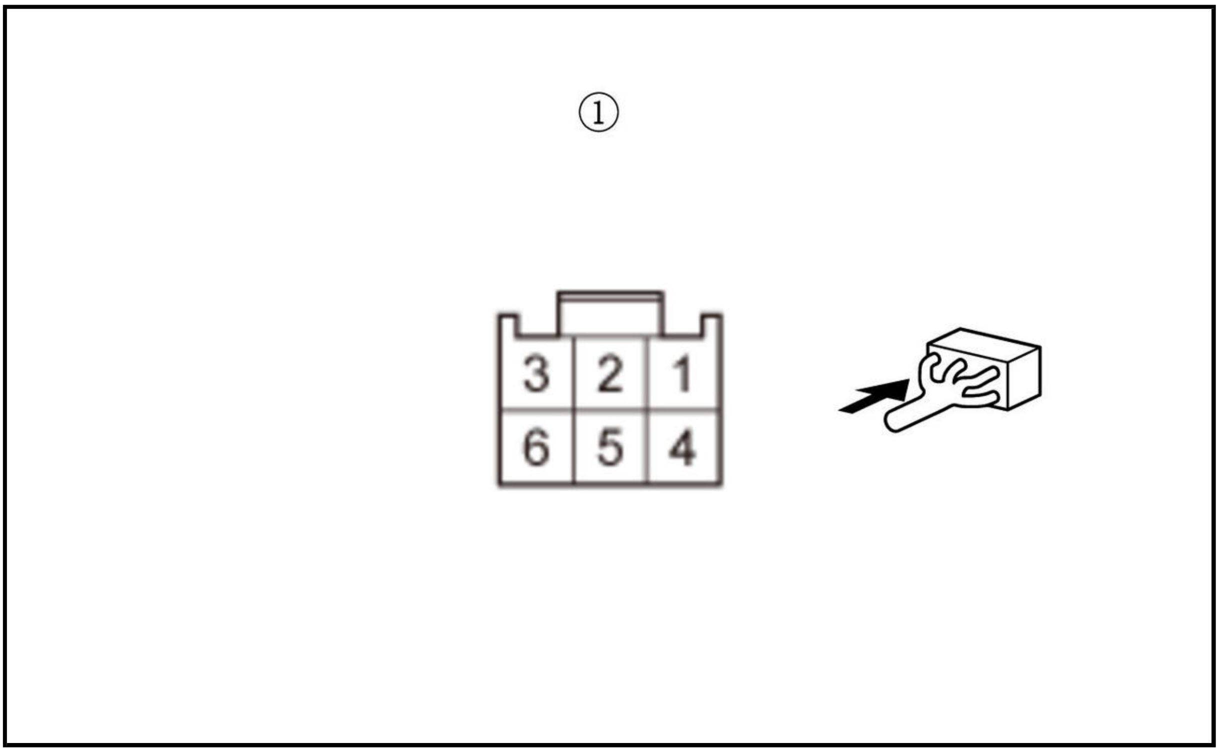
6. Determine possible failure area (PTG/PTL_CLCL line, PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 3: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Latch Gear Position Sw. neutral	B	B

Is data list value ON?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

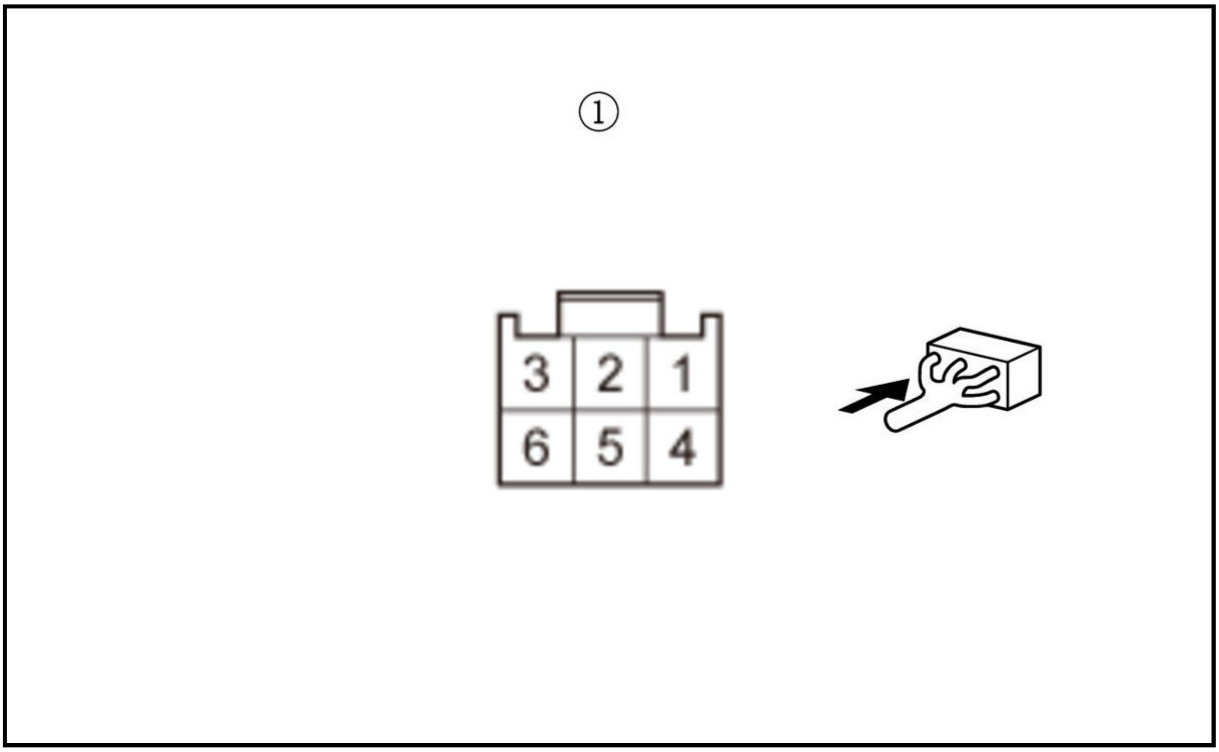
-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF(LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①

Test point 2	Power tailgate control unit connector A (24P) No. 21



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

8. Open wire check (PTG/PTL_CLCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

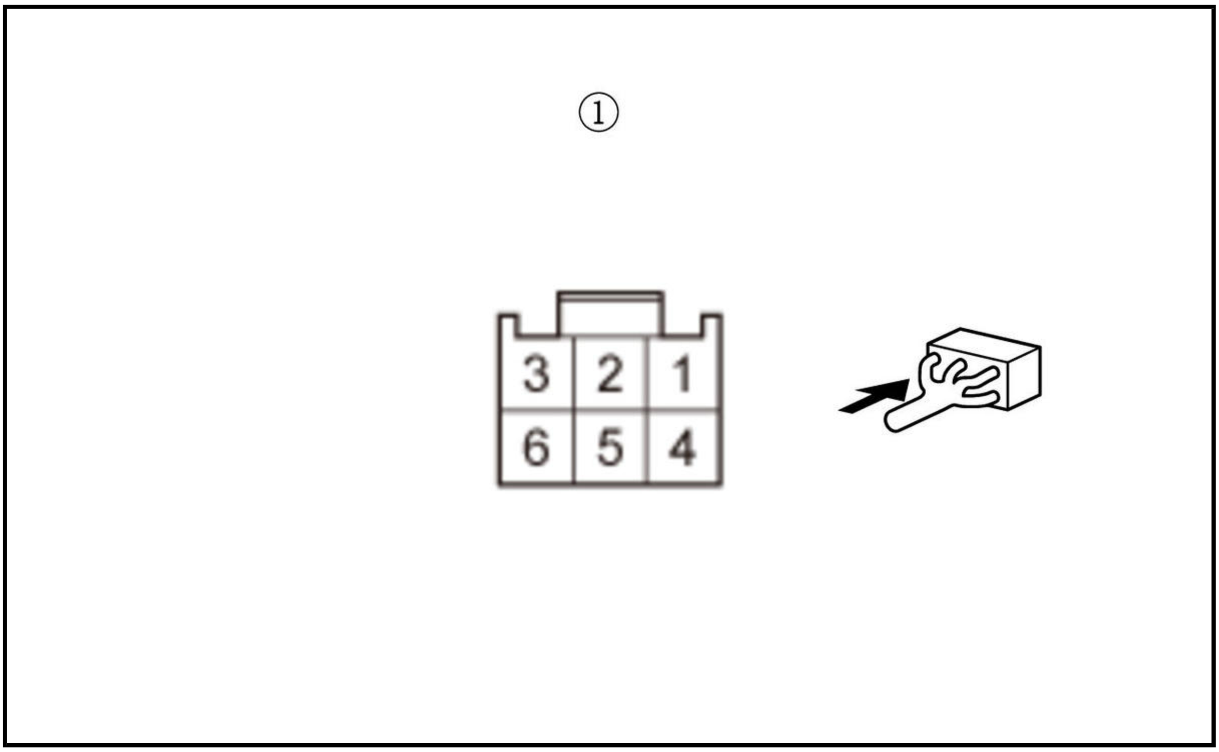
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 3: ①
Test point 2	Power tailgate control unit connector A (24P) No. 10



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1382

DTC B1382 : Tailgate Closer Unit Full Latch switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1382 Tailgate Closer Unit Full Latch switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1382 Tailgate Closer Unit Full Latch switch circuit malfunction	B

Is DTC B1382 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1384 Tailgate Closer Unit Half Latch switch circuit malfunction	B
B1390 Power Tailgate Closer Motor circuit malfunction	B

Is DTC B1384 and/or B1390 indicated?

YES

Go to the indicated DTCs troubleshooting, then recheck.

NO

Go to step 3.

3. Determine possible failure area (T/G_SW line short, others)

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Go to step 4.

NO

Go to step 6.

4. Determine possible failure area (power tailgate closer unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Go to step 5.

NO

Faulty full latch switch; **replace the tailgate latch** .

5. Shorted wire check (T/G_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 11**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the power tailgate control unit .

NO

Repair a short to ground in the wire.

6. Determine possible failure area (power tailgate closer unit, others)

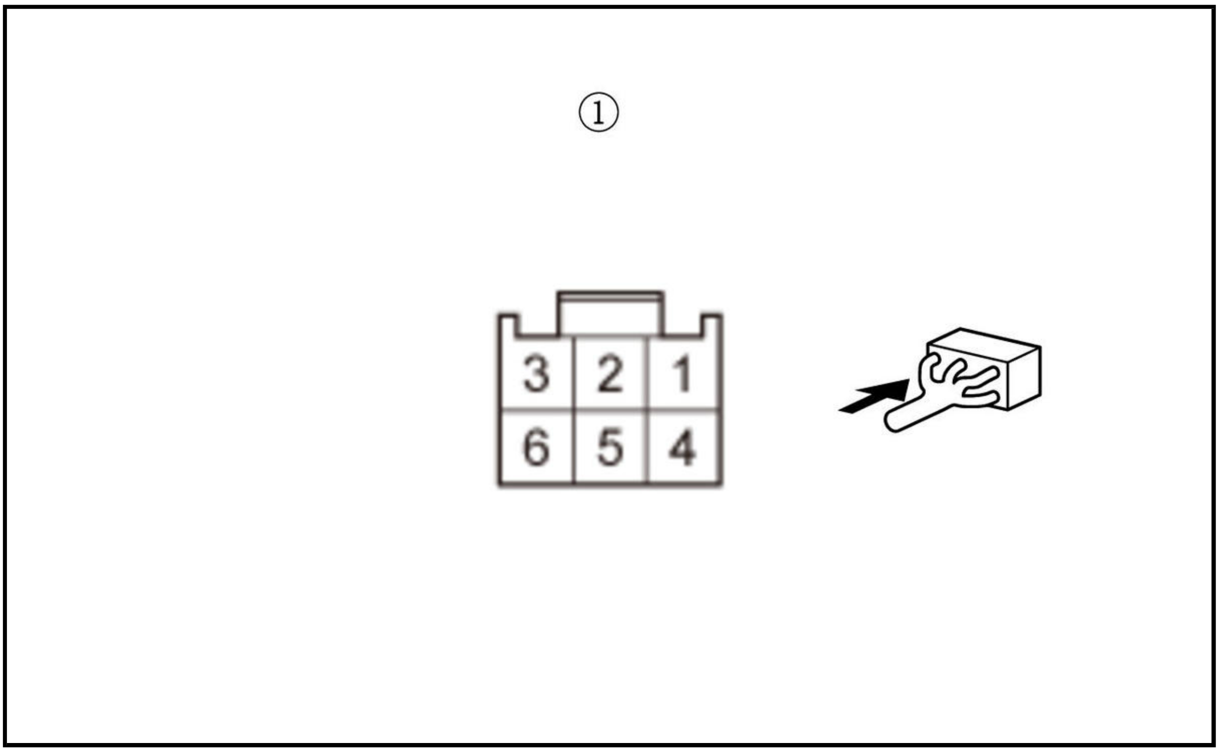
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Faulty full latch switch; replace the tailgate latch .

NO

Go to step 7.

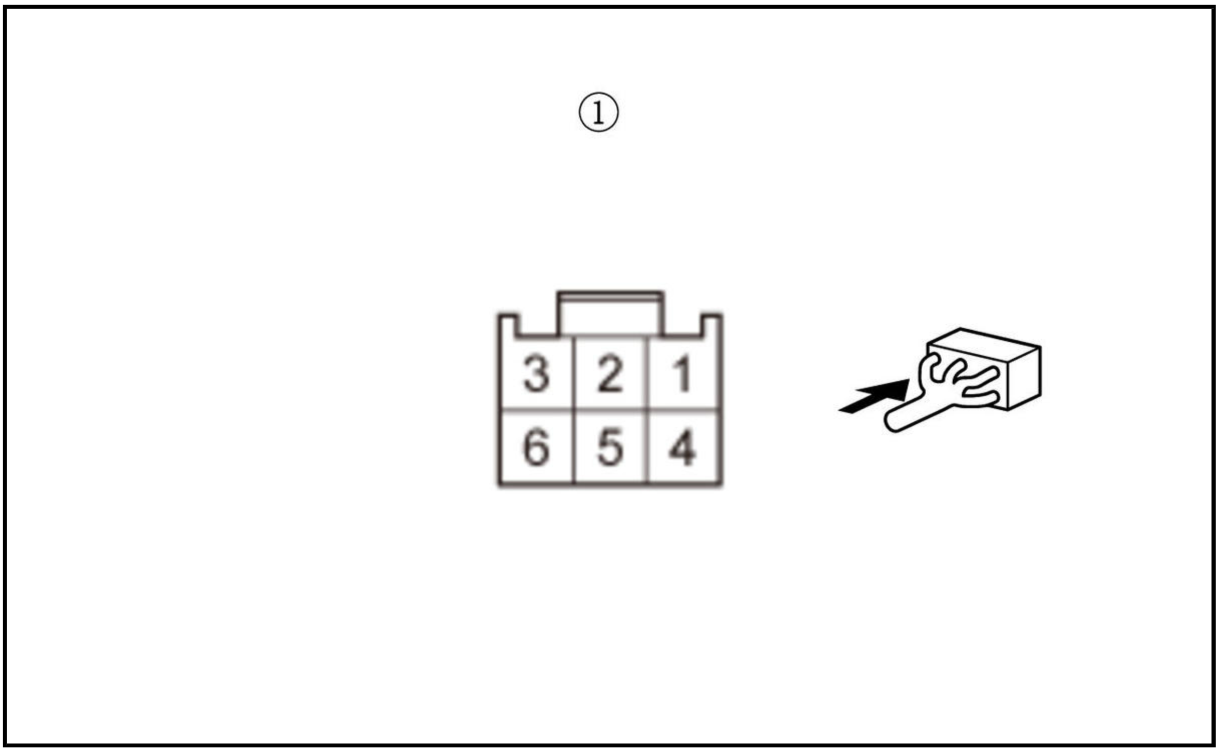
7. Determine possible failure area (T/G_SW line, PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Tailgate Lock Sw. Full Latch	B	B

Is data list value ON?

YES

Go to step 8.

NO

Go to step 9.

8. Open wire check (PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

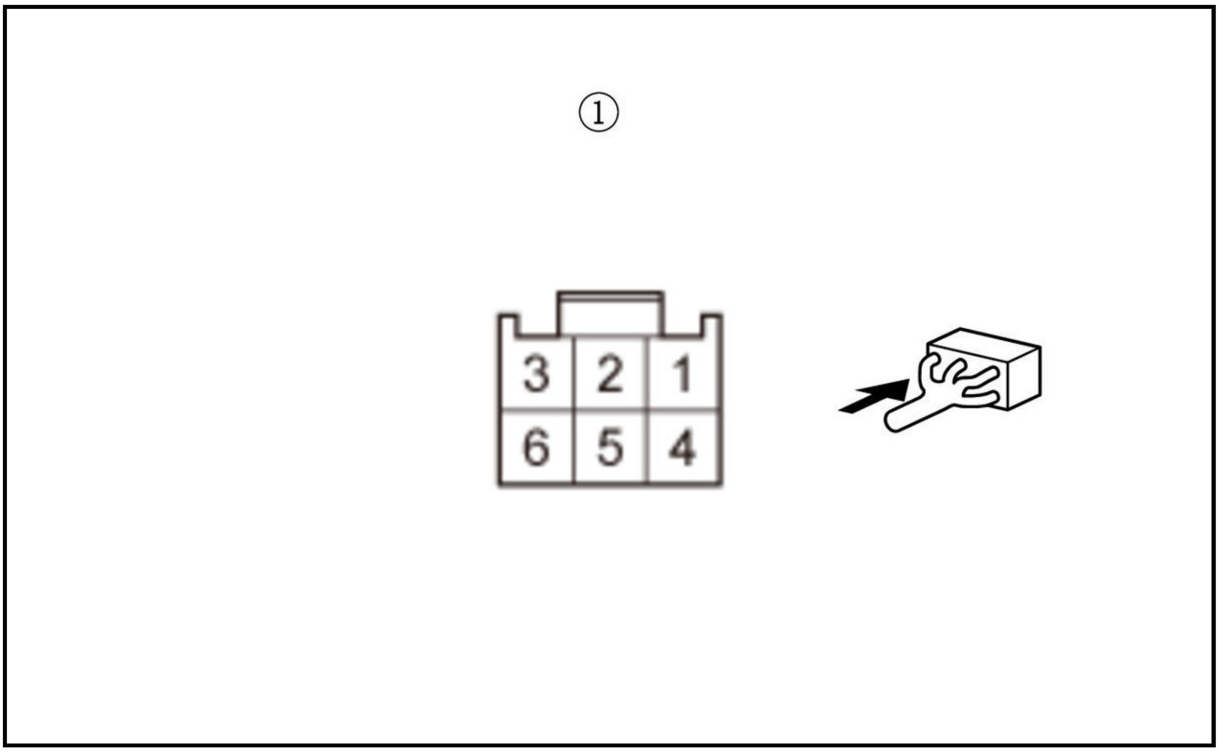
-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①

Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

9. Open wire check (T/G_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

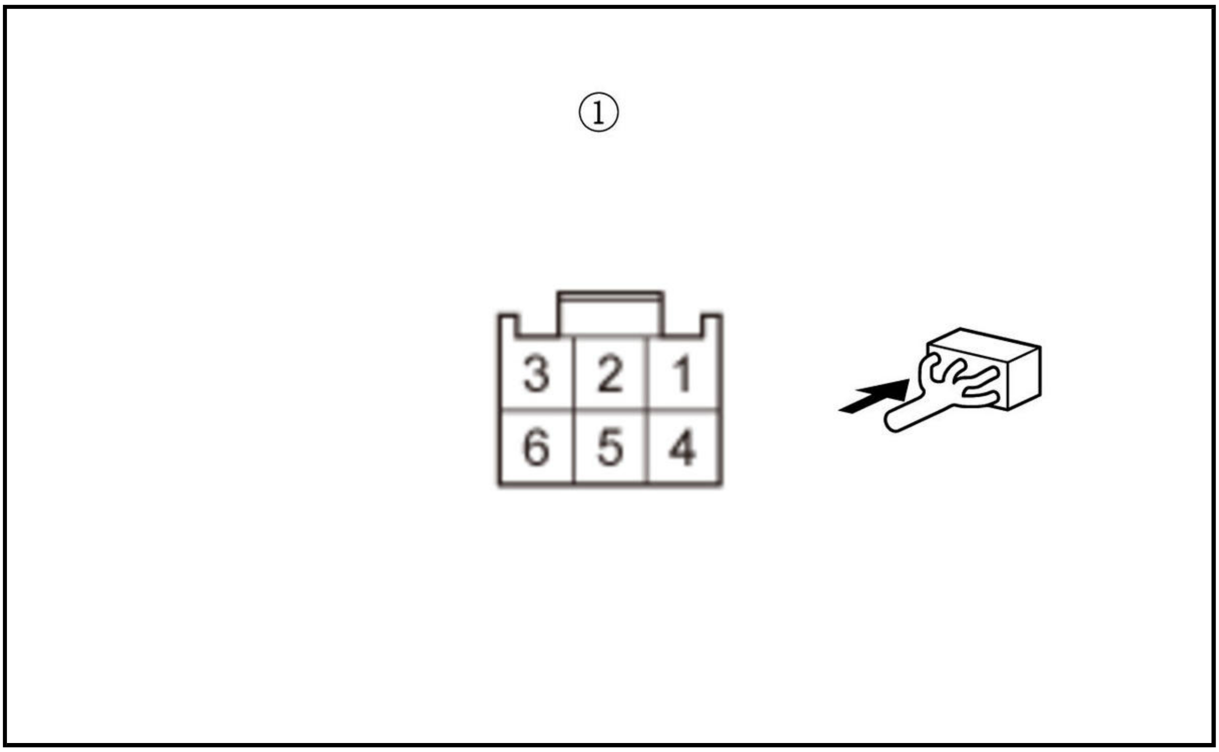
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 11**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1383

DTC B1383 : Tailgate Closer Unit Ratchet switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1383 Tailgate Closer Unit Ratchet switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1383 Tailgate Closer Unit Ratchet switch circuit malfunction	B

Is DTC B1383 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (PTG/PTL_RACT line short, others)

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Go to step 3.

NO

Go to step 5.

3. Determine possible failure area (power tailgate closer unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Go to step 4.

NO

Faulty ratchet switch; **replace the tailgate latch** .

4. Shorted wire check (PTG/PTL_RACT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the power tailgate control unit .

NO

Repair a short to ground in the wire.

5. Determine possible failure area (power tailgate closer unit, others)

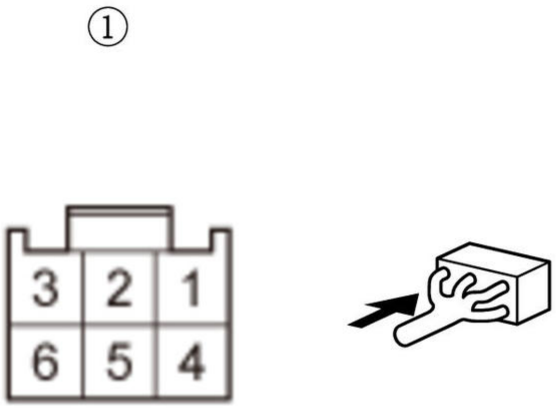
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 6: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Faulty ratchet switch; **replace the tailgate latch** .

NO

Go to step 6.

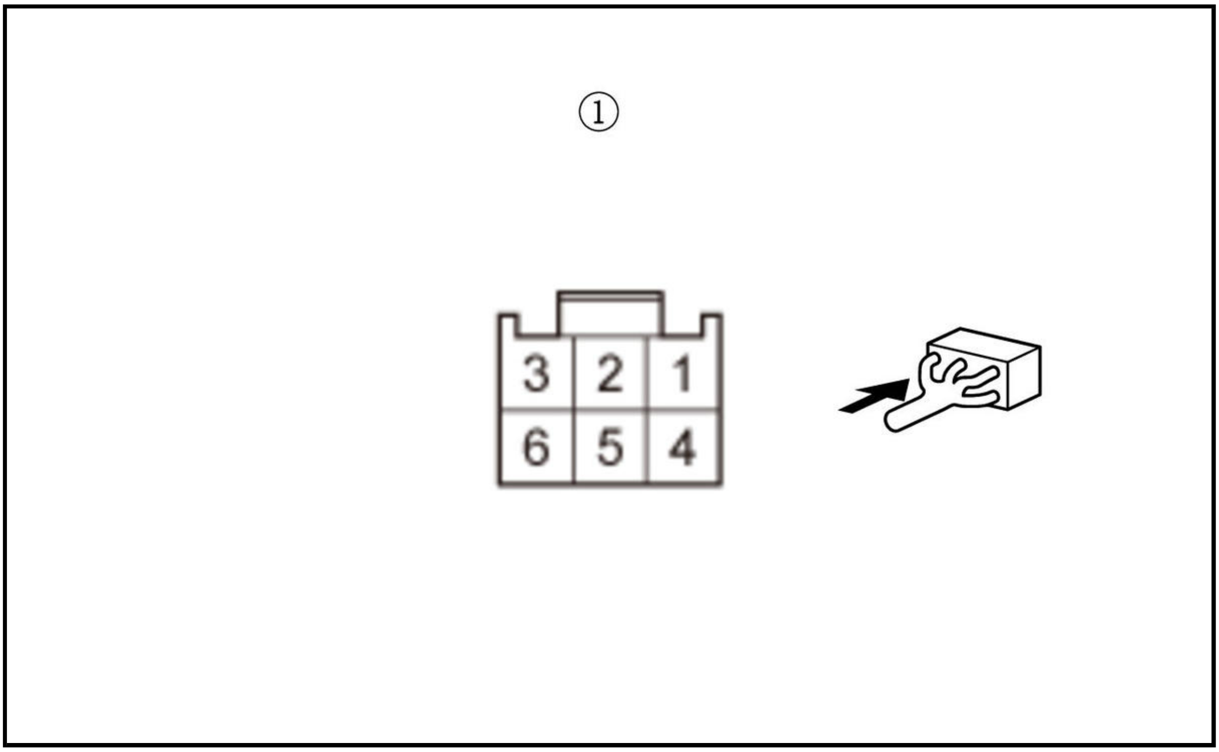
6. Determine possible failure area (PTG/PTL_RACT line, PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 6: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Ratchet	B	B

Is data list value ON?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

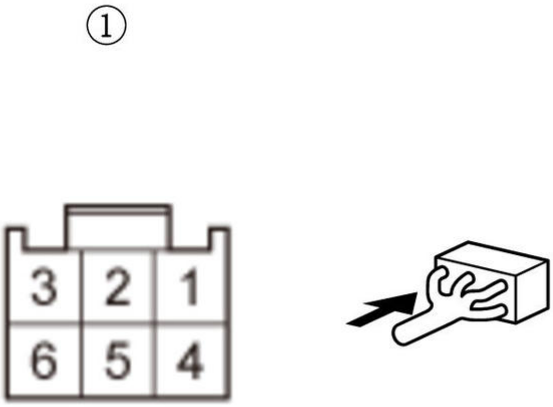
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

8. Open wire check (PTG/PTL_RACT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

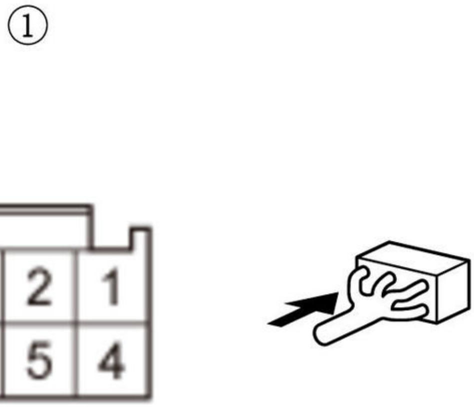
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 6: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 22**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1384

DTC B1384 : Tailgate Closer Unit Half Latch switch circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1384 Tailgate Closer Unit Half Latch switch circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate manually.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1384 Tailgate Closer Unit Half Latch switch circuit malfunction	B

   Is DTC B1384 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (PTG/PTL_HALF line short, others)

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

   Is data list value ON?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. Determine possible failure area (power tailgate closer unit, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

Is data list value ON?

YES

Go to step 4.

NO

Faulty half latch switch; **replace the tailgate latch** .

4. Shorted wire check (PTG/PTL_HALF line)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Disconnect the following connector.

Power tailgate control unit connector A (24P)

 -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	**Power tailgate control unit connector A (24P) No. 12**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the power tailgate control unit .

NO

Repair a short to ground in the wire.

5. Determine possible failure area (power tailgate closer unit, others)

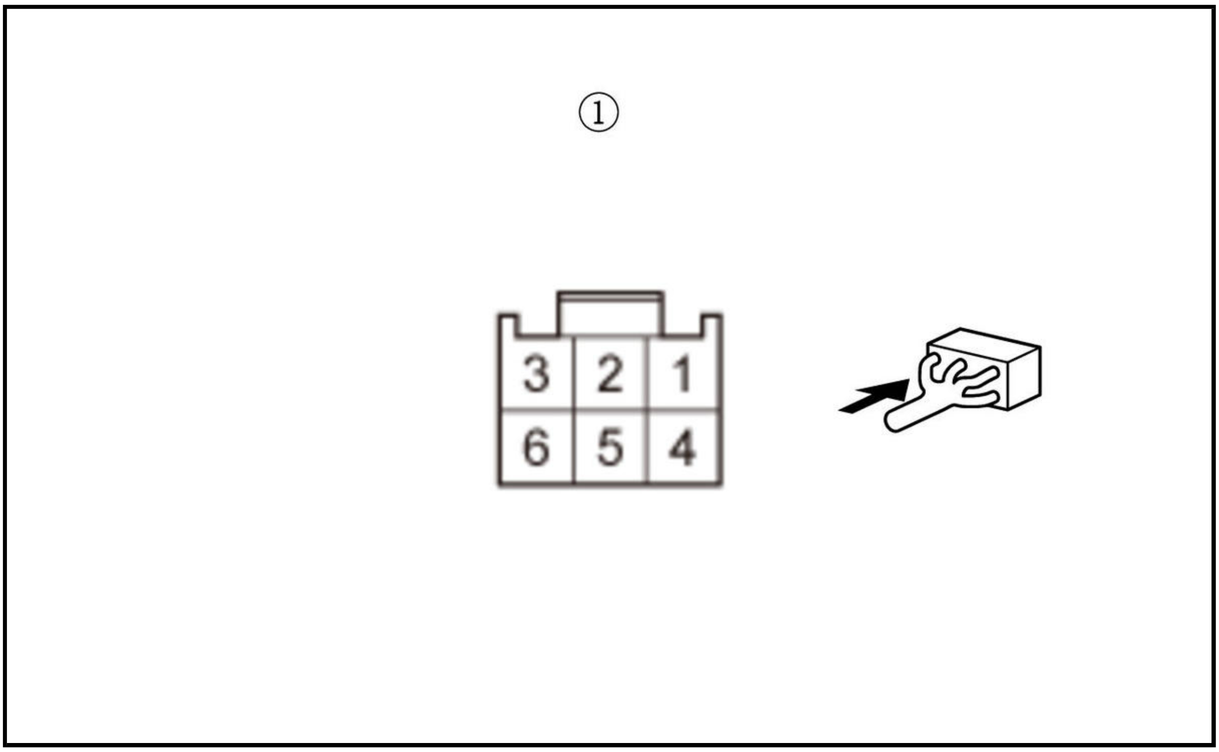
 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

 -3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Terminal B	Power tailgate closer unit connector B (6P) (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

Is data list value ON?

YES

Faulty half latch switch; **replace the tailgate latch** .

NO

Go to step 6.

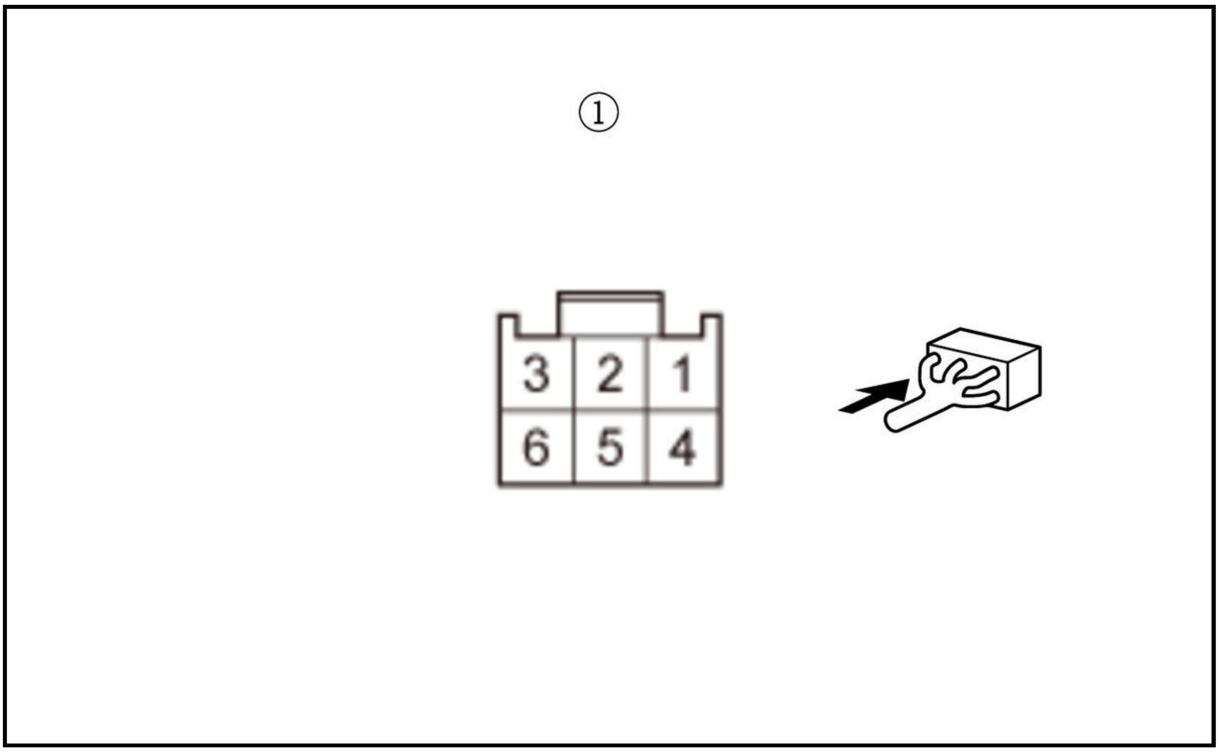
6. Determine possible failure area (PTG/PTL_HALF line, PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 4: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Tailgate Lock Sw. Half Latch	B	B

Is data list value ON?

YES

Go to step 7.

NO

Go to step 8.

7. Open wire check (PTG/PTL_SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

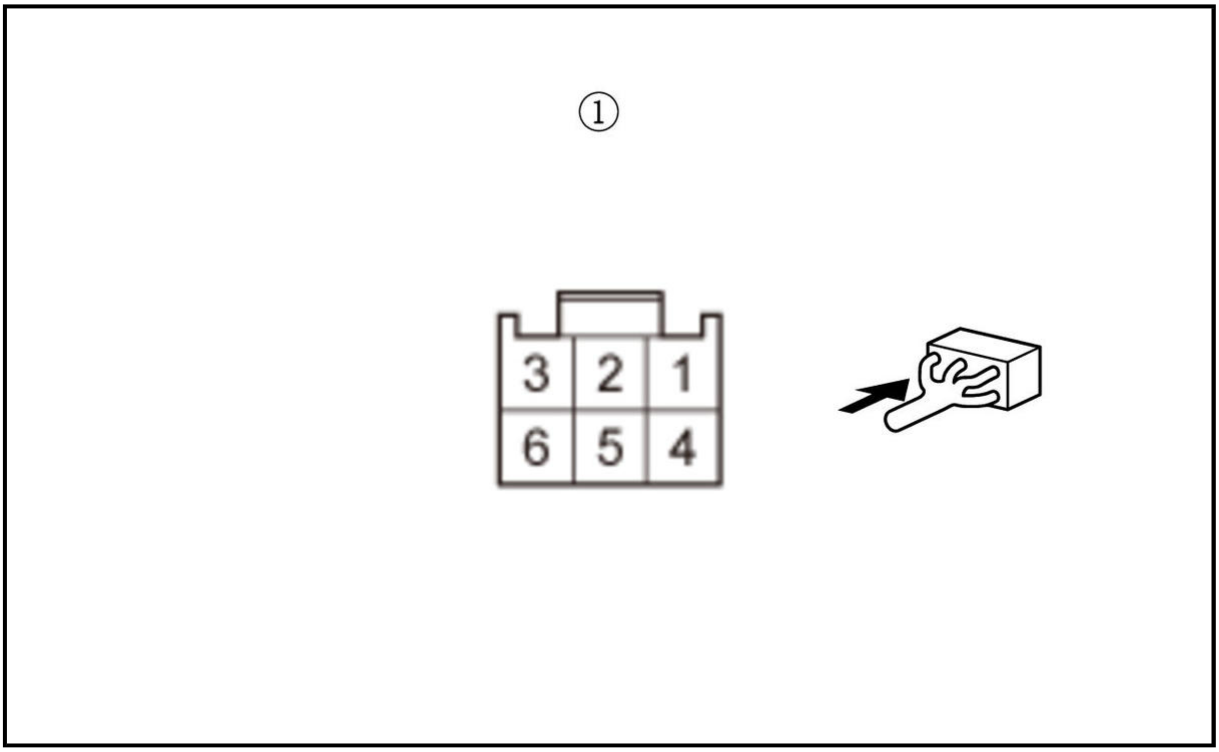
-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①

Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

8. Open wire check (PTG/PTL_HALF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

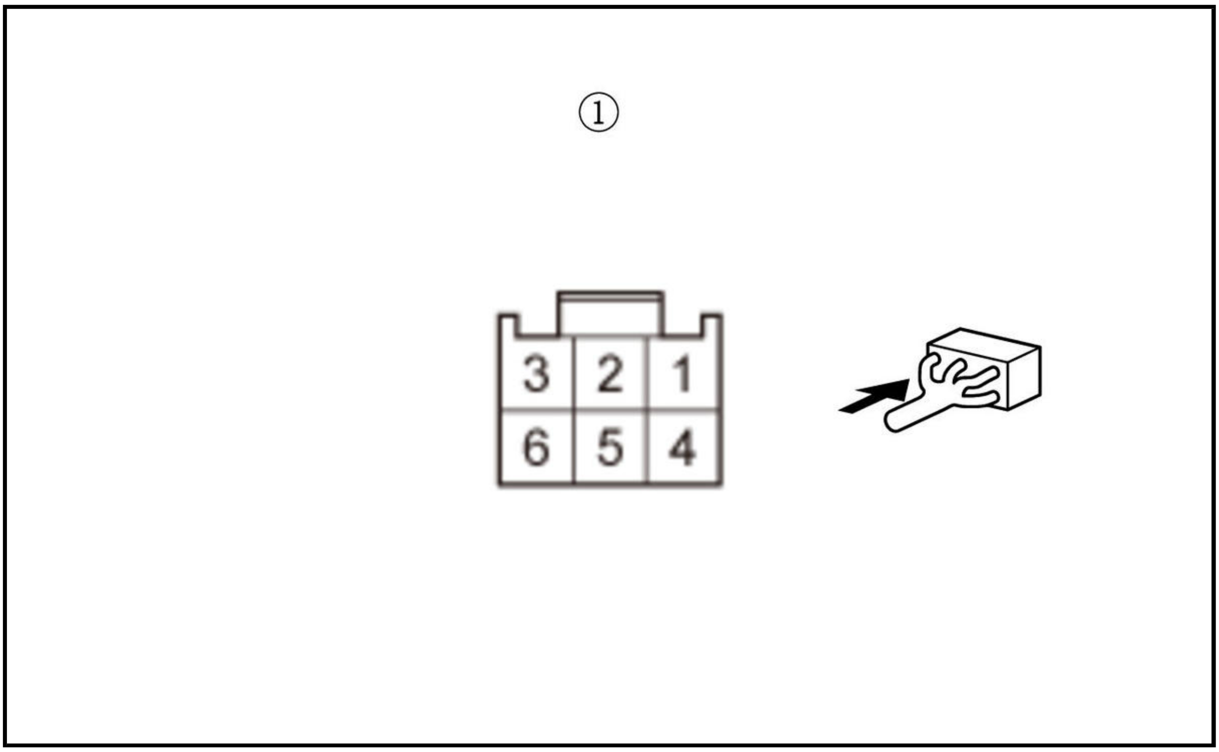
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 4: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 12**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1385

DTC B1385 : Power Tailgate temperature sensor malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1385 Power Tailgate temperature sensor malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate manually or with the keyless transmitter.

   -3. Close the tailgate with the keyless transmitter or driver's power tailgate switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1385 Power Tailgate temperature sensor malfunction	B

Is DTC B1385 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1378 Power Tailgate Right Touch/Pinch sensor circuit malfunction	B
B1379 Power Tailgate Left Touch/Pinch sensor circuit malfunction	B
B1385 Power Tailgate temperature sensor malfunction	B

Any of DTC are indicated at the same time with DTC B1385?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (PTG/PTL_SEG2 line)

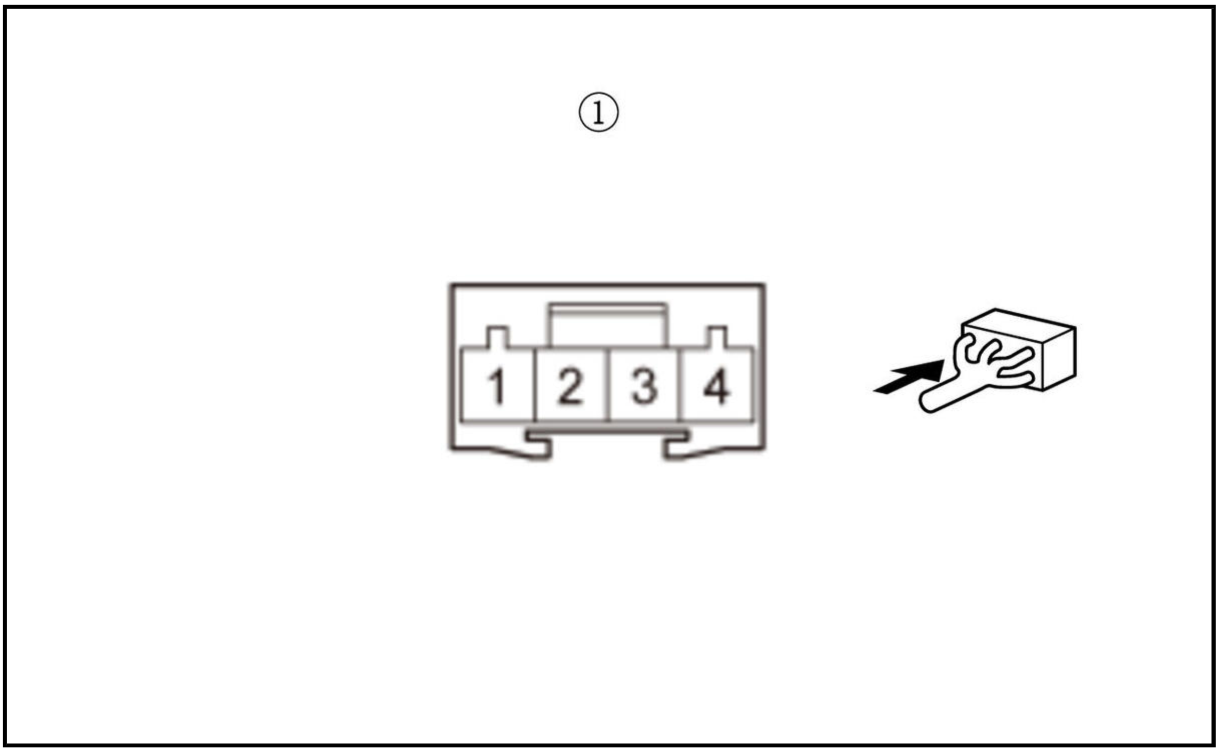
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power tailgate control unit connector B (10P) Left power tailgate pinch sensor 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector B (10P): disconnected Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 8**
Test point 2	Left power tailgate pinch sensor 4P connector (male terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

4. Determine possible failure area (left power tailgate pinch sensor thermistor, others)

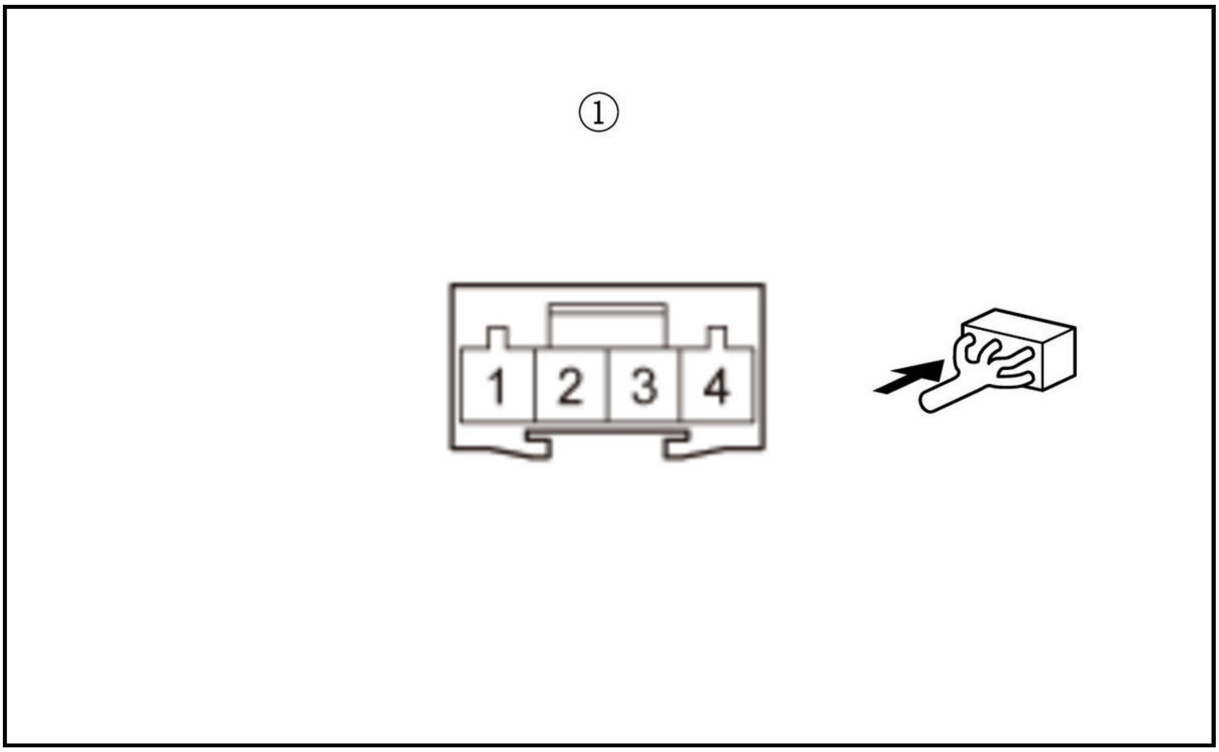
-1. Disconnect the following connector.

Left power tailgate pinch sensor 4P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	Left power tailgate pinch sensor 4P connector (male terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Replace the left power tailgate pinch sensor .

NO

Go to step 5.

5. Open wire check (PTG/PTL_THERMISTOR line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Left power tailgate pinch sensor 4P connector: disconnected
Test point 1	**Power tailgate control unit connector B (10P) No. 1**
Test point 2	Body ground

   Is there battery voltage?

   YES

   Repair an open or high resistance in the wire.

   NO

   Replace the power tailgate control unit .

DTC B1386

DTC B1386 : Power Tailgate sensor Pulse A circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1386 Power Tailgate sensor Pulse A circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate automatically with the keyless transmitter or power tailgate inside switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1386 Power Tailgate sensor Pulse A circuit malfunction	B

   Is DTC B1386 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1387 Power Tailgate sensor Pulse B circuit malfunction	B

   Is DTC B1387 indicated?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Shorted wire check (PTG/PTL_SVCC line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

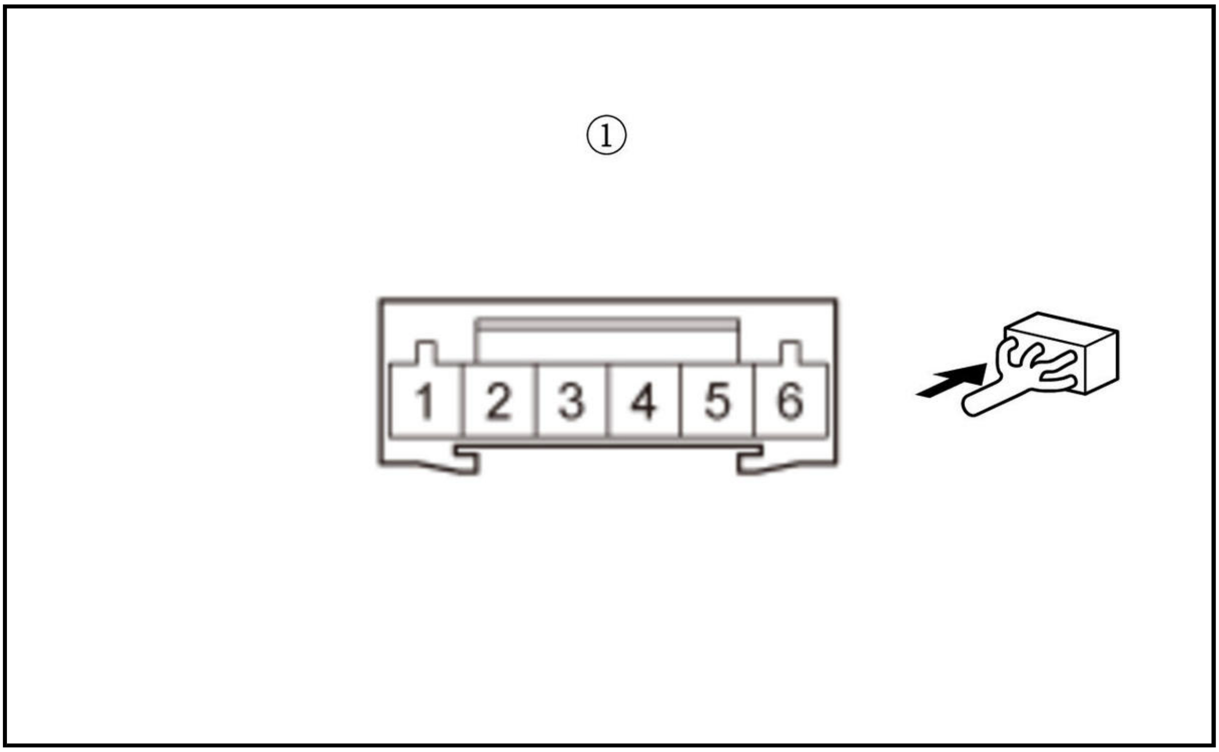
   -2. Disconnect the following connector.

   Power tailgate drive unit connector B (6P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B

Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

Replace the power tailgate control unit .

NO

Repair a short to ground in the wire.

4. Determine possible failure area (power tailgate sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

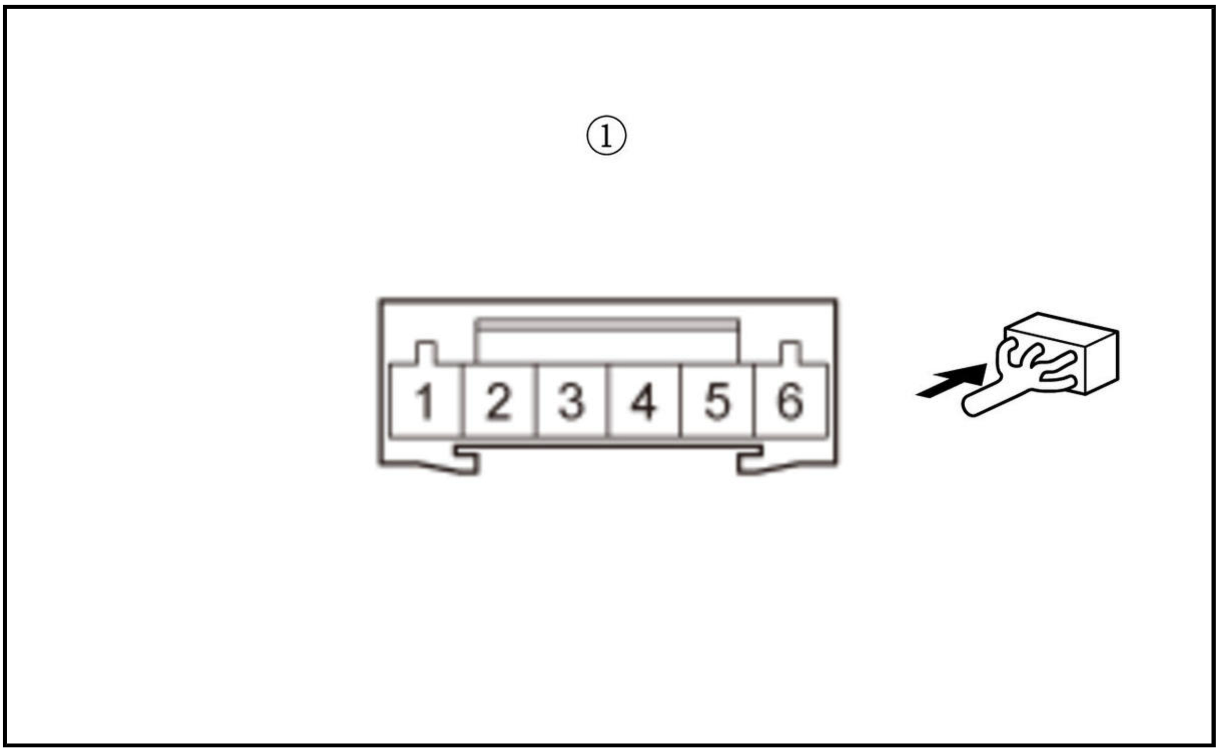
-2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 5V?

YES

Faulty power tailgate sensor; **replace the power tailgate drive unit** .

NO

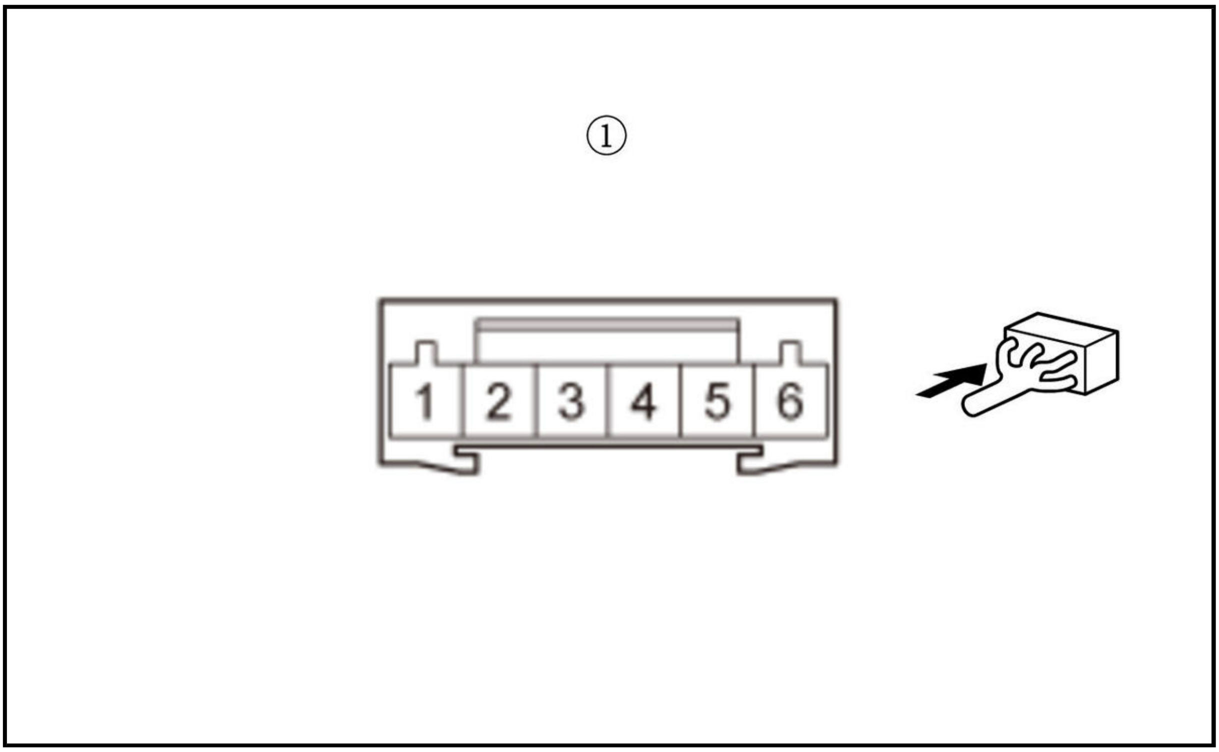
Go to step 5.

5. Shorted wire check (PTG/PTL_SENA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

Go to step 6.

NO

Repair a short to ground in the wire.

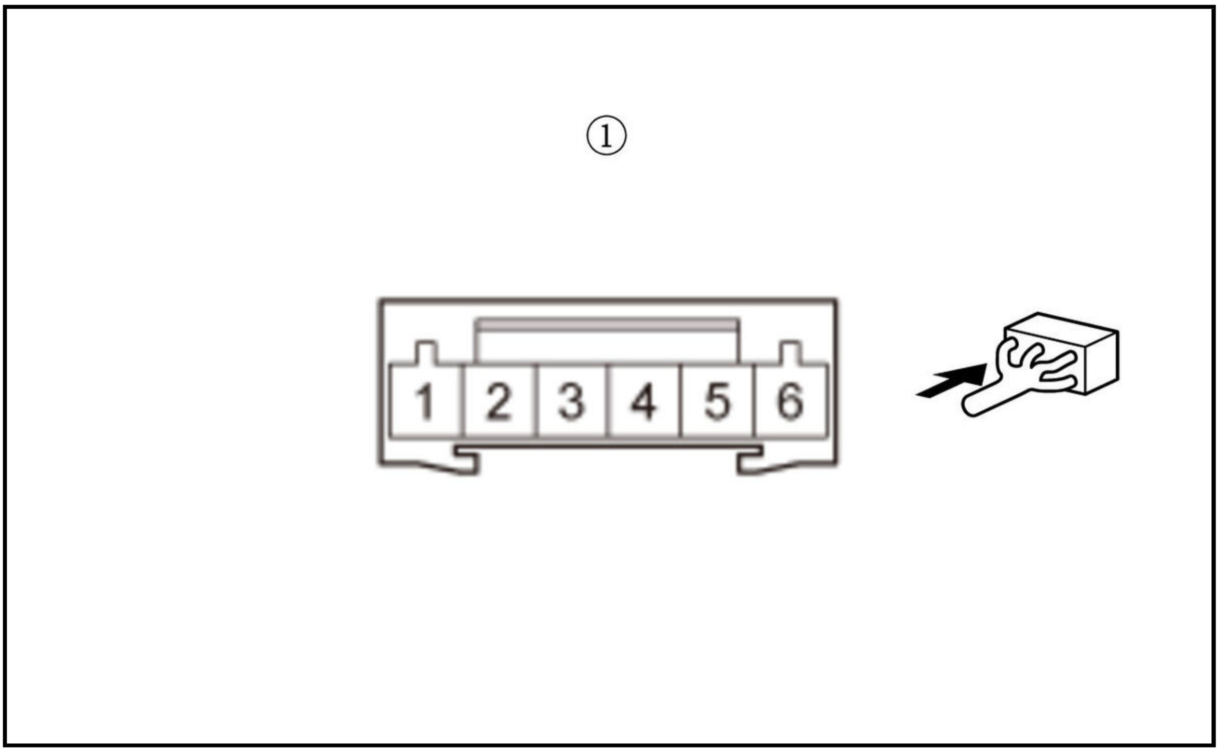
6. Open wire check (PTG/PTL_SENA line)

-1. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 3**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1387

DTC B1387 : Power Tailgate sensor Pulse B circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If the motor does not operate, **do the motor test first** .

DTC Description	DTC
B1387 Power Tailgate sensor Pulse B circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate with the tailgate outer handle switch.

   -3. Close the tailgate automatically with the keyless transmitter or power tailgate inside switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1387 Power Tailgate sensor Pulse B circuit malfunction	B

Is DTC B1387 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Problem verification 2

-1. Check for DTCs with the HDS.

DTC Description	DTC
B1386 Power Tailgate sensor Pulse A circuit malfunction	B

Is DTC B1386 indicated?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PTG/PTL_SVCC line)

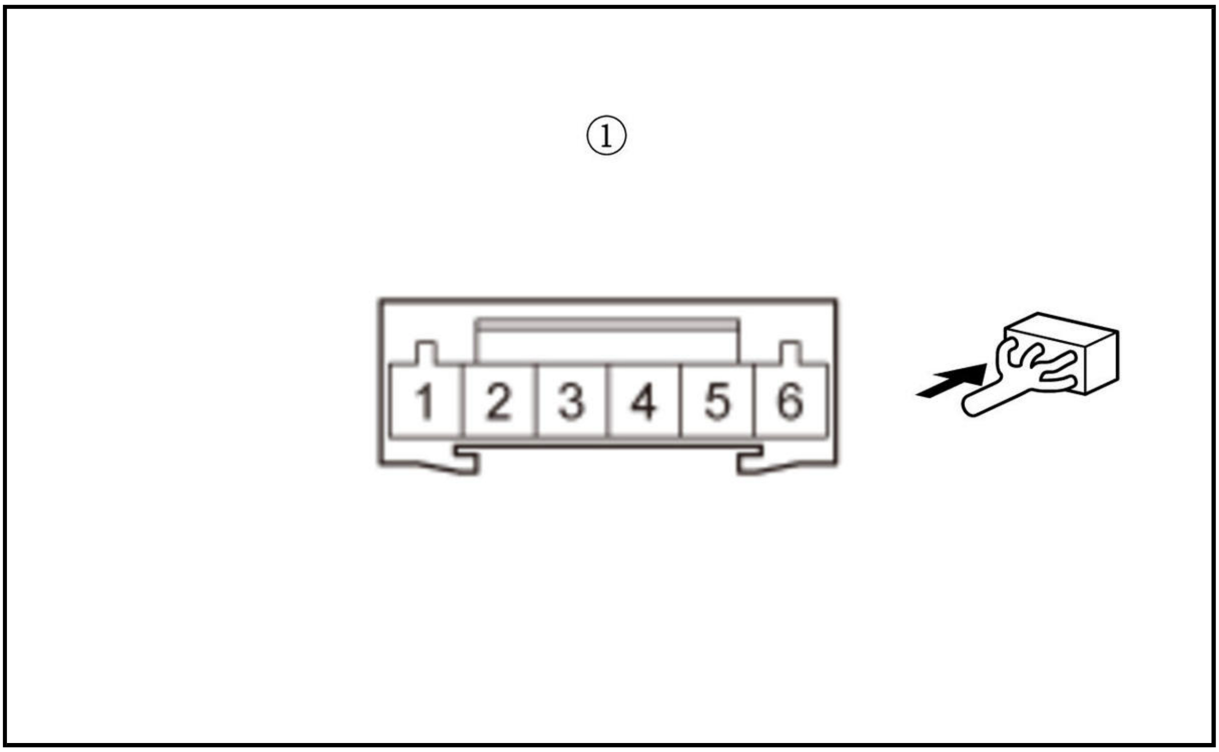
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF(LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

Replace the power tailgate control unit .

NO

Repair a short to ground in the wire.

4. Determine possible failure area (power tailgate sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

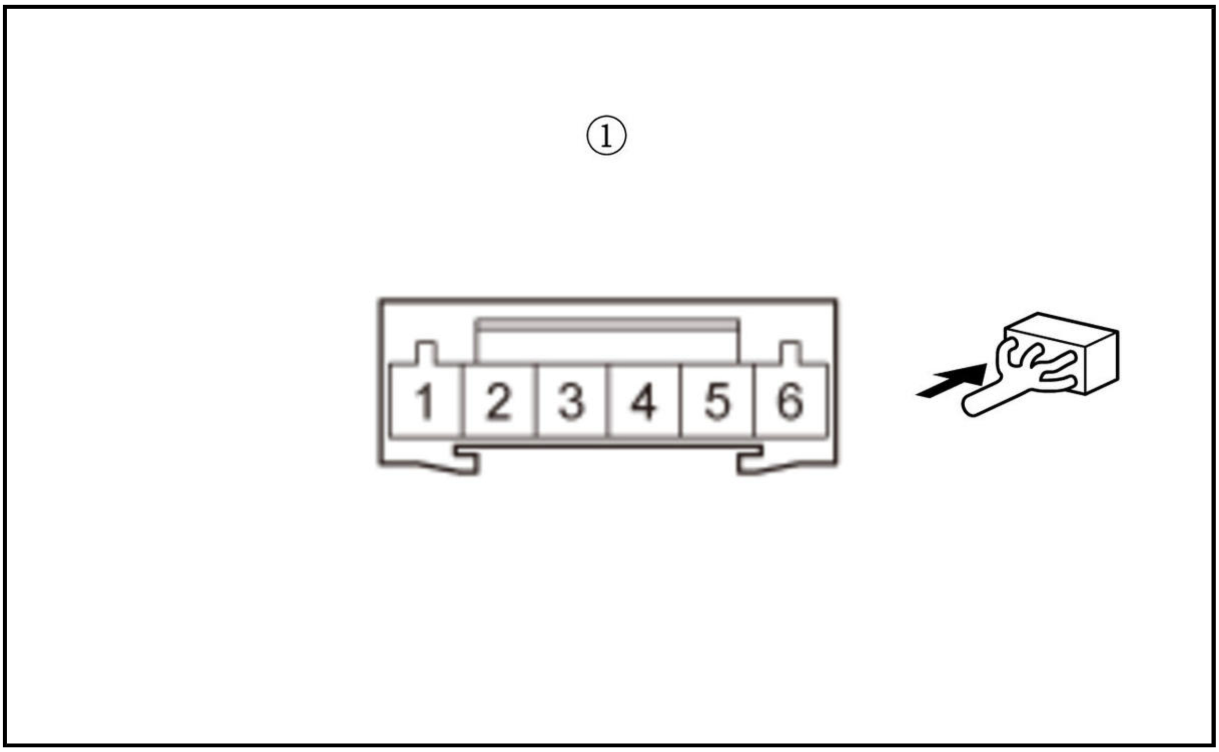
-2. Disconnect the following connector.

Power tailgate drive unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 3: ①
Test point 2	Body ground



Is there about 5V?

YES

Faulty power tailgate sensor; **replace the power tailgate drive unit** .

NO

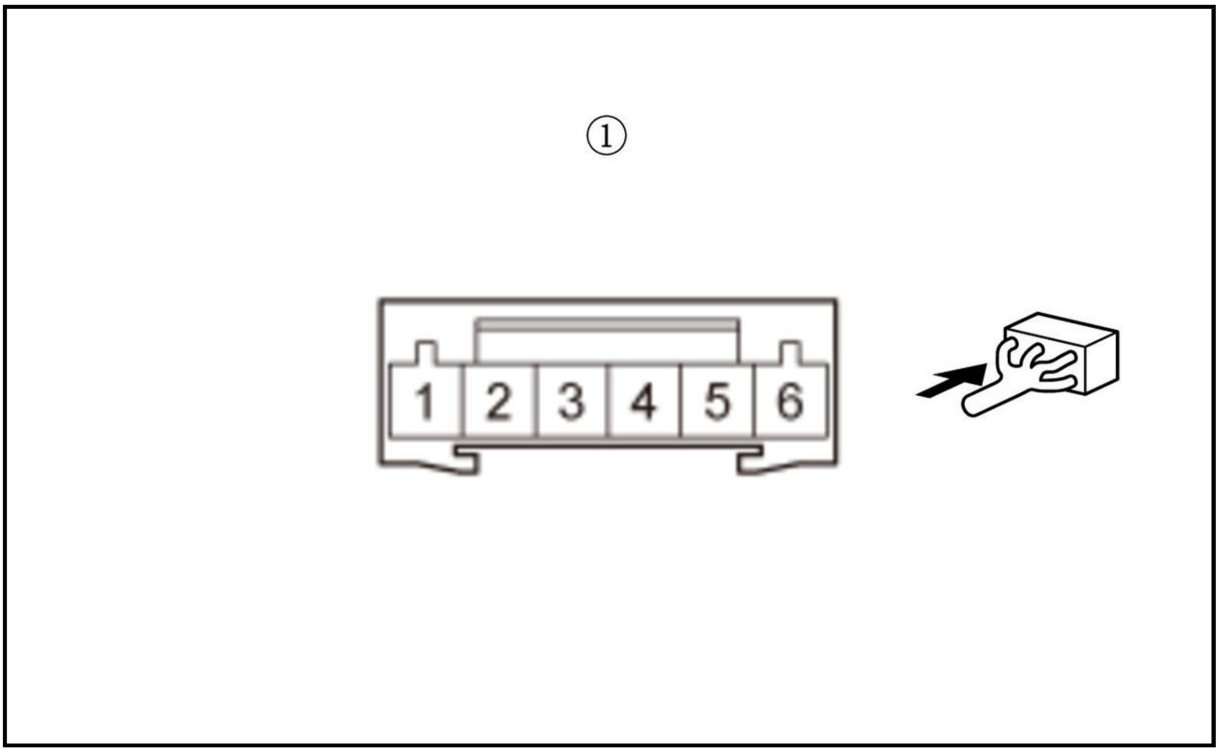
Go to step 5.

5. Shorted wire check (PTG/PTL_SENB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 3: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

Go to step 6.

NO

Repair a short to ground in the wire.

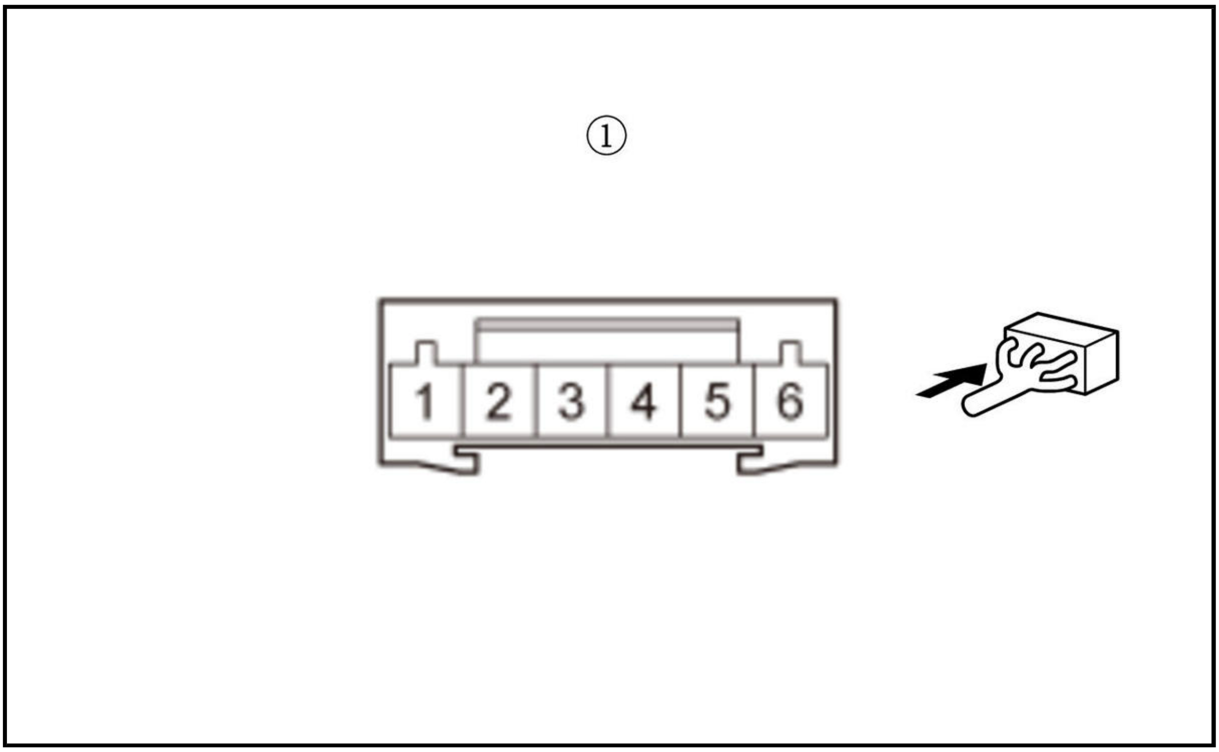
6. Open wire check (PTG/PTL_SENB line)

-1. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate drive unit connector B (6P): disconnected Power tailgate control unit connector A (24P): disconnected
B	B
Test point 1	Power tailgate drive unit connector B (6P) (male terminals) No. 3: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 16**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1388

DTC B1388 : Power Tailgate Drive Motor circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B1388 Power Tailgate Drive Motor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Open the tailgate.

   -3. Close the tailgate automatically with the keyless transmitter or power tailgate inside switch.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1388 Power Tailgate Drive Motor circuit malfunction	B

Is DTC B1388 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Power tailgate motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the power tailgate motor** .

Is the motor OK?

YES

Go to step 3.

NO

Faulty power tailgate motor; **replace the power tailgate drive unit** .

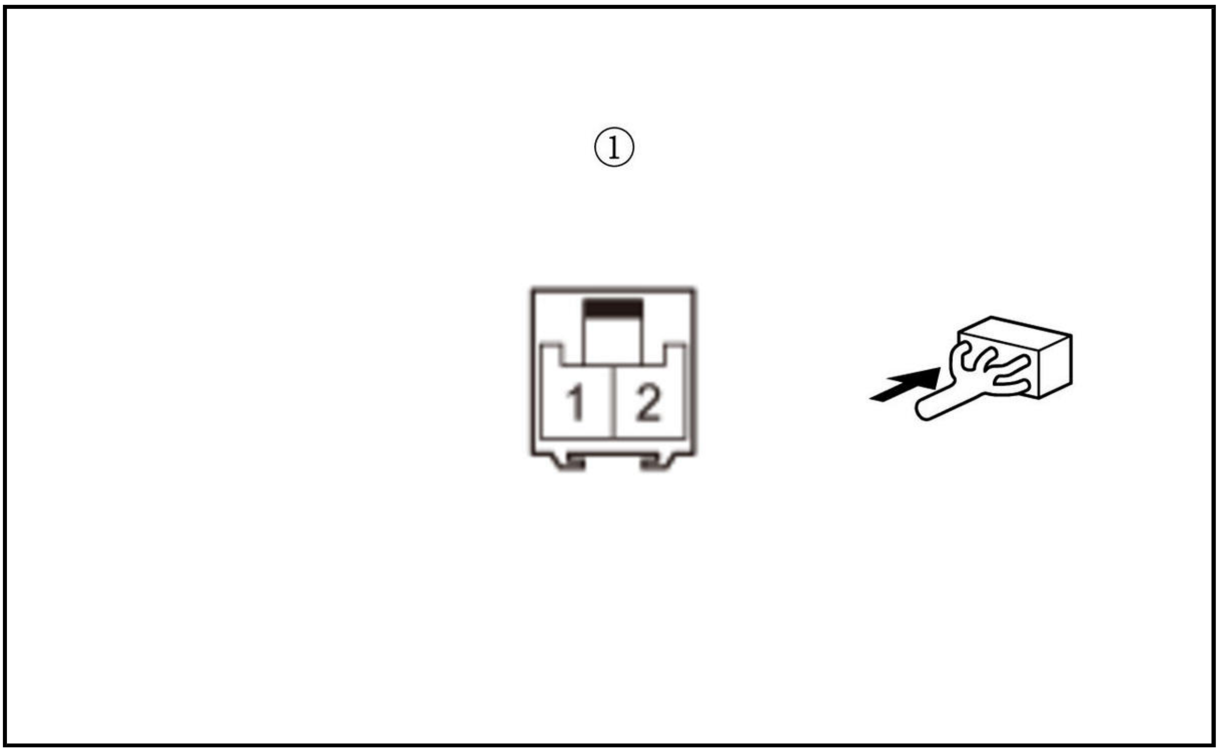
3. Shorted wire check (PTG/PTL_PTM+ line)

-1. Disconnect the following connector.

Power tailgate control unit connector C (5P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The PTG/PTL_PTM+ wire is not shorted. Go to step 4.

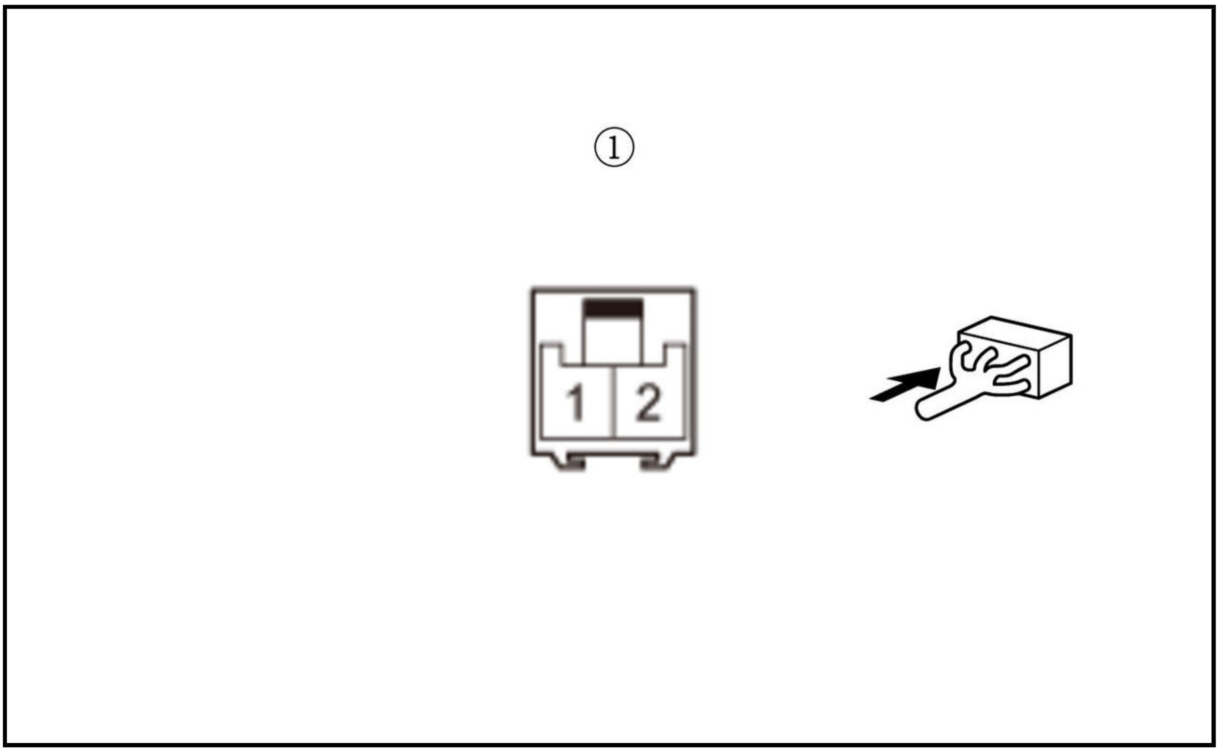
NO

Repair a short to ground in the wire.

4. Shorted wire check (PTG/PTL_PTM- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The PTG/PTL_PTM- wire is not shorted. Go to step 5.

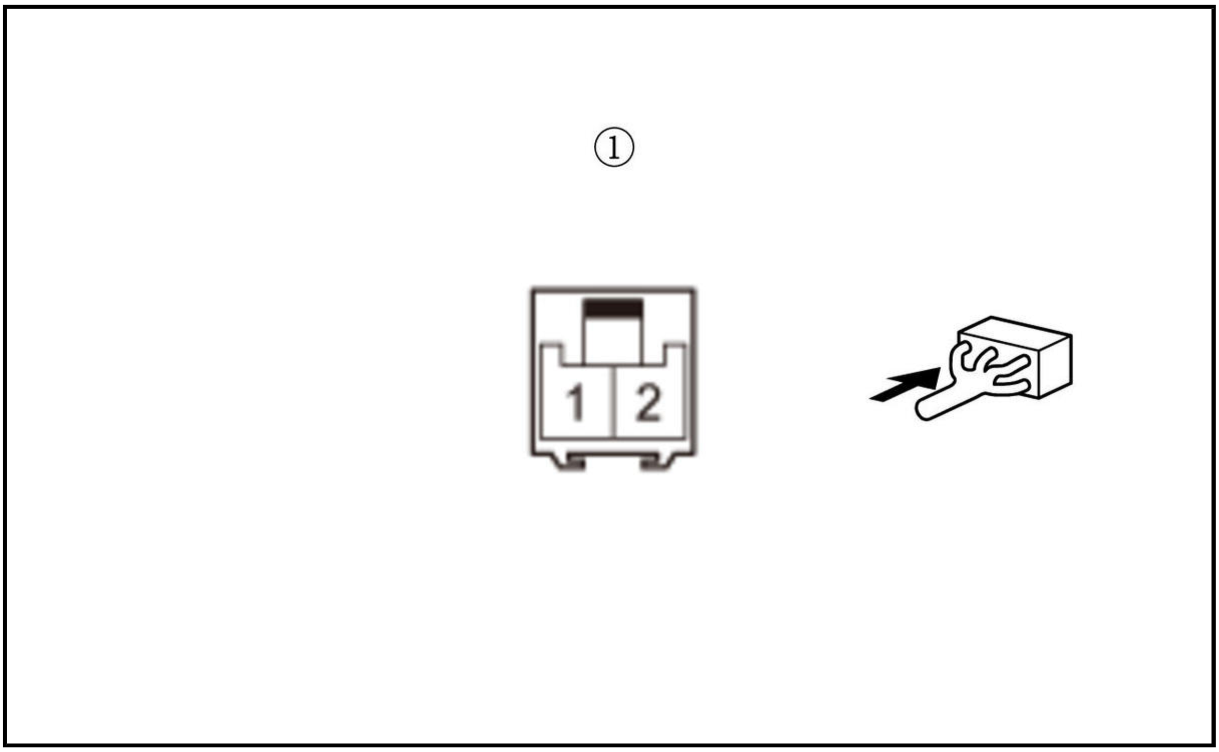
NO

Repair a short to ground in the wire.

5. Open wire check (PTG/PTL_PTM+ line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector C (5P) No. 3**



Is there 1.0 Ω or less?

YES

The PTG/PTL_PTM+ wire is not opened. Go to step 6.

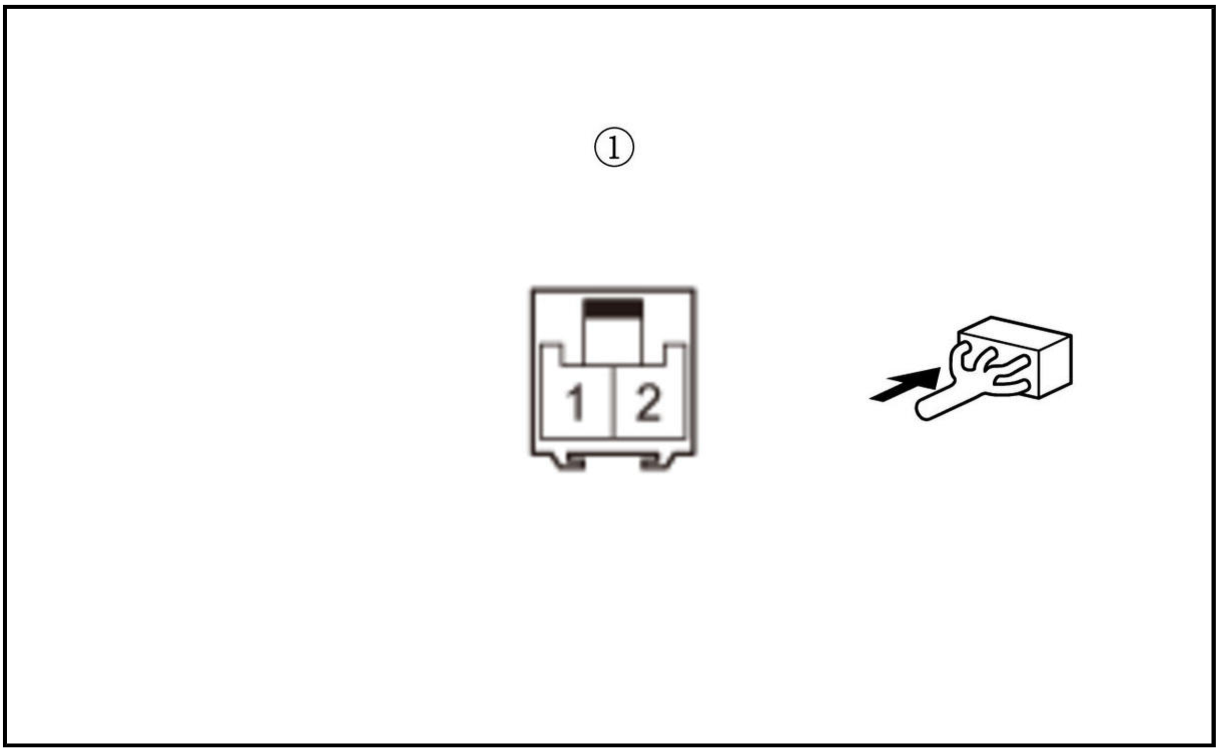
NO

Repair an open or high resistance in the wire.

6. Open wire check (PTG/PTL_PTM- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector C (5P): disconnected Power tailgate drive unit connector A (2P): disconnected
B	B
Test point 1	Power tailgate drive unit connector A (2P) (male terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector C (5P) No. 5**



Is there 1.0 Ω or less?

YES

Replace the power tailgate control unit .

NO

Repair an open or high resistance in the wire.

DTC B1390

DTC B1390 : Power Tailgate Closer Motor circuit malfunction

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B1390 Power Tailgate Closer Motor circuit malfunction	B

DTC (Power Tailgate Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. With the tailgate closed, press the tailgate outer handle switch and wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1390 Power Tailgate Closer Motor circuit malfunction	B

Is DTC B1390 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Check for power tailgate system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTCs troubleshooting, then recheck.

NO

Go to step 3.

3. Open wire check (PTG/PTL_CLM+ line)

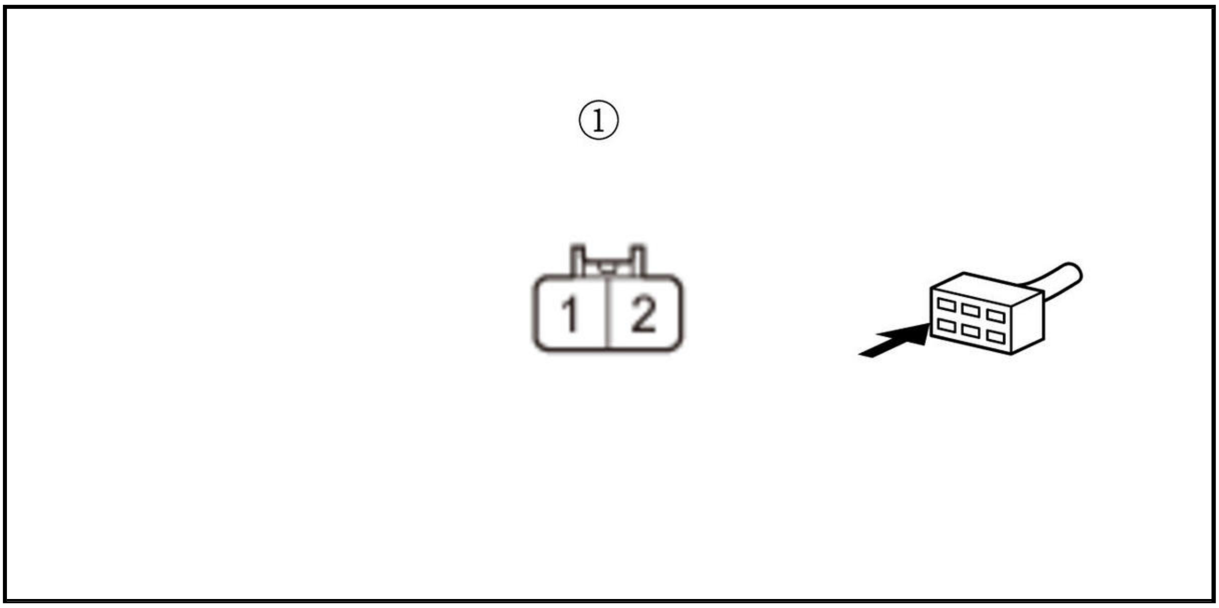
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Power tailgate closer unit connector A (2P) Power tailgate control unit connector B (10P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector A (2P): disconnected Power tailgate control unit connector B (10P): disconnected
Test point 1	Power tailgate closer unit connector A (2P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector B (10P) No. 2**



Is there 1.0 Ω or less?

YES

The PTG/PTL_CLM+ wire is OK. Go to step 4.

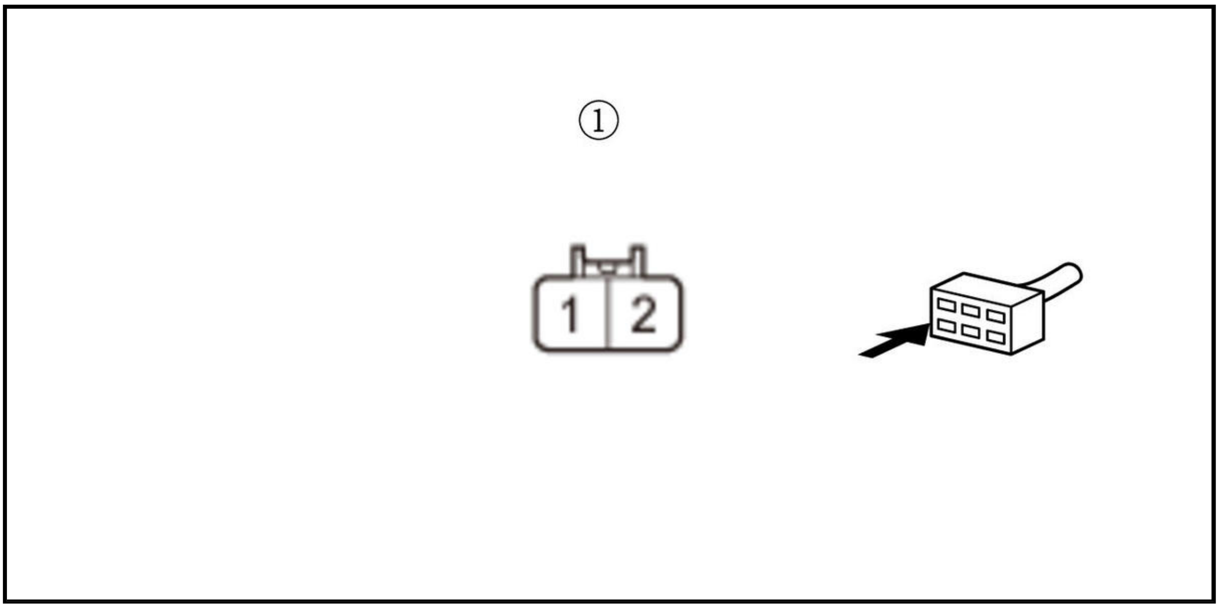
NO

Repair an open or high resistance in the wire.

4. Open wire check (PTG/PTL_CLM- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power tailgate closer unit connector A (2P): disconnected Power tailgate control unit connector B (10P): disconnected
Test point 1	Power tailgate closer unit connector A (2P) (female terminals) No. 1: ①
Test point 2	**Power tailgate control unit connector B (10P) No. 6**



Is there 1.0 Ω or less?

YES

Faulty closer motor; replace the power tailgate closer unit .

NO

Repair an open or high resistance in the wire.

DTC U0199, U1281, U128D (POWER TAILGATE CONTROL UNIT)

DTC U0199 : Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)

DTC U1281 : Lost communication with MICU (MICU frame)

DTC U128D : Power Tailgate Control Unit lost communication with GAUGE Control Module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit(the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0199 Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	B
U1281 Lost communication with MICU (MICU frame)	B
U128D Power Tailgate Control Unit lost communication with GAUGE Control Module	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0199 Lost communication with P/W (DRLOCKSW, KLDRLOCK frame)	B

DTC Description	DTC
U1281 Lost communication with MICU (MICU frame)	B
U128D Power Tailgate Control Unit lost communication with GAUGE Control Module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Power tailgate control unit connector A (24P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0199	Power window master switch 37P connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Power tailgate control unit connector A (24P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0199	B-CAN_H	Power tailgate control unit connector A (24P)	No. 6	Power window master switch 37P connector	No. 32
	B-CAN_L		No. 7		No. 31
U1281	B-CAN_H	Power tailgate control unit connector A (24P)	No. 6	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 7		No. 21
U128D	B-CAN_H	Power tailgate control unit connector A (24P)	No. 6	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 7		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U0199	Power window master switch
U1281	Body control module
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (POWER TAILGATE CONTROL UNIT)

DTC U1280 : Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 Communication Bus line Error(a bus OFF state is detected by Power Tail Gate ECU)	B

DTC (Power Tailgate Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Communication Bus line Error (a bus OFF state is detected by Power Tail Gate ECU)	B

   Is DTC U1280 indicated?

   YES

   Go to body control module DTC U1280 troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2017-22 ACCESSORIES AND BODY, CAB

Seat Heater System (Front) - Diagnostics - CR-V (Except Hybrid)

TROUBLESHOOTING

DTC B1C55

DTC B1C55 : Driver's heater thermistor circuit open

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C55 Driver's heater thermistor circuit open	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 90 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1C55 Driver's heater thermistor circuit open	B

   Is DTC B1C55 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Seat heater check 1

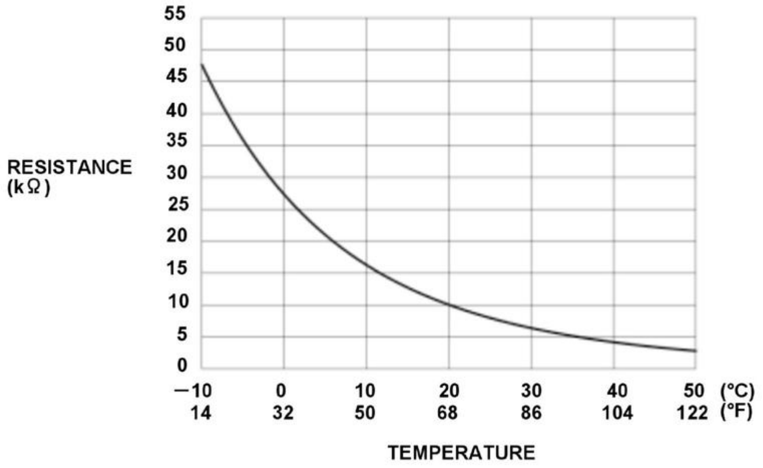
   -1. Disconnect the following connector.

Front seat heater control unit 24P connector

   -2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected
Test point 1	**Front seat heater control unit 24P connector No. 12**

Test point 2	Front seat heater control unit 24P connector No. 22



Is resistance value within the range?

YES

Replace the front seat heater control unit .

NO

Go to step 3.

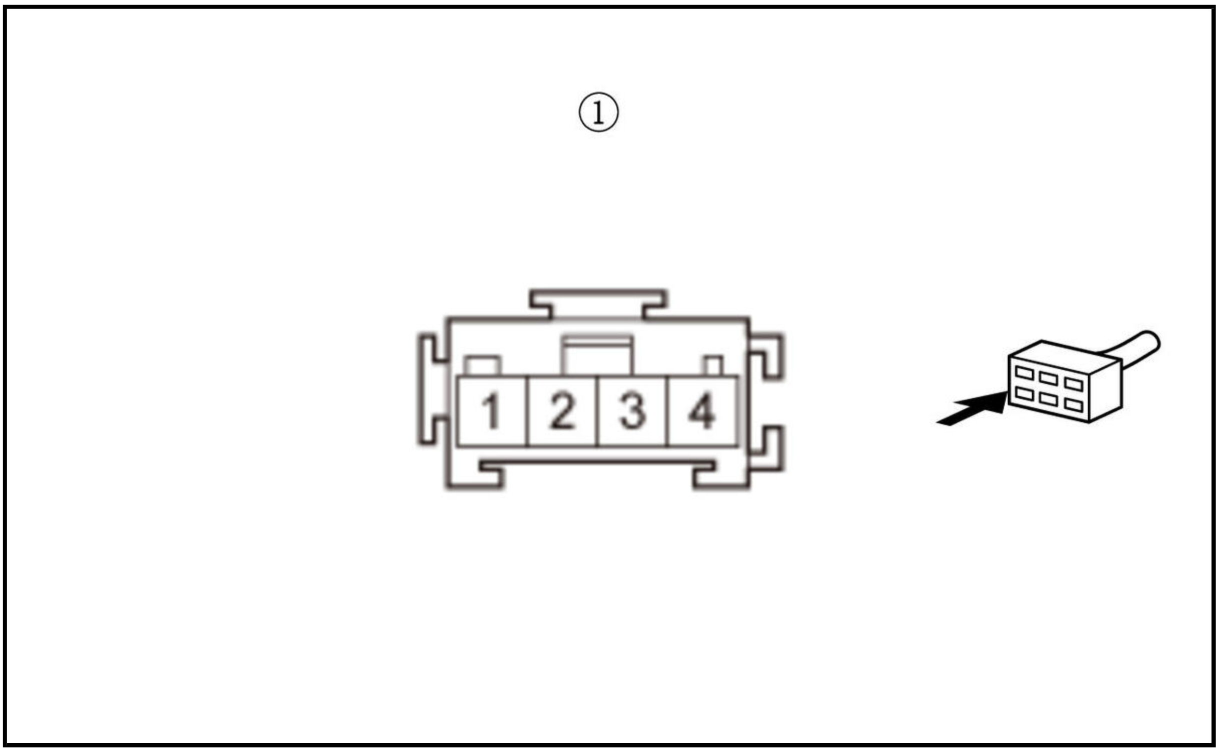
3. Seat heater check 2

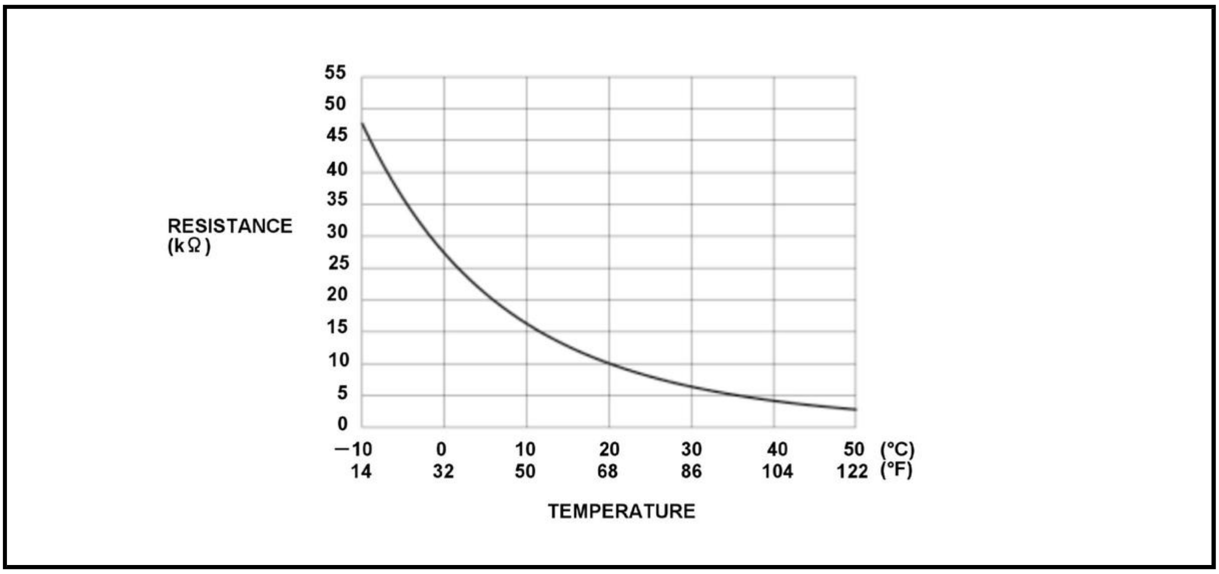
-1. Disconnect the following connector.

Driver's seat heater connector A (4P)

-2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Driver's seat heater connector A (4P): disconnected
Test point 1	Driver's seat heater connector A (4P) (male terminals) No. 3: ①
Test point 2	Driver's seat heater connector A (4P) (male terminals) No. 4: ①





Is resistance value within the range?

YES

Go to step 4.

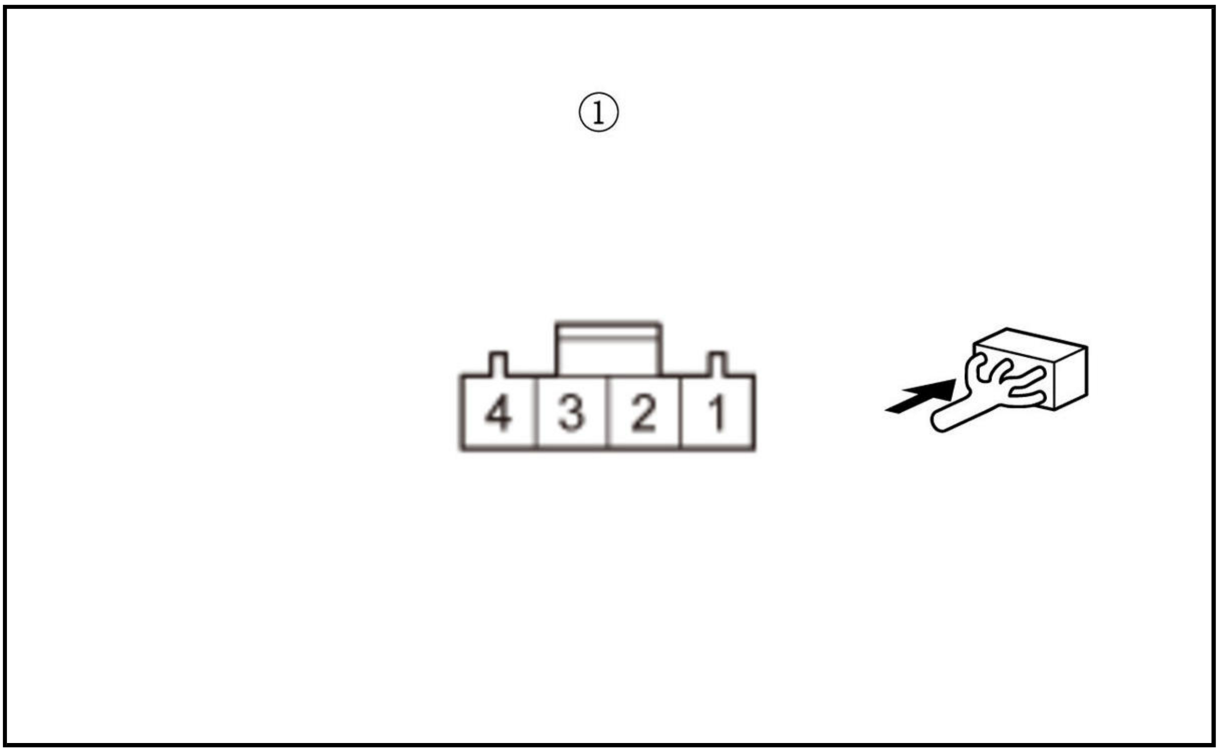
NO

Replace the driver's seat cushion heater .

4. Open wire check (TH+ DR line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Driver's seat heater connector A (4P) : disconnected
Test point 1	**Front seat heater control unit 24P connector No. 12**
Test point 2	Body ground

Is there continuity?

YES

Repair an open or high resistance in the TH- DR wire.

NO

Repair an open or high resistance in the TH+ DR wire.

DTC B1C56

DTC B1C56 : Driver's heater thermistor circuit short

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C56 Driver's heater thermistor circuit short	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 90 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C56 Driver's heater thermistor circuit short	B

Is DTC B1C56 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's seat heater connector A (4P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTCs with the HDS.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B1C56 Driver's heater thermistor circuit short	B

Is DTC B1C56 indicated?

YES

Repair a short in the TH+ DR wire.

NO

Faulty driver's seat heater thermistor; **replace the driver's seat cushion heater** .

DTC B1C57

DTC B1C57 : Passenger's heater thermistor circuit open

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C57 Passenger's heater thermistor circuit open	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 90 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1C57 Passenger's heater thermistor circuit open	B

Is DTC B1C57 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

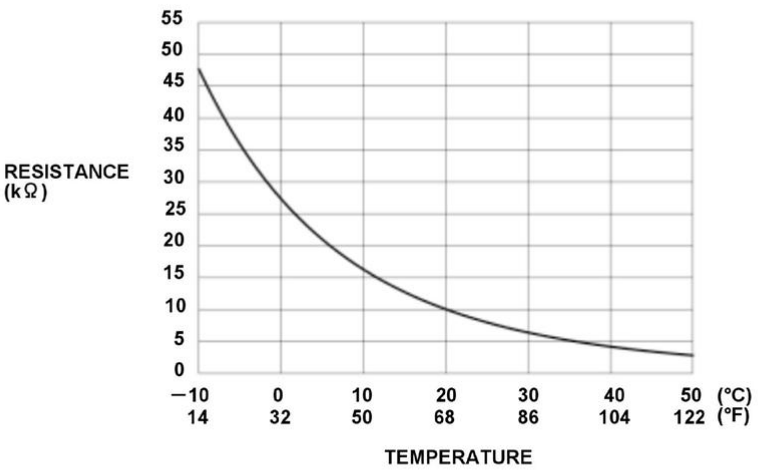
2. Seat heater check 1

   -1. Disconnect the following connector.

Front seat heater control unit 24P connector

-2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected
Test point 1	**Front seat heater control unit 24P connector No. 13**
Test point 2	**Front seat heater control unit 24P connector No. 23**



Is resistance value within the range?

YES

Replace the front seat heater control unit .

NO

Go to step 3.

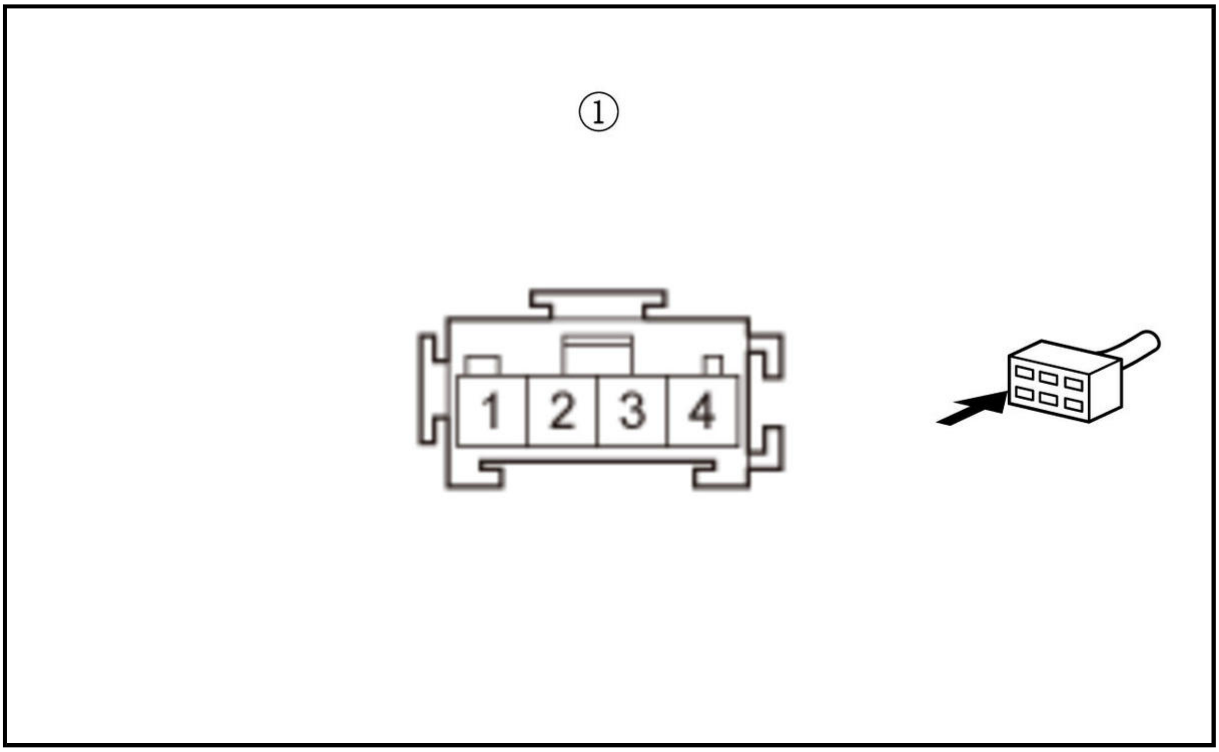
3. Seat heater check 2

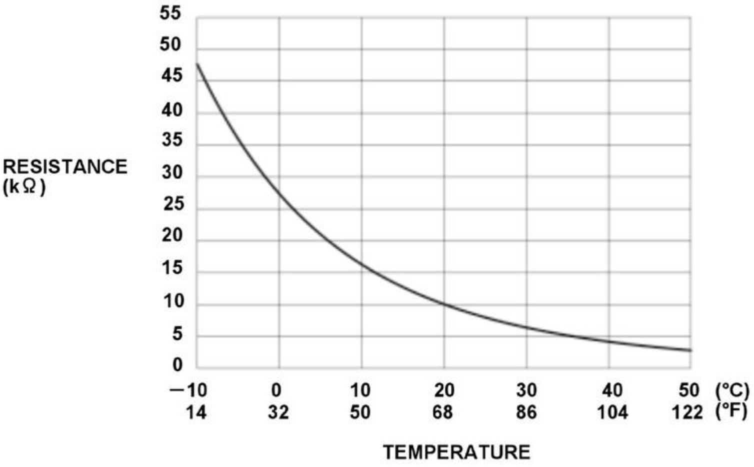
-1. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

-2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Front passenger's seat heater connector A (4P): disconnected
Test point 1	Front passenger's seat heater connector A (4P) (male terminals) No. 3: ①
Test point 2	Front passenger's seat heater connector A (4P) (male terminals) No. 4: ①





Is resistance value within the range?

YES

Go to step 4.

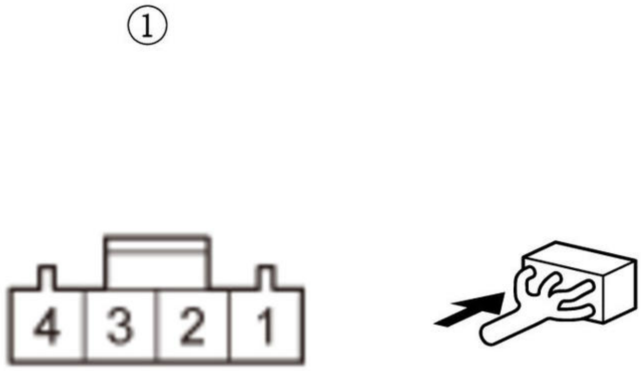
NO

Replace the front passenger's seat cushion heater .

4. Open wire check (TH+ AS line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Front passenger's seat heater connector A (4P) : disconnected
Test point 1	**Front seat heater control unit 24P connector No. 13**
Test point 2	Body ground

Is there continuity?

YES

Repair an open or high resistance in the TH- AS wire.

NO

Repair an open or high resistance in the TH+ AS wire.

DTC B1C58

DTC B1C58 : Passenger's heater thermistor circuit short

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C58 Passenger's heater thermistor circuit short	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 90 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1C58 Passenger's heater thermistor circuit short	B

   Is DTC B1C58 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTCs with the HDS.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B1C58 Passenger's heater thermistor circuit short	B

Is DTC B1C58 indicated?

YES

Repair a short in the TH+ AS wire.

NO

Faulty front passenger's seat heater thermistor; **replace the front passenger's seat cushion heater** .

DTC B1C60

DTC B1C60 : Driver's heater current abnormal high

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

Is DTC B1C60 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check 1

-1. Disconnect the following connector.

Driver's seat heater connector B (2P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

Is DTC B1C60 indicated?

YES

Go to step 3.

NO

Replace the driver's seat-back heater .

3. DTC check 2

-1. Disconnect the following connector.

Driver's seat heater connector A (4P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

Is DTC B1C60 indicated?

YES

Go to step 4.

NO

Replace the driver's seat cushion heater .

4. Shorted wire check (HEATER DR line)

-1. Disconnect the following connector.

Front seat heater control unit 24P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Driver's seat heater connector A (4P): disconnected
Test point 1	Front seat heater control unit 24P connector No. 1
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the wire.

NO

Replace the front seat heater control unit .

DTC B1C61

DTC B1C61 : Driver's heater current abnormal low

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C61 Driver's heater current abnormal low	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C61 Driver's heater current abnormal low	B

   Is DTC B1C61 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

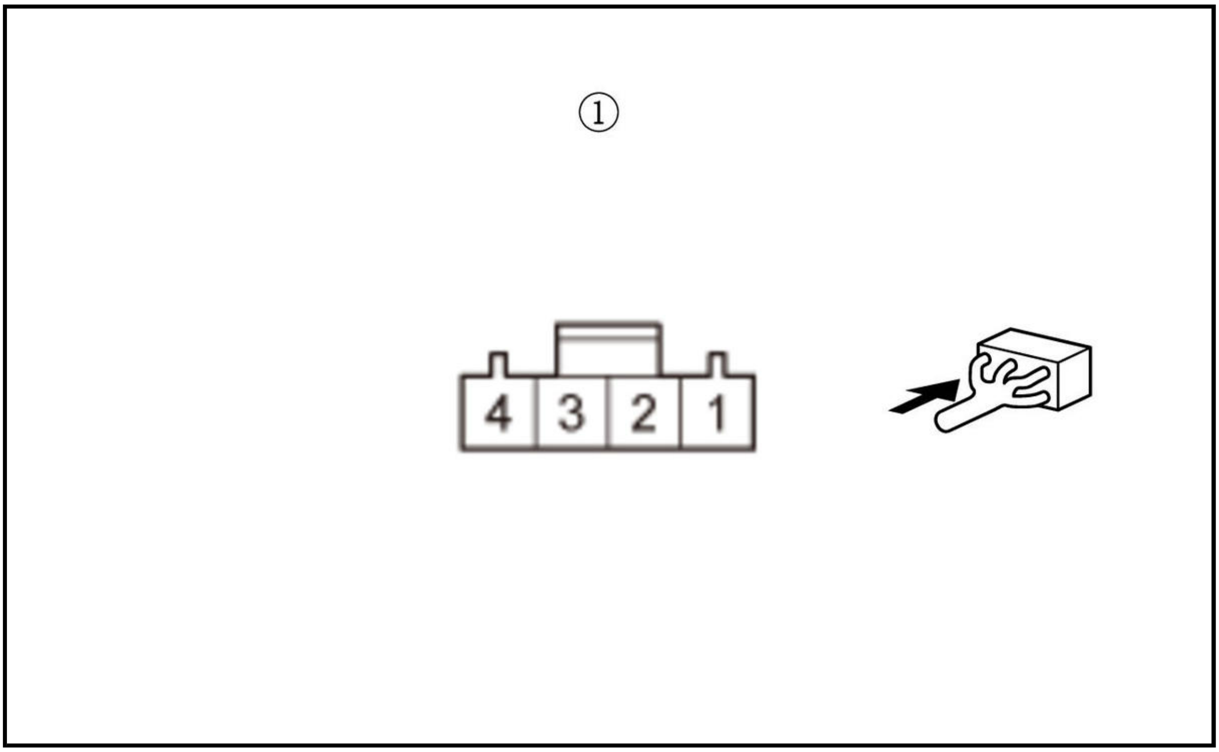
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Driver's seat heater connector A (4P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Clear the DTCs with the HDS.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B1C61 Driver's heater current abnormal low	B

Is DTC B1C61 indicated?

YES

Repair an open or high resistance in the HEATER DR wire.

NO

Go to step 3.

3. Seat heater check

-1. **Test the driver's seat heater** .

Are the driver's seat cushion heater and driver's seat-back heater OK?

YES

Replace the front seat heater control unit .

NO

Replace the driver's seat cushion heater and/or the driver's seat-back heater .

DTC B1C62

DTC B1C62 : Passenger's heater current abnormal high

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

Is DTC B1C62 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check 1

-1. Disconnect the following connector.

Front passenger's seat heater connector B (2P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

Is DTC B1C62 indicated?

YES

Go to step 3.

NO

Replace the front passenger's seat-back heater .

3. DTC check 2

-1. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

Is DTC B1C62 indicated?

YES

Go to step 4.

NO

Replace the front passenger's seat cushion heater .

4. Shorted wire check (AS H/SEAT LO RLY COM line)

-1. Disconnect the following connector.

Front seat heater control unit 24P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Front passenger's seat heater connector A (4P): disconnected
Test point 1	**Front seat heater control unit 24P connector No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the wire.

NO

Replace the front seat heater control unit .

DTC B1C63

DTC B1C63 : Passenger's heater current abnormal low

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C63 Passenger's heater current abnormal low	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C63 Passenger's heater current abnormal low	B

   Is DTC B1C63 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

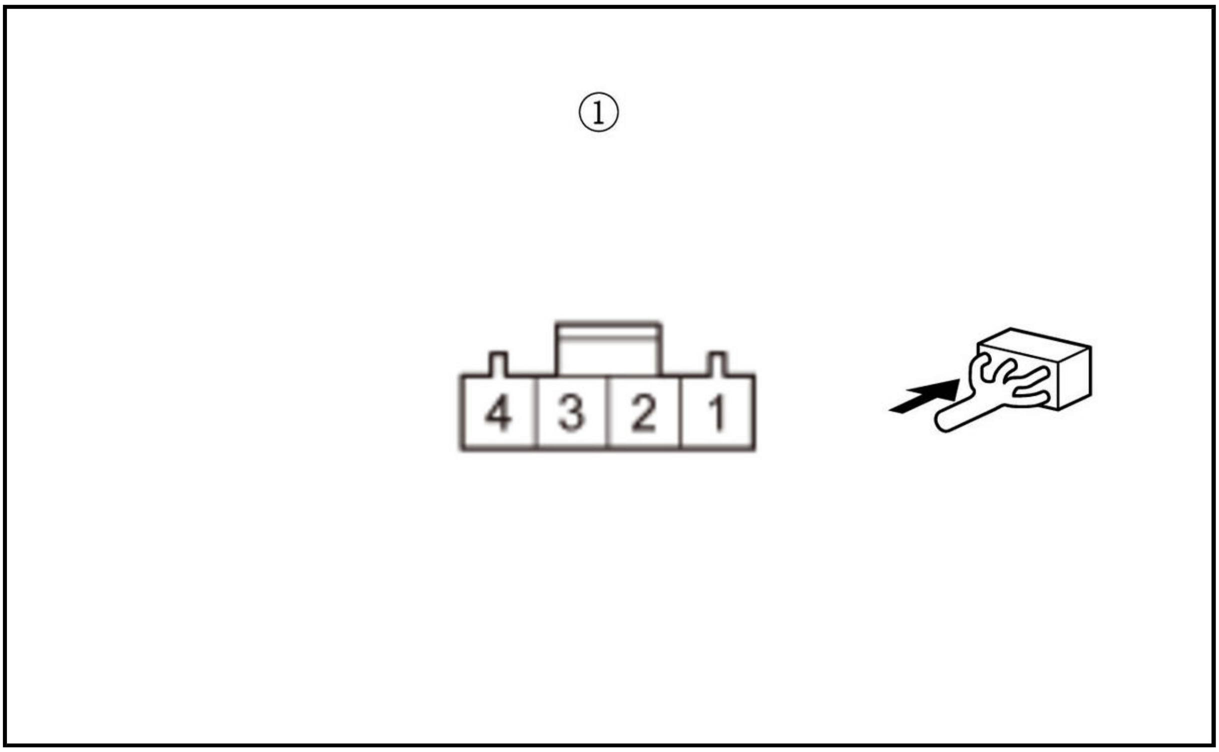
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Clear the DTCs with the HDS.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B1C63 Passenger's heater current abnormal low	B

Is DTC B1C63 indicated?

YES

Repair an open or high resistance in the AS H/SEAT LO RLY COM wire.

NO

Go to step 3.

3. Seat heater check

-1. **Test the driver's seat heater** .

Are the driver's seat cushion heater and driver's seat-back heater OK?

YES

Replace the front seat heater control unit .

NO

Replace the front passenger's seat cushion heater and/or the front passenger's seat-back heater .

DTC B1C68

DTC B1C68 : Driver's heater not heating

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C68 Driver's heater not heating	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C68 Driver's heater not heating	B

   Is DTC B1C68 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1C55 Driver's heater thermistor circuit open	B
B1C56 Driver's heater thermistor circuit short	B
B1C60 Driver's heater current abnormal high	B
B1C61 Driver's heater current abnormal low	B

   Are DTCs B1C55, B1C56, B1C60, and/or B1C61 indicated?

   YES: DTC B1C55 is indicated

   Go to DTC B1C55 troubleshooting.

   YES: DTC B1C56 is indicated

   Go to DTC B1C56 troubleshooting.

   YES: DTC B1C60 is indicated

   Go to DTC B1C60 troubleshooting.

   YES: DTC B1C61 is indicated

Go to DTC B1C61 troubleshooting.

NO

Replace the driver's seat cushion heater .

DTC B1C69

DTC B1C69 : Passenger's heater not heating

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C69 Passenger's heater not heating	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C69 Passenger's heater not heating	B

   Is DTC B1C69 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1C57 Passenger's heater thermistor circuit open	B
B1C58 Passenger's heater thermistor circuit short	B
B1C62 Passenger's heater current abnormal high	B
B1C63 Passenger's heater current abnormal low	B

   Are DTCs B1C57, B1C58, B1C62, and/or B1C63 indicated?

   YES: DTC B1C57 is indicated

Go to DTC B1C57 troubleshooting.

YES: DTC B1C58 is indicated

Go to DTC B1C58 troubleshooting.

YES: DTC B1C62 is indicated

Go to DTC B1C62 troubleshooting.

YES: DTC B1C63 is indicated

Go to DTC B1C63 troubleshooting.

NO

Replace the front passenger's seat cushion heater .

DTC B1C70

DTC B1C70 : Driver's main heater switch failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C70 Driver's main heater switch failure	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C70 Driver's main heater switch failure	B

   Is DTC B1C70 indicated?

   YES

   Replace the front seat heater control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1C71

DTC B1C71 : Passenger's main heater switch failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C71 Passenger's main heater switch failure	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C71 Passenger's main heater switch failure	B

   Is DTC B1C71 indicated?

   YES

   Replace the front seat heater control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1064 (FRONT SEAT HEATER CONTROL UNIT)

DTC U1064 : Seat heater control unit lost communication with climate control unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
U1064 Seat heater control unit lost communication with climate control unit	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1064 Seat heater control unit lost communication with climate control unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Front seat heater control unit 24P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1064	Climate control unit connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnectedTransmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1064	B-CAN_H	**Front seat heater control unit 24P connector**	No. 10	**Climate control unit connector A (32P)**	No. 25
	B-CAN_L		No. 9		No. 8

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.Refer to the DTC shown on the display, then replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U1064	**Climate control unit**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (FRONT SEAT HEATER CONTROL UNIT)

DTC U1280 : Seat heater control unit communication bus line error (BUS-OFF)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
U1280 Seat heater control unit communication bus line error (BUS-OFF)	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Seat heater control unit communication bus line error (BUS-OFF)	B

   Is DTC U1280 indicated?

   YES

   Go to body control module DTC U1280 troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC TROUBLESHOOTING

DTC B1C55

DTC B1C55 : Driver's heater thermistor circuit open

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C55 Driver's heater thermistor circuit open	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 90 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1C55 Driver's heater thermistor circuit open	B

   Is DTC B1C55 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Seat heater check 1

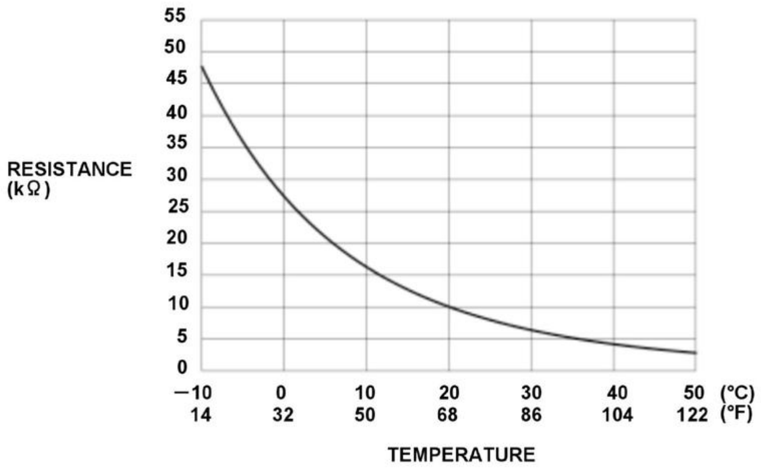
   -1. Disconnect the following connector.

Front seat heater control unit 24P connector

   -2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected
Test point 1	**Front seat heater control unit 24P connector No. 12**

Test point 2	Front seat heater control unit 24P connector No. 22



Is resistance value within the range?

YES

Replace the front seat heater control unit .

NO

Go to step 3.

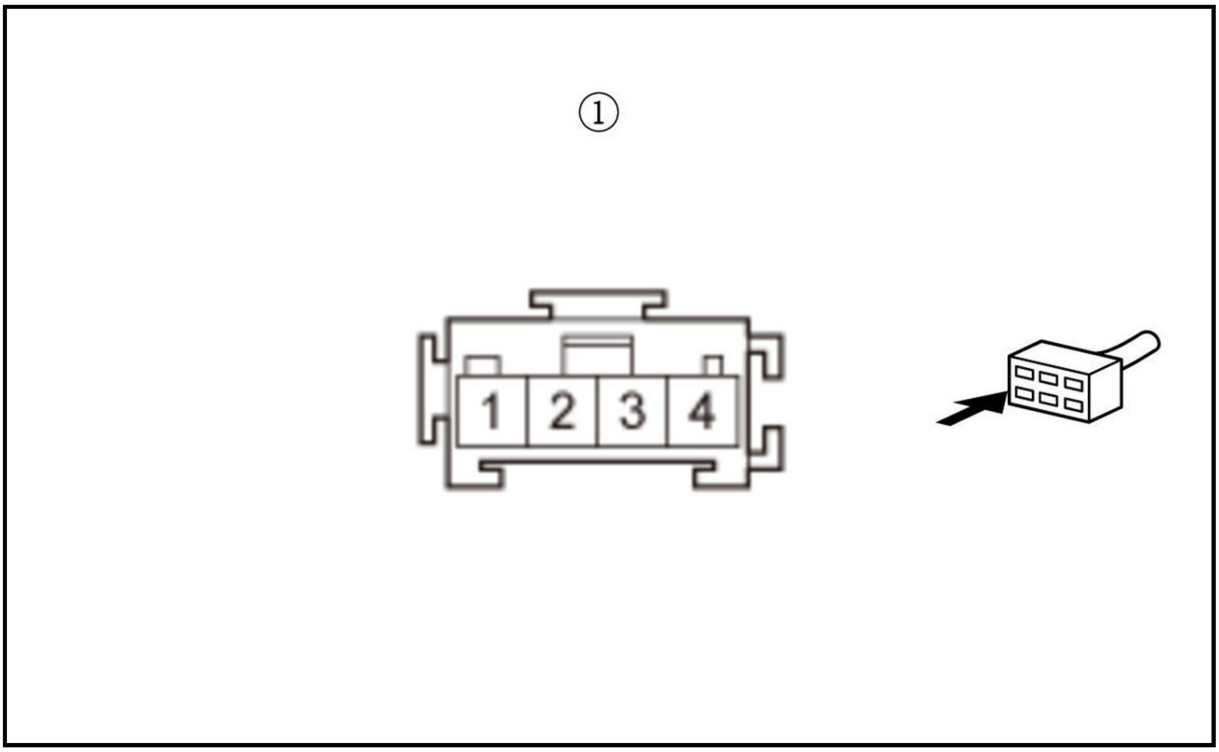
3. Seat heater check 2

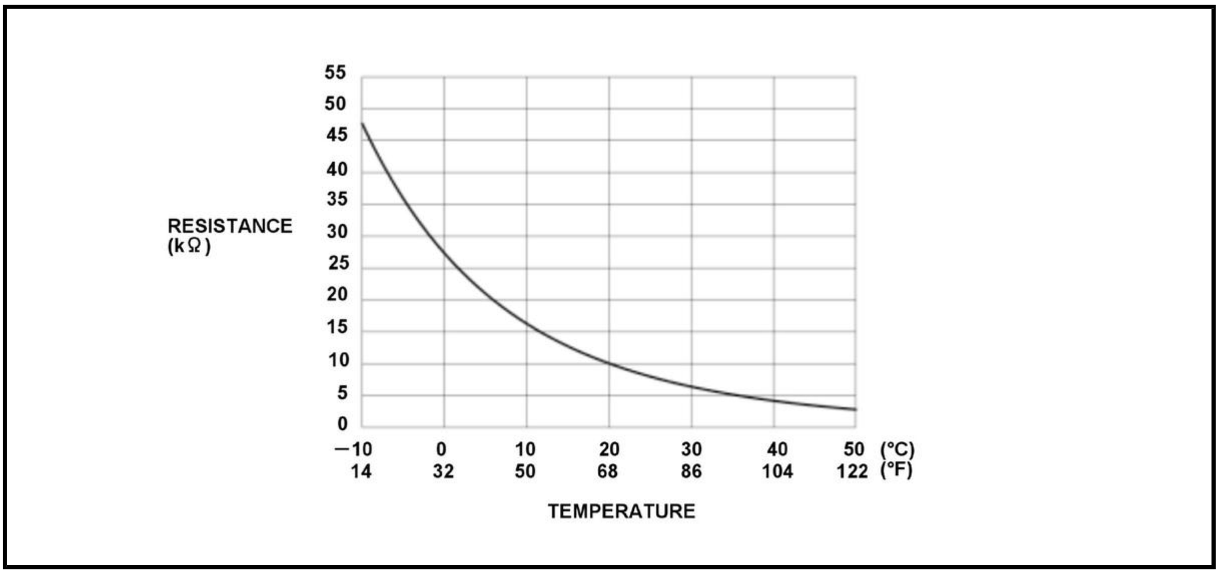
-1. Disconnect the following connector.

Driver's seat heater connector A (4P)

-2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Driver's seat heater connector A (4P): disconnected
Test point 1	Driver's seat heater connector A (4P) (male terminals) No. 3: ①
Test point 2	Driver's seat heater connector A (4P) (male terminals) No. 4: ①





Is resistance value within the range?

YES

Go to step 4.

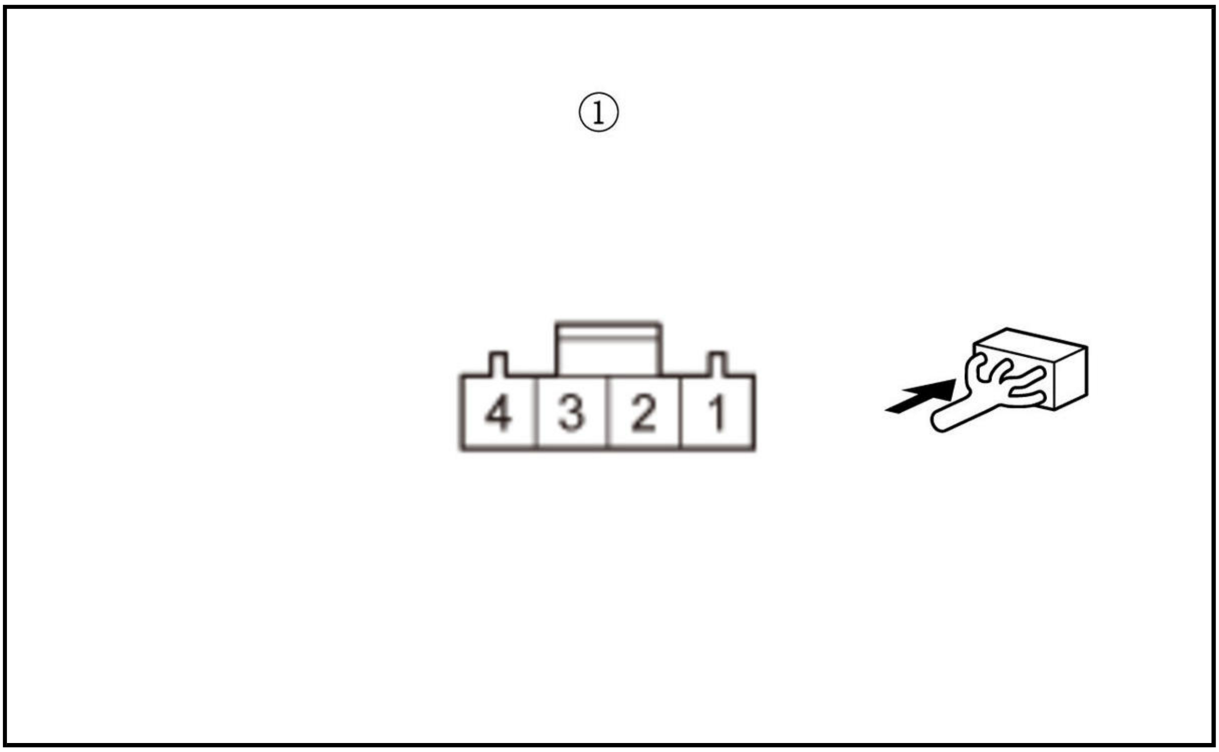
NO

Replace the driver's seat cushion heater .

4. Open wire check (TH+_DR line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Driver's seat heater connector A (4P) : disconnected
Test point 1	**Front seat heater control unit 24P connector No. 12**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Repair an open or high resistance in the TH-_DR wire.

NO

Repair an open or high resistance in the TH+_DR wire.

DTC B1C56

DTC B1C56 : Driver's heater thermistor circuit short

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C56 Driver's heater thermistor circuit short	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 90 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C56 Driver's heater thermistor circuit short	B

Is DTC B1C56 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's seat heater connector A (4P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTCs with the HDS.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B1C56 Driver's heater thermistor circuit short	B

Is DTC B1C56 indicated?

YES

Repair a short in the TH+_DR wire.

NO

Faulty driver's seat heater thermistor; **replace the driver's seat cushion heater** .

DTC B1C57

DTC B1C57 : Passenger's heater thermistor circuit open

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C57 Passenger's heater thermistor circuit open	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 90 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1C57 Passenger's heater thermistor circuit open	B

Is DTC B1C57 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

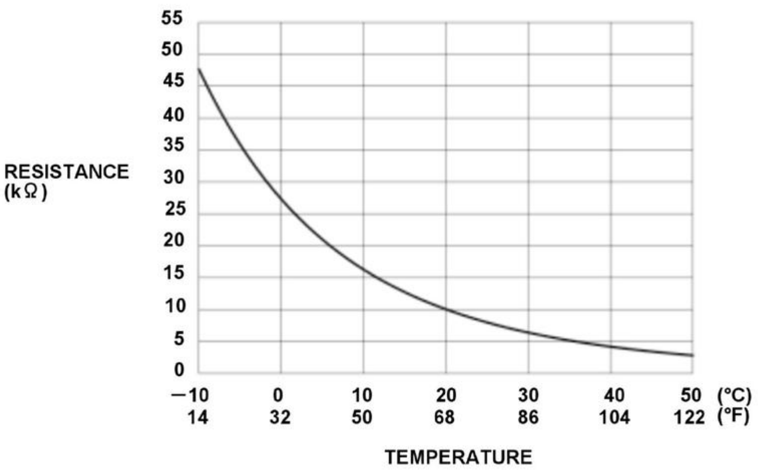
2. Seat heater check 1

   -1. Disconnect the following connector.

Front seat heater control unit 24P connector

-2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected
Test point 1	**Front seat heater control unit 24P connector No. 13**
Test point 2	**Front seat heater control unit 24P connector No. 23**



Is resistance value within the range?

YES

Replace the front seat heater control unit .

NO

Go to step 3.

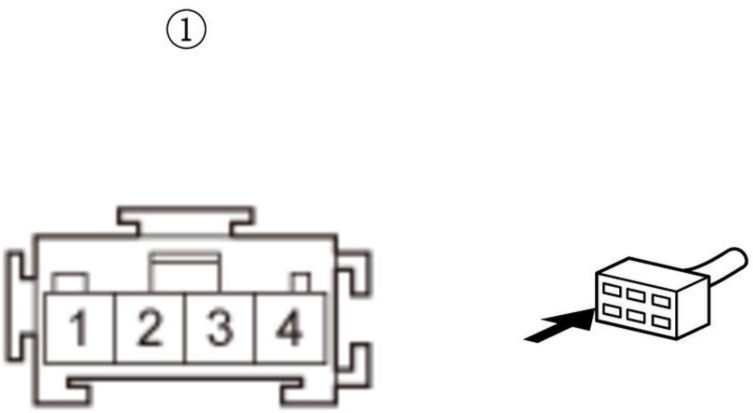
3. Seat heater check 2

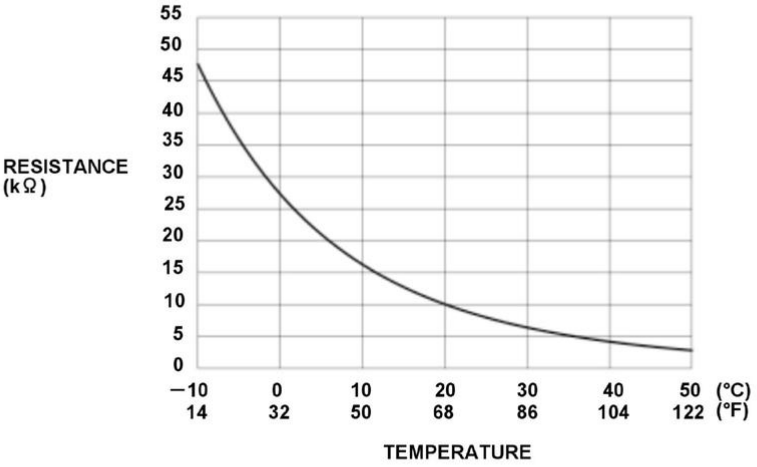
-1. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

-2. Measure the resistance between test points 1 and 2, refer to the following table.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Front passenger's seat heater connector A (4P): disconnected
Test point 1	Front passenger's seat heater connector A (4P) (male terminals) No. 3: ①
Test point 2	Front passenger's seat heater connector A (4P) (male terminals) No. 4: ①





Is resistance value within the range?

YES

Go to step 4.

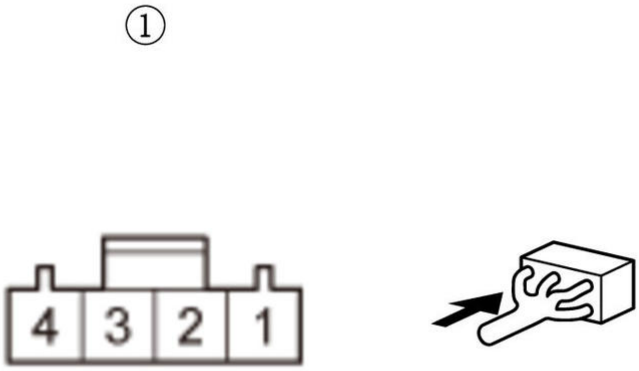
NO

Replace the front passenger's seat cushion heater .

4. Open wire check (TH+_AS line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Front passenger's seat heater connector A (4P) : disconnected
Test point 1	**Front seat heater control unit 24P connector No. 13**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Repair an open or high resistance in the TH-_AS wire.

NO

Repair an open or high resistance in the TH+_AS wire.

DTC B1C58

DTC B1C58 : Passenger's heater thermistor circuit short

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C58 Passenger's heater thermistor circuit short	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 90 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1C58 Passenger's heater thermistor circuit short	B

   Is DTC B1C58 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTCs with the HDS.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B1C58 Passenger's heater thermistor circuit short	B

Is DTC B1C58 indicated?

YES

Repair a short in the TH+_AS wire.

NO

Faulty front passenger's seat heater thermistor; **replace the front passenger's seat cushion heater** .

DTC B1C60

DTC B1C60 : Driver's heater current abnormal high

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

Is DTC B1C60 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check 1

-1. Disconnect the following connector.

Driver's seat heater connector B (2P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

Is DTC B1C60 indicated?

YES

Go to step 3.

NO

Replace the driver's seat-back heater .

3. DTC check 2

-1. Disconnect the following connector.

Driver's seat heater connector A (4P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C60 Driver's heater current abnormal high	B

Is DTC B1C60 indicated?

YES

Go to step 4.

NO

Replace the driver's seat cushion heater .

4. Shorted wire check (HEATER_DR line)

-1. Disconnect the following connector.

Front seat heater control unit 24P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Driver's seat heater connector A (4P): disconnected
Test point 1	**Front seat heater control unit 24P connector No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the front seat heater control unit .

NO

Repair a short in the wire.

DTC B1C61

DTC B1C61 : Driver's heater current abnormal low

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C61 Driver's heater current abnormal low	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1C61 Driver's heater current abnormal low	B

Is DTC B1C61 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

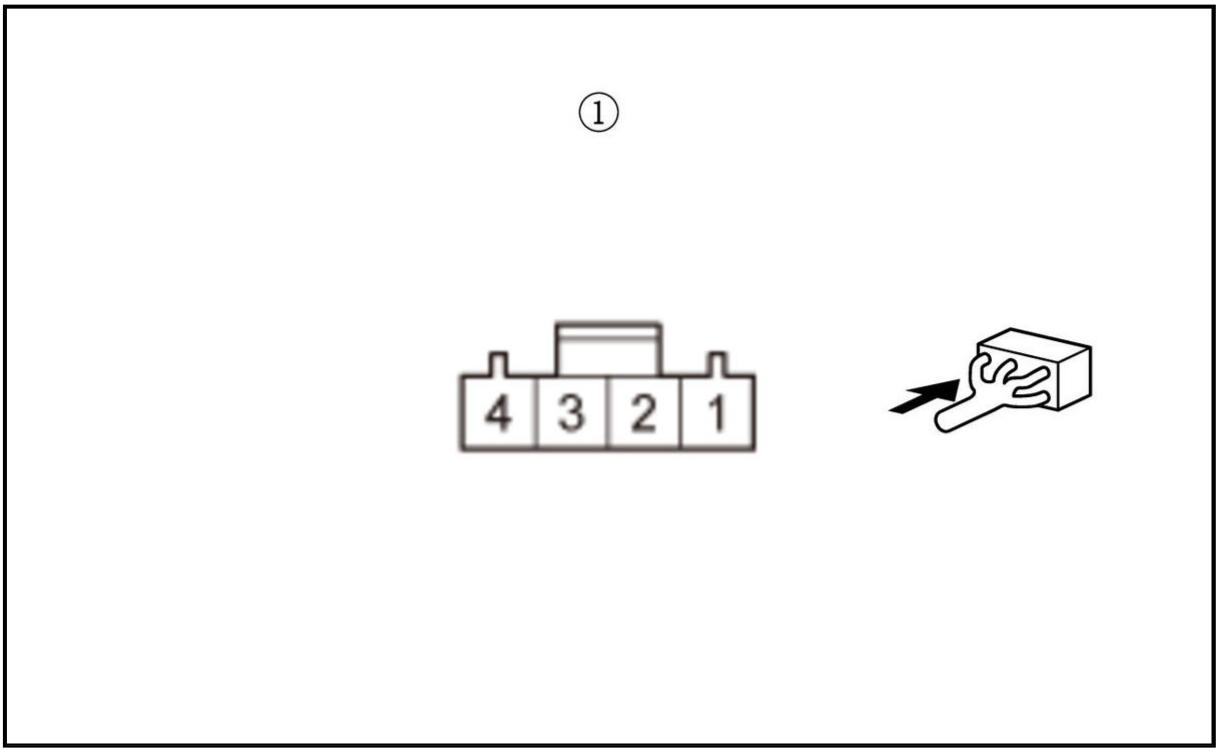
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's seat heater connector A (4P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Clear the DTCs with the HDS.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B1C61 Driver's heater current abnormal low	B

Is DTC B1C61 indicated?

YES

Repair an open or high resistance in the HEATER DR wire.

NO

Go to step 3.

3. Seat heater check

-1. **Test the driver's seat heater** .

Are the driver's seat cushion heater and driver's seat-back heater OK?

YES

Replace the front seat heater control unit .

NO

Replace the driver's seat cushion heater and/or the driver's seat-back heater .

DTC B1C62

DTC B1C62 : Passenger's heater current abnormal high

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

Is DTC B1C62 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check 1

-1. Disconnect the following connector.

Front passenger's seat heater connector B (2P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

Is DTC B1C62 indicated?

YES

Go to step 3.

NO

Replace the front passenger's seat-back heater .

3. DTC check 2

-1. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

-2. Turn the vehicle to the ON mode.

-3. Clear the DTCs with the HDS.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1C62 Passenger's heater current abnormal high	B

Is DTC B1C62 indicated?

YES

Go to step 4.

NO

Replace the front passenger's seat cushion heater .

4. Shorted wire check (AS_H/SEAT_LO_RLY_COM line)

-1. Disconnect the following connector.

Front seat heater control unit 24P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Front passenger's seat heater connector A (4P): disconnected
Test point 1	**Front seat heater control unit 24P connector No. 3**

Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the front seat heater control unit .

NO

Repair a short in the wire.

DTC B1C63

DTC B1C63 : Passenger's heater current abnormal low

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C63 Passenger's heater current abnormal low	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C63 Passenger's heater current abnormal low	B

   Is DTC B1C63 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

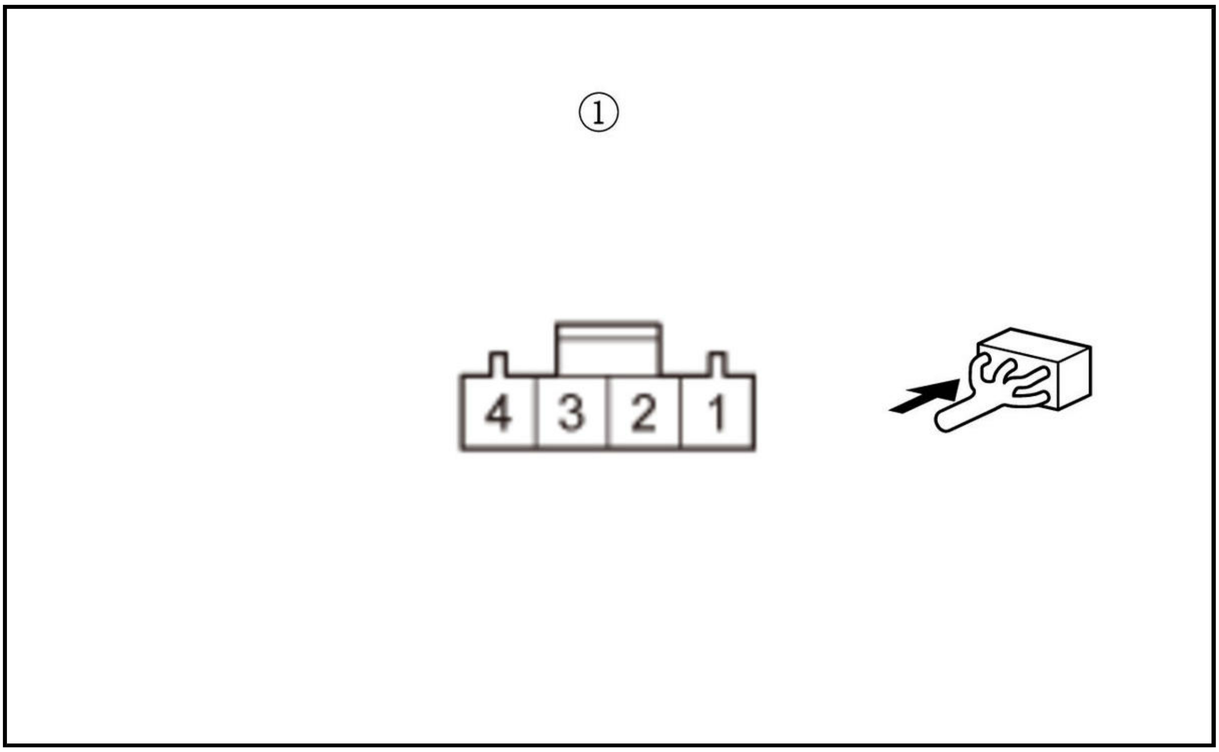
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Front passenger's seat heater connector A (4P)

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat heater connector A (4P) (female terminals) No. 3: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Clear the DTCs with the HDS.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B1C63 Passenger's heater current abnormal low	B

Is DTC B1C63 indicated?

YES

Repair an open or high resistance in the AS H/SEAT LO RLY COM wire.

NO

Go to step 3.

3. Seat heater check

-1. **Test the front passenger's seat heater** .

Are the front passenger's seat cushion heater and front passenger's seat-back heater OK?

YES

Replace the front seat heater control unit .

NO

Replace the front passenger's seat cushion heater and/or the front passenger's seat-back heater .

DTC B1C68

DTC B1C68 : Driver's heater not heating

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C68 Driver's heater not heating	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C68 Driver's heater not heating	B

   Is DTC B1C68 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1C55 Driver's heater thermistor circuit open	B
B1C56 Driver's heater thermistor circuit short	B
B1C60 Driver's heater current abnormal high	B
B1C61 Driver's heater current abnormal low	B

   Are DTCs B1C55, B1C56, B1C60, and/or B1C61 indicated?

   YES: DTC B1C55 is indicated

   Go to DTC B1C55 troubleshooting.

   YES: DTC B1C56 is indicated

   Go to DTC B1C56 troubleshooting.

   YES: DTC B1C60 is indicated

   Go to DTC B1C60 troubleshooting.

   YES: DTC B1C61 is indicated

Go to DTC B1C61 troubleshooting.

NO

Replace the driver's seat cushion heater .

DTC B1C69

DTC B1C69 : Passenger's heater not heating

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C69 Passenger's heater not heating	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C69 Passenger's heater not heating	B

   Is DTC B1C69 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B1C57 Passenger's heater thermistor circuit open	B
B1C58 Passenger's heater thermistor circuit short	B
B1C62 Passenger's heater current abnormal high	B
B1C63 Passenger's heater current abnormal low	B

   Are DTCs B1C57, B1C58, B1C62, and/or B1C63 indicated?

   YES: DTC B1C57 is indicated

Go to DTC B1C57 troubleshooting.

YES: DTC B1C58 is indicated

Go to DTC B1C58 troubleshooting.

YES: DTC B1C62 is indicated

Go to DTC B1C62 troubleshooting.

YES: DTC B1C63 is indicated

Go to DTC B1C63 troubleshooting.

NO

Replace the front passenger's seat cushion heater .

DTC B1C70

DTC B1C70 : Driver's main heater switch failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C70 Driver's main heater switch failure	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C70 Driver's main heater switch failure	B

   Is DTC B1C70 indicated?

   YES

   Replace the front seat heater control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1C71

DTC B1C71 : Passenger's main heater switch failure

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
B1C71 Passenger's main heater switch failure	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1C71 Passenger's main heater switch failure	B

   Is DTC B1C71 indicated?

   YES

   Replace the front seat heater control unit .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U1064 (FRONT SEAT HEATER CONTROL UNIT)

DTC U1064 : Seat heater control unit lost communication with climate control unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
U1064 Seat heater control unit lost communication with climate control unit	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1064 Seat heater control unit lost communication with climate control unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Front seat heater control unit 24P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1064	Climate control unit connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Front seat heater control unit 24P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1064	B-CAN_H	**Front seat heater control unit 24P connector**	No. 10	**Climate control unit connector A (32P)**	No. 25
	B-CAN_L		No. 9		No. 8

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.

Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1064	Climate control unit

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U1280 (FRONT SEAT HEATER CONTROL UNIT)

DTC U1280 : Seat heater control unit communication bus line error (BUS-OFF)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- The front seat heater control unit does not turn on the front seat heater until the seat core temperature is 185B°F (85B°C) or less. Make sure the seat core temperature is below 185B°F (85B°C) before troubleshooting.

DTC Description	DTC
U1280 Seat heater control unit communication bus line error (BUS-OFF)	B

DTC (Front Seat Heater Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 Seat heater control unit communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

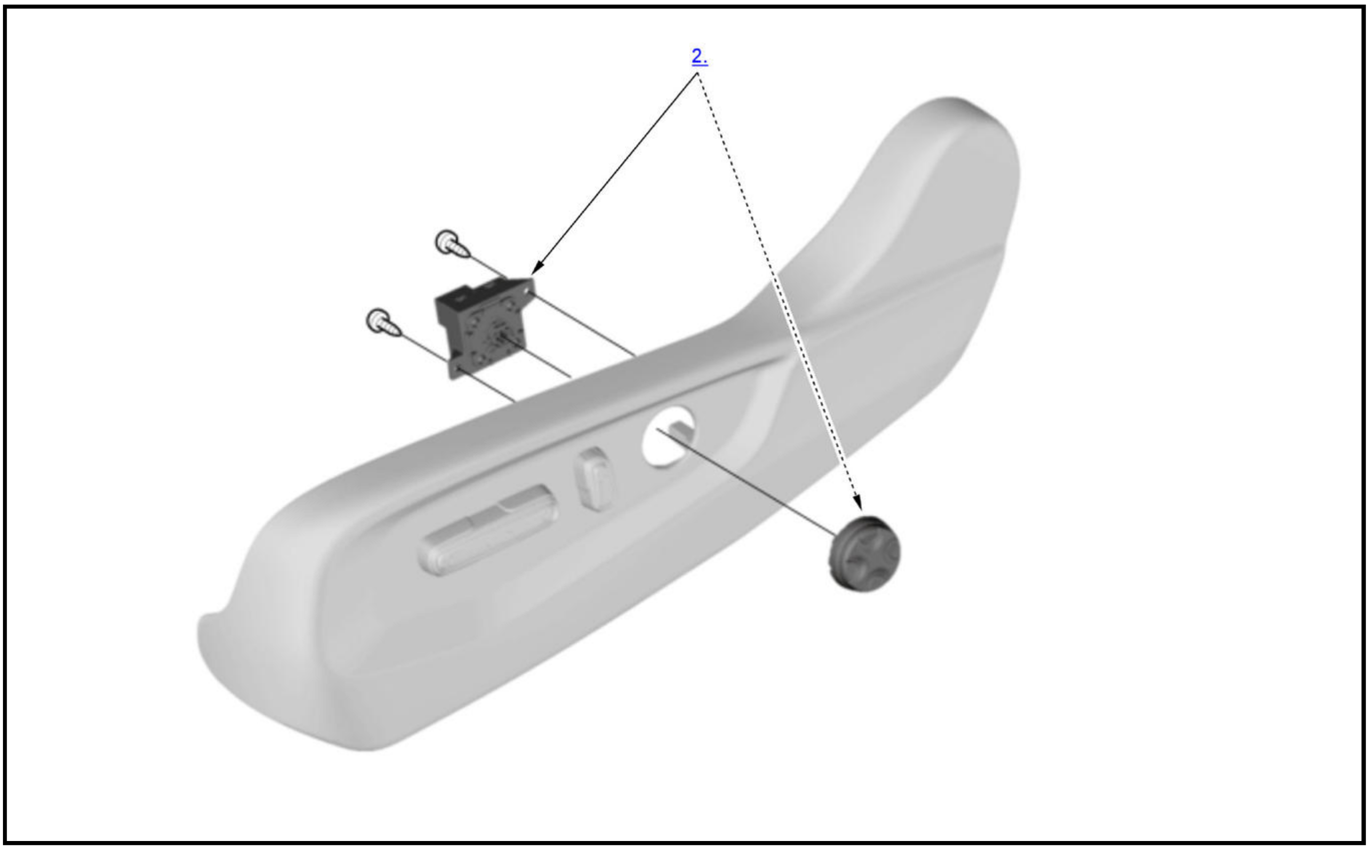
Intermittent failure, the system is OK at this time. Check for loose or poor connections.

REMOVAL & INSTALLATION TEST

POWER LUMBAR SUPPORT SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



1. **Driver's Seat Recline Cover - Remove**

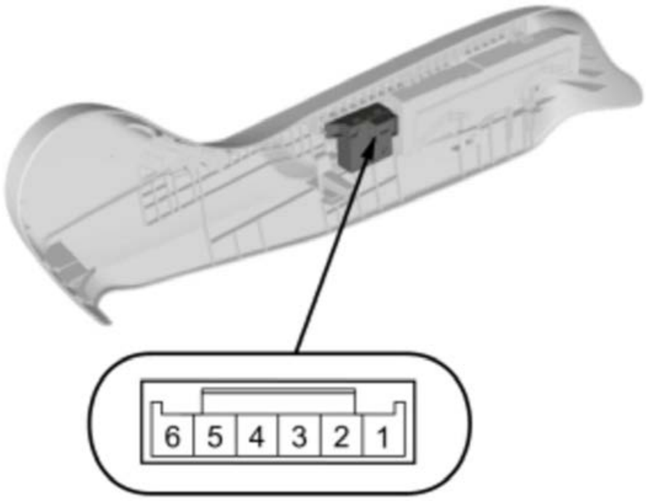
   NOTE: If removing the driver's seat recline cover, you do not need to remove the driver's seat.

2. Power Lumbar Support Switch - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

Test

1. Power Lumbar Support Switch - Test



Position \ Terminal	6	5	4	3	2	1
UP	*○	—	○			
				○	—	○
DOWN	*○	—	—	○		
			○	—	—	○
FORWARD	*○	—	—	—	○	
		○	—	—	—	○
BACKWARD	*○	○				
					○	○

*: There is continuity when switch is not pressed.

1. Check for continuity between the terminals in each switch position according to the table in illustration.

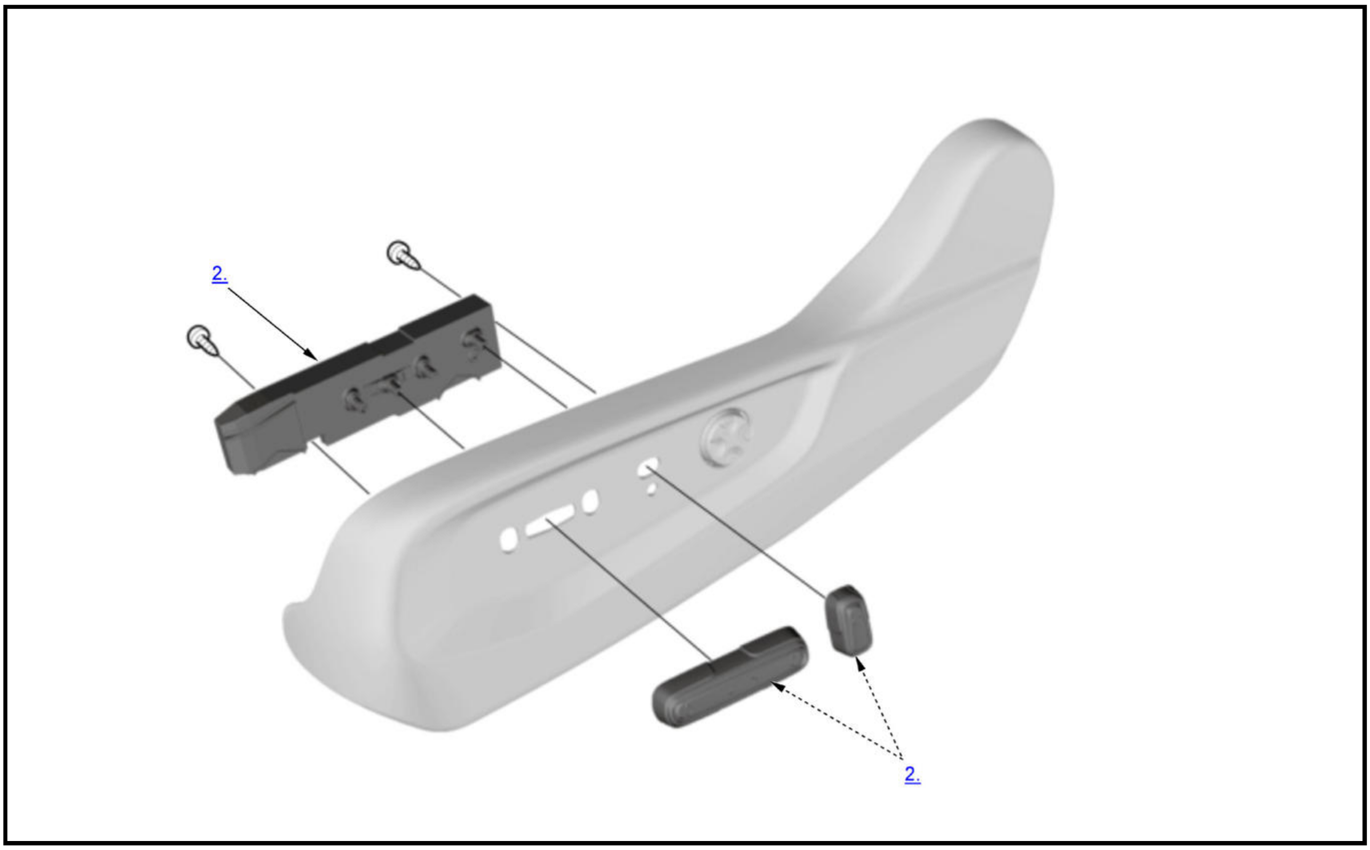
2. If the continuity is not as specified, replace the power lumbar support switch.

POWER SEAT ADJUSTMENT SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

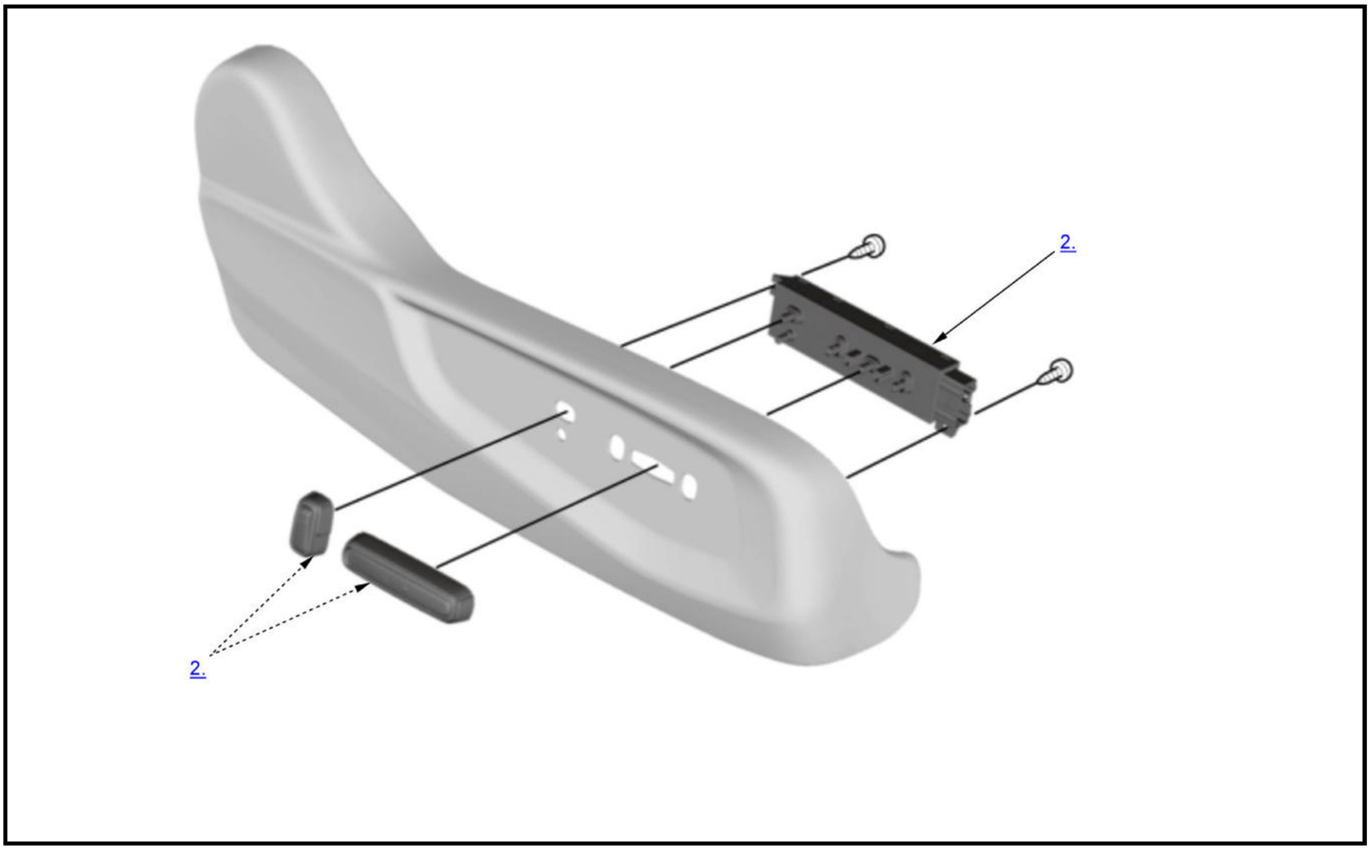
1

Driver's (Without DPMS)



2

Front Passenger's



1. **Driver's/Front Passenger's Seat Recline Cover - Remove**

   NOTE: If you are only removing the driver's and/or front passenger's seat recline cover, you do not need to remove the driver's and/or front passenger's seat.

2. Driver's/Front Passenger's Power Seat Adjustment Switch - Remove

3. All Removed Parts - Install

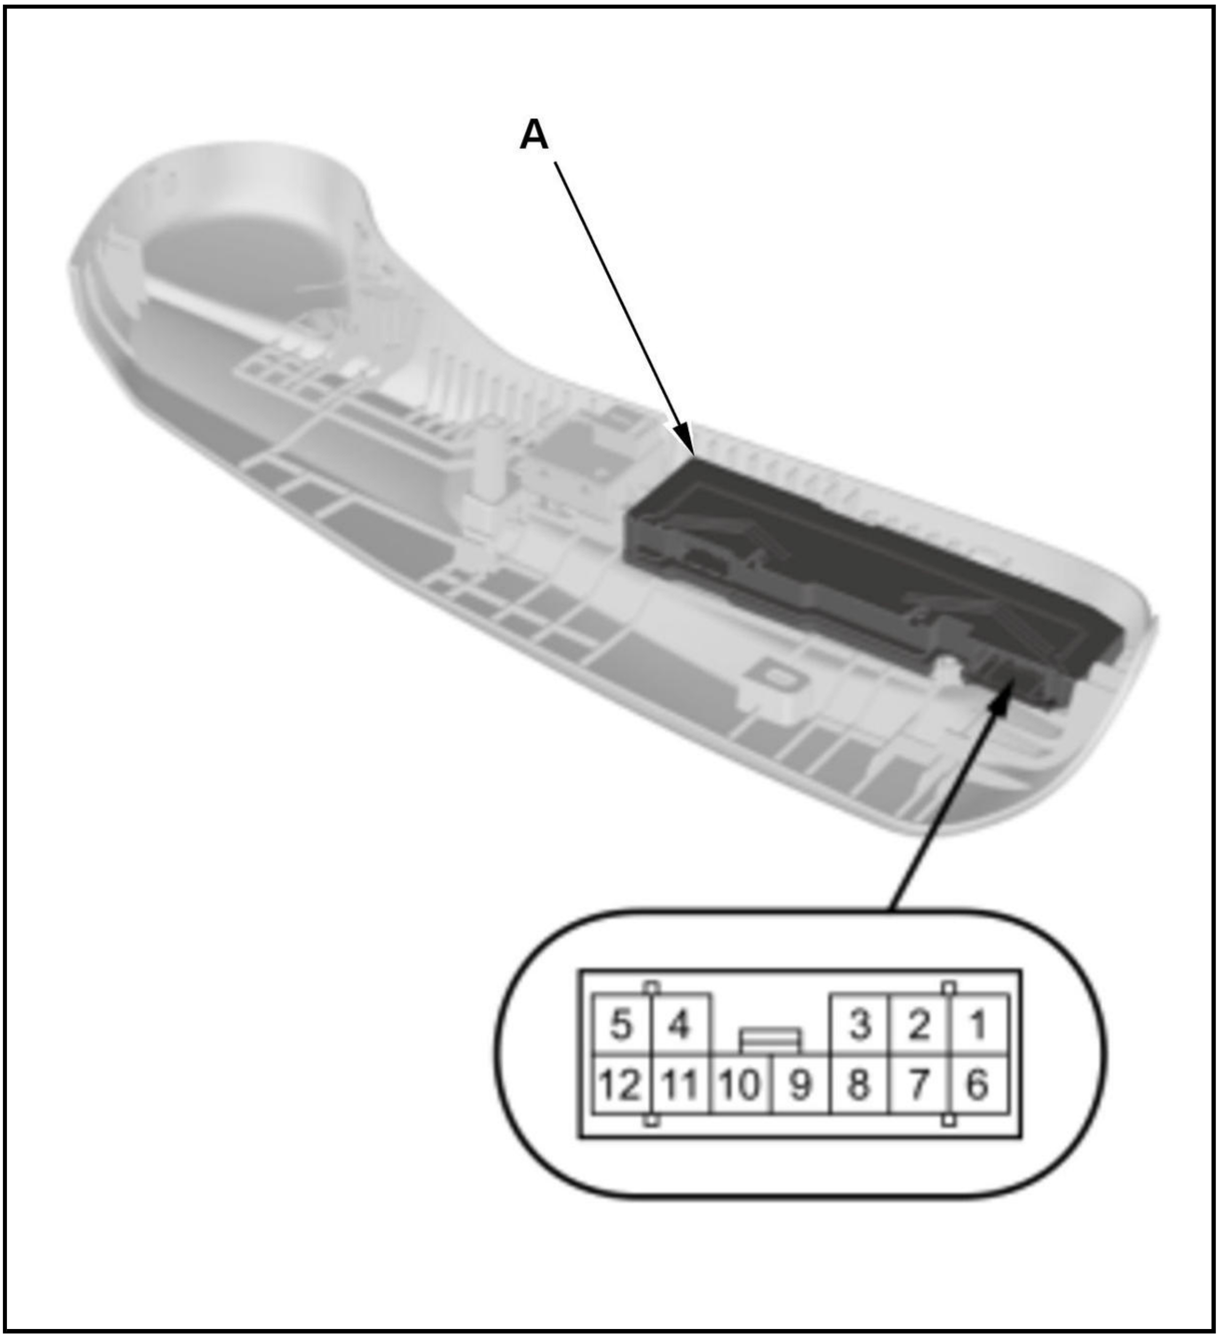
   1. Install the parts in the reverse order of removal.

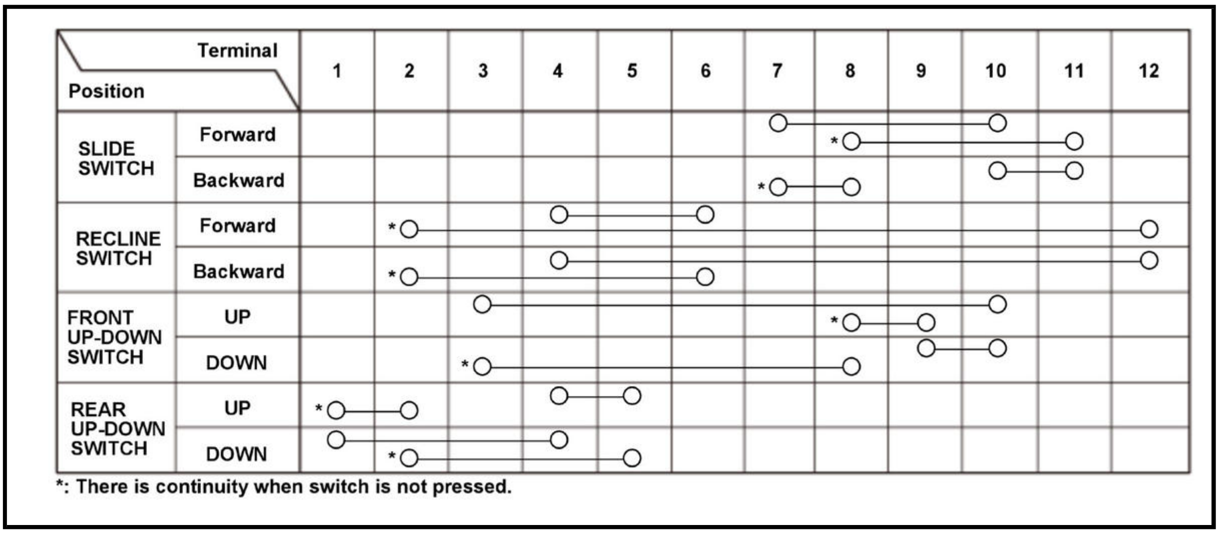
Test

1. Power Seat Adjustment Switch - Test

   Driver's (Without DPMS)

   1. Check for continuity between the terminals in each switch position according to the table in illustration.





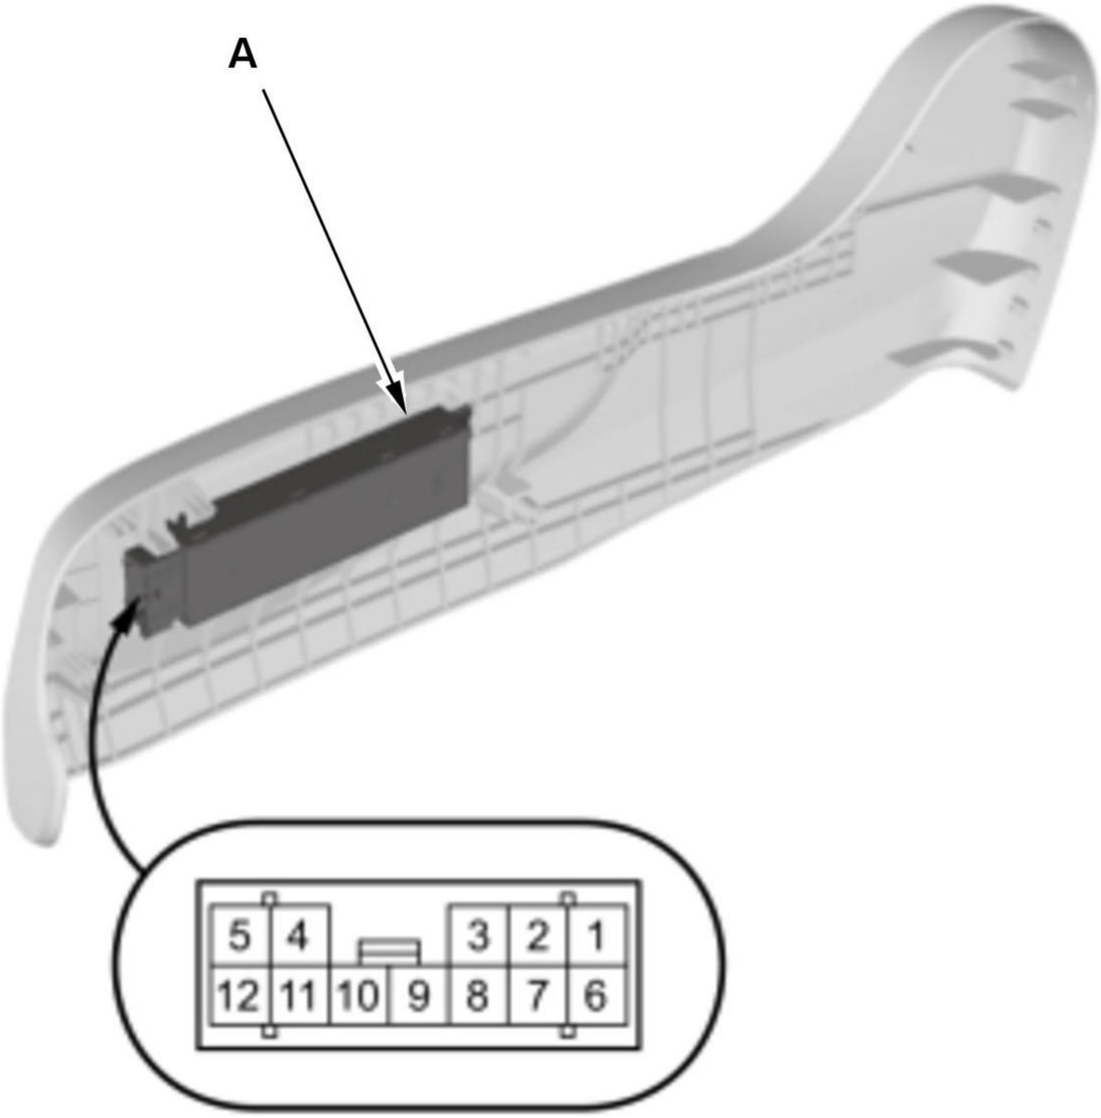
Position		1	2	3	4	5	6	7	8	9	10	11	12
SLIDE SWITCH	Forward							○			○		
									*○			○	
	Backward										○	○	
								*○	○				
RECLINE SWITCH	Forward				○		○						
			*○										○
	Backward				○								○
			*○				○						
FRONT UP-DOWN SWITCH	UP			○							○		
									*○	○			
	DOWN									○	○		
				*○					○				
REAR UP-DOWN SWITCH	UP				○	○							
		*○	○										
	DOWN	○			○								
			*○			○							

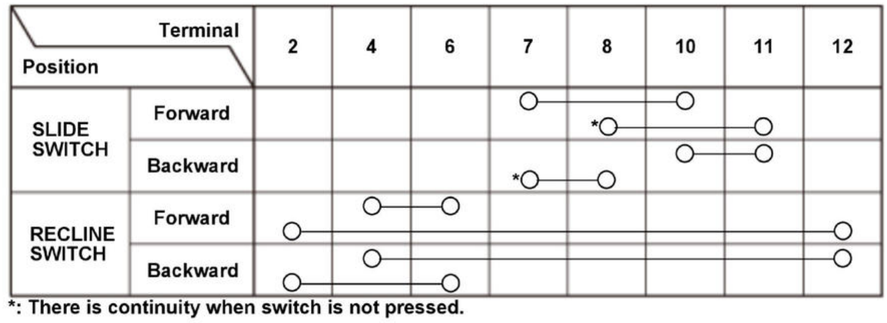
*: There is continuity when switch is not pressed.

2. If the continuity is not as specified, replace the driver's power seat adjustment switch (A).

Front Passenger's

3. Check for continuity between the terminals in each switch position according to the table in illustration.





Position		Terminal 2	4	6	7	8	10	11	12
SLIDE SWITCH	Forward				○	—	○		
						*○	—	○	
	Backward						○	○	
					*○	○			
RECLINE SWITCH	Forward		○	○					
		○	—	—	—	—	—	—	○
	Backward		○	—	—	—	—	—	○
		○	—	○					

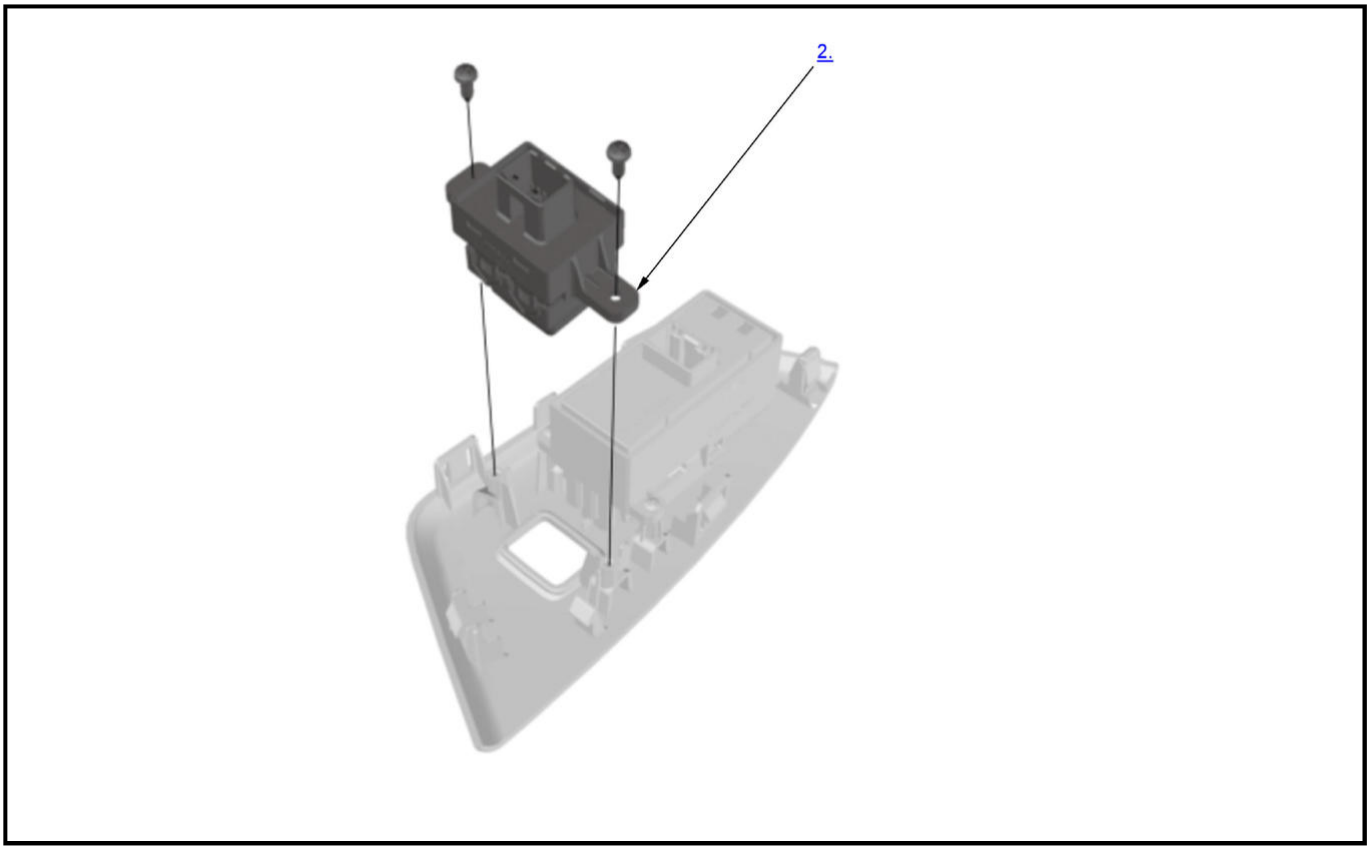
*: There is continuity when switch is not pressed.

4. If the continuity is not as specified, replace the front passenger's power seat adjustment switch (A).

SEAT HEATER SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



1. Rear Door Power Window Switch Panel - Remove
2. Rear Seat Heater Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Rear Seat heater Switch - Test

    1. Check the rear seat heater switch (A) according to the table in illustration.

NOTE:

- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**

   2. If the result is not as specified, replace the rear seat heater switch.
2. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

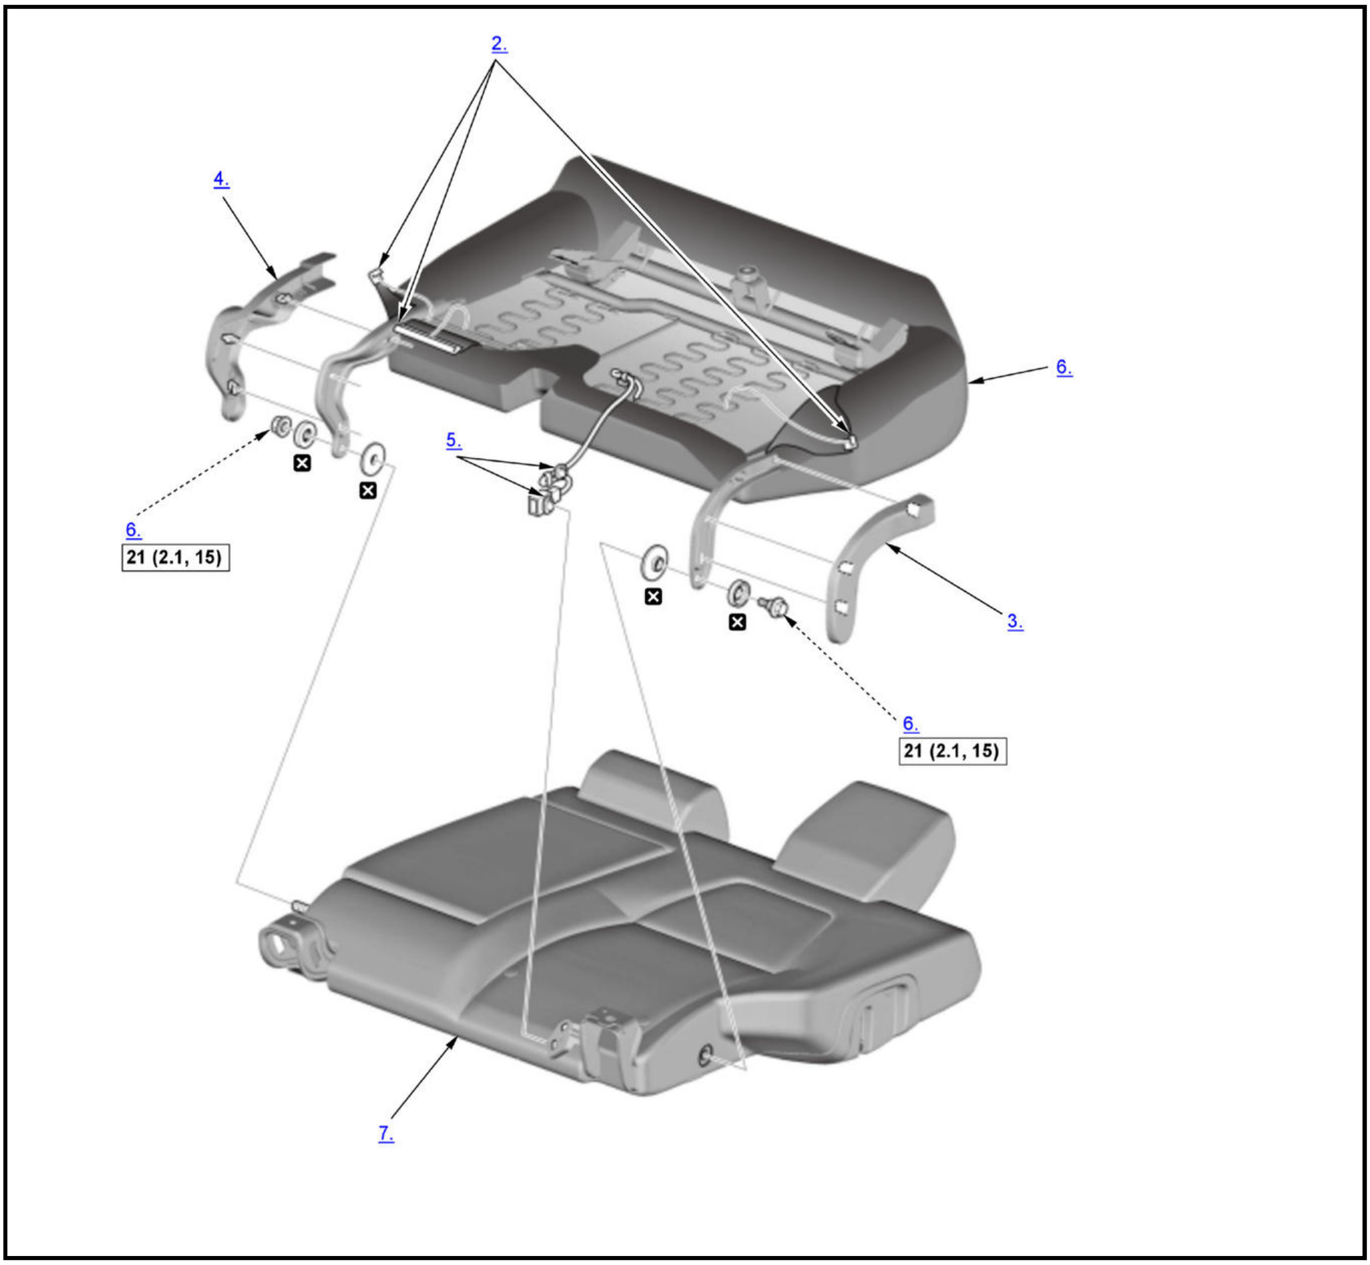
DISASSEMBLY AND REASSEMBLY

REAR SEAT DISASSEMBLY AND REASSEMBLY

Disassembly and Reassembly

NOTE: The left rear seat is shown, the right rear seat is similar.

1



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Rear Seat - Remove**
2. Rear Seat Cushion Cover Hooks - Release
3. Rear Seat Outer Arm Cover - Remove
4. Rear Seat Inner Arm Cover - Remove
5. Rear Seat Cushion Heater Harness Clips - Remove (For Some Models)
6. Rear Seat Cushion - Remove
7. Rear Seat-Back - Remove
8. All Disassembled Parts - Reassemble

1. Reassemble the parts in the reverse order of disassembly.

REMOVAL AND INSTALLATION

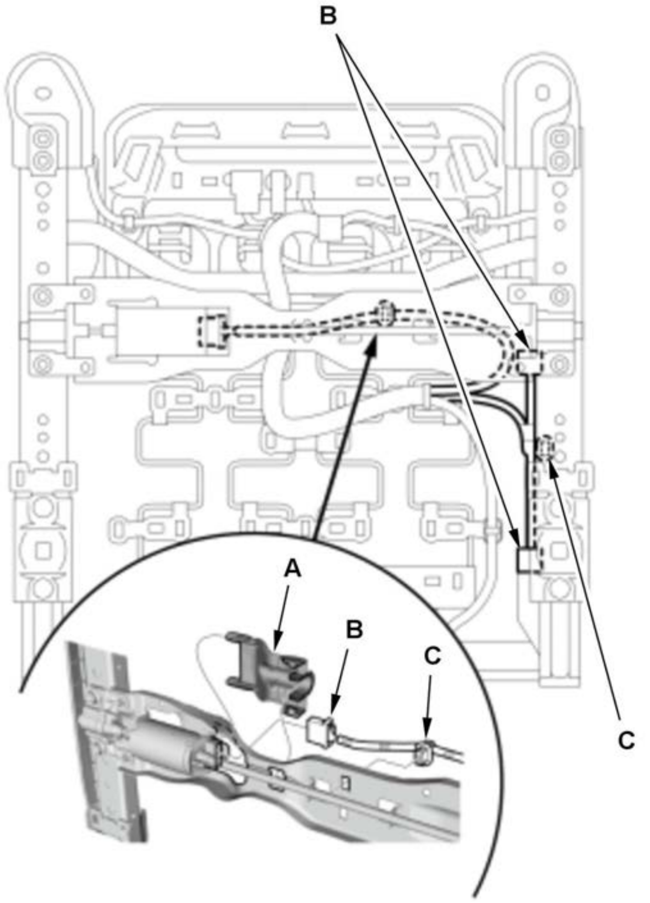
FRONT PASSENGER'S SEAT RAIL REMOVAL AND INSTALLATION (POWER SEAT)

Removal and Installation

NOTE:

- **How to read the torque specifications** .
- SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Front Passenger's Seat-Back Cover/Pad - Remove**
2. **Front Passenger's Seat Cushion Cover/Pad - Remove**
3. **Front Seat Outer/Inner Recline Inner Covers - Remove**
4. Front Passenger's Seat Rail - Remove (Power Seat)



1. Remove the slide motor cover (A).

2. Disconnect the connectors (B), and remove the harness clips (C).

 Fastener Locations A ● : 2 B ● : 2 C ☒ A 10 mm ☒ C ☒ B 8 mm F ☒ E ☒ H ☒ G ☒ D	3. Remove the nuts (A, B) and the washers (C), and then remove the front passenger's seat rail (D), the bushings (E, F), and the collars (G, H).
